**Sheet packing of interposed metallic and non-metallic material suitable for gaskets.** Claude B. Bailey (to McCord Radiator & Mfg. Co.). U. S. 1,948,252, Feb. 20. Sheets of materials such as steel and asbestos may be used together, various structural details being described.

**Magnetic bodies suitable for cores.** Charles C. Neighbors (to Western Elec. Co.). U. S. 1,948,308, Feb. 20. Finely divided particles such as those of Fe-Ni alloy are mixed with an insulating material including an org. acid, such as tartaric acid, Na silicate, talc and kaolin, and the mixt. is dried, then mixed with a further quantity of the insulating material and again dried.

**Oxidation-resisting carbon articles** such as heating resistors. Harry V. Johnson (to National Carbon Co.). U. S. 1,948,382, Feb. 20. The article is provided with a SiC coating about 0.01-0.05 in. in thickness and with an overlying glaze comprising a fluoride of an alkali or alk. earth metal in combination with an oxide of one or more of the elements: B, Si, Al, P, Mg and Ca.

**Composition for reconditioning wood** such as abraded spike holes in rail sleepers. Sri Krishna. U. S. 1,948,422, Feb. 20. Asphalt 50-57 is first mixed with rosin 7-12 parts at a temp. of about 115° and powdered S 5 parts is gradually added to this mixt., followed by the further addn. of a soln. of rubber in a fatty oil such as castor oil and vulcanization of the mixt. by heating with S.

**Mercurized printing plates.** Hermann G. Zimmermann U. S. 1,949,233, Feb. 27. A base of a metal, such as Cu, amalgamable with Hg is coated with a metal, such as Ni, not amalgamable with Hg, the design is formed on the coating, exposed parts of the base are amalgamated with Hg, the amalgamated parts are treated with a soln. of AgNO<sub>3</sub> and HNO<sub>3</sub> to produce a layer of Hg having a mat surface and metallic Hg is applied to the surface thus produced.

**Fluid suitable for use in hydraulic brake systems.** Jules Bebie and George L. Doelling (to Wagner Elec. Corp.). U. S. 1,949,775, March 6. Castor oil 35, alc. 45 and a toluenesulfonamide ester such as an ethyl ester mixt. 20 parts are used together.

**Ornamenting semiprecious stones.** Albert Wild and Otto Wild. Brit. 401,969, Nov. 23, 1933. See Ger. 576,233 (C. A. 27, 3790).

**Projection screens.** Trans-Lux Daylight Picture Screen Corp. Brit. 401,700, Nov. 14, 1933. A rear projection screen comprises a sheetlike body of cellulose acetate material having incorporated therein an agent, e. g., triphenyl phosphate, castor oil, to impart flexibility and having light-diffusing means, e. g., ZnO, Sb<sub>2</sub>O<sub>3</sub>, BaSO<sub>4</sub>, TiO<sub>2</sub>, and, if desired, light-filtering means, e. g., cobalt blue, Victoria blue, erioglaucine blue, oil-sol. ulizarin blue, assocd. therewith or formed thereon.

**Acoustic horns.** Alexander I. Abrahams. Brit. 401,474, Nov. 16, 1933. Layers of textile material having a deep pile are stretched over a form so that the piles thereof intermesh and the whole is impregnated with a H<sub>2</sub>O-sol. varnish. The varnish may have a base of cashew-nut-shell oil, contg. cardol and anacardic acid combined with CH<sub>3</sub>O or Mn oxide, all dissolved in a hydrocarbon, or alternatively the varnish may include 25-35.5% China wood oil and 25-12.5% resin. The horn may, after baking, be further coated with the varnish.

**Protective layers.** Soc. pour l'ind. chim. à Bâle. Swiss. 165,152, Feb. 1, 1934 (Cl. 36f). Layers which conduct heat but resist the action of chemicals consist of rubber mixed with about 50% of Si or Fe-Si in powder form.

**Brake linings.** Firma Louis Blumer. Ger. 591,846, Jan. 27, 1934 (Cl. 39b. 26). These are made by mixing glycerol, PbO, natural or synthetic resin, fatty oils, fiber and filling materials, molding and hardening.

**"Foamite" corrosion inhibitor.** Gerald M. Fisher. U. S. 1,948,029, Feb. 20. An acid aq. soln. for foam formation and contg. Al sulfate or alum is mixed with 1-10% of molasses to prevent corrosion of iron containers by the soln.

**Fire-extinguishing gas.** Minimax A.-G. and Werner Ursum. Ger. 591,542, Jan. 23, 1934 (Cl. 61b). Fire extinguishers contain compds. which evolve N when heated, such as NH<sub>4</sub>NO<sub>3</sub> or (NH<sub>4</sub>)<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>.

**Fireproof preparation.** Les Pils Levy-Finger. Fr. 757,699, Dec. 30, 1933. A coating which is incombustible and impermeable to gases is made from Na<sub>2</sub>SiO<sub>3</sub> or K<sub>2</sub>SiO<sub>3</sub>, water and powd. mica.

**Fireproofing materials.** Eduard S. Ali-Cohen. Fr. 757,333, Dec. 23, 1933. Insulating materials for elec. cables are fireproofed by impregnation or coating with a double borosilicate of Al<sub>2</sub>O<sub>3</sub> and a metal oxide, with a binding agent such as an ammoniacal soln. of casein. The agent may be prepd. by treating a mixt. contg. ZnO and sol. glass by a soln. of Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> and mixing the ppt. with a sol. salt of boric acid, the whole being dried, ground and mixed with the binder.

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. R. BARTON, C. H. KERR

**Essentials of glass technology based on American practice.** Samuel R. Scholes. *Ceram. Ind.* 22, 208-12 (1934); cf. C. A. 28, 1820<sup>9</sup>. Herbert S. Willson

**Preparation of high-melting glasses.** M. K. Hoffmann. *Fortschr. Mineral. Krist. Petrog.* 17, 420-1 (1932). --The magnetically deflected arc is employed; the molten drops fall into H<sub>2</sub>O. Cr<sub>2</sub>O<sub>3</sub> is readily melted at 2200°; BeO and Al<sub>2</sub>O<sub>3</sub> give alexandrite, while ZrO<sub>2</sub> and SiO<sub>2</sub> give zircon. Phenacite, beryl, mullite, alexandrite, corundum, zircon, fluorite, MgO, BeO, ThO<sub>2</sub> and ZrO<sub>2</sub> dissolve in glass. B. C. A.

**The briquetting of glass batch in practice.** Fritz Hoffmeister. *Glastech. Ber.* 12, 1-7 (1934). --The successful use of briquetting over a period of 2 1/2 years in the operation of both pots and tank furnaces is described. The advantages listed are: storage of larger stock in smaller space, decrease in loss of batch, quicker and easier introduction of batch, longer life of refractories and chambers, better glass by improved homogeneity, increase in melting efficiency of at least 20%. The amt. of Fe introduced by such a process is negligible. J. F. Hyde

**Suggests continuous glass tank design.** Wm. G. Bergman. *Ceram. Ind.* 22, 190-1 (1934). --It is claimed that the new design, while upsetting old theories, effects improvements by confining batch and finished glass in definite channels. Herbert S. Willson

**A rapid method of analysis of soda-calcium glasses and its application to potash glasses.** A. Noël. *Verre et silic.* 5, 86-7 (1934). Herbert S. Willson

**Stony glass.** Ludwig Springer. *Glashütte* 63, 742 (1934). --Stony glass can be classified into: (1) batch or melt stones (to these belong also sulfate stones); (2)

grog or Dinas crown stones; (3) devitrification stones. The reason for the appearance of the first group of stones is due to (a) the batch being too hard; (b) coarse-grained material, especially sand; (c) bad mixing; (d) low melting temp. Sulfate stones are due to undissolved Glauber salt. The 2nd group is due to irregularly melted or broken pots and brick material or drops from the crown. The 3rd group comes from seeps in the glass when the batch is wrongly adjusted, the melting is badly conducted, or the temp. of working is too low; they may be formed also because of keeping the finished melted glass at a low temp. for a long time. Batch stones are mostly colorless, are surrounded by blisters, and show devitrification at their edges. Sulfate stones are dull, of elliptic form, and have a net-shaped structure. Grog stones are mostly yellow to brown, are nontransparent, show rare crystal formations, and have cracks. Devitrification stones are dull, white, and have a radial felt structure. M. V. Kondoidy

**Safety glass.** F. Franceschini. *Ind. silicati* 11, 7-14 (1933). --Several types of safety glasses were examd., and the results of the expts. on the resistance to light, heat, water, etc., are given. The hardened glasses recently proposed as safety glasses did not give the expected results. G. A. Brayo

**Some factors affecting furnace practice.** R. J. Sarjant. *Trans. Ceram. Soc.* 32, 113-40 (1933). --The phys., mechanical and chem. properties of the special Ni-Cr heat-resisting steels and the application of these materials in kiln construction are described in detail. Extensive data are given for the loss of heat from, and the storage of heat in, simple and composite refractory walls. B. C. A.

One-fire sanitary ware. J. B. Nealey. *Ceram. Age* 1 23, 73-5(1934).  
Herbert S. Willson

Light castings for enameling (McNair) 9. Action of Na amide on silicates and refractories (Peterson, Bergstrom) 7. Refractory materials for the Fe and steel industries (Searle) 9. Siemens-Martin furnace of refractory materials (Ger. pat. 590,242) 9.

Glass. James A. Jobling & Co. Ltd. and Ernest Joseph Jobling-Purser. Brit. 401,710, Nov. 20, 1933. Variegated glassware is made by adding glass of 1 or more colors, e. g., as short tubes or rods, powder, granules or molten, to a mass of molten glass contained in a suitable receptacle. The addnl. colored glass is preferably introduced into the forehearth of an automatic feeder. The mass of glass may also be contained in a rotating pot from which charges are gathered by suction into the molds of a forming-machine.

Apparatus for delivering measured quantities of molten glass. Oliver M. Tucker, Wm. A. Reeves and James M. Beatty. Ger. 592,457, Feb. 8, 1934 (Cl. 32a. 5). This corresponds to Brit. 258,228 (C. A. 21, 3114).

Method of and apparatus for circulating molten glass through a trough from which charges are gathered by suction-gathering, or are delivered by a feeder. Alexander F. McNish. Brit. 402,366, Nov. 30, 1933.

Mold for glass vessels. Soc. anon. d'études et de constructions d'appareils mécaniques pour la verrerie. Fr. 757,536, Dec. 28, 1933.

Glass-blowing apparatus suitable for use in making lamp bulbs, etc. Harold R. Schutz (to Libbey Glass Mfg. Co.). U. S. 1,949,435, March 6, 1933. Mech. features.

Glass-working apparatus suitable for manufacture of bottles. Benjamin T. Headley and Parke H. Thompson (to Hartford-Empire Co.). U. S. 1,948,218-19, Feb. 20, 1933. Mech. features.

Glass-blowing apparatus suitable for use in the manufacture of bottles, jars, etc. James W. Lyuch and Edward G. Bridges (to Lynch Corp.). U. S. 1,948,928, Feb. 27, 1933. Mech. features.

Machine for producing short sections of flared glass tubing, particularly the "flares" used for constructing electric lamp bulbs. Alfred Hofmann and Victor Anderson (to Alfred Hofmann & Co.). Brit. 402,306, Nov. 30, 1933.

Apparatus for manufacture of hollow glassware such as bottles. Adolf Schiller. U. S. 1,948,682, Feb. 27, 1933. Mech. features.

Glass furnace. Leonard D. Soubier (to Owens-Ill. Glass Co.). U. S. 1,949,380, Feb. 27, 1933.

Sliding plug for glass-melting furnace. Schlesische Spiegelglas-Manufactur Carl Tielsch G. m. b. H. Ger. 592,315, Feb. 5, 1934 (Cl. 32a. 5).

Furnace for hardening glass plates, "Mühlig-Union" Glasindustrie A.-G. Ger. 591,967, Jan. 30, 1934 (Cl. 32a. 30).

Hardening glass. Rudolf Seiden. Austrian 136,536, Feb. 10, 1934 (Cl. 32b). Sheet glass is hardened by heating different parts of the sheet simultaneously to different temps. Methods of procedure are indicated.

Mirrors. Peter Schlumbohm. Brit. 401,530, Nov. 16, 1933. The glass used in a mirror contains coloring matter giving the image of the user's face in artificial light an appearance simulating that given by an ordinary mirror in daylight. For use with gas-filled elec. lamps the glass is colored with equal proportions of Cu and Co oxides, a suitable compn. being  $\text{SiO}_2$  74,  $\text{CaO}$  11,  $\text{K}_2\text{O}$  4 and  $\text{Na}_2\text{O}$  11%, with a max. addn. of  $\text{CuO}$  0.025 and  $\text{CoO}$  0.025% for glass of 8 mm. thickness. Cf. C. A. 27, 5920.

Red-colored coating or patterns on glass. Norbert Kreidl. U. S. 1,947,781, Feb. 20, 1933. Compns. contg. Cu compds. which are reducible by sulfide glasses are applied to and burned upon the latter.

Apparatus for sheet glass manufacture. Carroll Cone (to Libbey-Owens-Ford Glass Co.). U. S. 1,948,563, Feb. 27, 1933. Mech. features.

Apparatus for drawing glass tubing or the like. Jean Cardot (to Corning Glass Works). U. S. 1,949,037, Feb. 27, 1933. Structural and mech. features.

Apparatus for drawing sheets of glass. N. V. Hollandische Maatschappij Voor de Vervaardiging van Glas. Fr. 757,403, Dec. 26, 1933.

Composite sheets of glass. Soc. anon. des manufactures des glaces et produits chimiques de Saint-Gobain, Chauny et Cirey. Fr. 757,502, Dec. 28, 1933. Composite glass is made by heat-welding 2 or more sheets of glass having different coeffs. of expansion, the sheets being heated separately or side by side to temps. such that their viscosity is between  $10^8$  and  $10^{10}$  C. G. S. units.

Apparatus for making laminated sheets of glass. Schlesische Spiegelglas-Manufactur Carl Tielsch G. m. b. H. Fr. 757,404, Dec. 26, 1933.

Laminated glass. John L. Drake (to Libbey-Owens-Ford Glass Co.). U. S. 1,948,506, Feb. 27, 1933. Mech. features.

Machine for extruding clay, etc. Charles Edward Morris. Brit. 402,014, Nov. 23, 1933. Addn. to 383,399 (C. A. 27, 5921).

Machinery for molding hollow bricks, closed at one end. Avon A.-G., Gesellschaft zur Verwertung von Ziegelpatenten. Brit. 401,995, Nov. 23, 1933.

Gray burned brick resembling granite. Ralph L. Atkinson (to Arthur D. Little, Inc.). U. S. 1,949,524, March 6, 1933. A normally buff burning clay is mixed with a small amt. of a finely divided Co compd. such as the oxide which will produce a Co silicate, and coarse granules of Mn ore are also incorporated with the material.

Kiln for ceramic ware. Fours électriques Borel Soc. anon. Swiss 162,939, Sept. 16, 1933 (Cl. 8c).

Ceramic electrical insulator and like products. Isador Kitsee (to Mineralite Corp.). U. S. 1,949,311, Feb. 27, 1933. A minor proportion of mineral wool is mixed with a major proportion of clay, and the mixt. is molded and baked at a temp. sufficiently high to fuse the mineral wool and produce a hard, dense, homogeneous product.

Ceramic "acoustical" material suitable for sound- or heat-insulation. Richard Ericson, James S. Offutt and Joseph R. Parsons (to U. S. Gypsum Co.). U. S. 1,948,878, Feb. 27, 1933. A deflocculated clay slip is treated with tenacious foam and an agent such as alum capable of reflocculating the slip after a definite lapse of time; ligneous fibers are incorporated in the mixt. and it is molded, allowed to set up in the mold, dried and then fired to harden it and burn out the added fibers and produce passages connecting the voids left by the foam.

Refractory bricks, etc. Feldmühle, Papier- und Zellstoffwerke A.-G., Friedrich Klein and Karl Rehtel. Ger. 589,500, Dec. 8, 1933 (Cl. 80b. 18.02). Addn. to 588,805 (C. A. 28, 1934<sup>9</sup>). In making fireproof bricks, etc., by the method of 588,805, the fused oxides are given an addn. of gas or vapor-forming substances shortly before cooling.

Refractory blocks, bricks, etc., for the construction of glass-melting and other furnaces. E. J. & J. Pearson Ltd. and Charles W. Thomas. Brit. 401,816, Nov. 23, 1933.

Compound refractory blocks, etc. Corning Glass Works. Brit. 402,160, Nov. 30, 1933. Blocks for glass-melting tanks, etc., are cast by pouring molten refractory material, consisting mainly of  $\text{Al}_2\text{O}_3$  and  $\text{SiO}_2$ , e. g., Al silicate, in contact with a backing member of different refractory material, e. g., unburnt slag.

Refractory articles such as bricks, etc. Trevor M. Caven (to Corning Glass Works). U. S. 1,949,038, Feb. 27, 1933. Refractory Al oxide grains are used together with a binder of refractory Al phosphate.

Refractory bodies. Arthur Sprenger. Ger. 590,357, Dec. 30, 1933 (Cl. 80b. 8.09). Addn. to 565,899 (C. A. 27, 2554). Fireproof bodies are made by using small amts. of finely divided Cr ores as binding agent for granular masses of  $\text{MgO}$ ,  $\text{Al}_2\text{O}_3$ , and small amts. of  $\text{SiO}_2$ ,  $\text{TiO}_2$ ,  $\text{Fe}_2\text{O}_3$ , etc. Cf. C. A. 28, 1832<sup>9</sup>.

Abrasive. Soc. pour l'ind. chim. à Bâle. Swiss 163,625, Nov. 1, 1933 (Cl. 85b). Granular abrasive material is

mixed with an amine resin and molded to a solid body by hot-pressing. Thus,  $\text{PhNH}_2\text{HCl}$  is treated with  $\text{CH}_3\text{O}$  and the product mixed with corundum and hot-pressed.

**Enamels.** Philipp Ever. Fr. 757,363, Dec. 26, 1933. White enamels and other pre-opacified glazes are made by adding to the mixts. in fusion an opacifying agent having a basis of  $\text{ZrO}_2$  and glass. The  $\text{ZrO}_2$  is freed from Fe. The glass may be made by fusing sand 100,  $\text{CaO}$  10,  $\text{K}_2\text{CO}_3$  10, soda 21 and saltpeter 1 part.

**Vitreous enamels.** Charles J. Kinzie and Charles H. Commons, Jr. (to Titanium Mfg. Co.). U. S. 1,949,479, March 6. An opaque frit for vitreous enamels resistant to acids is formed by fusion of a raw batch comprising Na Zr silicate 7.08, quartz 40.58, borax 14.94,  $\text{Na}_2\text{CO}_3$  19.65,

$\text{NaNO}_3$  3.5,  $\text{TiO}_2$  13.86,  $\text{PbO}$  3.04, Sh oxide 6.98 and fluorspar 5.94 parts.

**Opaque enamels for ironware, etc.** Ignaz Kreidl. U. S. 1,948,461, Feb. 20. While grinding an enamel frit in the presence of water, there is added to it, in lieu of previously known white insol. oxide clouding media, substances such as methylene blue or an inorg. nitrate which themselves do not serve as clouding agents but which evolve gases on burning of the enamel which remain in the latter together with a gas-adsorbing clay the quantity of which used serves to control the size and number of gas bubbles evolved on firing. Cf. C. A. 28, 1498<sup>1,2</sup>.

**Enameled sheet iron.** Ignaz Kreidl. Brit. 401,650, Nov. 13, 1933. See Austrian 136,003 (C. A. 28, 2491<sup>2</sup>)

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

**A modern cement mill in Czechoslovakia.** W. Zollikofer. *Rev. matériaux construction trav. publics* 1934, 40 3.—A description.

Karl Kammermeyer

**Simple apparatus for testing cement characteristics.** S. C. Pierce and H. McC. Larmour. *Eng. News-Record* 112, 114 16(1934).—Methods of detg. vol. change and a simple, inexpensive app. for detg. heat of hydration by the heat-of-soln. method are described. Results are given showing the variations in these properties between com. cements that are similar in chem. characteristics, indicating that mfg. details have as much bearing as compn on the ultimate results.

R. E. Thompson

**Temperature and humidity control in cement testing.** M. Houghn. *Eng. News-Record* 112, 17-18(1934).—A brief description of a const.-temp. and humidity-storage cabinet constructed in the phys. testing lab. at Columbus, by means of which the humidity can be maintained between 90 and 100% and the temp. within 1° of 70°F.

R. E. Thompson

**The influence of alkalinity and acidity in the setting of limes and cements.** Maurice Dérivé. *Rev. matériaux construction trav. publics* 1934, 33 5.—Expts. are reported of mixing water varying in  $p_{\text{H}}$  from 2 to 12. Cements show a distinct max. of strength at a  $p_{\text{H}}$  of about 6.5, while the phenomena are less distinct with the lime, showing max. strength from a  $p_{\text{H}}$  of 4.7-8. D. concludes that 2 distinct zones exist: (1) A  $p_{\text{H}}$  of 1 to about 5.5, where the formation of salts of  $\text{CaO}$  with the acid components cause a decrease of the  $p_{\text{H}}$ . When set takes place, the phenomenon is accelerated by the decrease of the ratio:  $(\text{CaO salts})/\text{CaCO}_3$ . (2) Above a  $p_{\text{H}}$  of 5.5, various carbonates are formed and on setting a delay is caused by the increase of the ratio:  $(\text{carbonates})/\text{CaCO}_3$ . Exptl. results are presented together with a crit. discussion of the work of other investigators. Six references.

Karl Kammermeyer

**Destruction of cement by magnesium salts.** J. Lopez Cayetano. *Afinidad* 13, 594-5, 609-12(1933); *Química e industria* 31, 106-7.—Briquets were made from 1 part of ordinary portland cement or of pozzuolana cement and 3 parts of sand. After complete hardening they were immersed for 28-180 days in fresh water or in sea water, and finally in 10% and 30%  $\text{MgSO}_4$  solns. Others were exposed to the air for 30 days and then immersed in the  $\text{MgSO}_4$  solns. Conclusions: Attack of the briquets increases with the  $\text{MgSO}_4$  concn; attack proceeds from the surface toward the center; pozzuolana cement is much more resistant than portland; briquets exposed to the air before immersion in  $\text{MgSO}_4$  soln. were decomposed much more slowly than those which had been immersed in either fresh or sea water.

A. Papineau-Couture

**The manufacture of portland cement by the dry process.** Salvador Mdsqueira R. *Ingeniera* 8, 15 25(1934).—Plant operations are described.

R. M. Symmes

**The nature of portland cement clinker.** H. G. Fisk. *J. Chem. Education* 11, 195-203(1934).

B. H.

**The activation of blast-furnace slags and the preparation of clinkerless cement.** P. P. Budnikov. *Compt.*

*rend. acad. sci. U. R. S. S. [N. S.]*, 1, 255 9(in English 259 63)(1934).— $\text{CaSO}_4$  as dihydrate, hemihydrate or anhydrite, dolomite dust, and mixts. of these two to the extent of 8-10% were added during the grinding process to blast furnace slags contg. not less than 46%  $\text{CaO}$ , 9%  $\text{Al}_2\text{O}_3$ , 3%  $\text{MnO}$  and not more than 2% Fe to give high-grade cements. Addn. of  $\text{CaS}$  or  $\text{CaCO}_3$  increased the mechanical strength, but oxidation again decreased it.

F. J. Rathmann

**Cementing oil wells.** S. B. Kocharov. *Nefte* 2, No. 18, 14 17(1931).—A general discussion on cementing oil wells including the standards for a good cement, temp. conditions, pressure of the column of water, influence of bore-hole waters, mud and crude oil admixts., and the action of accelerators.

A. A. Boettingk

**Activation of pozzuolana materials by heat.** Corrado Vittori. *Industria chimica* 9, 21-7(1934).—Pozzuolana cements made by addn. of pozzuolana from 5 sources to portland cement were heated to temps. ranging from 300° to 900° and the time of set and strength of a test piece from each measured. Each pozzuolana mix had an optimum temp. of treatment which gave the best results, but the pozzuolana giving the best results of all was one whose optimum temp. was 300°. This appears logical, for at lower temps. there is less clinkering, and thus greater surface, which would favor more rapid setting.

A. W. Conner

**Presence of silt and clay in sands used in cement mortars.** D. G. R. Bonnell. *J. Soc. Chem. Ind.* 53, 54 7T(1934).—The disadvantages of the A. S. F. M. method of detg. silt and clay in sands are: (1) clay present as adsorbed film is not completely removed, and (2) the method is tedious and requires considerable time. The proposed method uses dil.  $\text{Na}_2\text{C}_2\text{O}_4$  soln. to peptize the clay. The suspension is sampled and analyzed. A pipet is mechanically mounted so that it can be accurately lowered exactly 10 cm. in the liquid and the sample secured. By varying the time of sedimentation the concn of particles of various size can be detd. The effect of clay on the tensile strength of mortars was studied; with few exceptions clean sand increases the strength of mortars.

C. B. Jenn

**Concrete and industrial gases.** F. W. Friese. *Concrete Constr. Eng.* 28, 299-303(1933).—Corrosion of concrete by  $\text{H}_2\text{S}$  is caused by reaction with the free  $\text{Ca(OH)}_2$  in the cement. Oxidation products of  $\text{H}_2\text{S}$  also react with the concrete and with the reinforcements. Losses in strength up to 40-50% have been observed.  $\text{SO}_2$  reacts with the Fe compds. in the cement. Pure  $\text{CS}_2$  is harmless, but when  $\text{COS}$  is present, corrosion occurs. In the presence of moisture  $\text{COCl}_2$  causes disintegration. Examples are given and the mechanism of reactions is discussed. Dense concrete well cured before coming in contact with gases is recommended, to avoid corrosion, but certain protective coatings, details of which are given, may be used.

B. C. A.

**Test on methods of pouring under-water concrete.** Ambrose G. Hampton. *Eng. News-Record* 112, 17

(1934).—Brief data are given regarding exptl.-scale tests on the pouring of under-water concrete. R. E. T.

**Determining silt content in concrete aggregates.** D. T. M. Davis. *Eng. News-Record* 112, 53 (1934).—A rapid, simple and accurate pycnometer method is described for detg. sp. gr., moisture and silt content of aggregates.

R. E. Thompson  
**Standard specifications for brick pavements.** Roy L. Phillips. *Proc. Am. Soc. Munic. Engrs.* 39, 268 75 (1933).—New specifications are given for mastic cushion and for asphalt filler.

W. H. Boynton  
**Specifications for bituminous pavements.** H. F. Clemmer. *Proc. Am. Soc. Munic. Engrs.* 39, 276 (1933).

W. H. Boynton  
**The setting of plaster of Paris.** R. Stratta. *Industria chimica* 9, 28-34 (1934).—Measurements of the time of set of samples of plaster of Paris, together with the inspection of spectrographs of these samples while setting, indicate that there are 2 phases present in set plaster of Paris. These forms are: the semihydrate,  $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ ; and an insol. anhydrite, whose structure is identical with that of natural anhydrite, but which has a more rapid time of set than the natural product. The semihydrate forms on heating below  $160^\circ$ ; the second, when heating at  $160$ – $400^\circ$ ; heating above  $400^\circ$  produces a product identical with the natural product. A. W. C.

**Roofing-felt raw materials and quality control.** A. O. Bragg. *Paper Ind.* 15, 699 703 (1934).

A. P.-C  
**The chemical resistance of some important native [German] woods.** Edgar Morath. *Wochbl. Papierfabr.* 64, 742-5 (1933).—Spruce, pine and larch lose less than 10%, linden, oak and beech less than 30% of their (wet) bending strength when treated with acid or alkali in the pH range 3-11. They should be more widely used for construction involving chem. exposure. R. H. D.

**Effecting endothermic reactions [manuf. of cement]** (Ger. pat. 577,103) 13.

**Modern Road Emulsions.** London: The Carriers Pub. Co. Ltd.

**Acoustic plaster.** Charles A. Longley and Rhenolite Products Ltd. Brit. 401,360, Nov. 13, 1933. Fine granular pumice is mixed with  $\text{Ca}(\text{OH})_2$  and Na silicate and allowed to dry and the product used as a base for acoustic plaster by admixt. with ordinary plaster or cement or pumice plaster produced according to Brit. 401,361 (following abstr.).

**Plasters, etc.** Charles A. Longley and Rhenolite Products Ltd. Brit. 401,361, Nov. 13, 1933. A cementitious compn. is produced by admixt. of finely ground pumice and quick lime. Trachytic pumice is preferably used. 1-5% of natural rock asphalt is also preferably added to prevent formation of blow holes when using as a plaster. Calcined gypsum or anhydrite is added when the material is used as plaster for inside work and ordinary cement for outside work. For making slabs, boards or blocks a fibrous binder, e. g., asbestos, is added.

**Preserving wood.** Harold W. Walker (to Pennsylvania Lubricating Co.). U. S. 1,948,551, Feb. 27. Wood is impregnated with an oil such as creosote or fuel oil to which diphenylamine and  $\text{AsCl}_3$  have been added. Naphthalene also may be used.

**Preserving wood.** Carl Schmittutz. Brit. 402,023, Nov. 23, 1933. The process of Brit. 381,030 (C. A. 27, 5510) is applied to growing trees.

**Cements.** Foster D. Snell. Brit. 401,522, Nov. 16, 1933. A  $\text{H}_2\text{O}$ - and acid-proof cement, which forms a hard-setting plastic material with  $\text{H}_2\text{O}$ , comprises a drv. mixt. of ground aggregate, e. g., stoneware or other grog, powd. Na silicate and a fluosilicate, e. g.,  $\text{Na}_2\text{SiF}_6$ , in such proportion that it will react with all the  $\text{Na}_2\text{O}$  of the Na silicate and preferably leaves some fluosilicate in excess. In a modification a portion of the fluosilicate is replaced by a  $\text{H}_2\text{O}$ -sol. acid fluoride, e. g.,  $\text{KHF}_2$ . The material is

1 suitable as acid-proof lining, for binding abrasive wheels and for floors.

**Cement.** Constantin J. Choremi. Swiss 165,438, Feb. 1, 1934 (Cl. 8b). A hydraulic cement is made by mixing  $\text{CaO}$  with a substance contg. Si and Al compds., the amt. of  $\text{CaO}$  being 4-18% of the wt. of the Si and Al compds. "Santorine" earth may be used as the substance contg. Si and Al.

**Cements.** Paul Fisch. Fr. 757,484, Dec. 27, 1933.  
2 Graphite (0.5-5%) is added to hydraulic and refractory cements to render them waterproof, resistant to chem. agents and to wear by friction.

**Cement compositions.** Hans Opalsky. Austrian 136,398, Jan. 25, 1934 (Cl. 80c). Cement compns. are improved in their mech. properties and resistance to water by addn. of up to 2.5% of a protein and up to 12% of an alk. earth oxide or hydroxide, calcd. on the dry cement.  
3 These substances may be added before or during the addn. of water.

**Portland cement.** Willoughby E. Snyder. U. S. 1,948,433, Feb. 20. Raw material having a lime base such as  $\text{CaCO}_3$  is subjected to a temp. which will form  $\text{CaO}$  but insufficient to produce hydraulic properties, and the heat-treated material is then subjected to hydration, while in the unground condition resulting from the heat treatment and is thus reduced to finely divided condition for use in a cement-forming mixt.

**Rotary feed drum and kiln for cement manufacture.** Arno Andreas. U. S. 1,948,742 Feb. 27. Various structural and operative details are described.

**Rotary kiln and burner for use in portland cement manufacture.** Richard D. Cheesman (to Traylor Engineering & Mfg. Co.). U. S. 1,949,560, March 6.

**Concrete.** Ernest H. Coleman. Brit. 401,685, Nov. 17, 1933. A light aggregate for concrete is made by breaking gneiss, schist, slate, shale, etc., to a required particle size, e. g., 0.25-0.5 in., and heating, e. g., in a rotary kiln, to about  $1100^\circ$  until softening and expansion under the action of contained gas or moisture occurs.

**Apparatus (including an electric motor provided with an unbalancing weight) for subjecting concrete to vibration during placement.** Corwill Jackson. U. S. 1,947,941, Feb. 20. Mech. features.

**Bituminous emulsion.** Lester Kirschbraun (to Patent and Licensing Corp.). U. S. 1,948,881, Feb. 27. For producing a product suitable for road work, etc., an emulsion of a bitumen such as asphalt with water and clay is mixed with another emulsion of a bitumen of substantially the same m. p., water and soap, to produce a combined emulsion system having a consistency thinner than either of the original emulsions and a bitumen content higher than either of the original emulsions at the same consistency.

**Bitumen dispersion.** Hermann Planson. Swiss 164,100, Dec. 1, 1933 (Cl. 6c). An aq. dispersion of bituminous material for road surfacing contains a deriv. of cholesterol as the stabilizing dispersion agent, an org. solvent and an alkali. Thus, bitumen is added to a soln. contg.  $\text{KOH}$ ,  $\text{K}_2\text{C}_2\text{O}_4$ ,  $\text{C}_6\text{H}_6$  or toluene, lanolin and bone fat or wool fat. The fats may be chlorinated or sulfonated.

**Protecting metallic bodies such as pipes from corrosion.** Joseph F. Putnam (to Standard Oil Co. of Calif.). U. S. 1,948,007, Feb. 20. A body such as a pipe line is provided with a covering of bituminous mastic such as asphalt and mineral aggregate which is covered with a spirally wound sheathing which may be formed of paper with an overlying spirally wound fibrous covering such as paper and an interposed layer of flexible asphaltic material.

**Building material from ore slime.** "Kolloidchemie" Studiengesellschaft m. b. H., Johannes B. Carppow, Martin March, Robert Lenzmann and Hermann Sanders. Ger. 591,745, Jan. 26, 1934 (Cl. 80b.3.07). Cement, building material, plaster, etc., are prepd. by intimately mixing oxides or salts of heavy, alkali or alk. earth metals with ore slime, drying and, optionally, burning. Thus, slime is mixed with  $\text{Al}_2(\text{SO}_4)_3$  and dried to give a plaster suitable for walls. Several other examples are given.

**Bituminous coating composition suitable for uniting**

layers of laminated building board. George B. Dunford. U. S. 1,948,906, Feb. 27. A coating compn. flowable at atm. temps. contains asphalt with at least as much naphtha and at least half as much talcous-agalite. Asbestos, linseed oil, etc., also may be used.

Sheet material suitable for roofing. Philip W. Codwise (to Certain-Teed Products Corp.). U. S. 1,948,979, Feb. 27. A weather-resisting material comprises a sheet of felt contg. a substantial amount of soda pulp, impregnated with a water-proofing agent such as asphalt.

Waterproof bituminous compositions suitable for roofing tiles or the like. Frank W. Yeager (to Barrett Co.). U. S. 1,949,220, Feb. 27. Bituminous material such as pitch 15-45 is mixed with clay 15-40, sand 15-50, fiber such as asbestos, 17 parts and water to form a plastic mass, which is shaped and dried and then heated to above the m. p. of the bituminous material but below 425°.

"Anti-slip" material suitable for floors. Edward Van der Pyl (to Norton Co.). U. S. 1,949,517, March 8. A veined material in imitation of natural stone or marble is formed by mixing abrasive aggregates and cement in dry form, sepp. the mixt. into plastic masses by regulated addn. of water, coating the masses with coloring material, and then compressing them together before they have hardened.

Floor coverings. Karl Schneble. Swiss 162,932, Sept. 16, 1933 (Cl. 4d). A plastic mass for covering floors comprises cement, cork chips, calcined kieselguhr, filling and coloring materials.

Coating composition suitable for use on floor coverings, etc. Michele Croce (to Sloane-Blabon Corp.). U. S. 1,948,959, Feb. 27. A solidified oxidized and polymerized drying oil is dispersed in an aq. vehicle such as water contg. also rosin, a pigment, emulsifier, etc.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDEN H. EMERY

Motor fuels containing high percentages of alcohol. Sandro Doldi. *Giorn. chim. ind. applicata* 15, 593-8 (1933).—The process of L. Livraghi [Ital. pats. 307,368 and 309,243] has been applied in prepg. motor fuels contg. up to 70% alc., the rest being crude benzene. It is prepd. by heating the mixt to 500° at ordinary pressures. With a mixt contg. 32% MeOH, the distn. showed 97% distd. at 135°, while after treating, 90% distd. over at 83°. The loss is less than 3%. The calorific value is higher than that of the sum of the components, i. e., with a 40% MeOH mix, the values are 7720 and 8008 cal./g., resp. The S content remains low even when high in the original mix. The sp. gr. is very slightly lowered, while the viscosity is somewhat raised. Tests indicate that on a vol. basis, gasoline, benzene and the fuel give about the same power. This is probably due to these factors: (a) the exhaust gases from gasoline have a higher sp. heat [about 75% more H<sub>2</sub>O is formed than with the special fuel]; (b) the special fuel has a 50% higher rate of flame propagation, and the temp. of combustion reaches a higher figure; (c) the special fuel has a higher antiknock value.

A. W. Coniari

Heat loss through incomplete combustion of fuel. P. Vukoborov. *Neft* 3, No. 2, 21-3 (1932). A few illustrations are given pertaining to the calcn. of losses through incomplete combustion detected by various amts. of CO in the flue gases.

A. A. Boethlingk

Alloy skeletons as catalysts for benzene synthesis from carbon monoxide and hydrogen. Franz Fischer and Karl Meyer. *Ber.* 67B, 253 61 (1934). Catalysts prepd. by Raney's method (cf. C. A. 21, 2116) of dissolving Al or Si from alloys with Ni and Co are effective in hydrocarbon synthesis from water gas. Fe decreases the activity of a mixed Ni-Co catalyst.

G. B. Taylor

Development of formula to determine carbon dioxide in products of combustion. P. B. Place and J. Cruise. *Combustion* 5, No. 4, 28-9 (1933).—Stoichiometric formula based on the ultimate analysis of the fuel are presented.

Leslie B. Bragg

Progress in production of motor spirit by coal hydrogenation. C. H. S. Tupholme. *Ind. Eng. Chem., News Ed.* 12, 107 (1934).

E. J. C.

The making and interpretation of systematic petrographic analyses of coal-bed profiles. F. Kuhlwein, E. Hoffmann and E. Krupe. *Glückauf* 70, 1-8, 32-41 (1934).—Examples are given showing application of British (Threlfall, et al., C. A. 26, 5727) and American (Fieldner, et al., C. A. 26, 828) methods of petrographic analysis, and of the German method as modified by the authors. British and German methods are based mainly on macroscopic sepn. of coal constituents—vitrain, clarain, durain and fusain—whereas the American method as developed by the U. S. Bur. of Mines involves microscopic analysis of thin sections covering the whole profile. The

latter is most exhaustive and precise, but the macroscopic method is sufficiently accurate for practical purposes. Microscopic examin., where carried out in Germany, usually involves etching of polished specimens and study by reflected light. This is a more rapid method than that of the Americans which requires thin translucent sections. No relation can be traced between rank of coal and the distribution of petrographic constituents. Petrographic analysis enables one to distinguish between coking and noncoking or weakly coking material and serves as a guide in coal prepn.

J. D. Davis

Blending coals for carbonization. G. E. Foxwell and John Roberts. *Gas Eng.* 51, 145, 147 (1934).—Notes are given on the blending of coking and noncoking coals in order to obtain a uniform coke of a suitable texture for use in domestic open grates. Overcoking detracts from the combustible properties of the coke. Sized coals are usually preferred, but encouraging results have been obtained by blending slacks.

P. J. Wilson, Jr.

Significance of solvent extraction and rational analysis in coal carbonization. E. B. Kester, E. J. Schneider and P. W. Jung. *Ind. Eng. Chem., Anal. Ed.* 6, 98-103 (1934).—Twenty coals were studied exhaustively by extn. with C<sub>6</sub>H<sub>6</sub> under pressure, resolution of coal into  $\alpha$ -,  $\beta$ - and  $\gamma$ -constituents (Wheeler method), and analysis of the rational constituents, i. e., bitumens, ulmins and resistant plant residues. Methods and results are reported in detail. An attempt was made to correlate among themselves the quant. relationships so obtained, as well as with the gas-, coke- and by-product-making properties of the coal, and other functions of the coal numerically expressible. All such attempts at correlation proved disappointing; one may interpret little from a knowledge of the quantities of extractable constituents present within the restricted range of coking coals studied. It would be unwise to predict any aspect of the behavior of coal during the coking process or any properties of the coke produced from results so far obtained.

W. C. Ebaugh

Low-temperature carbonization of Lisichanskil coal in an oven with internal heating. G. V. Gritzevich. *Izvestiya Teploekkh. Inst.* 1933, No. 9, 35-45; cf. C. A. 27, 1735. According to expts. reported in detail the Lisichanskil coal may be subjected to low-temp. carbonization in ovens with an internal-heating arrangement provided the process is maintained within very stringent specifications such as the rate of feeding the coal through the oven, proper stoking, etc. The temp. of the air-steam mixt. should be kept at 80-82° and its vapor pressure, should amount to 70-72 mm. at the intake. The yield of liquid products amounts to 6.62% and that of semi-coke 54.82%, the latter contg. 29.90% ash. The gas amounts to 1.308 cu. m. per kg. coal and its calorific value is close to that of water gas. It contains 18.04 g. of H<sub>2</sub>S per m. of gas, and the tar contains 7.13% gasoline which is difficult to refine because of the high S content. Numerical data

on distn., yields and properties of the products are tabulated.

**A. A. Bochtlingk**  
Application of particular washing systems to specific coal-washing problems. E. Blümel. *Glückauf* 70, 29-32 (1934).—In coal-washing practice where coals from 2 or more beds are treated it is customary to treat them all together by one washing system because of the cost of app. for sep. treatment. This is bad practice because different coals require different treatments for the best results. B. shows (washing charts) that where only 1 system must serve to treat several beds the results can be varied and improved by judicious proportioning of the coals before treatment.

**J. D. Davis**  
Fusion characteristics of fractionated coal ashes. A. H. Moody and J. D. Langan, Jr. *Combustion* 5, No. 4, 15-17 (1933).—Low-fusion portions of coal ash may become sepd. in the boiler and exhibit different fusion temps. from the av. coal-ash mixt. Leslie B. Bragg.

**Determination of volatile matters in coals by the furnace method.** César Pablo Fernández. *Quim. e ind.* 10, 310 (1933).—The sample of coal is placed in a covered porcelain crucible and heated 8 min. in a Simon-Müller furnace electrically heated to 1000°. The results can be reduplicated in different labs.

**O. W. Wilcox**  
Velocity of adsorption of oxygen by coal in the presence of occluded gases. V. A. P'yankov and M. L. Loevskil. *Izol* No. 95, 60-9 (1933).—Expts. with various samples of coal from the Don basin contg. occluded  $\text{CH}_4$  at 20°, 30° and 40° show that the ratio of expelled  $\text{CH}_4$  to adsorbed  $\text{O}_2$  is a const. at a given temp. for all dry samples regardless of the time of exposure to air. The ratio decreases as the temp. increases. The ratio is not const. if moisture is present. Adsorption of  $\text{O}_2$  decreases with length of exposure and if moisture is present. Increasing the temp. decreases adsorption in some samples and increases it in others.

**H. W. Rathmann**  
Effects of fusain on the coking properties of coals. M. Mayer and L. E. Zukerman. *Coke and Chem.* (U. S. S. R.) 1933, No. 4, 51-62.—The effects of admixt. of fusain on the coking properties of different coal mixts. were studied. While addn. of 10-20% fusain to expanding coals high in volatile matter improved the quality of coke produced, addn. of more than 5% fusain to coals with good coking properties was harmful.

**James Sorrel**  
Low-temperature distillation of Bayac brown coal. Charrin. *Mat. grasses* 24, 9674-5 (1932).—The coal (20%  $\text{H}_2\text{O}$ ) affords 15% of tar and benzene (30% < 160°). The semicoke is briquetted with 10% of pitch.

**B. C. A.**  
Colloidal solution and hydrogenation of lignite. J. M. Portierra. *Anales soc. españ. fis. quim.* 31, 779-809 (1933).—Reaction between gaseous  $\text{H}_2$  and solid C is at a much higher velocity than in the first Bégins process, because of increase in C surface, due to the colloidal state. Velocity of hydrogenation reactions should exceed those of carbonization of the org. matter, and the most important result is conversion of all colloidal, org. matter dissolved in liquids and gases, without formation of coke or solid residue. To prep. colloidal lignite solns., lignite is treated with anthracene oil or its fractions under reflux at about 300°. Grinding lignite smaller than 200-mesh has little advantage over grinding to 60-mesh. In a  $\text{H}_2$  or  $\text{N}_2$  atm., almost all the lignite dissolves at 375°. Such ready soln. of lignite in anthracene oil is explained by a preliminary hydrogenation, which depolymerizes the combustible solid. Filtration of colloidal solns. seps. a large proportion of inorg. matter. Continuous hydrogenation of 1681 g. of a colloidal soln. contg. 80 g. of org. matter from Gualdo Cataneo lignite at 400-430° for 2 hrs. with  $\text{H}_2$  pressure 200 atm., catalyst  $\text{Mo}$  oxide, converted all the org. matter into products sol. in  $\text{Et}_2\text{O}$  and  $\text{CHCl}_3$ , without residue. The quantity converted into gas was 11.5% of the charge.

**E. M. Symmes**  
Simple method of calculation of the specific volume of superheated steam. Forner. *Arch. Wärmewirt.* 15, 15 (1934).—The product of pressure and vol. is nearly const. for a given total heat regardless of pressure. A diagram based on this fact is given. Also the product is

nearly proportional to the total heat; a diagram of the value of the correction term is given. The accuracy is better than 0.2%.

Ernest W. Thiele

**Pyrolysis of the lower paraffins. V. Conversion of the gaseous paraffins to aromatics in baffled metal tubes and the chemical composition of the products.** Adrian Cambron and Colin H. Bayley. *Can. J. Research* 10, 145-63 (1934); cf. C. A. 28, 1506°.—The thermal conversion of propane to aromatic compds. has been investigated by passing the gas through externally heated alloy steel tubes under conditions of turbulent flow. Recycling expts. carried out under pressure have shown that, when the gas flow is turbulent, high rates of conversion can be obtained at temps. as low as 800-810°. Heat-resistant Cr-Ni alloys of the 18:8 type have been found unsuitable for this purpose because of the catalytic formation of C. Yields of 23.3 lb. of light oil per 1000 cu. ft. of propane put through were obtained at 800° together with 10 lb. of liquids boiling above 200°. The compn. of the liquids obtained in these expts. has been detd. by fractionation and chem. methods. The light oil obtained under the above conditions contains about 64% benzene, 14% toluene, 7.8% styrene and small amts. of cyclopentadiene, xylenes and higher aromatic compds. The liquids boiling above 200° contain about 25% naphthalene and 12.5% anthracene together with smaller amts. of mono- and dimethyl-naphthalenes, acenaphthene and phenanthrene.

Study of the pressure drop in small diameter pipe lines. E. Biard. *J. usines gas* 57, 532-41, 560-9, 587-95 (1933). Prevot. *Ibid.* 610-16.—A study of pressure losses in steel and lead piping, fittings, etc. Conclusions: The pressure loss is proportional to pipe length and to the d. of the gas. The division of flow in Poiseuille or Venturi ranges is only valid in straight pipes of const. area; in all other cases these ranges are poorly defined or nonexistent. General equations are given for steel pipe: for Poiseuille flow  $H_1 = 2.12 \nu Q L / D^4$ , for turbulent flow (flow rate above crit. value)  $H_2 = 3.56 Q^{1.8} L / D^{4.8}$ , where  $H$  is pressure drop in mm.,  $\nu$  density of gas (air = 1),  $Q$  cu. m. gas per hr.,  $L$  length of pipe in m. including equivalents for fittings,  $D$  diam. of the pipe in cm.,  $\nu$  the ratio of viscosity gas:air. For Pb pipe the factor for  $H_2$  is 3.24 instead of 3.56;  $H_1$  is unchanged. These equations are more accurate than those of Monnier. Many curves, exptl. data and nomograms are given.

Industrial gas heating. Peter Lloyd. *Gas J.* 205, 557-60, 622-4 (1934); *Gas World* 100, No. 2589, *Ind. Gas Suppl.* 23-9.—Industrial gas-heating operations are classified. The importance and detn. of thermal efficiency are discussed and illustrated with examples. Special emphasis is laid on heat losses and equations for their calcn. are given.

**P. J. Wilson, Jr.**  
Desulfurization of industrial gases with recovery of elementary sulfur. I. M. V. Hoftman and S. G. Aronov. *Coke and Chem.* (U. S. S. R.) 1933, No. 1, 41-50.—The iron-soda process for elementary-S recovery from coke-oven gas developed by Kharkov Coal-Chem. Inst. is described. The chemistry of the process is as

follows: absorbing liquid (a 0.5-1% soda soln. + 0.2-0.5%  $\text{Fe}(\text{OH})_3$  in suspension) is circulated counter-current with gas contg.  $\text{H}_2\text{S}$  in an absorption app. The reactions are:  $\text{H}_2\text{S} + \text{Na}_2\text{CO}_3 = \text{NaHS} + \text{NaHCO}_3$ ;  $3\text{NaHS} + 2\text{Fe}(\text{OH})_3 = 2\text{FeS} + \text{S} + 3\text{NaOH} + 3\text{H}_2\text{O}$ . To regenerate the absorbing liquid air is blown through the soln. The reactions are:  $4\text{FeS} + 3\text{O}_2 + 6\text{H}_2\text{O} = 4\text{Fe}(\text{OH})_3 + 4\text{S}$ ;  $2\text{NaHCO}_3 = \text{Na}_2\text{CO}_3 + \text{CO}_2 + \text{H}_2\text{O}$ ;  $\text{NaHS} + \text{NaHCO}_3 = \text{H}_2\text{S} + \text{Na}_2\text{CO}_3$ . Some other secondary reactions also take place forming  $\text{Na}_2\text{S}_2\text{O}_3$ ,  $\text{NaCNS}$ , etc., which result in some loss of the absorbing liquid. A semi-plant was constructed and operated to study the technology of the process. This exptl. plant consisted of a scrubber, a vertical and a horizontal regenerator, 3 pumps, compressor and a centrifuge. It was found possible to remove practically all  $\text{H}_2\text{S}$  from the gas. The yield of elementary S was 70-75% of the total S absorbed. From 20 to 30% of S remained in combination with non-regenerable parts of absorbing liquid. The elementary S contained 40-50% moisture and 20% entrapped  $\text{Fe}(\text{OH})_3$ . II. Iron-ammoniacal method. M. V. Hofman, S. G. Aronov, S. E. Senichenko and M. B. Khvat. *Ibid.* No. 2, 47-53.—A similar study was made with the iron-ammoniacal method. The chemistry of this method consisted in: scrubbing the coke-oven gas with a weak soln. of  $\text{NH}_4\text{OH}$  with  $\text{Fe}(\text{OH})_3$  in suspension. The reactions are:  $\text{NH}_3 + \text{H}_2\text{S} = \text{NH}_4\text{HS}$ ;  $2\text{NH}_3 + \text{H}_2\text{S} = (\text{NH}_4)_2\text{S}$ ;  $3\text{NH}_4\text{HS} + 2\text{Fe}(\text{OH})_3 = 2\text{FeS} + \text{S} + 3\text{NH}_4\text{OH} + 3\text{H}_2\text{O}$ ;  $3(\text{NH}_4)_2\text{S} + 2\text{Fe}(\text{OH})_3 = 2\text{FeS} + \text{S} + 6\text{NH}_4\text{OH}$ . The absorbing liquid was then regenerated:  $4\text{FeS} + 3\text{O}_2 + 6\text{H}_2\text{O} = 4\text{Fe}(\text{OH})_3 + 4\text{S}$ ;  $\text{NH}_4\text{OH} = \text{H}_2\text{O} + \text{NH}_3\uparrow$ ;  $\text{NH}_4\text{HS} = \text{H}_2\text{S} + \text{NH}_3\uparrow$ ;  $3\text{H}_2\text{S} + 2\text{Fe}(\text{OH})_3 = 2\text{FeS} + \text{S} + 6\text{H}_2\text{O}$ . The yields of elementary S were 80% of the total S absorbed contg. 40-45% moisture and 20-25%  $\text{Fe}(\text{OH})_3$ . J. S.

**Production of gas rich in hydrogen for municipal supply and (chemical) synthesis.** Otto Hubmann. *Metallurg. Periodic Rev.* No. 8, 9-15 (1934).—A gas rich in H, poor in N and  $\text{CO}_2$  can be made by a new method from low-grade bituminous coals and lignite under pressure of O. A gas made from lignite contg. 18%  $\text{H}_2\text{O}$ , with O under moderate pressure, contained 50%  $\text{H}_2$ , 16%  $\text{CO}$ , 28%  $\text{CO}_2$ , 3%  $\text{CH}_4$ , and the remainder  $\text{N}_2$ , etc. After the 28%  $\text{CO}_2$  had been washed out a gas contg. 72%  $\text{H}_2$  was left from which H was sepd. by refrigeration. The crude gas made with 1, 10 and 20 atm. pressure contained, resp.,  $\text{CO}$  49, 25.8, 20.2;  $\text{H}_2$  37.0, 30.4, 25.8;  $\text{CO}_2$  11.3, 27.5, 31.8;  $\text{CH}_4$  2.7, 16.3, 22.2%. By modifying the working conditions a gas suitable for municipal supply was produced under a pressure of 20 atm. pressure with O and water vapor in suitable proportions; it contained, after  $\text{CO}_2$  and  $\text{H}_2\text{S}$  were washed out,  $\text{CO}$  2,  $\text{C}_2\text{H}_2$  0.4,  $\text{CO}$  18.4,  $\text{CH}_4$  20.2,  $\text{H}_2$  56.2,  $\text{N}_2$  3%, and had a max. heating value of 4300 cal. Fine and high-ash fuels with very high gasification capacities can be used in this process. M. Hartenbeim

**Oxygen determination in illuminating gas by combustion over platinum.** J. G. de Voogd and S. F. Bohlken. *Helv. Gas* 54, 43-6 (1934).—The error in detn. of  $\text{O}_2$  by P or pyrogallic acid is 0.2% in a total of 0.3% by vol. The Ambler method (C. A. 25, 262) was studied; its accuracy is 0.01%. It was somewhat simplified. In an Orsat app. with a buret especially accurate at low percentages, with  $\text{Na}_2\text{SO}_4$  soln. contg. some free  $\text{H}_2\text{SO}_4$  as confining liquid, the gas sample is freed of  $\text{CO}_2$  and illuminants by alkali and oleum, resp., as usual ( $\text{SO}_2$  vapors are removed by alkali); it is then passed back and forth through a thick quartz capillary contg. a 10 cm. Pt wire, twice folded, in and out of a second alkali pipet until the vol. contraction (3 times the  $\text{O}_2$  content) is const. The "combustion" of  $\text{O}_2$  to  $\text{H}_2\text{O}$  takes place rapidly (max. of 3 passes) at 450-580°;  $\text{CH}_4$  does not interfere; the contraction is 90% of the final after the first pass. The Pt wire is essential; care should be taken to protect it against alkali fog; the temp. of the capillary is checked by a thermometer inside a little asbestos heating box with the flame. Before use the Pt is cleaned with dil. HCl and water, ignited in an oxidizing flame, not activated. Il-

luminants if present will increase the contraction somewhat. The accuracy is 0.03%  $\text{O}_2$ . The method is especially applicable to detn. of the effect of  $\text{O}_2$  addn. in purification boxes. B. J. C. van der Hoeven

**The cold-warm tube principle applied to the dry purification and desulfurization of coal gas.** A. Pott, H. Broche and H. Thomas. *Gluckauf* 69, 1153-9 (1933).—The chief disadvantages of the dry purification method are the room required and cost of installation. The conversion of  $\text{Fe}_2\text{O}_3$  to  $\text{FeS}$  in removing  $\text{H}_2\text{S}$  from the gas is very rapid whereas the regeneration of  $\text{Fe}_2\text{O}_3$  (*in situ*) is relatively slow. Therefore the purifier space required is detd. by the speed of the latter reaction. Ninety % removal of  $\text{H}_2\text{S}$  ordinarily takes place in the first purifier box and takes place most efficiently at room temp. Regeneration, however, proceeds much more rapidly if the temp. is raised. By heating the discharge gas from the first box to 40-50° and humidifying the authors were able to increase the capacity of a given system approx. three fold. J. D. Davis

**Generation of carbureted water gas in the upper part of coke ovens.** Schumacher. *Gas u. Wasserfach* 77, 65 70 (1934).—Slight modifications in oven design or in existing ovens make it possible to gasify tar directly in the upper part of a coke oven or retort with an increase in heating value of the gas and an increased gas yield up to 15%. Diagrams are given of the application of this process to various types of ovens and retorts. R. W. Ryan

**Gas dehydration.** H. Brückner and W. Ludewig. *Gas u. Wasserfach* 77, 132-7 (1934).—A review of the economic advantages of gas dehydration for German conditions and a very complete and crit. summary of existing or proposed processes for gas dehydration. Fifty-five references. R. W. Ryan

**The combustion characteristics of city gases freed from carbon monoxide by the Müller (biological) process.** W. J. Muller and K. Graf. *Gas u. Wasserfach* 77, 122 4 (1934). The av. percentage compn. of the city gas and that of the gas treated by the biol. process (in parentheses) were:  $\text{CO}$  3.2 (2.4); illuminants 2.1 (2.3);  $\text{O}$  0.7 (0.6);  $\text{CO}_2$  15.8 (2.4);  $\text{H}_2$  44.1 (56.5);  $\text{CH}_4$  18.9 (19.7);  $\text{N}_2$  15.2 (16.1%). The heating values were 420 (424) B. t. u. and the sp. grs. 0.55 (0.42). The vol. of treated gas was about 1% less than that of the city gas, so that the products of the gas quantity and heating value were equal within exptl. error. Combustion expts. showed that the treated gas could be used in existing appliances without readjustment. \*The Ott not of this gas was larger, the min. pressure at which the flame was extinguished was smaller, the unburned combustible gas in the flue gas was less, the cooking time was shorter for the same gas pressure, and the distribution system could be utilized to better advantage. R. W. Ryan

**The combustion characteristics of gases with low carbon monoxide content.** Dietrich Witt. *Gas u. Wasserfach* 77, 97 102; *Gas J.* 295, 921 (1934).—Manufd. gases for use in Germany should have heating values in the range of 419-450 B. t. u. per cu. ft., and not below 419 B. t. u. or mains may be overloaded, although the heating value may rise 10-20% above 450 B. t. u. The sp. gr. should be between 0.54 and 0.40. The ignition velocity should be between 50 and 60-70 cm. per sec. The Ott not should not be below 55 or striking back may occur. Addn. of blue gas to coal gas increases sp. gr. and max. ignition velocity; addn. of producer gas or flue products decreases max. ignition velocity. Gases of low  $\text{CO}$  content (below 1%) were prepd. from manufd. gas by catalytic conversion of  $\text{CO}$  to  $\text{CO}_2$  with steam and by methanation of the remaining  $\text{CO}$ . Sufficient  $\text{N}_2$  was added to give a gas of the original sp. gr. and H then added to adjust the ignition velocity. The ignition velocity was found to be too low for a mixed gas having a sp. gr. of 0.4 and a heating value of 440 B. t. u. per cu. ft. By subsequent complete removal of  $\text{CO}_2$  and addn. of  $\text{H}_2$ , a satisfactory ignition velocity was obtained at the expense of the sp. gr. For gases having a sp. gr. of 0.5 and a low  $\text{CO}$  content the ignition velocity was too low and long flames resulted, with danger of incomplete combustion. The sp. gr. of

such gases should not exceed 0.40 to 0.48 for a heating value of 419 to 450 B. t. u. Such a gas is best prepd. by mixing coal gas and blue gas before removing CO. The CO<sub>2</sub> must then be partly removed to adjust the sp. gr. of the resulting gas.

R. W. Ryan

**Gum formers in purified manufactured gas.** K. Bunte. *Gas u. Wasserfach* 77, 81-6(1934); cf. C. A. 27, 3001. The work of Berkhoff (cf. C. A. 26, 1755)<sup>9</sup> Fulweiler (cf. C. A. 26, 5732), Schuffan (cf. C. A. 26, 2849) and others is reviewed. Gum formation in gas is due to the presence of such gas constituents as cyclopentadiene, styrene, indene, cumarone, etc., and the chemistry of these substances is reviewed. These react with NO to form isonitroso compds. Gum formation is accelerated by O<sub>3</sub>, NH<sub>3</sub> or S compds. The removal of NO by dry purifiers is attributed to the formation of nitroprusside compds. (Fe<sub>2</sub>FeCN<sub>5</sub>NO).

R. W. Ryan

**Removal of sulfur compounds from stack gases in Great Britain.** David Brownlie. *Combustion* 5, No. 8, 18-21(1934); cf. C. A. 28, 2883. The water-spraying system at Battersea and milk of lime scrubbing are discussed. The present trend is toward high stacks with electrostatic dust separators.

Leslie B. Bragg

**Absorption of hydrogen sulfide from gas and sulfur recovery with arsenic salts solution.** S. G. Aronov. *Coke and Chem.* (U. S. S. R.) 1933, No. 3, 47-52. Expts. were made to develop a method for recovery of pure S from coke-oven gas. The absorbing liquid was prepd. as follows: a soln. of Na<sub>2</sub>CO<sub>3</sub> was heated to boiling, As<sub>2</sub>O<sub>3</sub> soln. added and boiling continued for 2-8 hrs. (6Na<sub>2</sub>CO<sub>3</sub> + As<sub>2</sub>O<sub>3</sub> + 3H<sub>2</sub>O = 2Na<sub>3</sub>AsO<sub>3</sub> + 6NaHCO<sub>3</sub>). The soln. was oxidized with air and pure H<sub>2</sub>S blown through it to form Na<sub>3</sub>AsS<sub>4</sub>; air was blown through the soln., forming Na<sub>3</sub>AsOS<sub>3</sub> + S. The resulting soln. was used to absorb H<sub>2</sub>S from the gas in the expts thus: Na<sub>3</sub>AsOS<sub>3</sub> + H<sub>2</sub>S = Na<sub>3</sub>AsS<sub>4</sub>·H<sub>2</sub>O. The soln. was regenerated by blowing air through it. For best results the absorbing soln. should contain 5 g./l. As<sub>2</sub>O<sub>3</sub> and an amt. of Na<sub>2</sub>CO<sub>3</sub> just sufficient for the formation of Na<sub>3</sub>AsO<sub>3</sub>; an excess of Na<sub>2</sub>CO<sub>3</sub>, although it increases the absorption of H<sub>2</sub>S, interferes with the regeneration by promoting secondary reactions. Elementary S yields of 90% of the total S absorbed by the liquid were obtained in a single cycle. The best temps. for absorption and regeneration are 40-60°. Recovered S contained 0.5-2.0% As compds.

J. S.

**Removal of hydrogen sulfide from ammonia liquor.** D. F. Bezugliuf and F. A. Ignatenko. *Coke and Chem.* (U. S. S. R.) 1933, No. 3, 53-60. Several methods for removing H<sub>2</sub>S from NH<sub>3</sub> liquor were tried. Shaking the liquor with Fe ore in suspension (acidic ore of 65% suspension, i. e., sp. gr. liquor + ore = 1.72, gave the best results) followed by sepn. of the FeS formed was the most practical means of freeing the liquor from H<sub>2</sub>S. For the complete removal of the gas 15 parts ore to 1 part H<sub>2</sub>S in the liquor was necessary. The app. is described.

J. S.

**Ammonium sulfate from ammonia and roaster gases.** A. Girsowald and E. Stahl. *Metallges. Periodic Rev.* No. 8, 3-8(1934). (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> is made directly from the H<sub>2</sub>SO<sub>4</sub> of roaster gases without intermediate production of H<sub>2</sub>SO<sub>4</sub>. SO<sub>2</sub> concn. of the roaster gases is immaterial, even poor gases with 1 vol. % or less can be used; the gases can be hot and dry or wet and cold, and the flow does not need to be regular as for the H<sub>2</sub>SO<sub>4</sub> process. The sulfite formed in the process is oxidized rather rapidly when still in soln. The exptl. plant is described in detail; satd. solns. of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> have been produced contg. 640-650 g. sulfate per l. at 80°. On cooling to 25°, 100-120 g. per l. of sulfate crystallizes out entirely free from sulfite; the mother liquor returns to the process without evapn. The rate of reaction is 15-20 g. SO<sub>2</sub> per l. per hr. The cost of production of cryst. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> from SO<sub>2</sub> gases in this manner was approx. equal to the H<sub>2</sub>SO<sub>4</sub> process, based on a production of 15 tons (metric) daily. The process has the advantage that SO<sub>2</sub> gases can be used which cannot be used economically for making H<sub>2</sub>SO<sub>4</sub> and when such a plant would be too small for economic working. German and foreign patents have been applied for (not given).

M. H.

**Crude benzene recovery from vertical retort gas.**

H. J. Reynolds. *Gas World* 100, 278-81(1934).—Directions are given for operating, yields and costs for a wash oil process plant, erected in 1917, but now newly returned to operation.

P. J. Wilson, Jr.

**The recovery of benzene from vertical retort gas.** Experience at Swindon. C. H. Chester. *Gas J.* 205, 551-6(1934); *Gas World* 100, 246-51.—2.2 gal. of C<sub>6</sub>H<sub>6</sub> (76-77% off at 120°) is profitably recovered by washing the gas from steamed Glover-West verticals with gas oil. The quantity of C<sub>6</sub>H<sub>6</sub> available during carbonization of several coals and the portion recoverable without reducing the heating value of the gas below 150 B. t. u. and under the plant conditions have been detd.

P. J. W., Jr.

**Progress in producing benzene from municipal and coke-oven gases using "Benzorbon" activated carbon.** G. Mueller and W. Herbert. *Metallges. Periodic Rev.* No. 8, 16-24(1934).—Production of benzene from a national economic standpoint as well as from that of being the starting point of a no. of industries (motor fuels, explosives) is discussed and methods used so far are reviewed. A simpler method of using activated C made it possible to debenzolize coke-oven or other gases practically completely and to arrive at a substantial improvement in gas purification. Activated carbon, "Benzorbon," consists of molded hard granules of about 4 mm. diam. which are made up by a patented process from different materials, mixed, compressed, dried, activated and subjected to a special after-treatment. Each granule contains numerous ultra-microscopic fine capillaries giving an increase of interior surface amounting to 650 sq. m. of effective adsorption surface for 1 g. material. The operation and equipment of a plant since 1932 with a daily capacity of 80,000 kg. benzene from about 2,100,000 cu. m. of gas is described in detail; the benzene yield is 95-98%; 1 kg. of "Benzorbon" is required for 100 kg. benzene. The process has the further advantage of reducing HCN content and so to retard pipe corrosion; only 0.108 g. of this acid was contained per cu. m.

M. Hartenheim

**Technical practicability of the production of liquid fuels in gas works and coke-oven plants.** F. Schuster. *Chem.-Ztg.* 57, 661-2(1933).—The various methods for converting coal into liquid products by way of gasification and hydrogenation are brought together into a single flow-sheet. The table shows the temp., pressure and catalysts necessary, and the suitability of the different methods for use in gas works and coke ovens is discussed.

B. C. A.

**Electric tar separators at gas works and coke-oven plants.** II. Eirng. *Gas u. Wasserfach* 77, 113-19(1934).—The theory of elec. pptn. is reviewed, with special reference to tar separators. Elec. tar separators completely remove the tar from gas, as indicated by tests with the Drory filter, while these filters show a heavy stain with gases purified with the P. and A. extractor, even after passing through the naphthalene and ammonia washers. Elec. tar separators can be greatly overloaded without appreciable drop in efficiency. Power requirements vary from 1.4 to 1.5 kw. hrs. per M. cu. m. The pressure loss is only 3 mm. water. Tar fog is efficiently removed from carbureted water gas. Other advantages are the lessened contamination of benzene wash oil and the greater efficiency of dry purifiers. It may well be combined with low-temp. condensation. Bibliography is given.

R. W. Ryan

**Tar dehydration at small gas works.** Sonnabend. *Gas u. Wasserfach* 77, 104-5(1934).—A small tar dehydrator constructed at the works is described.

R. W. R.

**Use of coal-tar oil for firing boilers of heating systems.** H. Flasdieck. *Warme* 56, 472-4(1933); *Chimie & Industrie* 31, 62.—Comparative tests on low-pressure boilers showed that operation was satisfactory and reliable with an efficiency of about 85%. Comparative costs of heating with different fuels were: coke 1, gas oil 1.24, lignite-tar oil 1.23, and coal-tar oil 1.06 and 0.94 (fresh oil), illuminating gas 1.99.

A. Papineau-Couture

**Cracking of tar.** L. I. Ryabov. *Coke and Chem.* (U. S. S. R.) 1933, No. 2, 28-31.—It is claimed that the industrial cracking of cleaned coal oils at well-chosen

narrow temp. ranges, pressures and periods of time will make it possible to produce  $C_2H_4$  with yields not less than with cracking of mineral oils. James Sorrel

Glover-West verticals at Wellingborough. C. C. W. *Gas J.* 205, 684 (1934).—The operating results during 1933 are given for a new plant. Tests with South Yorkshire and Derbyshire coals indicate that the best results and the cheapest 440 500 B. t. u. gas are produced by use of the former, but the Derbyshire coals take steam more easily and might prove more valuable when a calorific value of less than 460 B. t. u. is required. P. J. W., Jr.

Results of C. O. L. intermittent vertical chamber ovens plant at the Brentford station of the Gas Light and Coke Co. Anon. *Gas Eng.* 51, 128 (1934).—Operating results are given from 48 ovens, holding 4.2 long tons each, and with a combined gas capacity of 5,000,000 cu. ft. of gas per day. P. J. Wilson, Jr.

Gibbons-Kogak coke ovens: New installation at the Robin Hood Coke Works of J. and J. Charlesworth, Ltd., Nr. Wakefield. J. Sinclair. *Colliery Guardian* 148, 433-6 (1934). R. H.

Efficiency and safety of coke oven charging gases. S. S. Naumov and G. L. Khazan. *Coke and Chem.* (U. S. S. R.) 1933, No. 2, 13 20.—The efficiency of steam ejection of gases in coke ovens of the Otto Co.'s construction is estd. to be 50-60% (on the basis of percentage ejection of gas into the hydraulic main to the total gas formed during the gas-generating period). The cause of poor efficiency is explained by the sucking in of air during the opening of the leveling door causing excessive loss of gas into the air; a steam counter blast at this point is proposed to increase the efficiency. James Sorrel

Application of oxygen for heating of coke ovens. Ya. O. Gabinskiĭ and V. I. Fontalin. *Coke and Chem.* (U. S. S. R.) 1933, No. 4, 8-15.—Stoichiometric computations were made to det. the temps., heat-transfer rate, and effects on coking for conditions when either coke-oven or blast-furnace gas was burned in an atm. of  $O_2$ -enriched air to heat the coke oven. The burning of gases in  $O_2$ -enriched air under the ovens will reduce the height of the gas flame and raise its temp., slow down the gas rate of flow, heat the lower parts of the coke oven to an excessively high temp. leaving the upper parts insufficiently heated, etc. The application of  $O_2$  in coke ovens, therefore, is believed undesirable. James Sorrel

Coke as a complementary fuel to gas. F. M. H. Taylor. *Gas World* 100, 254-6 (1934).—Utilization of coke is discussed. Its gasification in water-gas beds would greatly increase the importation of oil into Great Britain. The capital cost for the substitution of coke for coal or oil in boilers or central heating plants for the larger buildings is small as compared to the savings. The cost for applying thermostatic control to coke is less than with any other fuel, and the operating cost is negligible.

P. J. Wilson, Jr.  
A new method for taking average samples of coke. I. A. Kopoliovich and V. M. Bogin. *Coke and Chem.* (U. S. S. R.) 1933, No. 2, 20-8.—A new method for sampling coke is proposed to replace the method used at present in U. S. S. R. It consists in disintegrating the sample so that it will pass through 40-mm. mesh and then classifying it to size (sepg. into fractions). Each fraction is thoroughly mixed (this is easier to accomplish because of the uniformity of the particles), a small quantity taken from each fraction (proportional to its wt.), finely ground and all of the resulting ground portions are mixed together. Numerous data show the closer approach to the true average by this method of sampling with saving of time and reduction of the size of the sample. J. S.

Mountain wax (Ivanovsky) 27. Rept. of the Water Pollution Research Board [gas-works effluent] (Robertson, Calvert) 14. Harmful effect of  $NH_3$  liquor and still waste of coke plants on the fish in public waters (Brenner & Brandis, Keeman) 14. Reworking [tar or coal] hydrogenation catalysts (U. S. pat. 1,948,407) 18. App. for gravity sepn. of materials such as in coal purification (U. S. pat. 1,949,117) 1. Destructive hydrogenation of tars

(U. S. pat. 1,948,109) 22. Sepp. "run-of-mine" coal (U. S. pat. 1,948,730) 13. Rotary disintegrating mill for coal treatment (U. S. pat. 1,948,408) 9.

Fuel. John Tod. Brit. 401,820, Nov. 23, 1933. Fuel comprises a suspension of coal or coke and of cork flour or ground cork bark in oil in such proportions that the sp. gr. is above that of salt water but not above 1.10.

Fuel. Holzhydrolyse A.-G. Ger. 591,590, Jan. 23, 1934 (Cl. 10b. 16.01). Lignin residues from wood-sac charification processes are briquetted by pressing without hindering agents, and coking slowly, to preserve the briquet form.

Fuel. Imperial Chemical Industries, Ltd. Fr. 757,380, Dec. 20, 1933. A fuel which furnishes heat for a relatively short time is made by dissolving nitrocellulose in MeOH or EtOH, incorporating in the soln. a gel-forming substance, e. g., a compd. of Cu, Pb or Sn which is sol. at least in traces, in the soln., and adding a small amt. of an anti-solidifying aliphatic hydroxy acid, e. g., citra, tartaric or malic acid, before the soln. has thickened as a firm gel.

Motor fuel. Gustave Capart. Fr. 757,535, Dec. 28, 1933. The mixt. of fuel and air is ionized by a radioactive material surrounded by an appropriate glaze.

Hydrogenating fuel. Reinhard Wusew. Ger. 564,782, Dec. 12, 1933 (Cl. 12a. 1.05). Fuels, especially coal and hydrocarbons, are hydrogenated by mixing with  $Na_2CO_3$  and treating with a  $CO-H_2O$  mixt. at high temp. and pressure.

Destructive hydrogenation of carbonaceous materials. Lajos von Szeszich. U. S. 1,948,058, Feb. 20. Material such as brown coal-tar oil is subjected to the action of H at high temp. and pressure in the presence of  $H_2S$  and a catalyst contg. Mo or W; reaction products are sepd. into gaseous and liquid portions by cooling under substantially the reaction pressure; corrosive S compds. including  $H_2S$  are removed from the reaction products; the gaseous portion is pumped back to the reaction, and a portion of the recovered  $H_2S$  is added to this gaseous portion after it has passed the pumping app. and in such proportion that the activity of the catalyst is increased. An arrangement of app. is described.

Hydrocarbons. Pierre F. D. Dubois. Fr. 757,379, Dec. 26, 1933. Hydrocarbons (benzenes and petroleum derivs.) are submitted at a convenient temp. to the action of air or  $O_2$ . Gums are formed and the S and  $H_2S$  are transformed into inoffensive products and the hydrocarbon distd., giving a high quality motor fuel.

Fuel briquets. M. A. Tokarnik. Russ. 31,411, Oct. 31, 1933. Wood waste, such as bark and sawdust, is passed through rollers, pressed, dried with steam and warm air and passed finally through a tar or an asphalt bath heated to 110-120°.

Carbonized fuel briquets. Henry O. Loebell and Albert L. Klees (to Combustion Utilities Corp.). U. S. 1,948,471, Feb. 20. Readily ignitable briquets suitable for domestic use are prepd. from fuel mixts. such as coal and coke after carbonizing at temps. substantially above those of the low-temp. carbonization range while the material is in the form of a thin moving layer and continuous maintenance under a low pressure. App. is described.

Carbonizing solid fuel. Henry O. Loebell and Albert L. Klees (to Henry L. Doherty). U. S. 1,948,472, Feb. 20. Process and app. are described for compacting and reshaping the opposite surfaces of a uniform thin layer of finely divided carbonizable fuel while below its carbonization temp., then carbonizing the compacted and reshaped fuel while preventing substantial disturbance of the individual fuel particles and while continuously maintaining a regulated low pressure upon the fuel.

Low-temperature coal-carbonizing plant. Compagnie internationale de carbonisation (Soc. anon.). Fr. 757,208, Dec. 22, 1933. Construction of cellular plates.

Carbonizing coal, etc. Ira H. Derby and Harold R. Horner (to Peter C. Reilly). U. S. 1,948,515, Feb. 22. A charge of the material (in a described app.) is provided with heat-distributing channels extending through it.

and the upper exposed surface of the charge, to which the channels open, is subjected to the direct action of a gaseous heating medium such as combustion gases which, together with evolved distillates, is drawn down through the channels in direct contact with material of the charge.

Pulverizing coal pieces or other minerals, etc., by the action of jets such as superheated steam. Norwood H. Andrews and Walter J. Willoughby (to American Pulverizing Corp.). U. S. 1,948,609, Feb. 27. Various details of app. and operation are described.

Coal-washing and slurry sedimentation system. Bertram Norton. U. S. 1,948,184, Feb. 20. Various details of app. and operation are described.

Siphon gravity separator, etc., for use in cleaning coal with water, etc. Harrison A. Strohl. U. S. 1,948,140, Feb. 20. Various structural, operative and mech. details are described.

Cleaning coal by flotation. Rudolf Lessing. Ger. 592,116, Feb. 3, 1934 (Cl. 1c. 1.01). See Brit. 276,723 (C. A. 22, 2456).

Apparatus for dry cleaning of coal (with a reciprocated pervious deck). Edward O'Toole, Sr. U. S. 1,949,324, Feb. 27. Structural and mech. features.

Apparatus for dry removal of stones from coal. Auguste J. Revelart. U. S. 1,948,800, Feb. 27. Structural and mech. details.

Apparatus for compressing fine coal, etc. Maschinenfab. Augsburg-Nürnberg A.-G. Ger. 592,495, Feb. 9, 1934 (Cl. 16a. 15).

Apparatus for coking and compressing coal. Gustav Hilger. Ger. 591,676, Jan. 25, 1934 (Cl. 10a. 15).

Apparatus for stamping coal before coking. Carl Still G. m. b. H. Ger. 592,435, Feb. 7, 1934 (Cl. 10a. 14).

Filling masses for storing acetylene, etc. Alfred Burgeni. Ger. 586,534, Dec. 28, 1933 (Cl. 26b. 44.20). A foam of viscous or similar material is poured into containers for storing  $C_2H_2$ , etc., when set.

Apparatus for generation and superheating of steam. Walter G. Noack (to Akt.-Ges. Brown, Boveri & Cie.) U. S. 1,948,939-40, Feb. 27. Various structural and operative details are described.

Removing carbon deposits from engine cylinders. Charles A. Thomas and Carroll A. Hochwalt (to Thomas & Hochwalt Laboratories, Inc.). U. S. 1,949,588, March 6. A compn. for use in carbon removal comprises substances such as  $\alpha, \beta, \beta'$ -dichlorodimethyl ether, denatured alc., monochloronaphthalene,  $C_6H_6$  and gasoline or the like.

Device for mixing gases such as those for operating internal-combustion engines. Edwood T. Larkin (to Charles A. Crique). U. S. 1,947,603, Feb. 20. Structural and mech. details.

Fuel gas. Metallges. A.-G. (Otto Hubmann, inventor). Ger. 592,223, Feb. 3, 1934 (Cl. 24c. 2.05). Bituminous fuel or coke is treated under several atms. pressure with a mixt. of O (or oxygenated air) and steam in such proportions as to yield a gas contg. substantial amts. of  $CO_2$  and hydrocarbons. Thus, the fuel may be treated at 600-700° and 20 atms. pressure with a mixt. contg. O 1 and steam 6 parts. The gas may be purified, e. g., by removing  $CO_2$  and condensable hydrocarbons, with releasing the pressure. Cf. C. A. 27, 3806.

Water gas. Niels E. Rambush (one-half to Power Gas Corp. Ltd.). U. S. 1,947,614, Feb. 20. Primary air is passed through a coke bed, the air blow gases thus formed are led off and burned in contact with preheater elements by means of secondary air while avoiding direct impingement of the blow gases on these elements, which may be in the form of vertical U-tubes. At the same time steam is passed through the elements; the primary and secondary air are cut off; the superheated steam is passed up through the coke bed; the steam is then cut off; and steam is led around the preheater elements for superheating, and down through the coke bed. App. is described.

Water gas. Wm. V. Duke (to Carsten I. Johnsen). U. S. 1,949,503, March 6. Spaced hollow bodies such as triangular tubes are subjected to continuous internal heating (as by combustion gases) and the entraining action of

a current of water gas is utilized to carry pulverized coal and steam in proper proportions to form water gas between and in contact with the heated bodies. App. is described.

Water gas. Gerald J. Nordmeyer (to Koppers Co. of Del.). U. S. 1,949,728, March 6. In the operation of a water-gas plant including a generator having a bed of solid fuel and a superposed carbureting chamber, air blasts and steam are passed separately and successively in opposite directions through the fuel bed, a portion of the blast in each direction being utilized for the purpose of driving residual gas resulting from a previous steam run into a collecting medium, and heavy oil is admitted into the carbureting chamber coincidently with the steam runs to enrich the made gas; the gas is conducted to a collecting medium and the major portion of the reverse air blast passes downwardly through the upper portion only of the fuel bed and hence is withdrawn circumferentially of the generator at a point below the top of the fuel bed, so that carbonaceous deposits on the fuel bed resulting from admission of the heavy oil are consumed. App. is described.

Carbureted water gas. Gerald J. Nordmeyer and Thomas W. Stone (to Koppers Co. of Del. and Western Gas Construction Co.). U. S. 1,947,792, Feb. 20. An air blast and a steam run are alternately introduced into a fuel bed of a gas generator, and heavy oil is admitted into the top of the generator simultaneously with the steam run to enrich the resulting gas, the air blast being introduced in a reverse direction and downwardly through at least the upper portion of the fuel bed to consume carbonaceous deposits resulting from the heavy oil, and the air blast being withdrawn from the generator at a point below the top of the fuel bed. App. is described.

Apparatus for carbureting water gas, etc. Ges. zur Förderung der Braunkohlengaserzeugung B. V. Ger. 592,189, Feb. 2, 1934 (Cl. 24c. 2.07).

Producer-gas manufacture utilizing sodium carbonate. Alfred H. White and David A. Fox. U. S. 1,948,086, Feb. 20. For the manuf. of fuel gas low in  $CO_2$  from solid carbonaceous fuel in a gas generator, the carbonaceous fuel is mixed with less than 10% of a Na compd. such as  $Na_2CO_3$  which is capable of reacting with the fuel and evolving a continuous stream of the alkali metal vapor; the mixt. is ignited as a fuel bed and is blasted with air and steam so that a reaction zone is formed and  $CO$ ,  $H_2$ ,  $CO_2$  and a substantial amount of alkali metal vapor are evolved, the alkali metal vapor reacting with  $CO_2$  so that solid  $Na_2CO_3$  is formed which is filtered out in its passage through the upper part of the fuel bed and returned to the reaction zone as the fuel descends through the generator. App. and details of operation are described.

Apparatus for gasifying subdivided liquid fuels in presence of steam. Franz Herzberg. Ger. 588,089, Feb. 6, 1934 (Cl. 28a. 11).

Apparatus for complete gasification of subdivided solid or liquid fuels. Franz Herzberg. Ger. 589,426, Feb. 8, 1934 (Cl. 24c. 1.04).

Catalyst for manufacturing gas rich in hydrogen from hydrocarbons and steam. Garland H. B. Davis and James A. Franceway (to Standard Oil Development Co.). U. S. 1,948,338, Feb. 20. A catalyst is used which is prepd. by mixing an oxide such as that of Ni or Cr with a refractory oxide such as that of Al, Th, Zr or Ti, and with concd.  $H_3PO_4$  and baking the mixt. at a temp. (suitably about 160°) below the temp. of fusion of either oxide.

Gas generator for producing gas from coal or other fuel. Frank C. Greene. U. S. 1,947,590, Feb. 20.

Gas producer. Ernst Mahlkuch. Ger. 591,768, Jan. 26, 1934 (Cl. 24c. 5). Addn. to 547,555 (C. A. 26, 3661).

Fuel-distributing device for gas producer. N. V. Maschinenleen- en Apparaten-Fabrieken. Ger. 592,160, Feb. 2, 1934 (Cl. 24c. 9).

Apparatus for charging gas producers. N. V. Maschinenleen- en Apparaten-Fabrieken. Ger. 592,149, Feb. 2, 1934 (Cl. 24c. 9). The charging app. is automatically operated as soon as a predetd. vol. of air has been blown through the producer.

Apparatus for producing and purifying gas. Wilbert J.

- Huff, Lloyd Logan and Oscar W. Lushy. U. S. 1,947,778, Feb. 20. In a gas app. having cyclic operation including making and heating periods, a gas-purifying app. is included in the path of the hot gas contg. S-fixing substances from the 5th, 6th or 7th periodic groups such as Cr or V in promoter assocn. with Cu, Ag, Fe, Ni, Co, Pb, Sn, Sb or their oxides. App. is described.
- Gas-purifying apparatus.** Wilbert J. Huff, Lloyd Logan and Oscar W. Lushy (to Wilbert J. Huff, agent). U. S. 1,947,779, Feb. 20. Various structural features are described of an app. comprising a receptacle contg. refractory materials and chemicals contg. an element of the 5th and 7th series of the periodic classification such as Cu in intimate assocn. with material such as Cr, U or V contg. at least one element of the 4th and 12th series of the 5th, 6th and 7th groups of the periodic table; means is provided for alternately passing combustible gas such as blue or water gas and O-contg. gas over the materials and for automatically regulating the amt. of O in the O-contg. gas after passing through the purifying materials.
- Gas purification.** Wilbert J. Huff and Oscar W. Lushy. U. S. 1,947,776, Feb. 20. A gas such as that for domestic use contg. org. S compds. and  $H_2S$  is passed at a temp. above  $250^\circ$  over a unitary absorbent material consisting of an intimate mixt. of substances, one component of which, such as Cu, forms a metallic oxide easily reducible to the metal under the conditions of use, in admixt. with another component which contains at least one member of the sixth or seventh periodic group such as Cr and U which forms an oxide not reducible under the conditions of use; and the S removal is followed by revivification of the absorbent by an O-contg. gas in another phase of the cycle.
- Gas purification.** Wilhelm Glud, Fritz Brodkorb and Walter Klempf (to Ges. fur Kohlentchnik m. b. H.). U. S. 1,947,983, Feb. 20. For removing  $H_2S$  from gases, they are treated with an alk. aq. suspension of Fe hydroxide, and the Fe sulfide contained in the suspension is oxidized with an oxidizing gas such as air in an ammoniacal soln. in the presence of a sulfite in order to prevent sepn. of raw S.
- Reclaiming fouled wash such as that used in washing fuel gas to remove light oil.** Irvin H. Jones (to Koppers Co. of Del.). U. S. 1,949,746, March 6. A fouled oil which originally consisted of petroleum fractions all boiling above  $350^\circ$  is treated, at a temp. below  $70^\circ$ , with about 2-40% its volume of 60-66° B $\epsilon$ .  $H_2SO_4$  by which the oil is clarified; sludge formed by this treatment is removed, followed by washing with water and aq. alkali soln. App. is described.
- Combustible-gas detector.** Jerzy Malecki. Brit. 402,011, Nov. 23, 1933.
- Automatic control apparatus for use with two or more associated water-gas sets.** Walter A. Barr (to Western Gas Construction Co.). U. S. 1,948,004, Feb. 20.
- Device for controlling the flow of gases to and from regenerators such as those associated with coke ovens.** Carl Otto. U. S. 1,949,177, Feb. 27. Structural and operative details of valve arrangement.
- Apparatus for working up tars, oils, hydrogenated coal products, etc.** I. G. Furbenind. A.-G. (Karl Schoenemann, inventor). Ger. 591,729, Jan. 26, 1934 (Cl. 12a. 1.04). App. in which asphalt is pptd. and sepd. is described.
- Phenol, cresols and benzene hydrocarbons from crude tar phenols.** Fritz Hofmann and Karl Lang (to Ober-schlesischer Berg- und Huttenmännischer Verein e. v.). U. S. 1,947,648, Feb. 20. See Brit. 376,509 (C. A. 27, 4061).
- Coke oven.** G. N. Pannotov and G. N. Samofanov. Russ. 31,405, Oct. 31, 1933. Construction details.
- Coke oven.** N. P. Chizhevskii. Russ. 31,406, Oct. 31, 1933. Construction details.
- Coke oven.** G. A. Chernov. Russ. 31,407, Oct. 31, 1933. Construction details.
- Coke-oven battery.** The Koppers Co. Ger. 592,117, Feb. 1, 1934 (Cl. 19a. 13).
- Coke-oven doors.** N. I. Grachev. Russ. 31,408, Oct. 31, 1933. Construction details.
- Coking apparatus.** N. D. Tenet. Russ. 31,409, Oct. 31, 1933. Construction details.
- Plant for dry-cooling hot coke.** Gebrüder Sulzer, A.-G. Swiss 164,772, Dec. 16, 1933 (Cl. 12a).
- Apparatus for manufacture of coke and gas from peat.** A. G. Rembashevskii. Russ. 31,410, Oct. 31, 1933. Peat is distd. and the tar vapors in the crude gas are cracked by heating in a vertical chamber with a row of horizontal heating channels supplying the heat to the peat as well as to the cracking vessel.

## 22 - PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. PARAGHER

- Twenty years of petroleum research—a retrospect.** A. E. Duistan. *Proc. Am. Petroleum Inst. 14th Ann. Meeting*, Sect. III, 124-31 (1933). See C. A. 28, 617<sup>a</sup>.
- E. H.
- Hydrogenation of petroleum.** C. E. Nabuco de Araujo, Jr. *Chimica (Brasil)* 1, 174-6 (1933).—A brief review.
- H. C. A.
- Oil acidity determination by means of electrotitrimetric methods.** Some observations concerning the antimony electrode used in one of these methods: a new mode of preparing this electrode. Ed. Leclerc. *Ind. chim. belge* [2], 4, 415-26 (1933).
- A. L. Henne
- Emulsified oils for the lubrication of cylinders of hot steam locomotives.** J. Vincent. *Compt. rend. congr. graissage* 1931, 442-8.
- Cementing oil wells (Kocharov) 20.** Petroleum deposits of Roumania (Mrazec) 8. Origin and migration of petroleum (Krejci-Graf) 8. Reworking [oil] hydrogenation catalysts (U. S. pat. 1,948,407) 18. App. for working up oils (Ger. pat. 591,729) 21. Hydrocarbons (Fr. pat. 757,379) 21. Reclaiming fouled wash such as that used in washing fuel gas to remove light oil (U. S. pat. 1,949,746) 21. Sepg. emulsions such as those of petroleum (U. S. pat. 1,949,660) 13.
- Reducing the sulfur content of petroleum oils.** Wm. M. Malisoff (to Atlantic Refining Co.). U. S. 1,948,528, Feb. 27. Oil such as a cracked gasoline is maintained at a temp. of  $100-150^\circ$  in the presence of 0.5-4.0% anhyd.  $AlCl_3$  and agitated for not more than about an hr. to polymerize selectively S compds., and the latter and  $AlCl_3$  are sepd. by filtration or settling and decanting.
- Refining and dewaxing petroleum oils.** Ross J. Garofalo (to Union Oil Co. of Calif.). U. S. 1,948,346, Feb. 20. The oil is dissolved in a normally gaseous hydrocarbon diluent such as a propane mixt., and the dild. oil is treated with  $H_2SO_4$  to form finely divided sludge; a portion of the normally gaseous diluent is vaporized to chill the oil and ppt. the wax, the sludge and wax are sepd., and the diluent and oil are then sepd. from each other. An arrangement of app. is described.
- Preventing gum formation in petroleum distillates.** Robert E. Burke (to The Standard Oil Co.). Can. 339,715, Feb. 27, 1934. To prevent gum formation, cracked petroleum distillates are treated with 0.0004-0.5% of an org. compd. contg. the group  $-N=N-$ , as semicarbazide or a deriv. thereof, e. g., 4,4-diphenylsemicarbazide, or as hydrazine substituted with one or more alkyl or aryl radicals, except mononaphthyl. The inhibitor may first be dissolved in ether, benzene or the like and the soln. mixed with the petroleum.
- Incorporating resins in petroleum oil.** Marion B. Hopkins (to Standard Oil Development Co.). U. S.

1,948,267, Feb. 20. In forming compns. such as those for *elec. insulation*, an oil is heated with a resin to a temp. above that at which steam condenses, and steam is passed through the mixt. and maintained over its surface under nonoxidizing conditions until the resin is completely dissolved in the oil. App. is described.

**Breaking petroleum emulsions.** Murray E. Garrison and Wm. F. Van Loenen (to Petroleum Rectifying Co. of Calif.). U. S. 1,947,709, Feb. 20. The emulsion is passed through a porous mass of comminuted  $Al_2O_3$  crystd. in an *elec.* furnace, so that the disperse phase of the emulsion is agglomerated (numerous details of app. and operation being described).

**Apparatus for dehydrating petroleum oil emulsions by heating, etc.** John B. Turner. U. S. 1,948,481, Feb. 20. Various structural and operative features are described.

**Apparatus for hydrogenating petroleum oils.** Ralph H. Price (to Standard Oil Co. of Ind.). U. S. 1,948,732, Feb. 27. Various structural and operative details are described.

**Destructive hydrogenation of petroleum hydrocarbons.** Clarke T. Harding (to Standard-I. G. Co.). U. S. 1,948,378, Feb. 20. In a continuous recycling process for the destructive hydrogenation of hydrocarbon materials such as oils, at temps. above  $380^\circ$  under more than 20 atm. pressure in which the mixt. of fresh oil and recycled oil is first heated in a heating coil and then discharged into an enlarged reaction zone, the temp. in the hydrogenation zone is maintained within the optimum range for destructive hydrogenation by changing the proportion of recycle oil to fresh oil in the feed as required. App. is described.

**Refining cracked petroleum oils.** Jacque C. Morrell (to Universal Oil Products Co.). U. S. 1,949,756, March 6. The oil is treated with plumbite soln., and the reaction products of the plumbite treatment are removed by subjecting the oil to the action of a sol. sulfide and an adsorbing agent such as fuller's earth capable of removing suspended solids.

**Refining cracked petroleum products for motor fuel.** Walter S. Baylis (to Patco, Inc.). U. S. 1,949,673, March 6. To obtain a motor fuel substantially free from unstable compds., the products are passed in vapor phase through a treating zone into which finely divided solid adsorptive polymerizing material such as an acid treated clay is introduced along with the vapors and by their motive action, and the adsorptive material is subsequently sepd. (suitably by *elec.* pptn.). App. is described.

**Cracking oils.** Ross J. Garofalo (to Union Oil Co. of Calif.). U. S. 1,948,345, Feb. 20. Oil is heated under pressure to vaporize it, and the resulting vapor is relieved of pressure and intimately commingled with hot molten metal such as Pb or a Pb alloy in an injector. App. is described.

**Cracking oils.** Texaco Development Corp. Brit. 401,691, Nov. 17, 1933. Oils are cracked to obtain products of low b. p. by heating a condensate oil to a high-cracking temp., *e. g.*,  $1000-1050^\circ F.$ , under pressure, passing the products into a reaction chamber where they are cooled by contact with an oil at lower temp. and where sepn. into liquid and vapor occurs, passing the vapors to 1 or more digestion zones maintained at cracking temp. and thence to a fractionating zone in which a final light distillate is sepd. out to leave a reflux condensate which provides the condensate oil used as the starting material. Crude oil is cracked at low temp., *e. g.*,  $825^\circ F.$ , by passage through a coil and the products are passed through a pipe into a tower where they mix with and cool the products formed by cracking the condensate oil. App. is described.

**Cracking hydrocarbon oils.** Homer P. Parrigin and Ralph P. Currie (to Texas Co.). U. S. 1,948,003, Feb. 20. Oil is subjected to cracking conditions in an enlarged still chamber; vaporized cracked products are separately withdrawn and passed to a sep. zone where they are subjected to a limited dephlegmation, a small amt. of reflux condensate is sepd. and at least a portion of the condensate is introduced directly into the vapors

within the still adjacent the point of vapor withdrawal to wash the vapors just before their withdrawal. Vapors from the dephlegmating zone are passed to a sep. fractionating zone in which undesired higher boiling constituents are sepd. as reflux condensate and this reflux is passed through an elongated passageway in which it is heated to cracking temp. and thence is discharged into the enlarged still chamber for further cracking. App. is described.

**Cracking hydrocarbon oils.** Gustav Egloff and Harry P. Benner (to Universal Oil Products Co.). U. S. 1,948,567, Feb. 27. Various structural and operative details are described of an app. comprising a heating coil, enlarged chamber and assoc. app. including a second chamber to which vapors pass and from which they are taken off.

**Cracking hydrocarbon oils.** Lyman C. Huff (to Universal Oil Products Co.). U. S. 1,948,713, Feb. 27. Oil is subjected to cracking conditions in a heating zone such as a pipe coil and thence is passed to an enlarged reaction chamber for sepn. of vapors and unvaporized residue; it is withdrawn from this chamber and is subjected to distn. in a zone of reduced pressure, for further sepn. of vapors and residue; the first and second vapors sepd. are subjected to partial condensation, and the heavy components of the second vapors are withdrawn as condensate and commingled, without prior heating to cracking temp., with heated oil from the heating zone prior to its entrance into the reaction chamber, to cool the heated oil. App. is described. U. S. 1,948,714 relates to a process in which vapors from the reaction zone (of a generally similar installation of app. which is described) are dephlegmated to form a reflux condensate, the unvaporized oil being flash-distd. by pressure reduction and the resulting flashed vapors dephlegmated to form a flash reflux condensate of higher b. p. than the first-mentioned reflux condensate, which, unadmixed with heavier oil, is passed through a heating zone and heated to a cracking temp., thence discharged into the reaction zone, the flash reflux condensate being commingled, without prior heating to cracking temp., with the heated reflux condensate discharging from the heating zone into the reaction zone. Cf. C. A. 28, 25164.

**Cracking hydrocarbon oils.** Harris A. Smith (to Texas Co.). U. S. 1,949,029, Feb. 27. An oil is cracked and vaporized under superatm. pressure to produce a gasoline fraction and a liquid residue; the residue is separately distd. as reduced pressure in a flash distn. zone and the vapor thus formed is dephlegmated to produce a reflux condensate and a vapor fraction; the reflux condensate is revaporized, an unvaporized tarry portion is sepd. and the revaporized condensate, free from tar, is conducted to a vapor-phase-cracking zone; the uncondensed vapor fraction from the dephlegmation is passed to the vapor-phase-cracking converter and commingled with the other vapors in the converter for vapor-phase cracking. App. is described.

**Cracking hydrocarbon oils.** Gustav Egloff (to Universal Oil Products Co.). U. S. 1,949,460, March 6. In a process in which oil is maintained under cracking conditions of temp. and pressure in an enlarged reaction zone from which vapors are removed for fractionation, a portion of the charging oil for the process is preheated by heat exchange with the vapors undergoing fractionation, and this preheated oil, in mixt. with reflux condensate formed by the fractionation, is passed to a heating zone where it is heated to a cracking temp. under pressure and thence discharged to the enlarged reaction zone. Another portion of the charging oil is subjected to indirect heat-exchange relation with hot liquid oil constituents in the reaction zone where it is heated to a higher temp. than the first mentioned portion of the charging oil and is then combined with the hot oil stream discharging into the reaction zone. App. is described.

**Cracking hydrocarbon oils.** Lester Kirschbraun (to Universal Oil Products Co.). U. S. 1,949,480, March 6. Oil from a bulk supply is circulated through heating tubes and back to the bulk supply, and the heating

gases for a pressure-cracking still are passed first in heat exchange with oil in sep. heating tubes and then in heat exchange with the heating tubes of the oil-circulation system mentioned; an auxiliary supply of oil (without substantial admixt. with the oil of the circulating system mentioned) is passed once only through the sep. heating tubes mentioned and thence directly into the said bulk oil supply. Various features of app. are described.

**Cracking hydrocarbon oils.** Jacques C. Morrell (to Universal Oil Products Co.). U. S. 1,949,486, March 6. In cracking in an app. comprising a heating coil and reaction chamber, with fractionation of vapors from the reaction chamber, reflux condensate from the fractionator is returned to the heating coil for further treatment, vapors from the fractionator are recovered; non-vaporized residue from the reaction chamber is introduced into a coking chamber of lower pressure, vapors there liberated are fractionated and reflux condensate is returned to the heating coil, and overhead vapors from the latter fractionation are heated to a vapor-phase conversion temp. in a sep. heating coil and are introduced into the coking chamber for devolatilization and coking. Various features of app. arrangement are described.

**Cracking hydrocarbon oils.** Walter M. Cross (to Gasoline Products Co.). U. S. 1,948,492, Feb. 27. A stream of a relatively light hydrocarbon oil is heated to a cracking temp. under a relatively high pressure; another stream of a relatively heavier oil is heated to temps. above the b. p. of the lighter constituents; the 2 heated streams are passed to a common evapg. stage maintained under relatively low pressure, above the liquid level in this stage, and vapors are sep'd. from the 2 oils before mixing their unvaporized portions, and the vapors of one stream are prevented from contacting with unvaporized oil of the other stream while blending the vaporized and unvaporized portions and separately removing the blended vaporized and unvaporized portions. App. is described.

**Cracking hydrocarbon oils.** Harry L. Pelzer (to Sinclair Refining Co.). U. S. 1,949,655, March 6. Oil in the vapor phase is heated to a high-cracking temp. and the vapors are maintained at cracking temp. for a time in a digesting chamber, freed from tar by scrubbing with a liquid such as fresh stock or reflux and, in a subsequent refluxing operation, fresh stock is introduced in direct contact with the vapors to condense a part of the vapors and to preheat the fresh stock; reflux condensate and preheated fresh stock are passed to the heating stage, and sep'd. tar is discharged without being returned to the heating stage. An arrangement of app. is described. U. S. 1,949,656 relates to a generally similar process in which vapors produced are refined by contact with an adsorbent earth such as fuller's earth. App. is described.

**Cracking hydrocarbon oils.** Jean Delattre-Seguy (to Universal Oil Products Co.). U. S. 1,949,765, March 6. Oil is heated to a cracking temp. under pressure in a heating coil and thence passed to a reaction drum and sep. zone for sep. vapors and unvaporized oil; sep'd. vapors are removed and a portion of the withdrawn vapors are heated to a vapor-phase-cracking temp. and then injected into the unvaporized oil in the sep. zone, under such control as to distil the unvaporized oil substantially to dryness. App. is described. Cf. C. A. 27, 5180.

**Vapor cracking of hydrocarbon oils.** Willis F. Sims and Venus U. Cloer (to Panhandle Refining Co.). U. S. 1,948,890, Feb. 27. Charging oil is forced under regulable pressure into a preheating zone under super-atm. pressure, where it is preheated to a temp. sufficient to flash it into vapor under sub-atm. pressure, and is then passed into a flashing zone under sub-atm. pressure, and the vapors only, thus produced, are passed to a cracking zone such as a pipe coil, which is under a lower sub-atm. pressure, whence vapors are drawn off to maintain the low pressure and passed through fractionating zones, and a cooling and sep. system. App. is described.

**Cracking and hydrogenating heavy hydrocarbon oils.** Robert F. Ruthruff (to Standard Oil Co. of Ind.). U. S. 1,948,736, Feb. 27. An app. is described arranged for

1 heating oil to a cracking temp. at relatively low pressures, sep. gasoline and coke from the remaining reaction products, compressing the remaining liquid reaction products to above 100 atm. and heating them to above 400° while contacting them with H<sub>2</sub>, sep. gasoline and lighter products formed by the hydrogenation, and cracking the remaining hydrogenation products at a pressure of about 200 lb. and contacting the cracked vapors with the hydrogenated products, and returning the cracked residues to a prior stage of the system.

**Apparatus for cracking hydrocarbon oils.** Hans Magnus. U. S. 1,948,072, Feb. 20. An oil reservoir is connected with a preheating coil, and also directly with a cracking coil, and a pump is provided in a pipe between the juncture of the pipe from the reservoir to the cracking coil with the pipe between the 2 coils and the cracking coil; thermostatically operated valves increase the flow through the direct pipe when the temp. in the cracking coil rises and reduce it when such temp. falls.

**Pressure apparatus for use in cracking oils.** Thomas Montgomery and John C. Morrison (to Standard Oil Development Co.). U. S. 1,948,391, Feb. 20. A pressure shell which may be formed of steel is provided with a liquid-tight lining of concrete.

**Fractionating column suitable for use in oil-cracking systems.** Wm. H. Bahlke and Ernest W. Thiele (to Standard Oil Co. of Ind.). U. S. 1,947,577, Feb. 20.

**Refining overhead products of hydrocarbon oil cracking.** Jacques C. Morrell and Gustav Egloff (to Universal Oil Products Co.). U. S. 1,947,868, Feb. 20. Heated vaporous overhead products are subjected to the action of SO<sub>2</sub>, free O and steam in the presence of a nonmetallic solid contacting agent such as bauxite, fuller's earth or a zeolite to remove gum-forming substances, etc. U. S. 1,947,869 relates to a generally similar process in which the vapors are treated with a mixt. of SO<sub>2</sub> and steam in the presence of discrete particles of a solid metallic salt such as ZnSO<sub>4</sub>. Cf. C. A. 28, 2516<sup>a</sup>.

**Tower suitable for refining cracked hydrocarbon vapors with fuller's earth.** Philip S. Nisson (to Gray Processes Corp.). U. S. 1,948,126, Feb. 20.

**Bubble-cap fractionating apparatus suitable for use with hydrocarbon oils.** Raymond W. Hielfeldt. U. S. 1,948,500, Feb. 27. Structural details.

**Stabilization of hydrocarbon oils.** Joseph K. Roberts and George W. Watts (to The Standard Oil Co.). Can. 330,405, Feb. 13, 1934. From hot hydrocarbon-oil vapors are condensed undesired high-boiling constituents, and then a portion of the desired constituents. The vapor, contg. some of the desired constituent together with undesired excessively volatile constituents, is passed to an absorption system in which the desired constituent is absorbed in a liquid medium. The absorption liquid may be the condensate of the first fractionation contg. the constituents desired in the final product.

**Treating hydrocarbon oils with greensand to remove gum-forming substances, etc.** Charles D. Lowry (to Universal Oil Products Co.). U. S. 1,949,749, March 6. An oil such as a cracked distillate is treated in the vapor phase with greensand (suitably in the presence of HCl).

**Distilling hydrocarbon oils.** John S. Wallis (to Alco Products, Inc.). U. S. 1,947,817, Feb. 20. Vapors produced by heating a hydrocarbon oil are passed counter-current to and in contact with reflux oil in a fractionating zone; an intermediate fraction of the reflux oil is withdrawn from the fractionating zone, stripped of its lighter constituents in an external stripping zone; the heaviest reflux oil fraction is stripped with steam in an internal stripping zone sep. from the unvaporized oil while the steam and evolved vapors from the internal stripping zone are permitted to enter the fractionating zone. App. is described.

**Hydrocarbon oil conversion.** Malcolm H. Tuttle (to Gyro Process Co.). U. S. 1,948,872, Feb. 27. In a process in which hydrocarbons in vapor phase are pyrolytically converted at temps., of about 540-700° to form lower-boiling products, the conversion is arrested to prevent excessive formation of undesirable products such as fixed

gas and free carbon by flashing the preheated oil into vapors in a vaporizing zone, and directly admixing the vapors with the hydrocarbons formed in the pyrolytic conversion zone of the vapor phase conversion process to bring the temp. of the resulting mixt. to about 370–480°. App. is described.

**Destructive hydrogenation of heavy hydrocarbon oils in the vapor phase.** Howard W. Strong (to Imperial Chemical Industries Ltd.). U. S. 1,949,080, Feb. 27. Hydrogenation of vapor from oils is effected under a total pressure of at least 10 atm. and at an elevated temp. (suitably about 500°) with simultaneous use of juxtaposed catalytic materials one of which is of the massive type (formed of iron coated with Sn) and the other of the porous type comprising  $\text{Fe}_2\text{O}_3$ . App. is described.

**Destructive hydrogenation of heavy hydrocarbon oils.** Philip L. Young (to Standard-I. G. Co.). U. S. 1,949,230, Feb. 27. A heavy hydrocarbon oil such as a crude or lubricating stock is passed in liquid condition with free H under pressure above 20 atm. through a reaction zone contg. a sulfactive catalyst, with conditions of feed rate, partial pressure of H and temps. suitably interadjusted to increase materially, by destructive hydrogenation, the lubricating qualities of the heavier fractions, with a limited formation of lower-boiling fractions; liquid oil is withdrawn and lower-boiling fractions unsuitable for use as lubricants are sepd., and the lower-boiling fractions are passed, at a relatively higher temp. with free H under pressure above 20 atm., but with reduced H partial pressure, over a second sulfactive catalyst to produce, by destructive hydrogenation, a light low-boiling product of antidetonating properties suitable for use as a motor fuel. App. is described.

**Catalytic hydrogenation of hydrocarbon oils.** Robert P. Russell and Willard C. Ashbury (to Standard-I. G. Co.). U. S. 1,949,630, March 6. Various details of app. and operation are described for treating oil at an elevated temp. in the presence of a finely divided suspended catalyst such as Cr and Mo oxides.

**Hydrogenating higher-boiling oils to produce motor fuel.** Robert P. Russell (to Standard-I. G. Co.). U. S. 1,949,631, March 6. Hydrogenation is effected under pressures above 100 atm. at temps. above 480° in a reaction vessel at least the inner surface of which is formed of an alloy of Fe with Cr about 27%, Ni 22%, Si not more than 2% and C less than 0.5%. Various details of app. arrangement are described. U. S. 1,949,632 relates to the treatment of materials such as heavy reduced crude oils, refinery residues, etc., in liquid phase with H under more than 100 atm. pressure while it is passing through a reaction zone packed with lumps of solid catalytic material comprising oxides and sulfides of metals of the 6th group of the periodic system, such as those of Cr, Mo and W, at a temp. of about 460°, removing total liquid and vaporous products in a single stream without distn. from the reaction zone after most of the oil is converted into naphtha and heavier nonviscous fractions, cooling under full pressure to a temp. at which only the naphtha remains vaporized, and sepg. the products into fractions. App. is described.

**Partial oxidation of hydrocarbons.** Joseph H. James (to Clarence P. Byrnes, trustee). U. S. 1,948,817, Feb. 27. A mixt. of a finely divided hydrocarbon material such as gas oil or naphtha and an O-contg. gas such as air is fed through a hot reaction zone and thence in contact with a series of sep. oil layers contg. oxidation products which are maintained at different temps. for condensing compds. of different av. mol. wts. in the different layers. App. is described. Cf. C. A. 28, 1354°.

**Apparatus for condensing hydrocarbon vapor mixtures.** John C. Mahoney (to Alco Products, Inc.). U. S. 1,947,863, Feb. 20. Vapor is introduced into a cooling coil unit within a shell and directed downwardly over the unit to the lower portion of the shell and upwardly to the upper portion independently of the down-flowing vapor. Various structural details are described.

**Apparatus for determining critical pressures of substances such as hydrocarbons.** Gellert Alleman and

Augustine F. S. Musante (to Sun Oil Co.). U. S. 1,947,821, Feb. 20. Various structural and operative details are described.

**Separating hydrocarbons.** Sigbert Seelig. Ger. 591,877, Jan. 20, 1934 (Cl. 23b. 1.04). Addn. to 582,717 (C. A. 28, 890°). The method of 582,717 for obtaining oils by heating distn. residues in a rotary furnace is modified by introducing high-boiling residues from a fractionating plant and the products from a "cracking" plant, into the rotary drum furnace while still hot.

**Oils.** Max Naphtali. Fr. 757,490, Dec. 27, 1933. Fractions of gas oil, paraffin oil and lubricating oils are subjected, before cracking or before filtering and purifying, to an intermediate treatment by a mixt. of air or other gas contg. O and Cl, the amt. of Cl not being above 2% and the temp. below 50°. The treatment may be followed by treatment with alk. products or  $\text{H}_2\text{SO}_4$ .

**Oil recovery.** N. V. Olie-Zuivering-Maatschappij "Olzum." Fr. 757,234, Dec. 22, 1933. Waste lubricating and insulating oils are recovered by removing solid impurities, centrifuging and treating with alk. liquids, e. g., a soln. of  $\text{Na}_2\text{PO}_4$ .

**Combustible oil.** Imperial Chemical Industries Ltd. Fr. 757,320, Dec. 23, 1933. An oil for compression motors contains in the dissolved state a small amt. of an easily inflammable accelerator chosen to reduce the delay period (time between injection and lighting) and a small amt. of another accelerator chosen to lower the spontaneous flash point of the oil. The 1st may be an alkyl nitrite or nitrate (2%), and the 2nd an org. Br compd., e. g., benzyl or Bu bromide or an org. O compd., such as Cu oleate or stearate (0.1%).

**Refining mineral oil.** Jack F. M. Taylor and Harold I. Lounsbury (to The Shell Development Co.). Can. 339,531, Feb. 20, 1934. Mineral oil distillate is sepd. into a number of fractions. One or more of these fractions is treated in such a way as to change the constitution of S-bearing components so that these components can be sepd. by distn. After sepn. of the S compds. these fractions are blended with the others, which may or may not have been chemically treated.

**Vacuum- and steam-distillation system for mineral oils.** Metallges. A.-G. (Max Gensecke, inventor). Ger. 590,218, Feb. 1, 1934, and 592,311, Feb. 5, 1934 (Cl. 23b. 1.03).

**Apparatus for generating gas to be used in hydrogenation of petroleum.** Milton J. Trumble and Wm. L. Seeley (to Processco, Ltd.). U. S. 1,948,808, Feb. 27. Structural details of an app. are described. Superheated steam is brought into contact with carbonaceous oil sludge to sep. lighter oil in a continuous cyclic hydrogenation system. U. S. 1,948,809 relates to a petroleum-hydrogenating and -dephlegmating app. of the bubble-tower type.

**Destructive hydrogenation of oils, tars or the like.** Mathias Pier, Kurt Wissel and Walter Dinkler (to Standard-I. G. Co.). U. S. 1,949,109, Feb. 27. Material such as a tar or heavy oil, CO, etc., is heated with a hydrogenating gas under at least 20 atm. pressure in a reaction vessel the inner surface of which is formed of a Zn alloy having a m. p. above 500° such as an alloy of Zn 42, Cu 51 and Ni 7%. An arrangement of app. is described.

**Pressure-filter apparatus for separating solidified wax from diluted oil at low temperatures.** Chester E. Adams (to Standard Oil Co. of Ind.). U. S. 1,948,018, Feb. 20. Various structural, mech. and operative details are described.

**Condensation and separation of constituents of mixtures of gases, hydrocarbon vapors and steam.** Robert Pyzel (to Universal Oil Products Co.). U. S. 1,948,595, Feb. 27. Various details of structure and operation of a condensing and sepg. system are described, suitable for treating mixts. produced by hydrocarbon-oil conversion.

**Water-soluble "petroleum sulfonates."** Leo Libერთსონ (to L. Sonneborn Sons, Inc.). U. S. 1,947,861, Feb. 20. Water-sol. petroleum sulfonates in laminar form are obtained from sludges resulting from the treatment of petroleum oils with  $\text{H}_2\text{SO}_4$  and contg. green petroleum sul-

ionic acids together with non-acid org. compds., by selectively removing the non-acid org. compds., then reacting the acids with a base forming water-sol. salts, dissolving the resulting salts in a solvent and applying the resulting soln. as a thin film to a smooth heated metal surface to evaporate the solvent, so that laminae fragments can be dislodged and collected.

**Treating asphaltic oils with employment of aluminum chloride.** Ulric B. Bray and Claude E. Swift (to Union Oil Co. of Calif.). U. S. 1,948,163, Feb. 20. For producing lubricating oil, the oil is commingled with an "asphalt-pptg. solvent" such as a propane mixt. and the asphalt is removed from the oil dissolved in the solvent; solvent is removed from the substantially asphalt-free oil and the latter is treated with  $AlCl_3$  at a temp. below that at which any substantial cracking takes place, and the  $AlCl_3$  and assocd. reaction products are sep'd. from the purified oil. An arrangement of app. is described. U. S. 1,948,164 relates to a generally similar process in which the treatment with  $AlCl_3$  is at a temp. sufficiently high to convert the unstable hydrocarbons into reaction products.

**"Sweetening" gasoline.** Roland B. Day (to Universal Oil Products Co.). U. S. 1,948,565, Feb. 27. The gasoline is treated with a mixt. of a Cu compd. such as  $CuSO_4$  or Cu oxide and  $NH_4Cl$  and filtered through fuller's earth. App. is described.

**Purifying and deacidifying acid-treated gasoline.** Samuel J. Dickey. U. S. 1,949,786, March 8. Gasoline distillate which has been treated with  $H_2SO_4$  and contains sulfonates is heated, in a stream and in the absence of alkalis, to a temp. at which the sulfonates are decompd.; the stream is withdrawn from contact with any heated surface and in liquid form is immediately contacted, without previous material change in temp., with solid  $NaOH$ ; any resulting liquefied alkali is sep'd. from the stream, and the material is then fractionated. App. is described.

**"Antiknock" motor fuel.** Ludwig Rosenstein (to Shell Development Co.). U. S. 1,948,449, Feb. 20. An org. deriv. of a metallocyanic acid such as tetraisopropyl ester of hydroferrocyanic acid is added to motor fuel such as gasoline (suitably in a proportion of about 0.2-0.4%). Isopropyl alc., cyclohexanol, etc., may be used as blending agents. Cf. C. A. 27, 4390.

**Lubricating oil.** David R. Merrill and Philip Subkow (to Union Oil Co. of Calif.). U. S. 1,948,042, Feb. 20. For sepn. of a hydrocarbon oil into fractions, the oil is extd. with  $\beta, \beta'$ -dichloroethyl ether and liquid  $SO_2$  to form a raffinate phase and an ext. phase, and these phases are sep'd. from each other.

**Lubricating oils from unrefined viscous petroleum fractions.** Philip L. Young (to Standard-I. G. Co.). U. S. 1,949,231, Feb. 27. A viscous oil such as a reduced crude or lubricating stock is extd. with a selective solvent such as phenol and glycerol to sep. the oil into liquid portions of high- and low-lubricating value, and a fraction of the latter is subjected to destructive hydrogenation under a pressure above 50 atm. and at temps. of about 370-450° for conversion into oil of high-lubricating value.

**Apparatus for filtering and purifying lubricating oils.** Charles A. Winslow (to Catherine B. Winslow). U. S. 1,948,282, Feb. 20. Structural features.

**Apparatus for cleaning used oils.** Antonio E. Lega. Swiss 163,281, Oct. 2, 1933 (Cl. 384). App. for cleaning dirty used mineral oils by clarifying with an aq. alk. soln. of  $Na_2SiO_3$ , and filtering, is described.

**Lubricant for metal-drawing or stamping operations.** Robert C. Williams (to Ironsides Co.). U. S. 1,948,191, Feb. 20. A wax or wax-like material such as beeswax or carnauba wax which will remain in the form of solid or semi-solid particles at the usual operating temps. and prior to the contact of the parts to be lubricated is dispersed in a liquid vehicle such as a soap soln.

**Lubricants for textile machinery.** Deutsche Hydrierwerke A.-G. Ger. 592,267, Feb. 5, 1934 (Cl. 23c. 1) Use is made of oleic alc. or mixts. thereof with the lubricants ordinarily used.

**Wax-free blended asphalt.** Robert E. Haylett (to Union Oil Co. of Calif.). U. S. 1,948,296, Feb. 20. An oil contg. asphalt and wax, such as a crude or topped oil, is commingled with a liquefied normally gaseous hydrocarbon such as propane to sep. asphalt from the oil and wax dissolved in the solvent, as by settling, and the asphalt is removed and is then blended with oil to produce wax free blended asphalt. An arrangement of app. is described.

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

**Cellulose chemistry in 1933.** D. Krüger. *Zellstoff u. Papier* 14, 89-93(1934).—A review of the literature on the structure and mol. wt. of cellulose, the homogeneity of cellulose ( $\alpha$ -,  $\beta$ -,  $\gamma$ -cellulose), the action of salt solns. on pulps, hemicelluloses, the constitution of lignin, and the chemistry of ligninsulfonic acids, with 53 references.

**Assumed non-identity of cotton and wood cellulose.** J. Barsha and Harold Hibbert. *J. Am. Chem. Soc.* 56, 748(1934).—Bell (C. A. 26, 5414) has questioned the identity of the chem. structures of cotton and wood cellulose on the basis of methylation expts. These expts. cannot be duplicated, cellulose from spruce, beech and maple giving 44.24, 43.08 and 43.72% MeO, which are not max. figures.

**The heating of cotton when bulked and its effect on seed and lint.** H. P. Smith, M. H. Byrom, D. T. Kilough and D. L. Jones. *Agr. Eng.* 14, 280-4(1933).—Heating of piled cotton is caused by excessive moisture due to pulling the cotton before it is fully mature and to the presence of green leaves and green unopen bolls. Seed taken from the surface of a pile of cotton that had been heated in storage contained 17.21% fat, whereas those from the inside of the pile contained 15.34%. Heating of the seed on the inside of the pile caused the free fatty acids to sep. more readily, and this resulted in the production of a lower grade of refined oil. There was no significant difference in the water content of seed from the inside and the outside of the heated pile. Exces-

sive heating destroyed the germinating power of the seed, lowered the grade of lint and caused a loss of 31-35% in the strength of the fiber.

**The real meaning of  $\beta$ - and  $\gamma$ -cellulose.** E. L. Ritman. *World's Paper Trade Rev.* 100, 968-74(1933).—Analysis of a no. of European pulps (sulfite, sulfate, straw and hardwood) showed that: (1)  $\beta$ -cellulose content is a linear function of Cu no.; (2) Cl absorption no. is a linear function of the sum of lignin and  $\gamma$ -cellulose. It is concluded that: (1)  $\beta$ -cellulose is real cellulose, the micelle being affected in such a way that this form of cellulose is readily dispersed by mercerizing liquor and the ability to reduce Fehling's soln. is enhanced; (2)  $\gamma$ -cellulose contains a constituent which is affected by bleaching; as pure pentosans are not affected by Cl, but are sol. in mercerizing liquor,  $\gamma$ -cellulose is probably a mixt. of pentosan and a Cl-absorbing constituent. A. Papineau-Couture

**Recent advances in the knowledge of cellulose and fiber structure, and their relation to the beating process.** Leslie G. Cottrill. *World's Paper Trade Rev.* 100, 1216, 1218, 1250-61, 1295-8, 1336-44, 1375-80, 1420, 1427, 1463-8, 1502, 1504, 1546, 1584-90(1933); *Paper Maker & Brit. Paper Trade J.* 86, TS8-16, 25-30(1933).—A review of modern concepts of the mech. and chem. structure of cellulose fibers, and their bearing on the effects produced by the beating process, both in the stock and in the paper produced therefrom. C. advances a theory which is essentially the same as that of Campbell (C. A. 24, 1976; 26, 5416; 27, 4394). A. Papineau-Couture

**Manufacture of cellulose acetate foil by drying methods.** Max Ullmann. *Kolloid-Z.* 66, 247-51 (1933); cf. *C. A.* 28, 2178<sup>a</sup>.—Patent review. Arthur Fleischer

**The dielectric strength of acetylcellulose in thin films.** D. Fedorov. *J. Tech. Phys.* (U. S. S. R.) 3, 859-69 (1933).—The dielec. strength of acetylcellulose practically coincides with those of other materials of high mol. wt.

Eino Hanninen

**Preparation of triacetylcellulose.** Ichiro Sakurada and Ryohei Inoue. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 53-5 (1934).—Eleven samples of surgical cotton were acetylated after different pretreatments. The exptl. data show that the proper pretreatment of the cellulose with water or AcOH may accelerate the reaction 50- to 100-fold. The authors feel that AcOH is to be preferred to H<sub>2</sub>O, on account of the detrimental effect of H<sub>2</sub>O upon esterification and the long periods (about 10 days) necessary for the uniform distribution of H<sub>2</sub>O.

Karl Kammermeyer

**Comparative lignin determinations by the Forest Products Laboratory and the Waldhof [Noll] methods.** August Noll and Fritz Bolz. *Papier-Fabr.* 31, Tech.-wiss.-Teil 593-6 (1933).—Contrary to the results of Lewis, *et al.* (*C. A.* 27, 4393) the 2 methods give comparable results on a wide variety of pulps. It is necessary that the sample be finely ground, and an EtOH-C<sub>2</sub>H<sub>5</sub> extn. must be used with sulfite pulps. The improved Noll method (*C. A.* 27, 2804) has been accepted as tentative standard by the German pulp chemists.

R. H. Doughty

**New light on the structure and properties of cellulose.** James Strachan. *Paper Maker & Brit. Paper Trade J.* 86, TS1-2 (1933).—Recent work confirms statements made by S. us far back as 1923. A Papineau-Couture

**Progress of the division of industrial and cellulose chemistry, McGill University.** Harold Hibbert. *Pulp & Paper Can.* 35, 163 6 (1934).—A review of work on cellulose and lignin chemistry carried out during 1933.

A. Papineau-Couture

**Research progress in the division of physical chemistry, McGill University.** O. Maass. *Pulp Paper Can.* 35, 167-71 (1934); cf. *C. A.* 27, 2806.—A review of the work of interest to the pulp and paper industry carried out during 1933.

A. Papineau-Couture

**Research progress in the pulp and paper division of the Forest Products Laboratories (of Canada).** J. H. Ross. *Pulp Paper Can.* 35, 172-4 (1934); cf. *C. A.* 27, 3329.—A review of the work done during 1933.

A. P.-C.

**Report of the Committee on Physical and Chemical Standards (of the Technical Section of the Canadian Pulp & Paper Association).** C. A. Sanky, *et al.* *Pulp Paper Can.* 35, 74 5 (1934).—The comm. recommend: (1) adoption as official by the section of the British pulp evaluation app. and method; (2) use of the metric system, insofar as possible, as a common method for expressing test results. Appendix A. Determination of drainage factor with the British sheet machine. *Ibid.* 75.—A description of the technic of the detn., based on the work of Campbell (*C. A.* 27, 2807). Appendix B. Recent developments in classification of paper-making fibers at the pulp and paper division (of the Forest Products Laboratories of Canada). G. D. O. Jones and H. Wyatt Johnston. *Ibid.* 76 8; cf. *C. A.* 27, 2805.—Different devices for classifying fibers according to length were constructed and tested, and the theoretical basis of their action was examd. The previously described instrument has been simplified by reducing the no. of units from 5 to 2. The new arrangement has been shown to be practicable and has been adopted as a standard instrument by the pulp and paper division. Appendix C. Developments in standards during 1933. *Ibid.* 78-81.—Brief review with bibliography of 112 references. A. Papineau-Couture

**The future of cellulose and pulping processes.** James Strachan. *Paper Maker & Brit. Paper Trade J.* 86, TS177-8 (1933).—A very brief discussion. A. P.-C.

**Drum barking.** W. Schmid. *Papier-Fabr.* 31, Tech.-wiss.-Teil 596-8 (1933).—Mech. R. H. Doughty

**Groundwood studies: theoretical efficiency.** W. Boyd Campbell. *Pulp Paper Can.* 35, 218-19 (1934).—The

amt of useful work done in grinding wood is estd. to be about 0.012% of the total energy consumed by the machine. Though some of the values used in the calcs. are admittedly not very accurate, the estns. are of value in showing the order of magnitude of the efficiency of the wood grinder; if anything, the figure arrived at is on the high side.

A. Papineau-Couture

**The problem of bamboo.** Anon. *World's Paper Trade Rev.* 100, 1121-6 (1933).—Comparative semi-com. pulping and paper-making tests were carried out on old flowered bamboos, freshly flowered bamboos and mature bamboos. The results clearly showed that flowered bamboos, even after 4 yrs. standing and though dry and dead, retained their paper-making qualities, but required slightly more drastic treatment than mature bamboo.

A. Papineau-Couture

**Report on the manufacture of newsprint from southern pine under commercial operating conditions.** L. C. Anderson. *Paper Trade J.* 98, No. 9, 31-2 (1934).—Report by an observer on the com. run of newsprint made at the Thorold mill of Beaver Wood Fibre Co., from groundwood and sulfite made from southern pine in semi-com. equipment at Savannah, Ga., which proved conclusively that newsprint could be made commercially from southern pines. The quality did not measure up to that of standard Canadian newsprint, but could doubtless be improved with pulps produced on regular com. units.

A. Papineau-Couture

**Marginal problems in mill and woodlands departments.**

F. L. Mitchell. *Pulp Paper Can.* 35, 89-94 (1934).—Howard Kennedy. *Ibid.* 95-6.—Address discussing problems of direct interest to both the woodlands department and the mill-operating departments of pulp and paper companies.

A. Papineau-Couture

**Swelling wood with water and aqueous solutions.** C. G. Schwalbe and Willi Beiser. *Papier-Fabr.* 31, Tech.-wiss.-Teil 655-67 (1933); cf. Beiser, *C. A.* 28, 1163<sup>a</sup>. The swelling of sawdust is greater in both acids and bases than in distd. water, contrary to the behavior of wood pulp, as detd. by sedimentation vol. Time and nature of previous drying treatment have a large effect; rapid drying reduces the effect of electrolytes while slow seasoning intensifies it, relative to water. No differences were noted in the effect of water and electrolytes on wood sections that could be ascribed to the inhibiting effect of structure. There was no evidence of swelling into the lumen. The factors affecting swelling are: nature of drying treatment, d., percentage of springwood and presence of hair cracks. The rate of swelling is much greater in liquid than in vapor.

R. H. D.

**The influence of temperature on the rate of natural penetration of electrolytes into wood.** O. Maass. *Can. J. Research* 10, 180 9 (1934); cf. *C. A.* 27, 1253.—The rates of diffusion of NaOH, NaCl and HCl into chips of black spruce heartwood impregnated with water were measured for different shapes of chips at 20°, 50° and 75°. In the longitudinal direction of the wood, HCl diffuses the most rapidly and NaOH and NaCl diffuse at nearly the same rates. In the lateral direction NaOH diffuses the most rapidly, because of its action on the wood. Concn. of electrolyte is practically without influence on the time to half-value for NaOH and HCl. The d. of the wood does not affect the rate of diffusion of NaOH. The rate of diffusion of water into air-dry chips was measured at 20° and 50°.

J. W. Shipley

**Report of the Committee on Pulpwood (of the Technical Section of the Canadian Pulp & Paper Association).** R. W. Sterns, *et al.* *Pulp Paper Can.* 35, 82-3 (1934); cf. *C. A.* 27, 2803.—Two com. tests carried out with the preservative "lignasan" (the toxic constituent of which is Et mercuric chloride) by spraying on wood sent to the storage pile gave contradictory results—in the 1st test the wood was in practically the same condition after storage for 9 months; in the 2nd test it was badly discolored and showed considerable surface developments of fungus after storage for 4 months. Preliminary expts. have indicated, merely as a general trend, that as the sp.

gr. of wood increases there is an almost proportionate increase in the yield of pulp per unit of wood vol.

A. Papineau-Couture

Penetration of western hemlock chips by calcium bisulfite liquor. C. E. Hrubesky and G. H. Chidester. *Paper Trade J.* 98, No. 7, 34-7(1934).—Bomb-scale penetration tests on 5/8-in. chips of western hemlock (*Tsuga heterophylla*) heartwood and sapwood, both in freshly cut and oven-dry condition, were made at const. temps. of 110°, 115° and 120°, to det. the rate of penetration of the  $\text{CaH}_2(\text{SO}_3)_2$  liquor and the time required to burn the chips. Cooking acids contg. 3, 6 and 8% total and 0.8, 1.20 and 1.20% combined  $\text{SO}_3$ , resp., were used for each of the conditions stated. The time required for penetration of moist heartwood chips with each of the acids during a uniform rate of temp. rise from 30° to 110° was also detd. Penetration was accelerated by an increase in temp. and an increase in the excess  $\text{SO}_3$  content of the liquor. It was more rapid in the sapwood than in the heartwood and was, to a very slight extent, more rapid in oven-dry than in moist woods. The temp. at which the chips were burned varied with the acid concn. and  $\text{H}_2\text{O}$  content. At 110° the only burning occurred in moist sapwood chips when treated with the 8% acid.

A. Papineau-Couture

Circulation with heating brings automatic control of cooking. A. R. MacAllister. *Pulp Paper Can.* 35, 175-6(1934).—A discussion of the Babcock-Wilcox forced-circulation, indirect-heating sulfite cooking system installed at the Kimberly-Clark mill, Kimberly, Wis. (cf. Swanson, Lang and Smith, C. A. 26, 5204-5).

A. Papineau-Couture

Digester circulation systems. G. L. M. Hellstrom. *Pulp Paper Can.* 35, 135-6, 144(1934); cf. C. A. 27, 1750.—A brief discussion of forced circulation systems for sulfite cooking with particular reference to the Hellstrom system. The chief characteristics are: (1) downward circulation inside the digester; (2) elimination of a screen at the liquor intake, a trash-type of circulating pump being used that can handle any chips that are carried by the circulating liquor; (3) introduction of a glass inspection-piece just above the pump to observe the circulating liquor.

A. Papineau-Couture

Sulfite-digester circulating systems. A. H. Lundberg. *Pacific Pulp Paper Ind.* 7, No. 10, 15-17(1933).—A brief discussion bringing out the advantages of the use of hot acid.

A. Papineau-Couture

Acid circulation and gas re-absorption. A. D. Merrill. *Pulp Paper Can.* 35, 133-4(1934).—The advantages of circulating both liquor and the gas which seeps in the top of the digester are pointed out. This effects uniform distribution of both temp. and acid concn., and also maintains the strength of the acid at a higher level during the cook, so that a weaker initial cooking acid can be used. In the *Lurgi* system, all of the circulating piping and the siphon are located inside the digester.

A. P.-C.

Probable error and accuracy of testing (in the pulp and paper industry). Ragnar Monnberg. *Paper Trade J.* 98, No. 12, 41-2(1934).—M. presents and briefly discusses the results of error detns. characterizing the accuracy which has prevailed in a com. lab. in the detn. of:  $\alpha$ -cellulose, Cu no., pitch extn., ash (all in sulfite pulp), "Mead value" test and Valley beater test.

A. Papineau-Couture

Modern practice in screening pulp. L. E. Kendall. *Pulp Paper Can.* 35, 111-16(1934).—A review of present groundwood-screening layouts and of the variables affecting groundwood-screening.

A. Papineau-Couture

Effect of various methods of preparing the disintegrated pulps before beating on the strength and other characteristics after beating. H. Ainsworth Harrison. *Paper Maker & Brit. Paper Trade J.* 86, TS175-6; *World's Paper Trade Rev.* 99, 1698, 1700(1933).—Data are presented showing that different test results may be obtained depending on the method adopted for concg. the disintegrated pulp prior to beating in the Lampén mill. It is recommended that during the concn. of all pulps the filtered liquid should be repassed through the mat of pulp till quite free from fine fibers.

A. Papineau-Couture

The changes in pulp during beating. Kristian O. Berg. *Papier-Fabr.* 31, Tech.-wiss.-Teil 605-11, 617-22(1933).—

The length-diam. ratio ( $l/d$ ) of pulp fibers may either (1) decrease continuously, (2) approach a min. or (3) pass through a min. value during beating. Behavior 3 is characteristic of slow-growth northern conifers. The measuring technic of Bergman and Backmann (C. A. 23, 5580) was used. In an attempt to find a rapid means of obtaining representative fiber dimension values a sedimentation test was developed by means of photoelectric indication of concn. changes (cf. Hart, C. A. 24, 6031). To eliminate swelling effects and to obtain suitable  $d$  and viscosity of the suspension medium, alc.-glycerol mixts. were used; the results were anomalous. Tests in 98% EtOH gave more uniform results. Based on the sedimentation curves, the rate of fiber size reduction falls off considerably as beating progresses. The particle diam. by Stokes' law (if it is assumed that the particles are spherical) and the  $l/d$  via Gans' equation (C. A. 23, 3843), calcd. from the time required for 60% sedimentation, agree fairly well with the av. values obtained by microscopic means. Fiber strength via Ruhlmann (C. A. 20, 3567), increased during beating in a way characteristic of the pulp type, reaching 18 k<sub>g</sub>/sq. mm. for strong bleached pulps. Apparently the fibers rupture at their weakest points under beating. That sheet strength passes through a max. with beating while fiber strength continually increases may result from inability of small particles to mat together in a way to develop their full strength.

K. H. Doughty

(The evaluation of) pulp characteristics. V. Hottenroth. *Papier-Fabr.* 31, Tech.-wiss.-Teil 557 78(1933).—The methods and results of extensive cooperative tests of sulfite pulps for pulping degree, lignin, ash, cellulose, wood gum, pentosans, EtOH and Et<sub>2</sub>O soly., Cu no., viscosity, swellability and microscopic characteristics are recorded and discussed. The agreement attained is fairly good, but methods should be better standardized. The lignin content or a related test (bleachability, color reaction) offers a basis for a precise chem. scale of pulp hardness. Such a system, based on pulping degree, would take no account of strength and would not be directly applicable to bleached pulps. It would force a clear distinction between the present confused concepts of hard-soft and strong-weak as applied to pulps. Much work is required to select a strength test method and set up pulp specifications based thereon. The mass of special properties required in particular pulps must also be reduced to some sort of order.

R. H. Doughty

The substitution of purified (wood) pulp for rag pulp in the manufacture of high-grade paper. S. A. Fotov. *Zellstoff u. Papier* 14, 105-6(1934).—The effects of cooking (sulfite) and bleaching on the compn., strength and other properties of spruce fibers were studied. Medium-hard sulfite has greater strength than either the hard or soft varieties. Multiple-stage bleaching is more favorable to the strength characteristics of the pulp than single-stage bleaching. Also in *Leningrad. Oblastnoi Sovet Nauch. Issledovaniya Tekh. Obshchestva Tsellyulozno-Bumazhnoi Prom. New Problems of Cellulose-Paper Production* 1933, 37-63.

S. L. Aronovskiy

Permanganate number of pulp. R. H. Wiles. *Paper Trade J.* 98, No. 11, 34-6(1934).—A detailed description is given of a technic which has been found satisfactory, but the conditions of which must be adhered to strictly to obtain good duplication of results. In order that duplicate tests should agree within 0.5 cc., not more than the following tolerances should be allowed: wt. of test specimen 1.00  $\pm$  0.02 g. (oven-dry); temp. at start of reaction 25  $\pm$  2°; time of reaction 5 min.  $\pm$  20 sec.;  $\text{KMnO}_4$  concn. N/290 to N/310; acid concn. 0.128-0.139N. Modifications which can be made in the technic for routine mill control work are indicated.

A. Papineau-Couture

Ammonium bisulfite: its use as a base in the sulfite process. E. O. Houghton. *Pulp Paper Can.* 35, 97-101(1934).—Exptl. cooks were carried out to compare the relative effect of  $\text{NH}_4$  and Ca bisulfites in cooking acid on the properties of the pulp. Increasing concn. of  $\text{NH}_4$

HSO<sub>4</sub> or combined SO<sub>2</sub> tends to increase the cooking time necessary to obtain a pulp of a desired degree of digestion. Pulp (both unbleached and bleached) cooked with a Ca-base acid have a much lower Mullen test than those cooked with NH<sub>4</sub>-base acid. For a given Cl no., the  $\alpha$ -cellulose content of the unbleached pulp is higher with Ca-base acid than with NH<sub>4</sub>-base acid. Pulp from Ca-base acid yielded considerably more screenings.

**Fungus attack on sulfite pulp.** E. Opfermann. *Papier-Fabr.* 31, Tech.-wiss.-Teil 642-3 (1933).—Fresh moist roll pulp acquired a luxurious mold growth in 5 days from a contaminated freight car.

**The annual report of pulp bleaching for 1933.** Ladislav Rys and Alfred Bönnisch. *Zellstoff u. Papier* 14, 97 100 (1934).—A review with 33 references.

**Bleach requirements of pulp.** C. O. Seborg. *Paper Trade J.* 98, No. 8, 109 (1934).—The method is as follows: weigh out 5 portions of pulp each equiv. to approx. 15 g. oven-dry pulp, place in 2-quart wide-mouthed fruit jars, mix thoroughly by a small high-speed stirrer with enough distd. water to give a consistence of 1.5–2.1% after addn. of the bleach liquor, add amts. of standardized bleach forming a series extending both above and below the estd. bleach requirements of the sample, place in a thermostat at 40  $\pm$  2° with a suitable agitating device, let bleaching proceed till a drop of starch-KI soln. added to a small portion of the mixt. produces a light blue color which persists for 5 sec. (corresponding to about 99% exhaustion of the bleach), make test sheets from the pulp after washing, air-dry between filter papers, det. the color of the sheets in a suitable color-measuring device, calc. the bleach requirement of each sheet, and est. the min. bleach requirement which gives the color accepted as standard. The method is applicable to all types of pulps, and gives results that check within 1–2% on duplicate tests and that differ by not more than 1–3% from the actual amt. of bleach required in com. bleaching.

**Review of bleaching technics.** R. T. Steedman. *Pulp Paper Can.* 35, 101–2 (1934).—An outline of the phases passed through during the past 15–20 yrs., culminating in the Thorne tower type and pre-bleaching with Cl.

**Rapid methods for the determination of bleached and unbleached fibers in pulp and paper.** M. S. Kantrowitz and R. H. Simmons. *Paper Trade J.* 98, No. 10, 46–8 (1934).—The official Bright stain requires approx. 1 hr. for staining; the malachite green-Congo red stain of Seibert and Minor (*C. A.* 15, 2183), approx. 30 min.; the method using malachite green alone, not more than 5 min., and shows a fair degree of accuracy in the hands of experienced analysts. The malachite green-Congo red stain, with various concns. of Congo red, gives erroneous results (generally low for unbleached fiber content). The Filz method (*C. A.* 25, 589) takes approx. 15 min.; it has been further simplified by eliminating 2 steps in the procedure (solns. "A" and "B" are not mixed previous to application on the fiber; the FeCl<sub>3</sub>-K<sub>3</sub>Fe(CN)<sub>6</sub> stain is not completely removed by washing; a clear soln. of benzopurpurin is used, instead of a soln. of a colloidal nature). In this form it gives fully as accurate results as the Bright method, and allows the fibers to be sepd. sufficiently from one another to permit the use of the count method in detg. percentage of bleached and unbleached fibers.

**Continuous stuff preparation.** C. W. Morden. *Pacific Pulp Paper Ind.* 7, No. 12, 11–13 (1933).—A brief outline of trends and developments at present under way in Pacific Coast mills in the field of continuous stuff prepn.

**Trade names and their significance.** Frederick C. Clark. *Paper Trade J.* 98, No. 8, 71–108 (1934).—A paper classification chart based on the decimal system is presented, by means of which the relationship between all kinds of paper may be established.

**Paper and other thin sheet materials. Flexibility or stiffness tests using the flexometer.** R. I. Martin and

G. R. Bray. *World's Paper Trade Rev.* 100, 2008–20, 2068 (1933).—Detn. of the relative flexibility or stiffness of thin sheet elec. insulating materials by means of the flexometer (F. T. Peirce, *C. A.* 25, 820) promises to have application to such materials as fabrics, papers (both untreated and varnished), leatheroid, etc. With many materials the plain rectangular strip specimen curls and kinks, sometimes to such an extent as to make any reading impossible; in such cases, by using a pear-shaped loop specimen much more consistent readings were obtained. The method of making the test and of calcg. the results is explained.

**Machinery for the manufacture of paper.** Kurt Geisler. *Eng. Progress* 15, 41 8 (1934).—A review.

**Some possible developments in machine design for low-sulfite news [print] furnishes at high speeds.** E. M. Little. *Pulp Paper Can.* 35, 110 (1934).—A discussion emphasizing the importance of improving wire drainage conditions.

**Reduction of corrosion and wear by the use of laminated resinous machine parts.** G. E. Landt. *Paper Trade J.* 98, No. 7, 38–40 (1934).—A discussion of the contribution which resinous machine parts make in securing continuous and uniform operation in the paper mill.

**The vacuum-forming paper machine. Its present field and possible future applications.** A. N. Russell. *World's Paper Trade Rev.* 101, 586 94, 632 8 (1934).—A general description of the machine, with a discussion of its practical application to the making of certain grades of paper.

**Manufacture of parchment, imitation parchment and glassine papers.** Papyro. *Papeteria* 56, 126–33 (1934). Practical operating directions.

**Waterproofing of paper.** James Strachan. *Paper Maker & Brit. Paper Trade J.* 87, TS49 50 (1934).—A very brief discussion, giving an outline of early history of waterproofing of paper in England, a classification of water-resistant and waterproof papers and indications on the choice of such papers.

**Removal of static electrical charges from paper.** J. Rathier. *Papier* 37, 83 4 (1934).—Static electricity was effectively discharged from rolls of paper 750 mm. long and 600 mm. in diam. by exposing the end of the roll to the action of ultra-violet light for 10 min. at a distance of 1 m. from a Hg-arc lamp. Exposure for such a short period did not affect the color of the paper.

**Superficial esterification of paper.** N. Ya. Solechnik and N. N. Motovilova. *Bumashnaya Prom.* 12, No. 10, 39–43 (1933).—Paper was esterified with stearyl chloride by the method of Pringsheim, Lorand and Warel (*C. A.* 26, 6123), with such changes in the conditions of the reaction, time and temp. as to insure only a partial and superficial esterification. The lab. expts. were made in a glass app. with the exclusion of air and humidity. The paper was dried at 105°, and xylene was washed with metallic Na and redistd. The paper (4 g.) wetted with 40 g. quinoline and then heated in an oil bath with 46 g. stearyl chloride in 150 cc. xylene was washed with boiling alc and dried at 100°. The paper treated with quinoline and the soln. of stearyl chloride in xylene were preheated to the desired temp. of the esterification before use in the process. The increase in wt. of the esterified paper was 44% (esterification of 0.25 of 1 OH group) on heating 3 min. at 160° and 73% in 10 min. at 145° (0.5 of 1 OH). The products showed inferior mech. properties. Esterification to 30% decreased the hygroscopicity 50%. Esterification to 73% changed the hygroscopicity from 11.3% to 2.2% (the detns. were made at 15° in an atm. of 80% relative humidity). The elec. resistance of 73% esterified paper was  $8.95 \times 10^{14}$  as compared with  $2.04 \times 10^{10}$  for the same paper (after an exposure of 44 hrs. in an atm. of 100% humidity).

**Analysis of wool in paper.** V. Gruenman. *Papier* 37, 165–70 (1934).—A brief review and discussion of methods for the detection and detn. of wool in paper. The Kjeldahl method is considered most suitable for papers contg. no textile fibers, and the H<sub>2</sub>SO<sub>4</sub>-soln. method for papers contg. no highly lignified fibers.

**Glue in the paper industry.** E. Pallas. *Papier-Fabr.* 31, Tech.-wiss.-Teil 634-7(1933).—Analytical methods and recommendations for the use of glue sizing are given.

R. H. Doughty

The permeability of transparent papers to water and water vapor. Giulio Tocco and Emilio Cerbaro. *Boll. reparto fibre tessili vegetali staz. sper. ind. carta e fibre tessili vegetali* 5, 166-70(1933).—Results of comparative expts. are given. A new app. is suggested. G. A. B.

**The high-pressure acid system.** A. H. Lundberg. *Pacific Pulp Paper Ind.* 8, No. 2, 8-9(1934).—In this system, by varying the pressure in the pressure tower and the amt. of gas sent through the compressor, it is possible to produce at any time sulfite acid of desired total and combined  $\text{SO}_2$ , regardless of the water temp. and water contents of wood and steam. A. Papineau-Couture

Colorimetric determination of the  $p_{\text{H}}$  of turbid and colored solutions in the paper industry. Maurice Déribéré. *Papeterie* 56, 118-25(1934).—A description of the construction and operation of Caillé's ionocolorimeter (C. A. 22, 2495). A. Papineau-Couture

**Application of  $p_{\text{H}}$  value to titrimetric analysis.** A. Nicollet. *Papier* 37, 55-68(1934).—An explanation of the application of  $p_{\text{H}}$  values to titrimetric analysis, more particularly of liquors used in pulp manuf. A. P.-C.

**Studies in sizing, sizing troubles, and the preparation of rosin size.** Eicke. *Papier-Fabr.* 31, Tech.-wiss.-Teil 667-73(1933).—Practical mill experiences and tests made to eliminate operating troubles are reported. An explanation of sizing which differs in part from accepted theories but at least takes account of all the observations is offered. It is shown that salts present in water or pulp are not as deleterious as has been supposed. The sizing is improved when white water is used in the beaters. The effect of  $p_{\text{H}}$  seems to be mainly on the sintering point and floe size of the rosin ppt.; at optimum  $p_{\text{H}}$  the sintering point is below the drier temp. but the floe size is not yet large enough to destroy the sizing effect. The most important factor is the specific nature of the pulp, which depends on the wood and the cooking treatment. In particular, the ease of sizing runs parallel to the pentosan content (cf. Young and Rowland, C. A. 27, 5988). Methods of prep. size are discussed; the dispersity of the size soln. and of the ppt. in the beater are the factors which must be controlled for successful mill operation.

R. H. Doughty

**A sizing test and a sizing theory.** R. M. Cobb and Donald V. Lowe. *Paper Trade J.* 98, No. 12, 43-6(1934).—A new test for estg. the liquid resistance of papers is proposed and described. It consists essentially in detg. the amt. of liquid absorbed in a given time, is applicable to specimens that vary in thickness, and is particularly useful on all heavy stock, on hard-sized light stock, and for sizing research on hand-made sheets. The difference between surface sizing and internal sizing is shown to be due in part to difference in energy release. Internal sizing is effective only against liquids of poor wetting properties. Surface sizing seems to differ from internal sizing not only because of a difference in protective film at the surface and sheet structure, but also because of the difference between surface wetting and immersion wetting. A. Papineau-Couture

**Gloss and its measurement.** A. Klughardt. *Papier-Fabr.* 31, Tech.-wiss.-Teil 521-4(1933).—Reflected light is measured at various selected angles to the sheet. By means of the Lambert and Fechner laws and the Ostwald brightness scale these measurements are calcd. to apparent gloss,  $G$ .  $G$  depends on the fundamental brightness  $h_0$ , and for equally smooth surfaces is inversely proportional to it. From this relation the optical smoothness can be evaluated (cf. following abstr.). R. H. D.

**Gloss and smoothness.** A. Klughardt. *Papier-Fabr.* 31, Tech.-wiss.-Teil 697-705(1933).—The Ostwald brightness scale is redivided into physiologically equal parts. The gloss value  $G$  (cf. preceding abstr.) is a linear function of brightness expressed in these units, and can by this means be corrected for brightness, color and  $n$  of the surface elements. This leaves of the factors controlling

$G$  only the orientation of the surface elements, or surface smoothness, which is thus evaluated. At present too little is known of the  $n$ s of paper-making materials to develop the full use of the method; it is offered for trial and criticism. Representative data are given. R. H. Doughty

**Dyestuff problems (in the paper industry).** J. R. Roberts. *Paper Mill* 57, No. 4, 4, 10(1934).—A brief discussion of fastness to light, to acid, to alkali and to Cl and of 2-sidedness. A. Papineau-Couture

**Improvements in the production of light-fast shades by beater coloring.** M. Niederhauser. *Papier* 37, 71-3(1934).—Attention is drawn to the merits of Diazol Lumière, Solanthrene and Lutetia dyestuffs, of Etablissements Kuhlmann, for the production of fast shades on bleached pulps. A. Papineau-Couture

**Some problems of fading (in the paper industry)**

Julius Grant. *World's Paper Trade Rev.* 100, 1866, 1904, 1906, 1944, 1946, 1984-9(1933); *Paper Maker & Brit. Paper Trade J.* 87, TS59-63(1934).—The possibilities of making fading tests by noting the min. time required to produce a change in the fluorescence of the sample when exposed to unfiltered light of the Hg-arc lamp were investigated, and the results indicated that: (1) concordance with sunlight tests is not perfect, the greatest divergencies being experienced with basic colors and pigments; (2) the accuracy of the method is comparable to that obtained with the C arc, and the method is superior to the use of the Hg lamp to produce a fading visible in daylight; (3) the method is particularly suited for routine testing, where colors of known nature are under investigation; (4) on account of the rapidity of the test, the influence of temp. or humidity is minimized; (5) the unfiltered light of the Hg arc gives much more rapid and consistent results than the filtered light; (6) the appearance of the fluorescence varies according as the specimen is exposed to filtered or unfiltered light, to daylight, or to heat treatment, even if these processes produce changes which appear identical when viewed in daylight. With Prussian blues, C blacks and chrome yellows, the method gave fairly satisfactory results; with 2 competitive ultramarines, there was a rapid change (practically the same in both cases) in the fluorescence as viewed in ultra-violet light, while observation by daylight (after exposure to ultra-violet light) differentiated distinctly between the 2; the rapid initial change in fluorescence was traced to the action of the ultra violet rays on the paper, as distinct from the color. Artificial stimulation (ultra-violet light, C arc, heat) produces a more marked decrease in the folding resistance than natural exposure (daylight), and this decrease is greater for paper that has been treated with starch; there is no conclusive proof that accelerated aging tests produce the same changes in the fiber as natural aging. Sizing lowers slightly the stability of the color of undyed and sun-bleached pulp, and bleaching raises the natural color stability (possibly because of removal by bleaching of a light-sensitive constituent). When paper is exposed to tropical conditions, with increase in the Cu no. of the hall-stuff the stability to direct light increases and the stability on storage out of light decreases, indications that, under such conditions, there are at least 2 factors at work, one due to light and the other to other climatic conditions, the latter being the more important from a practical standpoint. Preliminary expts. indicated that: (1) light of short wave length tends to destroy resistance to water penetration conferred by rosin sizing; (2) heat, even for prolonged periods, has no deleterious effect on water penetration; the latter is sometimes even improved by heat treatment, apparently because of the action of heat on cellulose rather than on the size materials; (3) tub sizing exerts no protective nor deleterious effect on paper exposed to daylight, ultra-violet light, tropical light, C arc, or heated at 100° for 6 hrs.; (4) ultra-violet light seems to have less action on the water resistance of colored than of white papers, presumably because the coloring matter can absorb such light. A. Papineau-Couture

**Zinc sulfide pigments in today's paper industry—their incorporation and the resulting products.** V. A. Belcher. *Paper Trade J.* 98, No. 11, 37-9(1934).—The use of  $\text{ZnS}$

pigments to increase the opacity of a sheet permits the use of lighter sheets for mailing. New uses for ZnS pigments include: waxing paper for food wraps, boxboard, absorbent paper, fruit wraps, paper pie plates.

**Color problems in fillers.** John R. Roberts. *Paper Mill* 56, No. 43, 9-10(1933).—A brief discussion of the problems in paper coloring occasioned by the use of fillers.

**Beating and coloring problems.** H. C. Reimer. *Paper Mill* 56, No. 52, 4(1933); *Pacific Pulp Paper Ind.* 7, No. 12, 8(1933).—A brief discussion indicating remedies for 2-sidedness and mottled fibers.

**Visible and tangible effects of beating.** James Strachan. *Paper Maker & Brit. Paper Trade J.* 86, TS17-19(1933).—An explanation of the visible effects of beating on fibers.

**Curl in sulfite papers.** W. A. Ketchen. *Pulp Paper Can.* 35, 103-9(1934).—Curling is essentially due to 2-sidedness of the sheet with respect to H<sub>2</sub>O content, and can be largely eliminated by adjusting conditions so that both sides of the sheet have the same H<sub>2</sub>O content when it leaves the paper machine and also when it is used, either by the printer or by the converter.

**Microscopic and micrographic testing of paper.** A. R. Matthis. *Ann. chim. anal. chim. appl.* 16, 97-112(1934); cf. *C. A.* 28, 2293<sup>3</sup>.—The microscopic appearances of some of the fibers likely to be encountered are shown and described. The prepn. of the sample for microscopic examn. is also considered.

**Imperishable documents.** James Strachan. *Paper Maker & Brit. Paper Trade J.* 87, TS33-4(1934).—From a brief discussion of the Digby process\* (Pt printing on sheet Au) from both a common-sense and a scientific point of view, it is considered extremely unlikely that this method of preserving valuable records will ever become a practical proposition.

**Production of printing paper from waste paper.** B. N. Moiseev and P. V. Shumilov. *Bumazhnaya Prom.* 12, No. 9, 48-51(1933).—A general discussion. C. B.

**Breaker beaters for old papers.** Fritz Hoyer. *Wochbl. Papierfabr.* 64, 790-1, 809-12(1933).—Nine designs are illustrated and discussed, with patent citations.

**A revolutionary de-inking process.** Alex. Annandale. *World's Paper Trade Rev.* 100, 1077-8(1933).—The process consists in pulping the waste papers in a breaker heater in presence of a mixt. of chemicals (the nature of which is not disclosed) and washing in a specially designed washer, the whole operation requiring less than 1 hr. Its advantages are briefly indicated.

**Reprocessing printed groundwood papers.** Sidney D. Wells. *Paper Trade J.* 98, No. 10, 41-3(1934).—A new process is described wherein groundwood papers printed with an ink having an Fe lake of hematein as a pigment are re-used by removing the ink by the reducing and solvent action of SO<sub>2</sub> soln. on the wet stock which has been nodulized in rod mills.

**Results on newsprint obtained by use of the Bekk smoothness and porosity tester.** L. C. Anderson. *Pulp Paper Can.* 35, 85-6(1934).—A study of the instrument as used for the testing of standard newsprint (33 lb. basis wt.) showed that the time factor for converting results by the "rapid" method to those by the "precise" method is about 10.6; that the time with the "rapid" method must be read to 0.1 sec. to obtain the same accuracy as with the "precise" method; and that there is a rather large probable error in testing newsprint due to lack of uniformity, so that at least 10 (and preferably 20) tests should be made to obtain a good av. value.

**Water resistance of paper board.** Philip W. Codwise. *Paper Trade J.* 98, No. 10, 43-5(1934).—A description of an adaptation of the dry-indicator test which is considered suitable as a standard method for detg. H<sub>2</sub>O penetration through paper board.

**Safety papers.** James Strachan. *Paper Maker & Brit. Paper Trade J.* 86, TS161-2(1933).—The principal

methods used for making modern safety papers are indicated.

**Residual waters of paper factories.** R. Escat Serra. *Quim. e ind.* 10, 333-8(1933).—A general outline of the utilization and disposition of waste liquors of paper factories.

**Corrosion prevention by protective coatings in the industries of viscose rayon and viscose films (Oll) 9.** Adsorption and swelling of cellulose in electrolyte solns. of varying concns. (Kanamaru) 2. Chemistry of lignin (Phillips) 10. Formation of components of wood from the plant sap—fructose as the source of "lignin" (Wislicenus, Hempel) 11D. Esters for use as plasticizers for pyroxylin (U. S. pat. 1,949,093) 10.

**α-Cellulose.** Adolf Basler. *Ger.* 591,516, Jan. 23, 1934 (Cl. 55b. 1.40). Grasses are treated first with aqua regia and then with alkali.

**Continuous system for recovering cellulose from wood, etc.** Victor Jansa and Gunnar Planck. *Ger.* 592,332, Feb. 5, 1934 (Cl. 55b. 2.10).

**Cellulose esters.** Carl J. Malm and Charles L. Fletcher (to Kodak Ltd.). *Brit.* 401,918, Nov. 23, 1933. The esterification of fibrous cellulose or cellulose derivs. contg. free OH groups, e. g., cotton linters, surgical cotton wool, sulfite wood pulp, hydrocellulose, etc., is carried out in a reaction mixt. contg. an ether of h. p. above 70° as diluent, e. g., Pr, Bu, iso-Bu, Am and iso-Am ethers. Examples are given.

**Cellulose esters.** Lonza Elektrizitätswerke und Chemische Fabriken A.-G. (Giorgio Renato Levi and Guiseppe Benaglia, inventors). *Ger.* 591,755, Jan. 26, 1934 (Cl. 12o. 6). Esters contg. N are obtained by treating cellulose with an anhydride of a monocarboxylic acid contg. N, such as cyanoacetic acid, amino- or acetyl amino-benzoic acid, nitrobenzoic acid, etc. Alternatively cellulose may be treated with an acid such as AcOH and the CN group finally introduced. These esters have a strong affinity for dyes. Examples are given. Cf. *C. A.* 28, 634<sup>8</sup>.

**Cellulose esters.** C. F. Boehringer & Soehne G. m. b. H. (Richard Muller, Martin Schenck and Wilhelm Wirhatz, inventors). *Ger.* 591,936, Jan. 20, 1934 (Cl. 12o. 6). Addn. to 581,827 (*C. A.* 28, 1196<sup>9</sup>). In esterifying cellulose, nitromethanedisulfonic acid is used as the catalyst instead of methanedisulfonic acid. Examples are given. In one, cotton is esterified by treatment with Ac<sub>2</sub>O, C<sub>6</sub>H<sub>5</sub> and H<sub>2</sub>SO<sub>4</sub> in the presence of nitromethanedisulfonic acid as catalyst to give a product contg. 62.5% of AcOH.

**Cellulose esters.** I. G. Farbenind. A.-G. *Fr.* 757,319, Dec. 23, 1933. Fibrous cellulose or fibrous derivs. of cellulose are partly or completely esterified to produce esters, mixed esters or ether esters which retain the fibrous structure, by carrying out the esterification in the presence of a mixt. of chlorinated aliphatic hydrocarbons and org. liquids which have the power of reducing the solvent power of the reaction mixt. for the esters formed. Examples are given of the use of a mixt. of CH<sub>2</sub>Cl<sub>2</sub> and toluene, C<sub>2</sub>H<sub>5</sub>Cl<sub>2</sub> and AcOEt, and CH<sub>2</sub>Cl<sub>2</sub> and CCl<sub>4</sub>.

**Precipitating cellulose esters such as cellulose acetate, propionate or benzoate.** Donald B. Mason (to U. S. Industrial Alc. Co.). *U. S.* 1,949,213, Feb. 27. A stream of soln. of the ester dispersed in liquid SO<sub>2</sub> is discharged under pressure and commingled with a stream of pptg. agent such as water and steam under such conditions as to vaporize and release the SO<sub>2</sub> as pptn. of the cellulose ester is effected, the ester being obtained in loose condition suitable for various subsequent treatments. App. is described, and U. S. 1,949,214 also relates to such app.

**Cellulose ester and ether articles.** Celluloid Corp. *Brit.* 402,877, Dec. 14, 1933. Articles made of or contg. cellulose esters or ethers, e. g., sheets, photographic films, fountain-pen parts, containers, screw caps and other closures for bottles, parts of elec. app., are rendered resistant to H<sub>2</sub>O, acids, alkalis, gases or vapors and org. solvents by coating with a material comprising a polym-

erized vinyl hydrocarbon, particularly polymerized styrene or its homologs, ethylstyrene or *p*-methylstyrene. The coating must not contain a (synthetic) resin. Plasticizers or softening agents, drying oils, cellulose ethers and pigments or dyes may be incorporated. The polymerized compd. is preferably applied as a soln. in an org. solvent, *e. g.* (halogenated) hydrocarbons.

**Cellulose derivative compositions.** British Celanese Ltd. and Wm. H. Moss. Brit. 402,071, Nov. 15, 1933. A solid moldable plastic compn. is prepd. by admixt. of a cellulose ether or ester with at least its own wt. of a synthetic resin which consists substantially of or includes a phenol-ketone-aldehyde resin, preferably the diphenoxypropane-CH<sub>2</sub>O resin prepd. according to Brit. 299,065 (C. A. 23, 3115). The preferred addnl. resin is a phenol-aldehyde resin prepd. with acid catalyst. Suitable proportions of fillers, *e. g.*, china clay, bentonite, and of plasticizers are used. The product is used for the prepn. of gramophone records.

**Improving the color of organic derivatives of cellulose such as cellulose acetate.** Camille Dreyfus and George Schneider (to Celanese Corp. of America). U. S. 1,948,517, Feb. 27. Directly after pptn., the material is treated with a soln. such as NaOCl which is capable of liberating Cl<sub>2</sub> at temps. above 50°, and then washed and dried. Cf. C. A. 27, 4395.

**Precipitation and dehydration of cellulose derivatives** Donald B. Mason (to U. S. Industrial Alc. Co.). U. S. 1,948,625, Feb. 27. Streams of a soln. of a cellulose deriv. such as a soln. of cellulose acetate in liquid SO<sub>2</sub> and a precipitant such as water are commingled and the pptd. cellulose deriv. is centrifuged for dehydration. App. is described.

**Plasticizing cellulose derivatives such as cellulose acetate.** George Schneider (to Celanese Corp. of America). U. S. 1,949,434, March 6. An org. deriv. of cellulose such as cellulose acetate is caused to absorb plasticizers such as dimethyl phthalate and triphenyl phosphate in the presence of a penetrating agent such as Turkey-red oil and xylene while both materials are suspended in a liquid such as water.

**Cellulose acetate.** Ernst Berl. Brit. 402,692, Dec. 7, 1933. Addn. to 381,991 (C. A. 27, 4395). The process of 381,991 is modified by passing the pretreating liquor and (or) the acetylating liquor intermittently or continuously through the cellulose while the latter is kept in a quiescent state, *e. g.*, supported on 1 or more perforated plates. The resultant fibrous cellulose triacetate may be treated with a warm neutral salt soln., *e. g.*, 2% Na<sub>2</sub>SO<sub>4</sub> at 80°, to render it stable.

**Improving the stability of acyl celluloses such as cellulose acetate.** Erich Correns and Albert Möhring (to I. G. Farbenind. A.-G.). U. S. 1,948,903, Feb. 27. The material is treated with a hydrolytically acting agent such as very dil. aq. or alc. H<sub>2</sub>SO<sub>4</sub> soln. at atm. pressure and at temps. up to 100°, and the process is interrupted before any of the org. acyl groups are split off.

**Increasing the tensile strength of cellulosic material such as cotton by artificial ultra-violet radiation.** August J. Pacini (to Milprint Products Corp.). U. S. 1,948,276, Feb. 20. The material is subjected to the action of artificially produced ultra-violet radiation controlled to prevent the formation of detectable oxycellulose.

**Copper oxide-ammonia cellulose solutions.** Emil Hubert and Karl Weisbrod (to I. G. Farbenind. A.-G.). U. S. 1,947,939, Feb. 20. A cellulose soln. is prepd. in aq. CuO-NH<sub>3</sub> in the presence of a cyanide such as KCN, K<sub>2</sub>FeC<sub>6</sub>N<sub>6</sub> or cyanoacetamide, which serves to inhibit depolymerization of the cellulose.

**Apparatus for fibering and cleaning cellulose.** Felix Göbl and Sixten M. Hjelte. Ger. 591,658, Jan. 24, 1934 (Cl. 55c. 12).

**Apparatus for producing closed-ended tubes of celluloid or the like.** John N. Whitehouse. U. S. 1,948,605, Feb. 27. Structural and mech. details.

**Lignin derivatives suitable for use as adhesives, fillers and sizing.** Guy C. Howard. U. S. 1,948,858, Feb. 27. A heated aq. dispersion contg. free lignin sul-

fonic acid and which is substantially free from nonligneous org. matter is exposed to an atm. such as air and water vapor which is favorable to a substantially complete escape of SO<sub>2</sub> from the dispersion. An arrangement of app. is described. Various other details and modifications of procedure also are described.

**Piston pump for viscose.** Gustav Krienelku. Ger. 592,400, Feb. 6, 1934 (Cl. 59a. 15).

**Regenerating viscose.** Wm. D. Wolfe (to Wingfoot Corp.). U. S. 1,948,323, Feb. 20. A viscose-contg. film is treated with a compn. contg. water, a sol. org. polyhydroxy compd. such as glycerol or dextrose and borax or boric acid.

**Rayon.** Feldmühle A.-G. vorm. Loeb, Schoenfeld & Co. Rorschach. Swiss 164,803, Jan. 2, 1934 (Cl. 18b). Fine rayon is spun from viscose to which a higher fatty alc., such as that obtained by reducing ricinoleic acid, has been added during its ripening.

**Colored rayon.** Henry Dosne. Brit. 403,049, Dec. 14, 1933. Regenerated cellulose materials in the form of threads, ribbons, films, etc., are obtained directly in a dyed state by adding to the viscose, etc., soln. an ester salt of a substance yielding by acid oxidation a colored compd., preferably an ester salt of a leuco vat dye, the color being developed simultaneously with or subsequent to coagulation. Alternatively the cellulose soln. may be applied to a fabric and the color similarly developed during or after coagulation of the effect coating. In examples colored viscose and cuprammonium threads are produced by using salts of the acid sulfuric esters of leucoindigo, leuco-6,6'-diethoxyindigo, leucodimethoxydibenzanthrone, leucodibenzopyrenequinone, 3,3'-dichloro-1,2,2',1'-dianthronequinoneazine, etc., suitable oxidizing agents being NaNO<sub>2</sub>, Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, CuSO<sub>4</sub> and FeCl<sub>3</sub>.

**Rayon, etc.** Henry Dreyfus. Fr. 757,276, Dec. 22, 1933. In making filaments, ribbons, cloth, etc., org. derivs. of cellulose which contain NH<sub>2</sub> groups and which are prepd. from substances contg. a relatively low proportion of N are incorporated with the cellulose acetate or other org. deriv. of cellulose. Fast dyes, particularly with anthraquinone derivs., are obtained on the products. Thus, a spinning soln. contains a mixt. of cellulose acetate and the product obtained by the action of NHEt<sub>3</sub> on cellulose chloroacetate (cf. Brit. 320,842, C. A. 24, 2599) or the product obtained according to Fr. 704,871 (C. A. 25, 4705).

**Rayon, etc.** Henry Dreyfus. Fr. 757,324, Dec. 23, 1933. Di- or poly-glycerols, their esters and ethers (including cyclic ethers and cyclic ether esters) are used for drawing threads, etc., contg. org. derivs. of cellulose. Substances include diglycerol, polyglycerol acetate, diglycerol mono-, tri- and tetra-acetates, diethyl deriv. of diglycerol chlorohydrin, monoacetyl deriv. of diglycerol trichlorohydrin and acetyl derivs. of triglycerol tetra-chlorohydrin.

**Artificial threads.** British Celanese Ltd. and Wm. I. Taylor. Brit. 401,652, Nov. 14, 1933. Threads are produced from a plurality of artificial filaments contg. org. derivs. of cellulose, particularly cellulose acetate, by causing them to adhere superficially to one another by application thereto of a substance exerting a solvent or softening action, the adherence being effected without substantial alteration in the cross-sectional form of the filaments, to yield a product having a flexibility substantially equal to that of an ordinary thread of similar compn. and from which individual filaments can be withdrawn substantially without rupture.

**Apparatus for producing artificial threads of materials such as cellulose acetate.** Henry Dreyfus and Wm. I. Taylor (to Celanese Corp. of America). U. S. 1,949,004, March 6. Various structural and operative details are described.

**Films, artificial threads.** Cyril W. Bonniksen and Protectoglass Ltd. Brit. 402,784, Dec. 4, 1933. The formation of bubbles during the coagulation of cellulose ester films, sheets or threads is obviated by subjecting the ester soln. before use to a vacuum to remove air and also

by deaerating the coagulation liquid by boiling or vacuum treatment. App. is described.

**Cellophane yarn.** Earl W. Twitchell. U. S. 1,949,065, Feb. 27. A ribbon of sheet cellulose having a straight edge and an irregular edge is twisted to form a yarn of substantially uniform diam. but varying in flexibility throughout its length. App. is described.

**Sheet-metal spinning jet for producing artificial filaments, yarns, threads, etc.** Henry Dreyfus. Brit. 401,732, Nov. 20, 1933.

**Dry-spinning cell for rayon, etc.** "Chatillon," Società anon. italiana per la seta artificiale. Brit. 395,115, July 13, 1933. Addn. to 372,503 (C. A. 27, 3607).

**Blowpit operation.** Robert W. French (to Hammermill Paper Co.). U. S. 1,947,707, Feb. 20. A blowpit is filled with liquid to a level above the drainage surface; the contents of a digester are blown into the pit in the presence of the liquid, and a continuous circulation of a portion of the same liquid is maintained during the blowing operation. App. is described.

**Apparatus for digesting wood chips, etc.** Sidney D. Wells. U. S. 1,949,669, March 6. App. is described provided with a measuring device adapted to feed a cooking liquor (such as alk. liquor for making kraft pulp) from a supply tank to a digester at a controllable rate.

**Pulp production from wood.** Carl B. Thorne. U. S. 1,947,888, Feb. 20. Liquids and solids are discharged from a digester into a blowpit, liquids are allowed to drain from the blowpit, and the liquids are pumped back into the blowpit until a sufficient quantity of the solids has accumulated in the blowpit to form a filter for the liquids. App. is described. U. S. 1,947,880 relates to pulp manuf. in which material such as wood is cooked in a digester, fluids relieved from the upper part of the digester are passed through a heat exchanger to recover heat from them and, after the cooking operation has been completed, solids and liquids from the bottom of the digester are discharged into a blowpit, liquid from the blowpit is drained and passed through a heat exchanger, and circulating liquid to be heated is passed through the heat exchanger countercurrent to the hot fluids from the digester. App. is described.

**Refined cellulose pulp.** George A. Richter (to Brown Co.). U. S. 1,949,549, March 6. An alkali-liberated and alkali-refined cellulose pulp is prepd. (suitably from wood) so that it has an  $\alpha$ -cellulose content of at least 93% and a tear resistance of at least about 50% greater than that of the unrefined pulp (the preparatory treatment suitably including heating for 30 min. to 2 hrs. at 30° with 5-8% NaOH soln.).

**Disintegrating, hydrating and partially dewatering cellulose pulp stock.** Wm. T. Doyle (to Sturtevant Mill Co.). U. S. 1,949,534, March 6. Various details of app. and operation are described.

**Apparatus for purifying pulp, cellulose, etc.** Maschinenfabrik zum Buderhaus and Willy Wamser. Ger. 583,551, Dec. 9, 1933 (Cl. 55d. 2.01).

**Paper-pulp refining apparatus.** Judson A. DeCew. U. S. 1,947,900, Feb. 20. Structural and mech. details.

**Beating or refining engine for paper pulp.** John Gell. Brit. 401,536, Nov. 16, 1933.

**Aqueous fibrous pulp suitable for sheets or molded articles.** Harry C. Fisher (to Richardson Co.). U. S. 1,949,249, Feb. 27. A mixt. of fibers such as those of sulfite pulp or cotton linters is formed with an adhesive binder such as asphalt to individualize and coat the fibers, a substance is further incorporated such as "Kontakt" which will aid in partially washing away the adhesive coating of the fibers, and the mixt. is beaten with wax.

**Paper.** Daniel A. Smith (to Dist. of Columbia Paper Mfg. Co.). U. S. 1,949,188, Feb. 27. An over-sized paper sheet is formed from which a strip is then cut at a point removed from the cylinder mold, the pulp of the cut strip being then returned to the stock supply vat. An arrangement of app. is described.

**Paper.** Armand Deplanche. Fr. 757,540, Dec. 28, 1933. Paper for checks, etc., has a sensitive product ap-

plied to its surface which is immediately scraped while drying to allow only a very thin film to remain on the surface. Any subsequent washing or scraping will destroy the film.

**Apparatus for disintegrating fibrous materials for paper making.** Hans Unglaub. Ger. 591,780, Jan. 26, 1934 (Cl. 55d. 12).

**Shell lining for Jordan engines.** Frank M. Gloyd (to Simonds Worden White Co.). U. S. 1,947,644, Feb. 20. Structural and mech. features.

**Paper-making apparatus.** Hans Krenn. Ger. 592,476, Feb. 9, 1934 (Cl. 55d. 33.01). Means is described for regulating a paper-making machine so that a product of const. wt. per sq. m. is obtained.

**Paper-making apparatus with nozzles for treating the paper web with hardening agents, etc.** Leon M. Yoerg (to American Writing Paper Co.). U. S. 1,948,874, Feb. 27. Various structural and operative details are described.

**Suction-box for paper-making machine.** Rohrbacher Lederfabrik Jos. Poeschl's Söhne A.-G. Austrian 136,501, Feb. 10, 1934 (Cl. 55b). Addn. to 133,780 (C. A. 27, 4925).

**Driving mechanism for paper-making machine.** Karl Schönmann. Ger. 592,125, Feb. 1, 1934 (Cl. 55d. 25).

**Drive for calenders of paper-machines, etc.** Eric H. Laabs (to Igranite Electric Co. Ltd.). Brit. 401,538, Nov. 16, 1933.

**Perforated rubber-surfaced rolls for paper-making apparatus.** Earl E. Berry (to Beloit Iron Works). U. S. 1,947,636, Feb. 20. Structural and mech. details of manuf.

**Press roller for paper-making and other machines.** Frank Reddaway and Jabez Muskett. Brit. 401,800, Nov. 23, 1933.

**Device for regulating the dehydration of stuff-conveying bands in paper-making machines.** Firma J. M. Voith. Ger. 591,715, Jan. 25, 1934 (Cl. 55d. 8.01).

**Machine for making laminated paper.** Beloit Iron Works. Ger. 592,396, Feb. 8, 1934 (Cl. 55d. 8.10). See Brit. 380,599 (C. A. 27, 5540).

**Apparatus for treating paper with bleaching, sterilizing and deodorizing baths, etc.** Wm. R. Redd. U. S. 1,949,330, Feb. 27. Mech. features.

**Apparatus for drying paper.** Frank C. Ladd. U. S. 1,949,125, Feb. 27. Structural and mech. details.

**Nitrating paper.** Milton O. Schur, Benjamin G. Hoos and Thomas C. Morris (to Brown Co.). U. S. 1,948,943, Feb. 27. Paper is nitrated after transferring waxy material such as 0.1% of paraffin from a transfer surface such as a roll to the outermost fibers of the paper, in order to inhibit undesired by-reactions. U. S. 1,948,944 (Milton O. Schur, to Brown Co.) relates to a process in which compact sheets of cellulosic material such as wood-pulp sheets are steeped in a stationary bath in a bath of nitrating acid to which addnl. acid of the desired compn. is fed while acid is progressively withdrawn from the bath as nitration proceeds. App. is described.

**Coating paper, etc.** Carrier-Ross Engineering Co. Ltd. Brit. 401,980, Nov. 23, 1933. Webs of paper, etc., are coated by applying an excess of coating material with 1 roll, removing the coating from the surface of the web by a 2nd roll, removing excess coating material from the 2nd roll and re-applying the coating material remaining on the 2nd roll to the web. App. is described.

**Sizing paper with a "synthetic super-resin" of petroleum origin.** Carleton Ellis (to Standard Oil Development Co.). U. S. 1,948,442, Feb. 20. Paper is treated with a synthetic resin compn. such as an emulsion comprising gas-oil synthetic resin and paraffinic acids obtained by the oxidation of paraffin wax.

**Recovery of rosin size from paper.** Shigenari Yano. U. S. 1,949,000, Feb. 27. Rosin-sized paper is submitted to steaming at 55-100°.

**Applying adhesives to the surface of webs such as those of paper or metal foil.** John A. Johnson. U. S. 1,949,419-20, March 6. Various details of app. and operation are described.

**Apparatus for applying substances, e. g., gum, to a web**

of material such as paper or cardboard. Anciens Etablissements L. Chambon (to Chambon Ltd.). Brit. 402,007, Nov. 23, 1933.

Corrugated board suitable for shipping containers, etc. Charles L. Keller (to Richardson Co.). U. S. 1,940,255, Feb. 27. A corrugated board is formed with at least one inner ply and at least one corrugated filler ply formed from the felted product of a pulp contg. asphalt in minute

uncoated particles and vegetable fibers in intimate and stable relation, consolidated under heat and pressure.

Cigaret paper. Neuburg'sche Verwaltungsgesellschaft m. b. H. Ger. 591,744, Jan. 26, 1934 (Cl. 55f. 16). See Fr. 747,943 (C. A. 27, 5189).

Waterproof cigaret paper. Louis P. Schweitzer and Wm. P. Schweitzer. Brit. 402,346, Nov. 30, 1933. See U. S. 1,909,924 (C. A. 27, 4082).

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

Modern explosives. Guido Guastalla and Giovanni Raccui. *Industria chimica* 8, 1533-7 (1933); cf. C. A. 28, 2185<sup>7</sup>. — Picryl sulfide is discussed. A. W. Contieri

Modern war explosives. Franco Grotjanelli. *Atti congresso naz. chim. pura applicata* 4, 81-97 (1933). — A review of recent developments. B. M. Symmes

The thermic analysis of explosives. T. Tucholski. *Acta Phys. Polonica* 1, 351-5 (351 in French) (1932); cf. C. A. 25, 4798; 28, 1584<sup>7</sup>. — The thermic analysis of alkali and alkali earth picrates reveals a change of the initial temp. of explosion with the at. no. of the cation. If heated slowly the picrates show 2 distinct phases: in the first dehydration takes place; in the second an exothermic decompn. takes place ending in an explosion. The temp. just before the explosion is higher than the initial temp. of the explosion itself. J. Wiertelak

Pentrit and Hexonit. An experimental contribution to the theme of high brisance in military and civil respects. Alfred Stettbacher. *Nitrocellulose* 4, 179-84, 189-206, 222-7 (1933); 5, 6-12 (1934). — Pentrit is a mixt. of nitroglycerin and pentaerythritol tetranitrate (I). Hexonit contains at least 10% of hexogen (trimethylenetrinitramine) in place of I. Pentaerythritol and (C<sub>12</sub>H<sub>22</sub>N<sub>4</sub>) can be nitrated by concd. HNO<sub>3</sub> alone, no H<sub>2</sub>SO<sub>4</sub> being needed to give good yields. Many tests of explosive effects are shown. B. M. Symmes

The inflammability of painted wood. C. A. Lobry de Bruyn. *Verhroniek* 6, 322-5 (1933). — To measure the inflammability of painted wood, the method of Truax and Harrison (*Proc. Am. Soc. Test Materials* 29, 973 (1929); 30, 463 (1930)) is recommended. Exptl. results are given. B. J. C. van der Hoeven

Explosive force and its determination. I. A. Haid and H. Koenen. *Z. ges. Schiess-Sprengstoffw.* 28, 369-72 (1933). — A discussion of theory. II. *Ibid.* 29, 11-14, 37-9 (1934). — A modification of Kast's app. for measuring explosive force by the compression of Cu cylinders is described. In order to allow for the fact that the force exerted by the explosive is not directly proportional to the linear compression of the cylinders, the compression in mm. is converted into "compression units" which indicate the relative brisance of the explosives. Comparative results were as follows: dinitrobenzene 6.2, TNT 10.1, picric acid 12.2, tetryl 14.0, tetranitropentaerythritol 17.0, Hg(NCO)<sub>2</sub> 18.6. C. G. Storm

Microscope as aid to study of detonation. A. Michel-Lévy and H. Muraud. *Compt. rend.* 198, 825-6 (1934). — Microscopic examn. of the result of detonating a minute particle of PbN<sub>6</sub> shows a central space dotted with globules of Pb, surrounded by an almost continuous ring of Pb, and this again by radially arranged pulverized Pb. A second similar particle 3-4 mm. distant is detonated almost simultaneously, i. e., by the explosion wave, one distant 15 mm. after a larger interval, i. e., on arrival of the hot gases (cf. C. A. 25, 5032). C. A. Silberrad

Ionisation during explosions of solid explosives. S. Kalandyk. *Acta Phys. Polonica* 1, 295-308 (295-7 in French) (1932). — Total charges obtained during the explosion of K capionate, K, Cu, Fe and Ca picrates and of nitrocellulose are of the same order of magnitude as those in gaseous explosions. With picrates the ionization potential is independent of the cation present. The charge seems to increase with the intensity of the explosion, the neg. charge being about twice as large as

the pos. one. An increase of the p. d. causes a not proportional rapid rise of the charge, probably because of an irregular distribution of the flame. The course of the current as a function of time is studied during explosion and slow combustion of nitrocellulose by means of a cord galvanometer. The total charges are the same in both reactions. The duration of the combustion is independent of the p. d. applied. The above method of testing is adapted to the study of the ionization of explosions in conditions prevailing in fire arms. Thus, the charge obtained on explosion of black powder is found to be about 10 times as large with the same mass and potential, as in the explosion of nitrocellulose. J. Wiertelak

Explosion of a diethylsulfate container. Karl Siebenicher. *Angew. Chem.* 47, 105 (1934). — The results of an investigation of an explosion led to the belief that moisture in the container caused formation of H<sub>2</sub>SO<sub>4</sub> and ald. with resulting corrosion of the container and formation of FeSO<sub>4</sub> and accumulation of H<sub>2</sub> giving rise to excessive pressures. Karl Kammermeyer

Explosive. Walter C. Holmes (to The Canadian Industries Ltd.). Can. 339,449, Feb. 20, 1934. An explosive compn. comprises nitroglycerin, nitrocellulose, one or more O-carrying compds., absorbent materials for the liquid explosive, and 0.1-2.0% of dicyanodiamide; e. g., nitroglycerin 34.0, nitrocellulose 1.0, NaNO<sub>2</sub> 52.0, wood pulp 8.0, starch 3.0, S 1.6 and dicyanodiamide 0.4%.

Explosive. Clifford A. Woodbury (to The Canadian Industries Ltd.). Can. 339,467, Feb. 20, 1934. An explosive compn. comprising nitroglycerin 85, nitro cotton 1, wood pulp 13 and chalk 1% is capable of being subsequently combined with addnl. ingredients to form various types of nitroglycerin high explosives.

Explosive. Clifford A. Woodbury (to The Canadian Industries Ltd.). Can. 339,468, Feb. 20, 1934. A blasting gelatin comprises nitroglycerin 86-92, nitrocellulose, and kieselguhr 3-6%.

Explosive. Clifford A. Woodbury (to The Canadian Industries Ltd.). Can. 339,469, Feb. 20, 1934. Gelatinous dynamite is manufd. by mixing nitrocellulose 1-5, a dope material 3-10, and gelatinizing the resulting compn. with a liquid nitric ester 33-92 parts.

Dynamite. William E. Kirst and John Marshall (to The Canadian Industries Ltd.). Can. 339,433, Feb. 20, 1934. A dynamite of low d. comprises nitroglycerin, NaNO<sub>2</sub>, NH<sub>4</sub>NO<sub>3</sub> and the pith of cornstalks, e. g., nitroglycerin 15, NH<sub>4</sub>NO<sub>3</sub> 58, NaNO<sub>2</sub> 9 and cornstalk pith 18%. Part of the cornstalk pith may be replaced by wood pulp.

Gunpowder. Wolff & Co. Komm.-Ges. auf Aktien und Otto Erler. Ger. 592,339, Feb. 6, 1934 (Cl. 78c. 1). The speed of combustion of gunpowder is regulated by treating it superficially with a fatty oil or latex or a mixt. of these. Thus, the powder may be sprayed in a polished drum at 100° with rapeseed, linseed or castor oil or an aq. emulsion thereof. The process is particularly useful in the manuf. of fuses.

Explosive suitable for blasting deep well holes. John M. Jeffries (to Atlas Powder Co.). U. S. 1,948,583, Feb. 27. A main body of gelatinous dynamite is provided with a core of less gelatinous dynamite having a propaga-

tion sensitiveness materially in excess of that of the main charge under the conditions of use.

**Fuses for explosives.** Bickford & Co. A.-G. Austrian 136,397, Jan. 25, 1934 (Cl. 78b). Fulminate fuses, which have been treated with aq. glycerol in known manner, are rendered stable to storage by impregnation with a reagent which displaces the water but not the glycerol, e. g., fused paraffin.

**Fireworks.** Vincenz Prey and Soc. de pyrotechnie du Sud-Est (Soc. à r. l.). Austrian 136,232, Jan. 10, 1934 (Cl. 78b); Fr. 757,444, Dec. 26, 1933. For the manufacture of fireworks giving a colored spray effect, a mixt. of a combustible substance, e. g., a resin, fat, cellulose or nitrocellulose, with flame-coloring salts such as nitrates,

chlorides, oxides, carbonates, acetates of Ba, Sr, Ca, Th, Cu, K or Na is worked into granules with the aid of a nonaq. binder, e. g., a nitrocellulose lacquer. The granules are coated with a metal, e. g., Cu, by known elec. or mech. means, and are then attached to a combustible core formed, e. g., from a mixt. of dextrin 10, Al 5, Fe 30 and Ba(NO<sub>3</sub>)<sub>2</sub> 55%.

**Miners' safety and like lamps, burning gaseous fuel.** Flame Lamp Research Association Ltd. and Richard L. Woosnam. Brit. 401,042, Nov. 9, 1933.

**Non-flaming combustible composition for cigar and cigaret lighters.** Hector M. Minnie (to Reynolds Metals Co.). U. S. 1,947,790, Feb. 20. Materials such as tinder, rjter and tapioca starch are used together.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**Interesting sources of natural dyestuffs.** C. D. Mell. *Textile Colorist* 56, 50-2, 57, 125-8(1934); cf. C. A. 27, 1758.—The following sources are discussed: the British yellow-wort (*Chlora perfoliata*) for a yellow dye and tannin; the chucum (*Pithecolobium ubicans*), which inhabits the Peninsula of Yucatan, for dyes and tannin; the bark of the buckthorn trees (*Rhamnus utilis* and *R. chlorophora*), indigenous to Asia Minor and the warmer parts of China, for a green dye; the cornflower of England and Europe (*Centaurea cyanus*), for a blue dye; the milfoil or wild yarrow (*Achillea millefolium*) for yellow and brown dyes; many species of the genus *Iris* for dyes; the aroeria vermiclia tree of Brazil (*Schinus terebinthifolia*) as substitute for the quebracho tree for dyes and tannin and the American white walnut or butternut (*Juglans cinerea*) for brown and black dyes. Ruby K. Worner

**Chemical composition of "St. John's root."** Oswaldo de Almeida Costa and Renato Dias da Silva. *Rev. soc. brasil. quim.* 4, 199-201(1933).—Analysis is given. St. John's root is used in dyeing and as a source for berberine which has therapeutic properties. John Ladino

**Colorimetric determination of sulfur dyes.** G. E. Levant and R. I. Nemtsova. *J. Applied Chem.* (U. S. S. R.) 6, 546-51(1933).—The dye to be tested and a standard are oxidized with H<sub>2</sub>O<sub>2</sub> and compared in a colorimeter. A. A. Bochtlingk

**Neutralizing naphthol AS developing baths.** H. Jager. *Melliand Textilber.* 14, 401-2(1933).—Excess of NaOH introduced by the naphtholated fabric into the bath contg. the diazotized base is progressively neutralized by the addn. of NH<sub>4</sub>Cl and CH<sub>3</sub>O, thus: 4NH<sub>4</sub>Cl + 6CH<sub>3</sub>O + 4NaOH = (CH<sub>3</sub>)<sub>2</sub>N<sub>2</sub> + 4NaCl + 10H<sub>2</sub>O. Coupling may occur between the (CH<sub>3</sub>)<sub>2</sub>N<sub>2</sub> and the diazotized base, and in the absence of NaOH acidity may develop; as both these reactions are comparatively slow they usually have no adverse effect on the development. B. C. A.

**Dyeing textiles with colors resistant to alcoholic stains.** Geo. Rice. *Textile Colorist* 56, 34, 60(1934). R. K. W.

**Dyeing wool flocks for decorating walls.** Geo. Rice. *Textile Colorist* 56, 103, 137(1934). R. K. W.

**Influence of iron on the coloration of the fibers in the retting [of flax and hemp] by Bac. felsineus.** III. D. Carbone. *Boll. soc. intern. microbiol., Sez. ital.* 5, 339-40(1933); cf. C. A. 26, 4479.—Several nonoxidizing steels and other metals were tested with good results (except for Al) in the retting of flax. All of the metals examined gave good results for hemp. G. A. Bravo

**A note for naphthol dyers on the prevention of occupational dermatitis.** Hilton Radley. *Dyer* 71, 127(1934).—A light greasing of the hands and the wearing of comparatively tight-fitting cotton gloves over which are worn the usual loose-fitting rubber gloves are recommended. The cotton undergloves are not to be removed until the completion of the working period. R. K. W.

**Mechanism of direct dyeing.** J. S. Brown. *Textile Colorist* 56, 83-5, 132(1934). Ruby K. Worner

**Aluminum with regard to textile dyeing and finishing**

**machinery.** G. L. Atkinson. *Textile Colorist* 56, 129-30(1934). The advantages of more frequent use of Al for textile finishing machinery in place of iron and steel are pointed out. Ruby K. Worner

**Pumps for the dyeing and allied industries.** The theory of the centrifugal pump. F. Marshall. *Dyer* 71, 39, 41(1934). Ruby K. Worner

**The feeding of silkworms with mulberry leaves sterilized with silver fluoride and the ratio between fibroin and sericin [content of the silk].** Guido Colombo. *Boll. ufficiale staz. sper. seta* 3, 99(1933); cf. C. A. 28, 20692.—Contrary to the results of Trauquilli (*Atti commiss. inchiesta ind. biologica e serica* 2, 119) the treatment with AgF does not modify the ratio fibroin/sericin of the silk. G. A. Bravo

**Matt rayon under the microscope.** R. Laesse. *Melliand Textilber.* (Sept. 1933); *Dyer* 69, 617, 619; 70, 35, 137, 341, 115, 447, 551, 553, 657, 659(1933). R. K. W.

**Faults in rayon woven cloth.** H. Chadwick. *Dyer* 71, 87-91(1934).—A survey of causes of defects from winding to making up operations. Ruby K. Worner

**Determination of oxidized fatty acids in threads and crepes.** G. Baroni. *Boll. ufficiale staz. sper. seta* 2, 100-3(1932).—Oxidation of linseed oil on threads is fairly rapid at room temp.; max. oxidation is reached after 1 hr. at 110°. For the detn. of OI acids the fibers are boiled for 1 hr. with a soln. of neutral Marseilles soap. B. C. A.

**Effect of mercerization on the "counts" of cotton yarn.** O. Mecheels and G. Stuhmer. *Melliand Textilber.* 14, 463-4(1933).—Data are given for various single and two-fold cotton yarns. Prepn. of yarn for mercerization by

boiling for 3 hr. in 0.05% Na<sub>2</sub>CO<sub>3</sub> soln. increases the counts by 2%; subsequent mercerization allowing length changes of -5 and +5% results in counts changes of -5 and +10%, resp. Soln. of the cotton cellulose and impurities during mercerization increases the counts appreciably. Shrinkage (previous to the usual subsequent stretching) in mercerization is a reliable means for comparing the consequent luster increases of cotton yarns only when they have nearly equal original luster. Data relating to the original and final luster, and the shrinkage produced in mercerization, are given for various types of yarns. B. C. A.

**The elimination of cloth-milling defects.** F. C. Pratt. *Textile Colorist* 56, 45, 65(1934). Ruby K. Worner

**The elimination of [wool] carbonizing defects.** F. C. Pratt. *Textile Colorist* 56, 101, 130(1934). R. K. W.

**Piece-bleaching machinery.** A. Grunert. *J. Soc. Dyers Colourists* 49, 285-90(1933).—An account of modern app. B. C. A.

**Sodium perborate as a bleaching agent.** A. Jones. *Dyer* 70, 589-90(1934). Ruby K. Worner

**Old-time scouring agents.** D. Kermode. *Dyer* 70, 391(1933).—The use of lant and hog's manure ("seark") for scouring wool is described. Ruby K. Worner

**The converting of mohair pile upholstery fabrics.** B. S. Hillman. *Textile Colorist* 56, 39-41, 59, 93-4, 132(1934).

--The scouring, dyeing and finishing of mohair pile fabrics for use in furniture and automobiles are described. Dye formulas are given. Ruby K. Worner

Dyestuff problems (Roberts) 23. Improvements in the production of light-fast shades by beater coloring (Niederhauser) 23. Alleged color and dyeing properties of derivs. of tetraarylmethanes (Weisberger, Thiele) 10. Condensation products from aldehydes and phenols [for use as mothproofing agents] (U. S. pat. 1,948,894) 10. Purifying liquids [used for washing textiles] (Fr. pat. 757,503) 13. Amino-nitrogen-contg. conversion products of aliphatic hydrocarbons [used as acid soaps in dyeing] (U. S. pat. 1,948,924) 10. Alkylolamine derivs. [used as dye intermediates] (U. S. pat. 1,949,247) 17. Aniline-sulfonic acids [products used as dye intermediates] (U. S. pat. 1,947,837) 10.

Klinger, J.: Die textilmikroskopischen Untersuchungen in der Praxis. Vienna: Verlag Sullmayersche Buchhandlung. 93 pp. M. 7.50. Reviewed in *J. Textile Inst.* 25, No. 2, P19(1934).

Mayer, Fritz: Chemie der organischen Farbstoffe. 3rd ed. Bd. 1 Kunstliche organische Farbstoffe. Berlin: J. Springer. 255 pp. M. 23.60; bound, M. 24.80.

Dyes. Soc. pour l'ind. chim. à Bâle. Swiss 163,541, Nov. 1, 1933 (Cl. 37a). The *o*-hydroxyazo dye obtained by coupling diazotized 1-amino-2-naphthol-4-sulfonic acid with  $\beta$ -naphthol is treated with a Cr-yielding agent and then an alkali. The dye colors wool from an acid bath in fast marine blue shades.

Dyes. Soc. pour l'ind. chim. à Bâle. Swiss 161,443, Dec. 1, 1933 (Cl. 37b). Addn. to 161,051 (C. A. 28, 648<sup>7</sup>). The dye 1,4-dimethyldiaminoanthraquinone is prepd. by heating 1-methoxy-4-aminoanthraquinone with alc. MeNH<sub>2</sub>, till a test shows that the methoxy and amino groups are replaced by MeNH<sub>2</sub> groups. The dye gives blue shades to acetate silk. Cf. C. A. 28, 648<sup>7</sup>.

Dyes. 1. G. Farbenind. A.-G. (Hermann Berthold and Erwin Liese, inventors). Ger. 591,547, Jan. 23, 1934 (Cl. 8a. 1.02). Preps. of vat and S-dyes contain oxidation products of thiodiglycol or its homologs or analogs. Thus, a printing paste of the dye *N*-dihydro-1,2,1',2'-anthraquinonazine contains thionylglycol.

Water soluble dyes. Chemische Fabrik vorm. Sandoz. Swiss 163,186 to 163,188. Oct. 2, 1933 (Cl. 37b.). Addns. to 160,757 (C. A. 28, 648<sup>7</sup>). 1-Benzoylamino-4- $\beta$ -naphthylaminoanthraquinone is treated with H<sub>2</sub>SO<sub>4</sub> (163,186); or 1-benzoylamino-2-bromo-4- $\beta$ -naphthylaminoanthraquinone with fuming H<sub>2</sub>SO<sub>4</sub> (163,187); or 1-acetylamino-2-methyl-4- $\beta$ -naphthylaminoanthraquinone with H<sub>2</sub>SO<sub>4</sub>.H<sub>2</sub>O.

Dyes containing chromium. Soc. pour l'ind. chim. à Bâle. Swiss 164,434 to 164,442. Dec. 1, 1933 (Cl. 37a). Addns. to 162,464 (C. A. 28, 650<sup>1</sup>). See Fr. 756,136 (C. A. 28, 2195<sup>4</sup>).

Dye preparations. Soc. pour l'ind. chim. à Bâle. Swiss 165,137, Jan. 16, 1934 (Cl. 24a). A prepn. for dyeing acetate silk is made by mixing dyes of similar constitution which are practically insol. in water, and which have an affinity for the silk. Thus, a prepn. is made by mixing 1-amino-4-anilinoanthraquinone and 1-amino-4-toluiinoanthraquinone to a paste with H<sub>2</sub>SO<sub>4</sub>, to impart blue shades to acetate silk.

Dyes (anthraquinone derivatives). 1. G. Farbenind. A.-G. Brit. 402,605, Dec. 7, 1933. Cf. Ger. 578,502 (C. A. 28, 902<sup>9</sup>). H<sub>2</sub>BO<sub>3</sub> is required. The dyes are suitable for dyeing acetate rayon.

Dyes of the benzanthrone series. David C. R. Jones and Robert F. Thomson (to Imperial Chemical Industries Ltd.). U. S. 1,948,116, Feb. 20. For obtaining a dye-dyeing cotton from the vat in blue shades, a monobenanthrone is reacted with an *o*-halobenzoic acid in the presence of an alk. condensing agent such as KOH, the alkali-sol. portion of the reaction product is recovered, boiled with hot concd. HOAc and the residue is recovered.

Mordant dyes (condensation products of the benzanthrone series). Georg Kraenzlein and Martin Corell (to General Aniline Works). U. S. 1,947,948, Feb. 20. Dyes crystg. from glacial HOAc and having good fastness are obtained from initial materials such as 2,3-hydroxynaphthoic acid, benzoic or *m*-chlorobenzoic acid ester by heating with Na Al chloride, preferably at a temp. of about 140-60° for several hrs., forming products such as 4-hydroxybenzanthrone-3-carboxylic acid, m. 285°, and 4-hydroxy-6-chlorobenanthrone-3-carboxylic acid, m. 250-2°. Various details of procedure are given.

Azo dyes. Emmet F. Hitch (to E. I. du Pont de Nemours & Co.). U. S. 1,947,550, Feb. 20. Monoazo dyes practically insol. in water, suitable for use as pigment colors, and which when developed on the fiber give orange to red to blue shades of good fastness, may be obtained by combining any diazo compd. not contg. a sulfonic or carboxylic acid group with derivs. of 3-hydroxy-2-naphthoic acid having the general formula 3-(HO)-2-(R'YNCORNHCO)C<sub>10</sub>H<sub>6</sub>, in which R represents any radical of the C<sub>6</sub>H<sub>5</sub> series not contg. a sulfonic or carboxylic acid group, R' represents any org. radical of the aliphatic or aromatic series not contg. a sulfonic or carboxylic acid group and Y is H or an aliphatic or aromatic radical. Various examples are given.

Azo dyes. Werner Lange (to General Aniline Works). U. S. 1,947,945, Feb. 20. Substitution products of 4-nitro-1,3-diaminobenzene that contain no further neg. substituents, such as Cl, the nitro or sulfonic acid group, may be diazotized to form a monodiazocompd. and the latter may be coupled with any azo component in an acid, neutral or alk. medium to form azo dyes. As substituents contained in 4-nitro-1,3-diaminobenzene, the alkyl and the alkoxy group may be present. The azo dyes obtainable according to this procedure may be further diazotized either in substance or on the fiber and coupled with azo components. The monoazo dyes contg. sulfonic acid radicals, dye wool or leather or other animal fibers from an acid dyeing bath, while such dyes contg. a greater no. of azo groups substantively dye cotton. The monoazo dyes contg. no sulfonic acid or carboxylic acid radicals serve as pigments or fat dyes; alternatively, they may be used for dyeing acetyl cellulose and the products made thereof. They too may be diazotized on the fiber and coupled with further azo components. Several examples with details of procedure are given.

Azo dyes. Leopold Laska and Arthur Zitscher (to General Aniline Works). U. S. 1,947,946, Feb. 20. Azo dyes insol. in water (various examples of which dye garnet, red, brown or black shades) are obtained by combining any diazo, tetrazo or diazoazo compd. (numerous examples being given) with a 4-(2'-hydroxy-3'-naphthylamino)diphenylamine compd. (none of the components contg. sulfonic or carboxylic groups). If after-treatment with Cu compds. derivs. of good fastness to light are obtained.

Azo dyes. Friedrich Felix and Wilhelm Huber (to Soc. pour l'ind. chim. à Bâle). U. S. 1,948,208, Feb. 20. Monoazo dyes dyeing acetate rayon and various other cellulose derivs. fast red to violet tints are formed from components such as diazotized 5-nitro-*o*-aminophenols with an aromatic base such as (*o*-hydroxyethyl)aniline or the like.

Azo dyes. Emil E. Misslin and Rudolf von Capeller (to Soc. pour l'ind. chim. à Bâle). U. S. 1,948,224, Feb. 20. Diacyldiaminohydroxynaphthalenes such as may be produced by reducing the dyes obtained by coupling 1,5-aminonaphthol, or a deriv. which may be coupled in the 4-position to the amino group, in an acid medium, or by coupling 1,8-aminonaphthol or its derivs. which may be coupled in the 5-position, and acylating the diamino-products thus obtained to form 1,4-(or 1,5-) diacyldiamino-8-hydroxynaphthalenes are used with various other dye components to form dyes suitable for dyeing cotton or various artificial silks, and may be used for ice-color dyeing. Numerous examples with details of procedure are given.

**Azo dyes.** Hermann Winkler, Hans Reindel and Guido Freiherr von Rosenberg (to General Aniline Works). U. S. 1,949,228, Feb. 27. Dyes generally producing orange shades on wool and producing bluish to yellowish red dyeings when chromed are obtained by coupling 1-phenyl-5-pyrazolone-3-carboxylic acid amide (or a deriv. substituted, as by Et, on the amino N atom) with diazotized 1-hydroxy-2-amino-4-methyl(or, chloro)benzene-6-sulfonic acid or the like. Several examples with details of procedure are given.

**Azo dyes; dyeing.** I. G. Farbenind. A.-G. Brit. 395,026, July 10, 1933. H<sub>2</sub>O-sol. azo dyes are made by coupling a diazo or tetrazo compd. contg. a heavy metal complex in *o*-position to at least 1 azo group with a carbazole deriv., in which the substituent is OH or NH<sub>2</sub> and the nuclei may contain further univalent substituents. When coupling tetrazo compds. 1 mol. of a component of above formula and 1 mol. of another component may be used. They may be treated in substance or on the fiber with heavy metal compds. Blackish violet shades are obtained. Among examples (1) 6-chloro-2-aminophenol-4-sulfonic acid → 2-hydroxy-3-aminocarbazole (in presence of pyridine) (brownish violet on wool on after-chroming), and (2) 2-hydroxycarbazole ← benzidine-3,3'-dicarboxylic acid → resorcinol.

**Azo dyes.** I. G. Farbenind. A.-G. Brit. 403,007, Dec. 14, 1933. Azo dyes of the stilbene series are obtained by subjecting to the action of alk. reducing agents and of oxidizing agents, in either sequence, dyes obtained by condensing (a) 4,4'-dinitrostilbene-2,2'-disulfonic acid, (b) 4,4'-dinitrodibenzyl-2,2'-disulfonic acid or (c) a product of the alk. conversion of 4-nitrotoluene-2-sulfonic acid, with aminoazo compds. The products give orange to red dyeings of redder and brighter shades and more fast, especially to Cl and light, than the parent dyes. Examples are given. Cf. C. A. 28, 1542<sup>3</sup>.

**Azo dyes** I. G. Farbenind. A.-G. Brit. 403,022, Dec. 14, 1933. Azo dyes for leather are made by coupling 1 mole of resorcinol, or a COOH acid thereof, with 2 moles of 2-nitro-1-amino-4-diazobenzene (I), or with 1 mole thereof and 1 mole of another diazo or diazoazo compd., or by coupling 2 moles of I with 1 mole of an azo dye: amine → resorcinol, or a COOH acid thereof. In examples, (1) 2-nitro-1,4-diaminobenzene (II) → 1,3-dihydroxybenzene-5- or -6-carboxylic acid ← 1-amino-4-nitrobenzene-2-sulfonic acid; the 2nd component may be sulfanilic acid, an aminonaphthalenesulfonic acid, e. g., 1-amino-4-nitronaphthalene-6- or -7-sulfonic acid, or an amino compd., e. g., 4-aminoazobenzene-4'-sulfonic acid, or 2-naphthylamine-4,8-disulfonic acid → α-naphthylamine, (2) 2-nitro-1,4-diaminobenzene (1 or 2 moles) → resorcinol → H, K, J or γ-acid, and (3) II ← resorcinol, or its 5- or 6-carboxylic acid.

**Azo dyes.** J. R. Geigy A.-G. Swiss 163,804, Nov. 16, 1933 (Cl. 37a). A new dye is obtained by coupling *o*-chloro-*p*-nitrodiazobenzene with *N*-[ethyl-(*ω*-hydroxyethyl)]-*m*-toluidine. The dye imparts fast bluish red shades to lacquer and acetate rayon.

**Azo dyes.** J. R. Geigy A.-G. Swiss 163,805, Nov. 16, 1933 (Cl. 37a). A new dye is prepd. by coupling diazotized 2,4-dinitroaniline with bis(β-hydroxyethyl)-*m*-toluidine. The dye gives bluish violet shades to lacquer and acetate rayon.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 162,740, Sept. 16, 1933 (Cl. 37a). A direct acting dye is prepd. by diazotizing the dye from 1-diazo-2-hydroxy-4-nitro-5-benzenesulfonic acid and 1-amino-2,5-dimethoxybenzene and coupling the product with 2-benzoylamino-5-hydroxynaphthalene-7-sulfonic acid. The dye colors cotton in clear blue shades, which, by after-treatment with Cu-yielding agents, become fast greenish blue shades.

**Azo dye.** Soc. pour l'ind. chim. à Bâle. Swiss 163,008, Sept. 16, 1933 (Cl. 37a). A new dye is obtained by coupling diazotized 5-nitro-2-aminophenol with 1-(β-hydroxyethyl)amino-2-methoxy-5-methylbenzene. The dye colors acetate rayon in red-violet shades.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 165,039 and 165,040, Jan. 2, 1934 (Cl. 37a). Addns. to 163,080

(preceding abstr.). New dyes are obtained by coupling diazotized 5-nitro-2-aminophenol with ethyl(β-hydroxyethyl)aniline (165,039), or with β-hydroxyethylaniline. The dyes impart blue-red and yellow-red shades, resp., to acetate silk.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 163,539, Nov. 1, 1933 (Cl. 37a). A new dye is produced by coupling diazotized 2-chloro-4-nitroaniline with β-phenethylaminomethyl methyl ether. The dye colors acetate rayon in Bordeaux red shades.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 165,406 to 165,415, Jan. 16, 1934 (Cl. 37a). Addns. to 163,539 (preceding abstr.). Diazotized 4-methoxy-1-aminobenzene is coupled with β-phenethylaminomethyl methyl ether to give a dye coloring acetate silk in yellow shades (165,406). The other patents described dyes obtained by coupling differently substituted diazotized PhNH<sub>2</sub> and similar ethers.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 166,072, Feb. 16, 1934 (Cl. 37a). Addn. to 163,539 (second preceding abstr.). A new dye is obtained by coupling diazotized 6-chloro-2,4-dinitroaniline with 1-(ethoxyethylamino)naphthalene. The dye colors acetate rayon in blue shades.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 163,540, Oct. 16, 1933 (Cl. 37a). A new dye is produced by coupling 1-diazotriphenylamine with the *p*-chloroanilide of 2,3-hydroxynaphthoic acid. The dye colors cotton, wool and rayon in fast blue shades.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 163,542, Oct. 16, 1933 (Cl. 37a). The dye obtained by coupling diazotized 3-sulfo-2-aminobenzene-1-carboxylic acid with 1-(2'-methyl-4'-sulfophenyl)-3-methyl-5-pyrazolone is treated with a Cl-yielding agent. The product gives wool from an acid bath fast reddish yellow shades.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 166,079 to 166,088, Feb. 16, 1934 (Cl. 37a). Addns. to 163,542 (preceding abstr.). A new dye is produced by chroming the dye from diazotized 5-chloro-2-aminobenzene-1-carboxylic acid and 1-(2',5'-disulfophenyl)-3-methyl-5-pyrazolone. The dye colors wool from an acid bath in fast golden yellow shades, (166,079). The other patents describe dyes obtained by chroming dyes from differently substituted aminobenzene-1-carboxylic acids and pyrazolones.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 163,546, Nov. 1, 1933 (Cl. 37a). A new dye is prepd. by coupling 1 mol. of tetrazotized 4,4'-diaminostilbene-3,3'-dicarboxylic acid with 2 mols. of 1-amino-8-naphthol-4-sulfonic acid. The dye gives cotton from a neutral or weakly alk. bath grayish blue shades, which, by treatment with Cu salts are converted to fast greenish blue shades.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 164,190, Dec. 1, 1933 (Cl. 37a). A new dye is produced by coupling the diazo compd. of the PhOH ester of *p*-nitroaniline-*o*-sulfonic acid with 2-amino-8-naphthol-6-sulfonic acid in an acid medium. The dye imparts fast violet-blue shades to wool from an acid bath.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 164,420, Dec. 16, 1933 (Cl. 37a). Addn. to 161,841 (C. A. 28, 649<sup>9</sup>). A new dye is produced by coupling 2-diazo-4,4'-dimethoxy-5-acetylaminomethyl-1,1'-diphenyl ether with the *p*-anilide of 2,3-hydroxynaphthoic acid. The dye imparts fast violet shades to cotton, wool and rayon.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 164,430 to 164,433, Dec. 16, 1933 (Cl. 37a). Addns. to 161,842 (C. A. 28, 650<sup>1</sup>). New dyes are produced by coupling esters of diazocarboxylic acid diphenyl ethers with arylides of hydroxynaphthoic acid. In 164,430, the methyl ester of 2-diazo-4-carboxylic acid-4'-methyl-1,1'-diphenyl ether is coupled with the 2-methyl-4-methoxyanilide of 2,3-hydroxynaphthoic acid. In 164,431, the same methyl ester is coupled with the *m*-nitroanilide of the same acid. In 164,432, the phenyl ester of the same ether is coupled with the anilide of the same acid. In 164,433, the butyl ester of 2-diazo-4-carboxylic acid-4'-chloro-1,1'-diphenyl ether is coupled with the 5-chloro-2-toluidine

of the same acid. The dyes produced give fast scarlet shades to cotton, wool and rayon.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 164,546, Dec. 1, 1933 (Cl. 37a). A new dye is prep'd. by coupling 4 - (methoxyphenoxyl)acetyl amino - 2,5 - dimethoxy - 1 - aminobenzene with the hydroxychrysene obtained by mononitrating chrysene, reducing to aminochrysene and heating this with dil. acid. The dye imparts fast violet shades to vegetable fibers.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 164,738 to 164,741, Dec. 16, 1933 (Cl. 37a). Addns. to 162,405 (C. A. 28, 650<sup>2</sup>). A new dye is obtained by further diazotizing the monoazo dye from 2-diazonaphthalene-4,8-disulfonic acid and  $\alpha$ -naphthylamine and coupling with 3',3''-diaminodibenzoyl - 1,4 - diamino - 8 - hydroxynaphthalene-6-sulfonic acid. The dye colors cotton in blue shades (164,738). In 164,739, the dye from 1-diazo - 8 - toluenesulfonylnaphthalene - 3,6 - disulfonic acid and  $\alpha$ -naphthylamine is further diazotized and coupled with 4',4''-diaminodibenzoyl - 1,4 - diamino - 8 - hydroxynaphthalene-6-sulfonic acid. In 164,740, the same monoazo dye is further diazotized and coupled with 1-naphthylamine-6-sulfonic acid, and the product still further diazotized and coupled with 3',3''-diaminodibenzoyl - 1,4 - diamino - 8 - hydroxynaphthalene - 6 - sulfonic acid. In 164,741, the dye from 2-diazonaphthalene-4,8-disulfonic acid and  $\alpha$ -naphthylamine is diazotized and coupled with a mixt. of 1-naphthylamine-6- and -7-sulfonic acid. The product is further diazotized and coupled with the previously mentioned 3',3''-diaminoderiv. of naphthalene.

**Azo dyes.** Soc. pour l'ind. à Bâle. Swiss 165,830, Feb. 16, 1934 (Cl. 37a). A new dye is produced by chroming the dye from diazotized 1-amino-2-hydroxynaphthalene-4-sulfonic acid and 2-hydroxynaphthalene, in an alk. medium. The dye colors wool from an acid bath in marine-blue shades.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 166,070 and 166,071, Feb. 16, 1934 (Cl. 37a). Addns. to 161,050 (C. A. 28, 649<sup>2</sup>). A new dye is obtained by chroming the dye from nitrated 1-diazo-2-hydroxynaphthalene-4-sulfonic acid and  $\beta$ -naphthol in a medium of  $p_n$  value less than 7. The chroming is finished in an alk. soln. The dye colors wool from an orange H<sub>2</sub>SO<sub>4</sub> bath in fast black shades (166,070). The first component may be replaced by diazotized 1-amino-2-hydroxynaphthalene-4-sulfonic acid and the second by naphthol giving a dye which colors wool from an acid bath in fast marine blue shades (166,071).

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 592,087, Feb. 1, 1934 (Cl. 22a. 2). *o*-Hydroxymonoazo dyes formed from a substantive dye component are converted by standard methods into complex compds. contg. both Cr and another metal, e. g., Ni, Fe or V. Dyes for vegetable and artificial fibers are obtained. Examples are given.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 592,088, Feb. 1, 1934 (Cl. 22a. 2). Azo dyes, prep'd. from unsulfonated *o*-hydroxy- or *o*-carboxy-diazo compds. and unsulfonated nitrogenous derivs. of naphthalene, are converted into their complex metal derivs. by treatment with suitable metal compds. in the presence of an org. base not contg. OH. Dyes useful for coloring cellulose esters or ethers or as pigment dyes are obtained. Numerous examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Fritz Müller, inventor). Ger. 590,255, Dec. 28, 1933 (Cl. 22a. 1). Addn. to 551,883 (C. A. 26, 4950). See U. S. 1,929,328 (C. A. 28, 331<sup>4</sup>).

**Azo dyes.** I. G. Farbenind. A.-G. (Karl Schnitspahn and Wilhelm Koch, inventors). Ger. 591,549, Jan. 23, 1934 (Cl. 22a. 1). Dyes insol. in water are prep'd. by coupling the 4-monodiazo compds. of 2,6-dihalo-1,4-diaminobenzene with arylides of 2,3-hydroxynaphthoic acid or their products substituted in the naphthalene residue, neither the azo nor coupling components contg. soly.-inducing groups. Examples, a table of diazo and coupling components and colors produced are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Alfred Gressly, inventor). Ger. 591,628, Jan. 25, 1934 (Cl. 22a. 13). Dyes of the stilbene series are prep'd. by subjecting the dyes obtained by condensing dinitrostilbenedisulfonic acid, dinitrobibenzylidene-sulfonic acid or products of nitro-toluenesulfonic acid, with aminoazo compds., and subjecting the products to an alk. reduction and finally oxidizing. Thus, the dye obtained by condensing Na dinitrostilbenedisulfonate with 4-aminoazobenzene-4'-sulfonic acid is reduced by treatment with Na<sub>2</sub>S and NaOH. The reaction mixt. is finally treated with NaClO to give a dye which colors cotton in a soda-alk. bath in orange shades fast to Cl and light. Other examples are given.

**Azo dyes.** Aceta G. m. b. H. Fr. 757,264, Dec. 22, 1933. Cellulose esters or ethers or polyvinyl esters are dyed by coupling diazo components on the fibers with acyl compds. of hydroxy compds. capable of coupling and sepp. the acyl group by sapon. before or during the coupling. Acyl compds. prep'd. from Ac<sub>2</sub>O and 2-hydroxynaphthalene-3-carboxylaminobenzene or 1-phenyl-3-methyl-5-pyrazolone or from the Me ester of chloro-carbonic acid and 2-hydroxynaphthalene-3-carboxylaminobenzene or 1-(2',4'-dichlorophenyl)-3-methyl-5-pyrazolone may be used.

**Azo dyes insoluble in water.** I. G. Farbenind. A.-G. Fr. 757,628, Dec. 29, 1933. Diazo, tetrazo or diazoazo components are combined with 1-hydroxy-3,5-diarylaminobenzenes. Shades going from bordeaux to brown and black are obtained. Thus, 1-amino-2,5-dichlorobenzene  $\rightarrow$  1-hydroxy-3,5-bis(4'-methoxyphenylamino)-benzene gives a yellow-brown.

**Metalliferous azo dyes.** Soc. pour l'ind. chim. à Bâle. Brit. 401,544, Nov. 16, 1933. See U. S. 1,936,276 (C. A. 28, 905<sup>4</sup>).

**Monoazo dyes; dyeing.** I. G. Farbenind. A.-G. Brit. 402,849, Dec. 14, 1933. H<sub>2</sub>O-insol. azo dyes are made in substance or on the fiber by coupling 2,3-hydroxynaphthoyl - 1' - amino - 2',4' - dimethoxy - 5' - chlorobenzene with diazotized derivs. of 2-amino-1-methoxybenzene-4-sulfonamide in which the H atoms of the amide residue are substituted by the same or different aliphatic, araliphatic or aliphatic-araliphatic residues contg. together at least 3 C atoms, with the exception of sulfodiethylamide. Fast Turkey-red shades are obtained. In examples the di-Bu, methylbenzyl, dibenzyl, MeEt, MePr, di-Pr, MeBu, EtBu, Me-iso-Bu, MeAm, Bu-iso-Bu, di-iso-Bu and Ar<sub>2</sub>-isocapryl-amides are specified as diazo components.

**Monoazo dyes.** I. G. Farbenind. A.-G. (Leopold Laska and Arthur Zitscher, inventors). Ger. 591,692, Jan. 25, 1934 (Cl. 22a. 1). Diazotized 2-(*p*-methoxyethoxy)-4-nitroaniline is coupled with 1-(2'-hydroxynaphthalene - 3' - carbonylamino) - 4 - methoxy - 3 - methylbenzene. Examples are given.

**Disazo dyes.** I. G. Farbenind. A.-G. Brit. 395,027, July 10, 1933. Disazo dyes contg. Cu are made by treating with a Cu-yielding agent a disazo dye obtainable by coupling in alk. soln. 1 mol. of a tetrazotized aromatic diamine, contg. an alkoxy group in *o*-position to each diazo group, with 2 mols. of 2-amino-5-naphthol-1,7-sulfonic acid, or a *N*-acyl deriv. thereof, or with 1 mol. of said acid, or a *N*-acyl deriv., and 1 mol. of a naphthol sulfonic acid, the coppering being performed so that the alkoxy groups are split up. In the case of urca dyes, a corresponding aminoalkoxy monoazo dye may be prep'd. first, converted into the urca and coppered. They dye silk, cotton and viscose violet to blue shades of good fastness to light. Among examples, (1) the dye di-anisidine  $\rightarrow$  2-acetyl amino-5-naphthol-1,7-disulfonic acid (I) is treated with ammoniacal CuSO<sub>4</sub>, and (2) the dye 4,4'-diamino-3,3'-dimethoxydiphenylurea  $\rightarrow$  I is coppered as in (1).

**Disazo dyes.** I. G. Farbenind. A.-G. Brit. 402,920, Dec. 14, 1933. Rubber is colored by incorporating into the mix H<sub>2</sub>O-insol. disazo dyes, free from NO<sub>2</sub> groups and corresponding to the formula RN:NC<sub>2</sub>X<sub>2</sub>YC<sub>2</sub>X<sub>2</sub>N:NR, where X is H or a univalent substituent, e. g., halogen, alkyl, alkoxy, R is a coupling component and Y represents

a bridge contg. O, *e. g.*, O, CO, NHCO, NHCONH,  $\text{SO}_2$  or  $\text{NHSO}_2$ . Such dyes are obtained by tetrazotizing diamino compds. of formula  $p\text{-H}_2\text{NC}_6\text{H}_4\text{YC}_6\text{H}_4\text{NH}_2$ , *p* and coupling with coupling components, *e. g.*, acetoacetic acid arylides, pyrazolones,  $\beta$ -naphthol and its derivs., *e. g.*, 2,3-hydroxynaphthoic arylides, or hydroxycarbazoles or their carboxylic arylides.

**Vat dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 163,279, Oct. 2, 1933 (Cl. 37e). A new vat dye is obtained by condensing 7-chloro-4,6-dimethyl-3-hydroxythionaphthene with the 2-(*p*-dimethylamino)anil of 5-chloro-7-methyl-3-hydroxythionaphthene. The dye colors cotton from a yellow vat in fast red-violet shades.

**Vat dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 165,047, 165,048 and 165,050, Jan. 16, 1934 (Cl. 37e). Addns. to 163,279 (preceding abstr.). 7-Chloro-4,6-dimethyl-3-hydroxythionaphthene is condensed with the 2-(*p*-dimethylamino)anil of 6-ethoxy-3-hydroxythionaphthene (165,047), or of 5-methyl-6-chloro-3-hydroxythionaphthene (165,048), or by condensing the first-mentioned 7-chloro-4,6-dimethyl-3-hydroxythionaphthene with 5,7-dibromoisatin  $\alpha$ -chloride (165,050). The formulas and colors of the dyes produced are given, together with examples.

**Vat dye.** Soc. pour l'ind. chim. à Bâle. Swiss 163,280, Oct. 2, 1933 (Cl. 37e). A new vat dye is produced by condensing the 2-*p*-dimethylaminoanil of 5-chloro-4,7-dimethyl-3-thionaphthene with 1-chloro-2,3-naphthothioindoxyl. The dye colors cotton from an orange-brown vat in fast blue-violet shades.

**Vat dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 165,051 to 165,058, Jan. 16, 1934 (Cl. 37e). Addns. to 163,280 (preceding abstr.). New vat dyes are obtained by condensing 5-chloro-4,7-dimethyl-3-hydroxythionaphthene with the 2-*p*-dimethylaminoanil of 6-ethoxy-3-thionaphthene (165,051), or of 1,2-naphthothioindoxyl (165,052), or of 7-methyl-3-thionaphthene (165,053). Dyes are formed condensing the 2-*p*-dimethylaminoanil of 4,7-dimethyl-3-thionaphthene with 2,1-naphthothioindoxyl (165,054), or with 1-chloro-2,3-naphthothioindoxyl (165,055). Other dyes are produced by condensing 6-chloro-4-methyl-3-hydroxythionaphthene with the 2-*p*-dimethylaminoanil of 5-chloro-4,7-dimethyl-3-thionaphthene (165,056), or of 4,7-dimethyl-3-thionaphthene (165,057), or of 5-chloro-7-methyl-3-thionaphthene (165,058). Structural formulas and colors of the dyes produced are given, with examples.

**Vat dye.** Soc. pour l'ind. chim. à Bâle. Swiss 161,842, Jan. 2, 1934 (Cl. 37b). A vat dye is prep'd. by halogenating 1-benzoylamino-8-haloanthraquinone to give the 1,8-dihalo deriv. One mol. of this is treated with 2 mol. of 1-aminoanthraquinone and a condensing agent.

**Vat dyes of the dipyrazolanthrone series.** Max A. Kunz and Karl Koeberle (to General Aniline Works). U. S. 1,948,178, Feb. 20. Dyes of various shades are obtained by condensing dipyrazolanthrone, its derivs. or homologs, contg. a neg. substituent with compds. to which a reactive H or metal atom is attached by means of N, O or S. As negatively substituted dipyrazolanthrone, preferably such as contain from 1 to 4 halogen atoms, nitro or sulfonic acid groups may be employed. Suitable reacting components contg. a H or metal atom attached to N, O or S are for example amines, imines, acid anilides or imides, hydroxy and mercapto compds., or compds. of the said kind contg. a metal atom instead of the reactive H atom. When dipyrazolanthrone contg. several neg. substituents are employed as initial material only one of the neg. substituents or several thereof may be replaced, but in the latter case the neg. substituents should be replaced by the same radical. The condensation is preferably carried out in org. dissolving or suspending media, for example in nitrobenzene, naphthalene, etc., and in the presence of acid-binding agents, such as for example the oxides of alkali or alk. earth metals, or alk. salts thereof, or org. bases, for example dimethylaniline. Condensing catalysts, such as metals or metal compds., are preferably added to the reaction mixt. The imines produced may be subjected, in the same reaction mixt.

in which the condensation is carried out, if desired, to alkylation, acylation, or carbazolation by means of acid or alk. condensing agents, or to saponification or to further condensation to higher mol. compds. in cases in which the radicals introduced are capable to undergo such further condensation, for example, when benzanthrone radicals have been introduced which may be further condensed to dibenzanthrone radicals.

**Indigoid vat dyes.** Jakob Muller and Robert Stocker (to Soc. pour l'ind. chim. à Bâle). U. S. 1,947,055, Feb. 20. Numerous examples are given of the production of dyes of various colors by condensing compds. such as the 5-chloro-6-methyl, 5-chloro-6-ethyl, 5-bromo-6-methyl, 5-methyl-6-chloro, 5-methyl-6-bromo derivs. of 3-thionaphthene (I), the 2-anil and the *p*-dimethylamino-2-anil of these compds. (which are obtainable for example by condensing the I with an aromatic nitroso compd.), the thionaphthenequinones corresponding with the said derivs. of I (obtainable, for example, by treating the 2-anils with a saponifying agent, such as  $\text{H}_2\text{SO}_4$ ), the corresponding thionaphthenequinone 2-mono- or 2-dihalides (obtainable for example from the derivs. of I by action of halogen or agents yielding halogen), and the thionaphthenequinone oximes with compds. such as five-membered condensed ring systems, as for example isatins, naphthisatins, indoxyls, thionaphthenequinones, hydroxythionaphthene, naphthohydroxythionaphthene, acenaphthenequinones and the like, their homologs and substitution products, anils and halides. The condensation takes place by heating the components in a solvent which may act as condensing agent. The resulting dyes may be halogenated if desired and have good fastness. Cf. C. A. 28, 2545<sup>1</sup>.

**Dye intermediates.** Soc. pour l'ind. chim. à Bâle. Swiss 162,898-162,901, Sept. 16, 1933 (Cl. 36q). Addns. to 160,170 (C. A. 28, 655<sup>1</sup>). Intermediates of the naphthalene series are obtained by introducing a *p*- or *m*-nitrobenzoyl group into both the amino groups of 1,4-diamino-5-naphthol-7-sulfonic acid and, if desired, reducing. Examples are given.

**Brominated dibenzanthrones.** Max A. Kunz and Karl Koeberle (to General Aniline Works). U. S. 1,949,209, Feb. 27. By brominating dibenzanthrone or isodibenzanthrone in sulfuric acid in the presence of a halogen carrier, there is obtained a brominated dibenzanthrone contg. 3 to 4 atoms of Br per mol., forming violet solns. with concd.  $\text{H}_2\text{SO}_4$ , which dyes vegetable fiber from blue vats blue shades. Cf. C. A. 27, 3832.

**Sulfonic acid.** Soc. pour l'ind. chim. à Bâle. Swiss 163,005, Sept. 16, 1933 (Cl. 36p). A new acid is obtained by treating  $\mu$ -heptadecylbenzimidazole with a sulfonating agent. The soap-like product is used in the textile industry.

**Sulfonic acids.** Soc. pour l'ind. chim. à Bâle. Swiss 164,730 to 164,736, Dec. 16, 1933 (Cl. 36p). Addns. to 163,005 (preceding abstr.). A new sulfonic acid is produced by sulfonating  $\mu$ -undecylbenzimidazole (164,730). The other patents describe the products obtained by sulfonating  $\mu$ -heptadecylbenzimidazole (164,731),  $\mu$ -heptadecyl-*N*-phenylbenzimidazole (164,732),  $\mu$ -heptadecyl-*N*-benzylbenzimidazole (164,733),  $\mu$ -heptadecylperimidine (164,734),  $\mu$ -heptadecyl-1,2-naphthimidazole and the imidazole mixt. obtained by condensing *o*-phenylenediamine with a com. mixt. of stearic and palmitic acids. The sulfonic acids are used in the textile industry.

**Condensation product.** Soc. pour l'ind. chim. à Bâle. Swiss 163,770, Nov. 1, 1933 (Cl. 36q). Addn. to 160,430 (C. A. 28, 653<sup>1</sup>). A product useful for reserve printing on animal fibers is obtained by treating the sulfonic acid mixt. resulting from the sulfonation of 1 mol. of 2-hydroxynaphthalene, with 1 mol. of benzoin.

**Condensation products.** Soc. pour l'ind. chim. à Bâle. Swiss 162,902-162,906, Sept. 16, 1933 (Cl. 36q). Addns. to 160,430 (C. A. 28, 653<sup>1</sup>). Products useful as reserve agents for printing wool or other animal fibers are obtained by condensing 2 mols. of benzoin with 1 mol. of 2-naphthol-3,6-disulfonic acid (162,902), or 1 mol. of benzoin with 1 mol. of 2-naphthol-6-sulfonic acid (162,903), or with 1 mol. of 1-naphthol-4-sulfonic acid (162,904), or with 1 mol. of 1-naphthol-4,8-disulfonic acid (162,905), or,

finally, with 1 mol. of 4,4'-dihydroxybiphenyl-2,2'-disulfonic acid (182,906). Examples are given.

**Condensation products of the pyrenequinone series.** Georg Kränzlein and Heinrich Vollmann (to General Aniline Works). U. S. 1,948,928, Feb. 27. A 4,5,8,9-dibenzopyrene-3,10-quinone is obtained by condensing a 2-arylbiphenylanthrone (such as 2-benzoyl- or 2-*p*-tolyl- or  $\alpha$ -naphthoyl-2-biphenylanthrone, or *p*-bromobenzoyl-2-benzanthrone) with  $\text{AlCl}_3$  or Na Al chloride (suitably with introduction of O or air and at 110–125°). The products dye cotton from orange-yellow vats intense yellowish red, and the chlorinated derivs. give brighter and the brominated derivs. darker tints. Various examples with details of procedure are given.

**Solutions for use in dyeing and textile printing.** Mordecai Mendoza and Arthur G. Murray (to Imperial Chemical Industries Ltd.). U. S. 1,948,589, Feb. 27. An agent such as  $\text{KBrO}_3$  and  $\text{KBr}$  which in acidified aq. soln. has oxidizing properties is formed into a dry mixt. with an arylidiazonium sulfonic acid, arylhydrazine- $\alpha$ - $\beta$ -disulfonic acid or  $\alpha$ -arylhydrazine- $\beta$ -sulfonic acid derived from an arylamine free from hydroxyl, sulfonic and carboxylic groups. In use, the mixt. is dissolved in water. Cf. C. A. 28, 2546<sup>a</sup>.

**Decorative colored compositions for use on cloth.** Wm. H. Adams (to Eastern Finishing Works). U. S. 1,948,464, Feb. 20. An adherent, penetrating and flexible compn. comprises a mixt. of Al, Pb and Cu soaps dissolved in a non-oxidizable neutral volatile solvent such as petroleum naphtha together with a pigment or lake in specified proportions.

**Discharge pastes.** R. I. du Pont de Nemours & Co. Brit. 401,850, Nov. 13, 1933. Discharge pastes, particularly suitable for use on materials made of or contg. cellulose esters or ethers, contain a  $\text{CH}_3\text{O}$ -sulfoxylate discharging agent,  $\text{Zn}(\text{CNS})_2$  and diethylene glycol (I). In an example  $\text{Zn}(\text{CNS})_2$  and I are added to a soln. of Na  $\text{CH}_3\text{O}$ -sulfoxylate in aq. gum tragacanth. Among examples of the production of discharge effects, a cellulose acetate fabric, dyed in the usual manner with Lomamine A diazotized on the fiber and developed with 2,3-hydroxynaphthoic acid, is printed with the above discharge paste, dried, aged at 100°, washed at 60° and dried to obtain pure white discharge effects.

**Colored discharge effects on textile materials.** George H. Ellis (to Celanese Corp. of America). U. S. 1,949,413, March 6. Material contg. an org. cellulose deriv. such as cellulose acetate is treated locally with an acid prepn. contg. a stannous compd. such as  $\text{SnCl}_2$  and an unreduced anthraquinone coloring substance such as 1-acetylaminoanthraquinone which in the unreduced state has an affinity for the cellulose deriv. material. Various examples are given.

**Dyeing.** British Celanese Ltd., George Holland Ellis and Ernest William Kirk. Brit. 396,429, July 26, 1933. Divided on 396,412 (C. A. 28, 650<sup>a</sup>). Azo dyes are made on the fiber by coupling thereon an amide or substituted amide of an aromatic hydroxycarboxylic acid with a diazo compd. obtained by diazotizing an anthraquinone compd. contg. an external diazotizable amino group (excluding 1-amino-4-hydroxyanthraquinones). Components specified are the aminoaryl or aminoaryl derivs. of 1-amino- or 1,5- or 1,8-diaminoanthraquinone, *e. g.*, 1,5-di-*p*-aminophenylaminoanthraquinone, 1-*p*-aminophenylaminoanthraquinone, 1-amino-5-*p*-aminophenylaminoanthraquinone; 1-amino- or 1-alkylamino-4-aminoarylaminanthraquinones, *e. g.*, 1-amino-1-methylamino-, 1-dimethylamino- and 1-hydroxyalkylamino-4-aminoarylaminanthraquinone. Coupling components may be arylides of hydroxy carboxylic acids of the  $\text{C}_6\text{H}_4$ ,  $\text{C}_6\text{H}_3$  and carbazole series, *e. g.*, arylides of salicylic, 2,3- and 1,4-hydroxynaphthoic acids, *e. g.*, the *o*-toluide and *m*-nitroanilide of 2,3-hydroxynaphthoic acid and di-2,3-hydroxynaphthoylbisanisidine.

**Dyeing.** Imperial Chemical Industries Ltd., Simon Thomson McQueen and Alexander Stewart. Brit. 401,665, Nov. 13, 1933. Cellulose ester or ether materials are dyed or printed in permanent colors by applying  $\text{H}_2\text{O}$ -

insol. dyes in aq. media in presence of an  $\alpha$ -mono- or  $\alpha,\gamma$ -diaryl or alkaryl ether of glycerol, *e. g.*,  $\alpha$ -mono-phenyl,  $\alpha$ -mono-*o*-tolyl,  $\alpha,\gamma$ -di-*o*-tolyl,  $\alpha,\gamma$ -dibenzyl ethers. Among examples, printing pastes are prepd. contg. dark British gum thickening, sol. oil and glycerol and (a) Duranol brilliant blue G and an emulsion of glycerol  $\alpha,\gamma$ -di-*o*-tolyl ether, or (b) Duranol green BS and glycerol  $\alpha,\gamma$ -dibenzyl ether.

**Dyeing.** I. G. Farbenind. A.-G. Brit. 401,731, Nov. 20, 1933. Acetate rayon is dyed by treatment with aminoanthrapyrimidines or their substitution products. Such dyes are prepd. by treating heteronuclear amidated anthraquinones contg. at least 1 amino group in  $\alpha$ -position with formamide; diluents, *e. g.*, phenols, and catalysts, *e. g.*,  $\text{H}_2\text{BO}_3$ ,  $(\text{COOH})_2$ , may be present. Among examples 2-, 3-, and *Py*-C-aminoanthrapyrimidines (orange to red shades), 4- and 5-methylaminoanthrapyrimidines, 4-amino-*Py*-C-aminoanthrapyrimidine, 4-amino-*Py*-C-phenoxyanthrapyrimidine, 4-amino-*Py*-C-chloropyrimidine, etc., are used.

**Dyeing textiles.** British Celanese Ltd., Geo. H. Ellis and Henry C. Olpin. Brit. 401,338, Nov. 6, 1933. Dischargeable full black dycings are produced upon cellulose esters or ethers in textile materials by applying a dischargeable yellow, orange and (or) red dye having affinity for said esters or ethers and resistant to diazotization, *e. g.*, benzeneazobenzeneazophenol (I), benzeneazophthaleneazophenol (II), 4-nitro-2-methoxybenzeneazodimethylaniline (III), applying also a diazotizable base having affinity for said esters or ethers and yielding navy blue or thin black shades upon diazotization and development, *e. g.*, *p*-aminobenzeneazodimethylaniline (IV), *o*-methoxybenzeneazobenzeneazophenol (V), 4,4'-diaminoazobenzene, bisaniline and then effecting diazotization and development. The amt. of diazotizable base used is such as will not, in the absence of the yellow, etc., dye yield full black shades. Among examples a cellulose acetate fabric is dyed (1) with aq. dispersions of 0.60% of IV, 0.36% of I and 0.04% of III, based on the wt. of the fabric, and the dyed fabric is diazotized and developed with 2,3-hydroxynaphthoic acid; the fabric is then printed with a discharge paste contg. "Decroline," diethylene glycol, Et lactate and gum arabic, dried, aged, washed and finished to obtain a white discharge on a full black ground, and (2) with 0.6% of V, 0.1% of II and 0.08% of III, based on the wt. of the fabric, the dyed fabric is diazotized and developed with 2,3-hydroxynaphthoic acid, printed with a discharge paste contg. Zn  $\text{CH}_3\text{O}$ -sulfoxyate, diethylene glycol, Et lactate and gum arabic, dried, aged, washed and dried to obtain a parchment white discharge on a full black ground. Cf. C. A. 28, 2197<sup>a</sup>.

**Dyeing wool.** Soc. pour l'ind. chim. à Bâle. Brit. 401,938, Nov. 23, 1933. Wool is grounded in an alk. bath with an arylide of an org.  $\text{COOH}$  acid, treated with a liquid, which contains a buffer substance that reacts with caustic alkalis, to finish the alk. of the grounded wool, and developed with a diazo compd. In examples wool is grounded with (1) 2,3-hydroxynaphthoic anilide, NaOH,  $\text{Na}_2\text{SO}_4$  and sulfite cellulose liquor, washed with  $\text{NaHCO}_3$  and developed with diazotized 4-ethoxy-4-aminodiphenylamine and (2) an alk. soln. contg. 2,3-hydroxynaphthoic acid  $\alpha$ -naphthylamide, washed with a soln. contg.  $\text{NaHCO}_3$  and "Igepon A" or other washing agent and developed with diazotized 4-chloro-2-toluidine.

**Dyeing acetate rayon.** Karl Roerberle and Joachim Mueller (to General Aniline Works). U. S. 1,947,855, Feb. 20. A bath comprising 4-amino-1,9-anthrapyrimidine or a deriv. is used dyeing yellow or orange shades. Cf. C. A. 27, 5198.

**Dyeing furs.** Soc. pour l'ind. chim. à Bâle. Ger. 591,411, Jan. 20, 1934 (Cl. 8m. 10.02). See Fr. 755,871 (C. A. 28, 2196<sup>a</sup>).

**Treating cellulose esters; dyeing and printing.** I. G. Farbenind. A.-G. Brit. 401,735, Nov. 20, 1933. The capacity for dyes of materials made of cellulose esters is increased by treatment with tetrahydronaphthalene- $\beta$ -sulfonic acid or a salt thereof. Among examples (1)

acetate rayon is immersed 0.5 hr. at 95° in a 10% aq. soln. of the Na salt, rinsed and dried, the product giving stronger dyeings or printings than the untreated rayon, (2) an aq. paste is prepd. from (a) the condensation product of Na 1-*p*-sulfomethyl-2-naphthol-6-sulfonate and a PhOH-CH<sub>2</sub>O resin in dil. NaOH at 126–150°, (b) Na ligninsulfonate and (c) Na tetrahydronaphthalene- $\beta$ -sulfonate (I); the dried and powd. product is used for the manuf. of printing pastes yielding very strong, even printings and (3) acetate rayon material is printed with a mixt. contg. industrial gum, I, thiodiglycol and H<sub>2</sub>O, steamed 0.5 hr., and dried or rinsed.

**Printing carpets, etc.** Hermann Toeller and Heinz von Bothmer. Ger. 591,751, Jan. 26, 1934 (Cl. 8c. 1). Carpets, etc., are soaked in a wetting agent and the excess of liquid removed. They are then printed by usual processes and the wetting agent removed from the backing by hot air drying.

**Foam treatment of textile materials as in dyeing, bleaching, etc.** Leon deR. Faber and Charles J. Carroll (to Faber Engineering Co.). U. S. 1,948,568, Feb. 27. Foam is generated the bubbles of which carry a treating agent such as a washing or bleaching agent and the bubbles are applied to material such as cloth and constituents from the bubbles are forced through the material by a differential pressure. App. is described.

**Machine for dyeing fabrics in the piece.** H. W. Mettler. Swiss 163,858, Nov. 16, 1933 (Cl. 14a).

**Dyeing and washing tray suitable for heating by steam.** Paul Tschammler. U. S. 1,949,287, Feb. 27. Structural and operative details.

**Treating fibers.** Ter Horst & Co. Fr. 757,341, Dec. 23, 1933. Crude fibers such as jute, hemp, linen, are bleached and made suitable for spinning by the action of a bath of NaOCl in the absence of air and at about 0°, after which they are dechlorinated.

**Treating fibers.** Ter Horst & Co. Fr. 757,377, Dec. 26, 1933. Crude vegetable fibers or threads or cloth made therefrom are treated at a low temp., e. g., about 0°, and in the absence of air, by an alk. bath contg. a stannate or aluminate and NH<sub>3</sub>, aerated for a few mins., bleached in a chlorinating bath, dechlorinated in a bath of sulfite and finally submitted for some mins. to the action of a bath contg. hyposulfites and, e. g., Marseilles soap, Turkey-red oil and suint, this bath being heated to a max. of 90°.

**Treating vegetable fibers.** Wladimir Wacngler. Austrian 136,231, Jan. 30, 1934 (Cl. 8c). The buckling, bleaching or like treatment of cotton, linen and other vegetable fibers is facilitated by pretreating the fibers in the warm with a dil. soln. contg. a bisulfite, e. g., NaHSO<sub>3</sub>, an alkali, e. g., Ca(OH)<sub>2</sub>, and NH<sub>4</sub>Cl. Alternatively, the fibers may be treated with a soln. contg. NaHSO<sub>3</sub> and NH<sub>4</sub>Cl, and then with a soln. of Ca(OH)<sub>2</sub>, or treatment with a soln. contg. NaHSO<sub>3</sub> and Ca(OH)<sub>2</sub> may be followed by treatment with NH<sub>4</sub>Cl soln.

**Purifying textile fibers.** Puschel & Co. Fr. 757,650, Dec. 29, 1933. Wool and other animal fibers are freed from grease and sticky substances by submitting them to a mech. treatment at below 0°.

**Greasing agents for fibers.** Deutsche Hydrierwerke A.-G. Ger. 562,921, Jan. 15, 1934 (Cl. 23c. 1). In spinning textile fibers, esters of higher alcs., such as octyl alc., and lower fatty acids, such as AcOH, are used for greasing the fibers.

**Oil for treating textiles.** Bruno Rewald (to Hanscatische Mühlenwerke A.-G.). U. S. 1,946,332, Feb. 6. A dressing, sizing and softening oil for treating textiles comprises an emulsion of soy-bean phosphatides and chemically uncombined fatty oil, fatty acid, Turkey-red oil and water (substantially free from remaining constituents of the vegetable material other than the oil).

**Preparations for treating textiles.** Soc. pour l'ind. chim. à Bâle. Swiss 163,274, Oct. 2, 1933 (Cl. 86p). The imidazole mixt. obtained by condensing *o*-phenylenediamine with a tech. mixt. of stearic and palmitic acids, such as obtained from beef tallow, is treated with a benzylating agent to give a soapy product useful in the textile industry.

**Preparations for treating textiles.** Soc. pour l'ind. chim. à Bâle. Swiss 165,036 and 165,037, Jan. 2, 1934 (Cl. 86p). Addns. to 163,274 (preceding abstr.). Preps. for dressing textiles are obtained by methylating (165,036) or benzylating (165,037) the imidazole mixt. produced by condensing *o*-phenylenediamine with the tech. mixt. of stearic and palmitic acids obtained from beef tallow.

**Incorporating metal oxides in textile materials.** Franz Hoelkeskamp (to American Bemberg Corp.). U. S. 1,947,507, Feb. 20. Materials such as those which undergo swelling are satd. with a metallic oxide-NH<sub>3</sub> compd. such as Ni hexamine aluminate in aq. soln. followed by drying at 70–80° to volatilize the NH<sub>3</sub>, leaving the metal oxide in the material where it may serve as a weighting agent, etc.

**Treating acetate rayon to improve its dyeing properties.** etc. Karl Beck. U. S. 1,947,928, Feb. 20. See Fr. 710,209 (C. A. 26, 1136).

**Treating artificial filaments, films, etc.** Henry Dreyfus. Brit. 401,679, Nov. 13, 1933. Artificial yarns, foils, etc., especially those contg. cellulose acetate, are treated, while traveling from 1 point to another, with a moving body of liquid contg. a softening agent for the materials, the concn. of softening agent in (a portion of) the liquid is then altered by the incorporation of a liquid therewith and the materials are subjected, preferably after stretching, to a further treatment with the liquid of altered concn. App. is described.

**Stretching cellulose ester or other filaments, yarns, films, etc.** Henry Dreyfus. Brit. 402,776, Dec. 7, 1933. Org. di-esters and ether-esters of alkylidene glycols, e. g., methylene, ethylidene or propylidene diacetate or dipropionate, methoxymethyl acetate, ethylidene acetate propionate, are used as softening or assisting agents, either alone or dild. with H<sub>2</sub>O, alcs., ethers and hydrocarbons or mixed with other solvents. In 403,072, Dec. 6, 1933, an improvement in tenacity of the product is effected when stretching by mech. means by treating with an assisting agent comprising a H<sub>2</sub>O-miscible solvent and an oily or fatty substance or soap or wetting agent either dissolved or emulsified in the assisting agent. Animal or vegetable oils, the soaps of such oils, including ethanalamine and other org. soaps, sulfonated soaps, *o*-alkylamides of fatty acids and their sulfonated derivs. and alkylated naphthalenesulfonic acids may be used. In 403,106, Dec. 14, 1933, the extensibility and tensile strength of stretched cellulose ester or ether products are improved by subjecting the material, while traveling, to a shrinking treatment prior to the stretching operation. In examples methylene chloride-C<sub>6</sub>H<sub>6</sub> and aq. dioxane are used both as shrinking and stretching agents.

**Saponifying cellulose ester threads, etc.** Henry Dreyfus. Brit. 403,071, Dec. 6, 1933. By conducting the sapon. of filaments, threads, yarns, etc., of cellulose acetate and other org. cellulose esters on the materials while traveling at a speed which diminishes along their path so that contraction may take place, an improvement in tensile strength results. Washing and drying are also preferably so conducted.

**Creping rubberized material.** Jay J. Siedler (to Hodgman Rubber Co.). U. S. 1,948,138, Feb. 20. A soft flexible sheet material such as cotton cloth is coated with a vulcanizable rubber compn., the sheet being rendered temporarily adherent, and it is creped in a described app.

**Ventilated fabric comprising rubber and textile fabric.** Alfred A. Glidden and Virgil H. Boffe (to Hood Rubber Co.). U. S. 1,949,189, Feb. 27. A fabric suitable for shoe uppers, etc., comprises a reticulated elastic sheet of rubber formed with crossed bands of rubber, with facing plies of porous textile material such as knitted fabric secured to the rubber sheet by adhesive such as a rubber dispersion.

**Rubberized cloth.** The International Latex Processes Ltd. Fr. 757,230, Dec. 22, 1933. Floccular or granular ppts. composed wholly or partly of rubber obtained from aq. dispersions are applied to cloth. The rubber may be applied by spreading or spraying.

- Apparatus for rinsing rayon and other fibers.** Carl Hamel Spinn- und Zwirnereimaschinen A.-G. Swiss 162,969, Sept. 16, 1933 (Cl. 19d).
- Centrifuge for removing liquids from wound yarns.** Glanzstoff-Courtauld G. m. b. H. Ger. 592,285, Feb. 5, 1934 (Cl. 8a. 19).
- Rinsing rayon spools.** Feldmühle A.-G. vorm. Loeb, Schoenfeld & Co. Rorschach. Swiss 162,984, Sept. 16, 1933 (Cl. 24f).
- Mercerizing textiles.** Chemische Fabrik vorm. Sandoz. Ger. 591,923, Jan. 29, 1934 (Cl. 8k. 2). The wetting capacity of a mercerizing lye is increased by addn. of a mixt. of phenols and hydrogenated phenols. Thus, a mercerizing lye is given an addn. of cresol and methylcyclohexanol. Cf. C. A. 27, 4102.
- Bleaching.** H. Th. Böhme A.-G. Brit. 401,199, Nov. 9, 1933. See Fr. 755,637 (C. A. 28, 2198<sup>3</sup>).
- Bleaching.** I. G. Farbenind. A.-G. Brit. 403,009, Dec. 14, 1933. Cotton fibers are kier-boiled in a lye which contains no org. solvent but has, besides an alkali, an adsorptive inorg. substance, other than a metal hydroxide, and a wetting or washing agent. Among examples the lyes contain (1) NaOH, fuller's earth and the Na salt of the condensation product of oleic acid chloride and phenyltaurine, (2) NaOH, waterglass and an alkylated naphthalenesulfonic acid and (3) calcined  $\text{Na}_2\text{CO}_3$ , the oleic acid ester of Na hydroxyethanesulfonate and silicic acid gel.
- Bleaching textiles.** Walther Huesy and Walther Krauer. Brit. 402,622, Dec. 7, 1933. The goods are boiled in a closed kier, the liquid withdrawn so as to expose them to steam action and the liquor then returned, said alternate treatment under const. pressure and temp. being repeated as often as desired. App. is described.
- Closed bleaching vessel for textiles.** N. V. de Eibergsche-Stoomblekerij v/h. de Firma Gerrit Jan ten Cate & Zonen. Ger. 591,750, Jan. 26, 1934 (Cl. 8a. 18).
- Apparatus for subjecting clothes to ultra-violet radiation and ozone in laundry operations.** Wm. R. Redd (to Milprint Products Corp.). U. S. 1,948,230, Feb. 20. Various details are described of an app. with a belt conveyor, etc.
- Peroxide solutions.** H. Th. Böhme A.-G. Brit. 403,035, Dec. 14, 1933. Peroxide solns., especially for bleaching textiles, are stabilized against hardness and alkalis by adding alk. earth, Mg or Al salts of the sulfonation products of higher satd. or unsatd. alcs. Said salts also have a capillary action which results in more efficient bleaching action. Examples are given.
- Washing and other agents for textiles.** Soc. pour l'ind. chim. à Bâle. Swiss 163,536, Oct. 16, 1933 (Cl. 36c). A prepn. for dressing textiles is obtained by treating a salt of *p*-toluenesulfonic acid with a hydrogen halide ester of lauryl alc., and sulfonating the resulting sulfine. An example is given.
- Derivatives of montan.** Michael Jahrstorfer and Hans G. Hummel (to I. G. Farbenind. A.-G.). U. S. 1,948,299, Feb. 20. For producing a dispersing agent suitable for use with textile-treating compns., etc., a deriv. of montan such as a montancarboxylic amide is treated with a sulfonating reagent such as chlorosulfonic acid.
- Sulfuric acid derivatives.** Soc. pour l'ind. chim. à Bâle. Swiss 164,195, Dec. 1, 1933 (Cl. 36c). A new deriv. is obtained by sulfonating the hydrogenation product of 4,4'-dihydroxydiphenylmethylmethane consisting of 4-hydroxyphenyl-4'-hydroxycyclohexyldimethylmethane and perhydro-4,4'-dihydroxydiphenyldimethylmethane. The product is used for treating textiles.
- Mothicide.** J. R. Geigy A.-G. Swiss 162,658, Oct. 2, 1933 (Cl. 3c). A mothicide is produced by condensing isatin-5-sulfonic acid with thymol by the aid of an acid condensing agent.
- Mothicide.** J. R. Geigy A.-G. Swiss 165,030 to 165,032, Jan. 2, 1934 (Cl. 3c). Addn. to 162,658 (preceding abstr.). Isatin-5-sulfonic acid and *p*-chlorophenol are condensed by the aid of an acid-condensing agent (165,030). The second constituent may be replaced by 2,4-dichlorophenol (165,031) or 6-chloro-cresol (165,032).
- Dry cleaning.** Warren T. Reddish. Brit. 401,752, Nov. 23, 1933. See U. S. 1,911,289 (C. A. 27, 4104).
- Clarifying "dry-cleaning" solvents.** Victor G. Norquist and Earl E. Treanor (to Butler Mfg. Co.). U. S. 1,947,873, Feb. 20. Contaminated solvent withdrawn from a washing zone is mixed with a purifying chemical in a mixing zone and some of the same chemical is simultaneously introduced into a clarifying zone (of a described app.) and the mixt. from the mixing zone is passed through the chemical in the clarifying zone.
- Fluid for dry cleaning of textile fabrics.** George I. Parkhurst (to Standard Oil Co. of Calif.). U. S. 1,948,045, Feb. 20. 1,1-Dichloroethane, 1,1,1-trichloroethane, 1,1,2-trichloroethane or 1,1,1,2-tetrachloroethane is used, suitably in admixture with petroleum naphtha.

## 26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

- Effect of cold weather upon paint films.** Henry A. Gardner. *Natl. Paint, Varnish Lacquer Assoc. Circ.* No. 451, 38-46(1934).—An epidemic of peeling of paint from metal surfaces, such as trucks, sign boards, etc., is ascribed to a combination of unusual cold weather and high humidity along the eastern coast of the U. S.
- G. G. Sward
- Influence of light on paint.** W. Toeldt. *Farben-Ztg.* 39, 140(1934).—Various methods of reporting the effects of light on paint films are reviewed. The use of the Pulfrich step photometer together with the Ostwald color system is recommended.
- G. G. Sward
- The dealer and the oil content of oil paints.** Cornelius Hebing. *Farbe u. Lack* 1934, 87, 101-2, 123-4, 138-9.—The functions of the oil and the pigment in paints are discussed.
- G. G. Sward
- Oil requirements and thixotropy of linseed oil paints.** Hans Wolff. *Farben-Ztg.* 39, 194-6(1934).—See C. A. 28, 1204<sup>4</sup>.
- G. G. Sward
- Drying of white lead paint films.** C. P. van Hoek. *Verfkronek* 7, 16(1934).—A short review. The drying action of white lead on linseed oil is not due to sapon. but probably to (1) catalytic effect on autoxypolymerization of the oil, (2) chem. binding of acid oxidation products, (3) relatively low oil content of paint, (4) little adsorption of the driers.
- B. J. C. van der Hoeven
- Satin white.** Edw. Sutermeister. *Paper Ind.* 15, 696 8(1934).—From a discussion of the properties of satin white, it is considered that, in the present state of our knowledge, it seems most likely that it is  $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 3\text{CaSO}_4 \cdot 3\text{H}_2\text{O}$ .
- A. Papineau-Couture
- Ocher and earth color deposits in the Upper Palatinate.** A. Kruse. *Farbe u. Lack* 1934, 98, 114.—The ocher and similar deposits in the Upper Palatinate are small but widely distributed. High-grade products are available but unlimited competition on lack of railway facilities have made profitable operation of mines difficult.
- G. G. Sward
- Effect of tung and fish oils in outside white paints.** Toronto Club. *Am. Paint & Varnish Mfrs.' Assoc. Circ.* No. 423, 1 p.(1932).—A preliminary account is given of exposures of straight linseed-oil paints and similar paints in which fish oil and tung oil have been incorporated.
- B. C. A.
- Experimental studies on colloid nature of Chinese black ink.** I. Torahiko Terada, Ryuzo Yamamoto and Tetu Watanabe. *Sci. Papers Inst. Phys. and Chem. Research (Tokyo)* 23, 173-84(1934).—The ink is a stable

aq. suspension of sumi, a lampblack from vegetable oil mixed with gelatin glue, molded and dried. The particles in the ink are less than  $1\ \mu$  and average  $0.12\ \mu$  by count. When sumi is spread on water, it may be expanded to a film which is calcd. to be  $6.9\ \text{\AA}$  thick. The film can be solidified by Cu ions, compression and other means. After compression, it may again be liquefied by expansion. The solidified film yields characteristic radiating cracks and jets when pierced. In the liquid film, if sufficiently thick, vortices arise by convection. Dyeing with sumi film is briefly described. Also in *Proc. Imp. Acad.* (Tokyo) 10, 10-12 (1934).

**Zinc sulfate for tung-oil groves.** Henry A. Gardner. *Natl. Paint, Varnish Lacquer Assoc. Circ.* No. 452, 47-8 (1934).—Early expts. on the use of  $\text{ZnSO}_4$  to combat "bronzing" of tung-oil trees are briefly reviewed.

**American and German methods of preparing albertol tung oil varnishes.** E. Fourolbert, C. P. Holdt and F. Wilborn. *Farben-Ztg.* 39, 89-90, 113 (1934).—The German method of prep. albertol tung oil varnishes consists in thickening the oil at about  $280^\circ$ , subsequently dissolving the resin. The American practice consists in heating the oil and resin together throughout the procedure. The former method gave varnishes of paler color, lesser skinning tendencies, lower  $\eta$ , better flow and harder films (because of thinner films). The latter method gave varnishes of lesser wrinkling when baked, better gas proofness, more resistance to alkalis and to hot  $\text{H}_2\text{O}$ .

**The manufacturing of insulating varnish.** E. R. Grunsey. *Paint Manuf.* 4, 44-8 (1934).—Formulation, requirements, methods of test and application of insulating varnishes are described.

**The influence of film-forming components of nitro varnish on the properties of the nitro-varnish film.** G. M. Zilbermann, S. V. Yakubovich, P. M. Romanova and S. Rozhdetsvenskii. *J. Applied Chem.* (U. S. S. R.) 6, 289-302 (1933).—Films obtained from freshly prep. nitro varnishes after they had been kept for 2 days indicate that nitrocellulose of high viscosity is superior to that of low viscosity, this being expressed in the elasticity of the films. The greatest influence on the properties of the films of freshly prep. nitro varnishes is shown within a viscosity range of 0.5-10.5 sec. The properties of the films prep. from nitro varnishes stored for 3 months do not have exactly a direct relation to the viscosity of the nitrocellulose. In most of the cases, however, films from low-viscosity varnishes were superior to those from the high-viscosity ones, except with the 0.5 sec. nitrocellulose. The elasticity and the elongation of the films are increased with prolonged storage of the varnish independently of the viscosity of the nitrocellulose. Conclusion: There is no need for the nitrocellulose to have a high viscosity for the prep. of high-quality films.

**The effect of dust on wet varnish films.** R. Meldau. *Farben-Ztg.* 39, 169-70 (1934).—The effects of dust on the durability of varnishes vary according to the period of contact, being in general more severe if appearing before or soon after application.

**Lacquers for special purposes.** Ray C. Martin. *Metal Cleaning and Finishing* 6, 17-20 (1934).—The formulation and characteristics of crackle, cryst. and heat-resisting lacquers used in the finishing of certain products are discussed.

**Metallic soaps.** P. H. Faucett. *Paint, Oil & Chem. Rev.* 96, No. 3, 8-10 (1934).—Alc. pastes provide a convenient form of metallic soaps for use as flattening agents in varnishes and lacquers. To prep. them, the pptd. soap is given a final washing with alc., but is not dried.

**Linoleum and possible modifications thereof.** Felix Fritz. *Chem.-Ztg.* 57, 907-9 (1933); cf. *C. A.* 27, 3349.—The compn. of linoleum has remained practically stationary since its invention 70 years ago, but the standard materials are now difficult to obtain in Germany. As substitutes F. discusses: for linseed oil, the oil of seeds of

certain native weeds, as Binkelkraute (*Mercurialis* sp.) and Wolfsmilch (*Euphorbia* sp.); for kauri gum, chloronaphthalenes; for rosin, solid chloronaphthalene; for cork flour, ground peat; for jute, paper; for triolin, nitrocellulose. Other materials considered are soft resin from naphthalene and  $\text{C}_{12}\text{H}_{10}$  and other artificial resins, coumarone resin, stearin pitch, glue, rubber, asphalt. Thirty-two references.

**Chemical investigation of amber.** II. Leopold Schmid and Fajek Tadros. *Monatsh.* 63, 210-12 (1933); cf. *C. A.* 27, 4697.—The hydrocarbon  $\text{C}_{12}\text{H}_{14}$  on oxidation and esterification gives tri-Me hemimellitate; the oily filtrate with  $\text{HNO}_3$  gives trimellitic acid, which is probably due to an impurity.

**Natural vs. synthetic resins in the paint and varnish industry.** A. F. Suter. *Oil & Colour Trades J.* 85, 606-9 (1934).

**Corrosion prevention by protective coatings (Ohl) 9.** Protective coatings for metal work (Hurst) 9. Inflammability of painted wood (de Bruyn) 24. Glycerol ethers as solvents (Merz) 13. Mechanics of adherence in metal plating [in relation to varnishing and enameling] (Altmaierberger) 9. Anodic oxidation of Al [in relation to paint and varnish] (Mantell) 4. Azo dyes [for lacquer] (Swiss pats. 163,894 and 163,895) 25. Coated fabrics (Brit. pat. 402,269) 30.

**Rust-preventing paint.** Adolf Schneider. Brit. 402,255, Nov. 30, 1933. Addn. to 343,993 (*C. A.* 25, 4723). A pigment is prep. from magnetite by grinding the ore with  $\text{H}_2\text{O}$  in crushing mills having vertical runners from which it is discharged over rotating tables supplied with a current of  $\text{H}_2\text{O}$ . The lighter materials are washed away, the finely powd. oxide being left. This is removed from the tables by magnetic separators and dried and wind-sifted to obtain the finest concentrate particles which are incorporated in a binding medium.

**Anti-fouling metal sulfonates suitable for use in paints, etc.** Siegfried L. Langedijk (to N.-V. de Bataafsche Petroleum Maatschappij). U. S. 1,947,652, Feb. 20. A material suitable for use in soln. with paint oils comprises a heavy metal salt such as the Cu salt of those sulfonic acids which are extd. from the oil layer only of the product resulting in the sulfonation of a mineral oil previously subjected to purification with sulfurous acid.

**Compositions for preparing metal surfaces for painting.** James H. Gravell (to American Chemical Paint Co.). U. S. 1,949,713, March 6. A trihydric inorg. acid such as  $\text{H}_3\text{PO}_4$  is used with a wetting agent comprising a sulfonated aromatic isopropyl compd. such as "neomerpin."

**Pigments.** I. G. Farbenind. A.-G. (Paul Weise and Friedrich Raspe, inventors). Ger. 592,382, Feb. 8, 1934 (Cl. 22f. 7). Details are given of the manuf. of mixed pigments from solns. contg. a sulfate of Ti and a filler, e. g.,  $\text{BaSO}_4$ , by a process of the kind described in Fr. 738,620 (*C. A.* 27, 2050).

**Writing ink.** Consortium für elektrochemische Industrie G. m. b. H. (Wolfram Haehnel, and Willy O. Herrmann, inventors). Ger. 591,979, Jan. 30, 1934 (Cl. 22g. 1). Ink for writing is prep. from a mixt. of pigment and aq. solns. of highly polymerized vinyl alc. and fatty oil. Water colors, jelly preps., dichlorohydrin, Na oleate, mastix, copaiba balsam, etc., may also be added. The mixt. is specially suitable for white inks, dispersions of  $\text{ZnO}$  being used.

**Coating compositions.** James K. Hunt and George H. Latham (to E. I. du Pont de Nemours & Co.). U. S. 1,948,582, Feb. 27. A drying oil is used with a pos. oxidation catalyst such as a Mn compd. and creosol which in the proportions used prevent oxidation of the compn. in bulk without materially retarding the normal drying rate of the compn. in thin film form. Numerous examples are given. Cf. *C. A.* 27, 1530.

**Coating compositions.** Paul Glöckner, Josef Janoušek, and Wenzel Šuma. Austrian 136,371, Jan. 25, 1934 (Cl. 22c). A freshly boiled and filtered aq. alk. soln. of bone

glue is mixed at about its b. p. with neutralized comminuted cellulose, and a subordinate amt. of linseed-oil varnish is added to the hot mixt., with or without another filler, e. g.,  $Al_2O_3$  or kaolin, a softening agent, e. g., glycerol or castor oil, and a pigment. The compns. may be applied directly to walls, floors and other rigid surfaces or products of the linoleum type may be made by applying the compns. to flexible supports such as paper or fabric. A specific compn. is described.

**Bituminous coatings.** Adele Thielmann. Ger. 591,539, Jan. 23, 1934 (Cl. 39b. 24). The coatings consist of melted depolymerized soft rubber vulcanizates with a 10% addn. of molten mineral oil bitumen. A filling material may be added. The mass is especially suitable for coating metal objects.

**Nonchalking coating composition suitable for use on automobiles, etc.** Robert T. Hucks (to E. I. du Pont de Nemours & Co.). U. S. 1,948,580, Feb. 27. A cellulose compd. vehicle such as a nitrocellulose lacquer is used with Zr oxide as the sole white pigment in the compn.

**Apparatus for baking enamel coatings on wire.** Hal F. Fruth and Raymond L. Reading (to Western Elec. Co.). U. S. 1,947,548, Feb. 20.

**Hydroxyalkylamino compounds.** I. G. Farbenind. A.-G. Brit. 401,435, Nov. 16, 1933. See Fr. 740,410 (C. A. 27, 2318).

**Condensation products from dimethylolurea.** Martin Luther (to I. G. Farbenind. A.-G.). U. S. 1,947,997, Feb. 20. Dimethylolurea is heated in admixt. with an aliphatic alc. such as isobutanol together with a buffer substance such as phosphates; a pH of about 6.0 is maintained to form a product which may be used for lacquers, etc.

**Urea- and thiourea-aldehyde condensation products of resinous character.** Karl Eisenmann and Theodor Kollmann (to Unyte Corp.). U. S. 1,948,343, Feb. 20. Condensation is effected in the presence of a substantially anhyd. alc. such as BuOH and of an inert org. dehydrating agent such as  $CaCl_2$ .

**Resinous reaction products from diolefins and alkyl benzenes.** Charles A. Thomas (to Dayton Synthetic Chemicals, Inc.). U. S. 1,947,626, Feb. 20. A resinous product substantially free from halides and metallic compds. is formed from a diolefin and an alkyl benzene in the presence of  $AlCl_3$ , and is suitable for use in coating compns. Numerous examples are given.

**Synthetic resins.** Madhav R. Bhagwat (to Combustion Utilities Corp.). U. S. 1,948,465, Feb. 20. For producing curable resinous condensation products of the phenol-formaldehyde type from a coal-tar distillate, the distillate is caused to react with a dil. aq. soln. of a caustic alkali, thus dissolving the tar acids contained in the distillate to form a soln. of salts of the tar acids; the soln. is sepd. from

1 residual oily liquid, and is then treated with an active  $CH_3$ -radical-contg. substance such as formaldehyde.

**Synthetic resins.** Soc. pour l'ind. chim. à Bâle. Brit. 401,535, Nov. 16, 1933. See Fr. 750,025 (C. A. 28, 666<sup>9</sup>).

**Synthetic resins.** Soc. pour l'ind. chim. à Bâle. Brit. 401,589, Nov. 13, 1933. Urea- or thiourea-aldehyde condensation products are produced as covering layers on materials of various kinds, e. g., an asbestos plate, absorbent paper, a printed material, by coating (and impregnating) with a suspension of the condensation product, drying and hardening by heat and pressure. The liquid phase is a soln., in  $H_2O$  or org. solvent, of a carbamide-aldehyde condensation product. As the solid phase a powd. carbamide-aldehyde condensation product may be used in such condition that it is not dissolved but only swollen by the liquid phase. Fillers, luminous, and coloring substances and plasticizers may be incorporated with the solid phase together with bronze powder or metal filings. When the suspension is allowed to dry at ordinary temps. a compact hard layer is obtained on the support.

**Synthetic resins.** British Celanese Ltd. <sup>6</sup> Brit. 401,971, Nov. 23, 1933. Resins are prepd. by heating a resin acid, e. g., abietic acid (I), colophony, with a partial AcOH ester of a di- or poly-hydric alc., thereby esterifying the free OH group (s) of the ester. Suitable esters are mono- and di-acetin, glycol monoacetate and propylene glycol monoacetate. The resins, with or without added solvents, plasticizers, dyes, pigments and cellulose derivs., may be used in the prepn. of yarns, lacquers, films or sheets, molding compns. and adhesives, especially in the manuf. of laminated glass. In an example monoacetin is esterified with I in presence of Al as catalyst

**Oil-soluble synthetic resins.** Kenneth M. Irey (to Resinox Corp.). U. S. 1,948,469, Feb. 20. Reaction, at refluxing temp., is effected of a mixt. of a bis(4-hydroxyaryl)dialkylmethane such as  $\beta,\beta$ -bis(4-hydroxyphenyl)propane and a bis(4-hydroxyaryl)dialkylmethaneketone condensation product such as the condensation product of  $\beta,\beta$ -bis(4-hydroxyphenyl)propane with acetone with not an excess of 0.5 mol. of an aldehyde such as formaldehyde for each mol. of phenol reacted in producing a specified mixt. The resulting product is sol. in China wood oil and like oils.

**Synthetic resin compositions.** Allgemeine Elektrizitäts-Ges. Ger. 592,310, Feb. 5, 1934 (Cl. 22h. 3). Suspensions of synthetic resins in org. liquids, e. g., synthetic resin coating compns., are stabilized by addn. of a small proportion of an "organophile sol," e. g., a soln. of rubber, nitrocellulose or a polymerized vinyl ester. Specific compns. are described.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

**Identification of foreign fats in cacao butter.** Bruno Paschke. Z. Untersuch. Lebensm. 67, 79-84 (1934); cf. C. A. 27, 4702.-A further development of P.'s work, including an investigation of various fats and oils and an admixt. of some of them with cacao butter. F. L. D.

**Removal of stearin from fatty oils with liquefied hydrocarbon gases.** C. E. Adams, G. L. Parkhurst and V. Voorhees. Oil and Soap 11, 43-5 (1934).—Propane and butane have been used experimentally in concns. of 70-75% as diluents for vegetable oils and animal fats in the sepn. of stearin. The procedure is to put the oil or fat in soln., cool to  $-10^\circ F.$  and  $-30^\circ F.$ , resp., and allow to stand until the top layer becomes clear, when it is drawn off; and the diluent is removed by distn. and the oil tested for haze at  $32^\circ F.$  The process is adapted to handle large quantities of material with lower labor costs. Lower cloud points are also possible. E. Scherubel

**Determination of the rancidity of fats by the Stamm reaction.** István Korpácz. Z. Untersuch. Lebensm. 67, 75-9 (1934).—See C. A. 28, 1881<sup>4</sup>. F. L. D.

**Permanent color standards for fats, oils and other colored liquids.** J. E. Doherty and J. F. Abcarin. Oil and Soap 11, 46-52 (1934).—A new set of color standards for fats and oils is proposed to replace the present F. A. C. color standards. The following solns. are recommended: 1 to 19 F. A. C. inclusive (except 11C)—uranyl chloride,  $CoCl_2$  and  $CuCl_2$  in distd. water, 11C, 21 to 25 and 31 to 41 inclusive— $Na_2Cr_2O_7$ ,  $CoSO_4$  and  $CuSO_4$  in 0.02 N  $HNO_3$ . Nos. 27, 29, 43 and 45— $Na_2Cr_2O_7$ ,  $CoSO_4$  and  $CuCl_2$  in 0.02 N  $HNO_3$ . These standards have been tested in the Fadeometer and no fading occurred in any of the colors in 119 hrs. Some variation in color occurs with changes in temp. and extremes have to be avoided when readings are made. E. Scherubel

**Free fatty acid content of herring-meal fat.** A. Moeu. Tids. Norske Landbruk. 40, 153-7 (1933).—Herring meal of low  $H_2O$  content keeps better than that of high. Quality can sometimes be judged on  $NH_3$  content, but the  $NH_3$  content of well-dried meal may be low. In such cases the content of free fatty acids, normally about 5% of the fat,

gives a good indication of quality, being as high as 40% in samples where much decompn. has occurred. B. C. A.

A micro method for the determination of the acetyl and of the hydroxyl number of fatty acids. Otto Furth, Hans Kaunitz and Minna Stein. *Biochem. Z.* 268, 189-201(1934).—Boil about  $\frac{1}{2}$  g. fat with at least 3 times the amt. of HCl for 0 hrs. under a reflux and in a  $N_2$  atm., cool, make slightly alk. with 60% KOH, cool again and ppt. the sol. soaps with lime water. Filter off the Ca soaps, suspend the ppt. in  $H_2O$  and set free the fatty acids with HCl, warming the mixt. for a time on the water bath to secure complete decompn. of the soaps. Cool, and ext. with petr. ether in a separatory funnel. Distil off the petr. ether and dry the residu. at  $60^\circ$ . Boil the mixt. of fatty acids in a  $N_2$  atm. and under a reflux with purest  $Ac_2O$ , and ext. in a small separatory funnel with  $H_2O$  until the wash water is absolutely neutral. Now ext. the acetylated fatty acids with petr. ether, place in flat dishes and dry at about  $70^\circ$ . Place 0.2-0.3 g. of the carefully weighed substance in a 10 cc. flask with a ground-in reflux, boil 2 hrs. in a  $N_2$  stream with 4 cc. 0.5 N alc. KOH, transfer the contents quantitatively to a 10 cc. vol. flask and dil. to the mark. With 3 cc. aliquots, the material is distd. in the Friedrich app. on a boiling water bath with 25 cc. 25% toluenesulfonic acid. Distd.  $H_2SO_4$  is removed by adding starch and 0.01 N  $I_2$  to the water, and finally the distd. AcOH is treated with  $KIO_3$  and KI, and the  $I_2$  set free titrated with 0.01 N  $Na_2S_2O_3$ . The method for calcg. the Ac. no. or mg. KOH bound by AcOH from 1 g. of the Ac product is fully discussed. Cod-liver oil has an Ac value of 32-33; dog fat 9.5-12.3; human fat 25-27.

S. Morgulis

The determination of the iodine number. C. H. Liberalli. *Rev. soc. brasil. quim.* 4, 250-263(1933).—L. discusses the Hubl, Kartus, Wijs, Waller and Winkler methods. The official labs. of Brazil have accepted the Winkler method for unity in official procedure.

John Ladino

Gravimetric microdetermination of unsaponifiable matter. G. Gorbach and A. Sablatnog. *Mikrochemie* 14, 256-62(1934). Dissolve 2-3 mg. of the fat or oil, or more if less than 2% of unsaponifiable matter is present, and transfer the soln. to a small sapon. flask. After the removal of all toluene by evacuation, det. the exact wt. of the sample taken on a microbalance. The sapon. flask which is recommended has a capacity of 1-15 cc. Place this flask in a wider vessel and add to the weighed fat 0.4-0.6 cc. of a mixt. of 2 parts N NaOH in EtOH and 1 part toluene. Heat in a Pregl drying block to  $120-130^\circ$ , under reflux condensation. After an hr. remove the condenser, evap. off the alc. and toluene almost completely and add 1 cc. of cold satd.  $Ba(OH)_2$  soln. Evap. without boiling almost to dryness and dry in a vacuum at  $30-50^\circ$ . Subject the residue to extn. with low-boiling petr. ether. Minute directions are given for carrying out the entire procedure. W. T. H.

Fatty oil of *Parinarium macrophyllum* (Néon oil). Alph. Steger and J. van Loon. *Rec. trav. chim.* 53, 197-204(1934).—The consts. found for this oil were:  $d_4^{20}$  0.8901, sapon. no. 190.0, R.-M. no. 0.33,  $n_D^{20}$  1.4741, unsaponifiable 0.9%, glycerol 4.3%. The percentage compn. of the acids was: satd. acids 11, eleostearic acid 32, linoleic acid 34, oleic acid 23. The extn. of Néon oil will not be carried out on a tech. scale on account of the low oil content of the put, 5.9%, and the great difficulties connected with the removal of the very hard shell.

E. Scherubel

The properties of fatty oils at their ignition points. F. Eckert. *Fettechem. Umschau* 41, 21-5(1934).—Method: A block of  $V_2A$  steel with 4 borings 15 mm. in diam.  $\times$  40 mm. deep is built into an elec. oven so that a regulated stream of O can be introduced (Jentzsch app.). A thermometer rests in one of the borings. The elec. current is regulated to  $10^\circ$  per min. When near the ignition point, a droplet of oil is placed upon a fresh combustion disk within the borings every 30 sec. until ignition occurs. The current is then cut out but testing is continued until ignition stops; the current is again cut in and regulated to 2-3° per min.

The first ignition is considered the "point of self-ignition." Results: The fatty oils decompose at their initial ignition point so rapidly that not enough O can be supplied for combustion; this causes a break in the curve in plotting the O required against the temp. The mineral oils show no such interruption in their ignition points but simply demand more O up to a max.; they then drop off again. Several curves and 2 tables illustrate the values obtained for 8 vegetable and 3 fish oils, accompanied by a discussion of results. P. Escher

Polymerization of fatty oils. III. The boiling of linseed oil in connection with the production of turbidity in the stand oils prepared therefrom. Alph. Steger and J. van Loon. *Rec. trav. chim.* 52, 1073-82(1933); cf. *C. i.* 1, 27, 201.—Both crude and pretreated linseed oils which are free from mucin and protein show a characteristic turbidity after boiling. In the prepn. of stand oils, linseed oils undergo decompn.; the unsaponifiable ingredients thus formed are liquid and oil-sol. even at low temp. and do not cause turbidity. However, at the same time there are produced free acids which are half-solid at room temp. The higher the acid no. of a stand oil, the more turbid it becomes as a result of the presence of these free, satd., slightly sol. acids. Stand oils which contain practically no free fatty acids always show a distinct opalescence if they are cooled at ice-box temp.; at room temp. they are transparent. Possibly during the polymerization there occurs a slight enrichment in satd. acids or their glycerides, as a result of the greater decompn. of the unsatd. portions as compared with the satd. From one linseed oil was isolated the very insol. croctic acid, which caused turbidity in the unboiled oil. The lower the content of satd. acids in different linseed oils, the less turbid do the stand oils prepd. therefrom become. The glycerides which contain these satd. acids are somewhat less sol. in the stand oil than in the linseed oil and therefore sep. from the former at a somewhat higher temp. than in the unpolymerized material. Louise Kelley

Train oil and its adulterants. S. Salm. *Allgem. Oel-u. Fett-Ztg.* 30, 385-7(1933).—Several commercial mixts. labeled as "Kunsttran" or "Helltran" consist only of mineral oils mixed with not more than 10-20% of marine-animal oils. B. C. A.

Cooking cottonseed meats containing high moisture. R. H. Fash. *Oil and Soap* 10, 125-6(1933).—In general, the plan is to assist the evapn. of the excess moisture in the meats by means of open steam, either superheated or not. E. Scherubel

Recovery of palm oil in Sumatra and Java. Hans Junwirt. *Chem. App.* 20, 137-9(1933). M. C. R.

Possibilities in pecan oil. W. D. Sims. Texas Pecan Growers' Assoc., *Proc. 13th Ann. Meeting* 1933, 41-3.—For cooking purposes, pecan oil can be substituted for nearly all other cooking oils with comparable results; it clouds at a lower temp. than other cooking oils and has a lower smoking temp. than cottonseed oil. A yield of 40 lb. of oil was obtained from 140 lb. of native (Texas) pecans, crushed in the hull and extd. by the cold process. K. D. Jacob

The constituents of Menuke oil. I. Determination of the aliphatic acids. Sei-ichi Ueno and Masayoshi Iwai. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 52-3 (1934).—Phys. and chem. consts. of the oil and acids are given. The acids consist of about 12% satd. and 88% unsatd. acids. The following satd. acids were identified: myristic, palmitic and stearic acid, the palmitic acid amounting to about 70%. Unsatd. acids found were  $C_{18}H_{32}O_2$  (probably zoomaric acid), mainly oleic acid,  $C_{20}H_{38}O_2$  (gadoleic acid) and  $C_{22}H_{40}O_2$  (probably cetoleic acid). Some more strongly unsatd. acids were also found, with 18, 20 and 22 C atoms. The acids of Menuke oil are characterized by the high contents of  $C_{18}$  and  $C_{20}$  acids of the oleic acid series, which are analogous to those of herring oil. Karl Kammermeyer

Castor-oil plant, its culture and utilization in the Italian Colonies. Isaia Baldrati. *Rass. econ. colonia* (Italy) 21, 469-517, 697-749, 930-85(1933).—The various species and varieties, the yields and industrial

uses of castor-oil plants are examd. Analyses of oils from cultivated and wild *Erythraea* plants, gave, resp.:  $d_{15}$  0.9655, 0.9643; acids (calcd. as oleic) 0.16, 0.11; I no. 84.5, 85.4; sapon. no. 180, 179.1; f. p. 18-22°, 18-20°.

G. A. Bravo

The weeds of the Urals as oil-producing plants. A. A. Khrebtov and V. S. Dvornikov. *Bull. inst. recherches biol. Perm* 8, No. 6-8, 259-64 (1933).—Specimens of weeds growing in the Ural region were collected and the frequency of their occurrence and conditions of growth studied. The oil contents in the seeds of 14 specimens (half of the total no.) were detd.: *Galeopsis tetrahit* 41.8, *Galeopsis ladanum* 40.7, *Galeopsis versicolor* 40.4, *Stachys palustris* 38.0, *Brassica campestris* 34.8, *Camelina glabrata* 31.7%; and less in others.

Walter P. Ericks

A new rapid method for determining the oil in a part of the seed. A. I. Ermakov. *Bull. Applied Botany, Genetics, Plant Breeding* (U. S. S. R.) Ser. A, 7, 61-8 (1933).—The method is based upon the difference in wt. of the seed before and after extn. of oil from the seed by ether in a special app. The construction of the app. and comparative tables of results of this method and previous one are given.

V. D. Karpenko

Paper-pulp beater in oil manufacture. Fred W. Freise. *Chem. App.* 20, 125-6 (1933).—Beater engines are employed in the pulping of oil-contg. seeds and fibers for oil recovery.

M. C. Rogers

Investigation of Japanese beeswax. III. Composition of a hydroxy fatty acid. Haruichi Ikuta. *Analyst* 59, 161-2 (1934).—See C. A. 27, 5999.

W. T. H.

Montan wax and wool fat, obtaining and refining them. Leo Ivanovszky. *Allgem. Oel-u. Fett-Ztg.* 31, No. 2, Mineralöle 7, 77-87 (1934).—A review, principally of patents.

E. H.

Table of the refractive index of pure glycerol at 20°. L. F. Hoyt. *Ind. Eng. Chem.* 26, 329-32 (1934).—The  $n_D$ s of glycerol-H<sub>2</sub>O solns. have been detd. with the dipping refractometer, and when plotted give nearly a straight line. The  $n_D^{20}$  was 1.47367. The temp. coeff. averages 0.000225 from 10° to 20°.

H. E. Messinore

Utilization of soap-stock in oil refining. K. Bandau. *Fettchem. Umschau* 40, 157-9 (1933).—The pptn. of soap-stock contg. a min. amt. of neutral oil is discussed, and also the recovery of oil from stock with a max. amt. of oil.

P. Escher

New synthetic products with soap-like properties. E. L. Lederer. *Angew. Chem.* 47, 119-25 (1934).—Com. Igepon A and T pastes were examd. for soly. in H<sub>2</sub>O and org. solvents, density of aq. solns., viscosity, surface and interfacial tension, emulsifying action, foam no. and foam consistency with and without the presence of electrolytes, and salting-out processes. The results are parallel to those obtained for soap solns. The reduction of the surface tension of H<sub>2</sub>O is far greater than in the case of equally concd. soap solns., and the interfacial tension with oil is also reduced to a greater extent. The emulsifying action toward org. solvents in general is less than with soaps. Many exptl. data are presented. Igepon A and T have the following compns., resp.: active substance 45, 33.5%; soap 4, 2.5%; salts 16, 8%; H<sub>2</sub>O 35, 56%; mol. wt. 412 and 425. The active substance in Igepon A and T consists of sulfonated products; in A the carboxyl group is modified by condensation and in T by amidation.

Karl Kammermeyer

Determination of free alkali in soap base. C. Bergell. *Seifensieder-Ztg.* 61, 89-90 (1934).—A 0.15% or more free alkali content in soaps causes skin irritation; 0.05% or less causes rancidity or brown spots. Its detn. in dried soap chips by the usual methods yields misleading results, because the Na<sub>2</sub>CO<sub>3</sub> and NaHCO<sub>3</sub>, which form through CO<sub>2</sub> absorption during drying, become increasingly sol. when during titration the H<sub>2</sub>O of the standard soln. dilutes the alc. soap soln. Method: Detn. the reaction of the soap as follows: Dissolve about 2 g. in hot alc. previously neutralized to a rose tint. If the color deepens immediately and remains so on cooling, free NaOH is present; any free fatty acid usually accumulates on the surface of the chips and decolorizes the alc. soln. Detn.

of total acidity including CO<sub>2</sub>: Boil 30 cc. of neutralized alc. alc.; add from a narrow-tipped buret 10 drops (= 0.2 cc.) of 0.5 N NaOH. Dissolve 2 g. of the chips with gentle boiling, cool to 40-50° and titrate back with 0.5 N acid. Run a blank and subtract if necessary. Detn. of free fatty acids alone: Dissolve 10 g. of the sample in 100 cc. of neutral ether-alc. by shaking every 10 min. for 3 hrs. and titrate against 0.5 N alc. NaOH; run a blank, which usually requires 3 drops 0.5 N NaOH to restore the original rose tint, and subtract from the no. of cc. used for titration.

P. Escher

Estimation of alkali in soap making. R. Krings. *Allgem. Oel-u. Fett-Ztg.* 31, 17-19 (1934).—The estn. of free alkali by the depth of color caused by phenolphthalein must be carefully carried out to give reliable results. Quicker and more reliable is the old method of testing with the tongue, which detects as little as 0.2% free alkali and differentiates between 0.2-0.3 and 0.3-0.6%. Occasional checking against values obtained by titration is sufficient.

Arnold M. Collins

Persulfate soap bleaching. Paul I. Smith. *Soap* 10, 55-6 (1934).—A min. amt. of persulfate should be used and must be found by expt., but 1% should not be exceeded. The bleach should be added to soap liquor and water in a sep. container and mixed before running into the kettle. The soap should be alk. before addn. of the persulfate and preferably in a finished condition.

E. Scherubel

Gross examples of rancidification of soaps. F. Wetka. *Allgem. Oel-u. Fett-Ztg.* 30, 381-5 (1933).—Abnormally rapid rancidification and discoloration of a certain soap were traced to the use of mowrah fat (I) (which contains a high proportion of unsatd. unsaponifiable constituents) in the stock, the oxidation being accelerated by traces of Cu derived, in one case, from the bronze of the stamping machines, and, in another, from Cu which is added to give a green color to the partly bleached I used by the soap-maker.

B. C. A.

Rancidity of toilet soaps. Paul I. Smith. *Am. Perfumer* 28, 666-7; 29, 50 (1934).—A review.

E. II.

Do perfumes affect the rancidity of soaps? Monsvin. *Parfumerie moderne* 27, 363, 365 (1933).—A brief discussion showing that perfumes are never the primary cause of the rancidity of soap.

A. Papineau-Couture

Determination of perborate in washing compounds. Stiepel. *Seifensieder-Ztg.* 61, 108 (1934).—S. modifies Grun-Jungmann's method as follows: Weigh 2.5 g into a 250-cc. graduated flask, add 150 cc. H<sub>2</sub>O and shake. Add enough CaCl<sub>2</sub> soln. to ppt. the soap and Na<sub>2</sub>CO<sub>3</sub>. Fill to 250 cc. or better to 251 cc., filter through a glass-wool plug. Acidify 100 cc. with H<sub>2</sub>SO<sub>4</sub> and titrate with KMnO<sub>4</sub>.

P. Escher

Addition to contribution to washing action. E. Götte. *Kolloid-Z.* 65, 236 (1933); cf. C. A. 27, 5564.—The standard method of soiling of the cloth was previously used by Dr. Frederking at Staatl. chen Materialprüfungsamt.

Arthur Fleischer

Evaluation of foam-producing and wetting-out materials and detergents, etc. Hetzer. *Chem.-Ztg.* 57, 715-16, 735-6 (1933).—The effects on the foam test of variations in exptl. technic and in fatty acid contents of the original oil are discussed. The foam values of soaps made from tallow are greater than those of soaps derived from palm kernel oil or hardened oils, particularly if the air space in the shaking vol. is large, and for const. results this should be a min. Foam value decreases with an increase in the age of the soln. up to 12 hrs., when it becomes const., this being partly accounted for by the longer duration of contact with air. To obtain const. results, 50 cc. of fresh sample is shaken 40 times in a 120-cc. cylinder at 20° and (or) 50°, and the percentage of foam is read at 1-min. intervals over 10 min.

B. C. A.

Heating of cotton when bulked and its effect on seed [oil] (Smith, et al.) 23.

Apparatus for extracting fats or fatty oils. I. G.

Farhenind. A.-G. (Julius Voigt, inventor). Ger. 592,187, Feb. 2, 1934 (Cl. 23a. 2).

**Separating solid and liquid aliphatic acids.** Ernst Schlenker. U. S. 1,948,083, Feb. 27. For sepg. substances such as oleic and stearic acids, a sol. and an insol. soap are formed by saponifying the material with 2 different alkalies one of which includes NaOH and the other  $\text{Ca}(\text{OH})_2$ , each in a quantity insufficient for complete saponification, the resulting ppt. is sepd. from sol. soap, and the soaps are retransformed to the acids by acidification.

**Nitrogen-containing derivatives of higher aliphatic acids.** Karl Keller (to General Aniline Works). U. S. 1,947,650, Feb. 20. Compds. such as hexachlorinated ricinoleic acid, hexachlorostearic acid, chlorinated linoleic acid or a tetrachlorinated deriv. of oleic acid ethylanilide in an org. solvent such as an alc. are treated with  $\text{NH}_3$  (suitably under pressure of 18–20 atm. and at a temp. of 140–50°), with or without a catalyst, to form N-contg. products which may be used as *wetting agents* in treating textile materials or as intermediates for making other acid derivs. Several examples with details of procedure are given.

**Removing water-soluble impurities from stearic acid, etc.** Stephen Juzsa (to Standard Brands Inc.). U. S. 1,948,585, Feb. 27. An alc. soln. contg. about 5% of impure stearic acid is injected in a finely divided condition into water, and the ppt. of stearic acid is skimmed off and dried in a vacuum. Various details of procedure are described and a generally similar process may be used for the sepn. of other substances from impurities.

**Apparatus for hydrogenation of oils, etc.** Nihon Tishiryō K. K. (Aiji Honda, inventor). Japan. 99,871, March 1, 1933. Diagrammatical.

**Neat's-foot oil.** Deutsche Hydrierwerke A.-G. Ger. 567,618, Jan. 2, 1934 (Cl. 23c. 1). A substance suitable for addn. to neat's-foot oil consists of the esterified aliphatic acids of sperm oil.

**Soap.** Paul Kuller. Brit. 401,866, Nov. 23, 1933. See Fr. 743,799 (C. A. 27, 4114).

**Soap.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. (Wilhelm Schulenburg, inventor). Ger. 592,090, Feb. 1, 1934 (Cl. 23e. 4). See Fr. 746,401 (C. A. 27, 4707).

**Resin soaps.** Antoine C. Gillet. Fr. 757,571, Dec. 28, 1933. Resin soaps having a high content of free resin are made by treating the resin in the presence of a protective colloid and at a total concn. of 35–55% of resin, by an amt. of alkali carbonate corresponding to satn. of resinic acids between 25 and 55%, without agitation and near the h. p., but without boiling.

**Wetting agent.** Soc. pour l'ind. chim. à Bâle. Swiss 164,811, Jan. 2, 1934 (Cl. 24a). A wetting agent for alk. baths is prepd. by mixing a terpene alc. with a sulfonated fatty substance resisting alkali. An example is given.

**Wetting agents, etc.** Soc. pour l'ind. chim. à Bâle. Fr. 757,725, Dec. 30, 1933. Sulfuric derivs. sol. in water are made by treating with sulfonating agents the partly or completely hydrogenated condensation products prepd. on the one hand from phenols and their derivs. and on the other hand from aldehydes or ketones. Thus, (*p,p'*-dihydroxydiphenyl)dimethylmethane is hydrogenated and then sulfonated with  $\text{HClSO}_3$ . Hydrogenated products of the type of "bakelite" may also be used. The products are used in the textile, leather and rubber industry as wetting agents, etc.

**Wetting and other agents.** J. R. Geigy A.-G. Swiss 162,732 and 162,733, Oct. 2, 1933 (Cl. 36a). A wetting, dispersing, emulsifying and washing agent is obtained by treating the fatty alc. mixt. resulting from the reduction of esters of palm-nut and coconut oil fatty acids, with

glycerol monochlorohydrin. The resulting monoglycerol ether is treated with  $\text{CH}_3\text{ClCOCl}$ . The product is then treated with  $\text{Na}_2\text{SO}_3$  to give a prepn. of the above character (162,732). In 162,733, the  $\text{CH}_3\text{ClCOCl}$  is replaced by phenoxyacetic acid chloride and the  $\text{Na}_2\text{SO}_3$  by  $\text{H}_2\text{SO}_4$  or a sulfonating agent.

**Wetting and other agents.** J. R. Geigy A.-G. Swiss 165,385 to 165,400, Jan. 16, 1934 (Cl. 36a). Addns. to 162,732 (preceding abstr.). The method of 162,732 for producing wetting, emulsifying and other agents is applied to monoglycerol ether, obtained from palm nut and coconut oil fatty acids in the same way as the glycerol ether of 162,732, or to monoglycerol or monoglycerol or similar ethers of oleyl alc., cetyl alc., myristyl alc., lauric alc., etc.

**Wetting and other agents.** J. R. Geigy A.-G. Swiss 165,401 and 165,402, Jan. 16, 1934 (Cl. 36a). Addns. to 162,733 (second preceding abstr.). Oleyl alc. or cetyl alc. is esterified with phenoxyacetic acid chloride and the product sulfonated, to give a wetting, emulsifying and other agent.

**Wetting and other agents.** J. R. Geigy A.-G. Swiss 163,000 to 163,003, Oct. 2, 1933 (Cl. 36a). A prepn. for wetting, dispersing, emulsifying or washing is obtained by esterifying with  $\text{CH}_3\text{ClCO}_2\text{H}$  the fatty alc. mixt. obtained by the reduction of esters of coconut or palm-nut fatty acids, and treating the ester mixt. with water-sol. salts of  $\text{H}_2\text{S}_2\text{O}_4$  (163,000). An agent for similar purposes is prepd. by esterifying lauryl alc. with  $\text{SO}_2\text{Cl}_2$  and treating the product with the Na salt of sulfanilic acid in the presence of an acid binding agent (163,001). The salts of  $\text{H}_2\text{S}_2\text{O}_4$  of the first process may be replaced by the Na salt of sulfanilic acid (163,002). The ester of the second process may be treated with the neutralized sulfonation product of  $\text{PhOH}$ , and an acid binding agent (163,003).

**Wetting and other agents.** Chemische Fabrik vorm. Sandoz. Swiss 163,766 to 163,769, Nov. 1, 1933 (Cl. 36a). Addns. to 160,755 (C. A. 28, 670\*). Wetting, washing, emulsifying and dispersion agents are prepd. by the interaction of a sulfonating agent,  $\text{BuOH}$  and ethers of glycol or glycerol. In 163,766,  $\text{BuOH}$ ,  $\text{H}_2\text{SO}_4$  and a mixt. of isomers of chlorocresyl glycol ethers are used. In 163,767, the first two substances and a mixt. of isomers of xylene glycol ether are used. In 163,768, a mixt. of isomers of dioxylene glycol ethers, and in 163,769,  $\alpha$ -naphthyl glycerol ether, are used. Cf. C. A. 28, 1213\*.

**Wetting and other agents.** J. R. Geigy A.-G. Swiss 165,403 and 165,404, Jan. 16, 1934 (Cl. 36a). Addns. to 163,000. Washing, wetting, dispersing or emulsifying agents are obtained by esterifying oleyl or cetyl alc. with  $\text{CH}_3\text{ClCO}_2\text{H}$  and treating the resulting ester with water-sol. salts of  $\text{H}_2\text{S}_2\text{O}_4$ . The products are used for dressing and other treatments of textiles.

**Acyl polyalkylene polyamines.** Wilhelm Neelmeier, Theodor Nocken and Hermann Friedrich (to General Aniline Works). U. S. 1,947,951, Feb. 20. By condensation of varying proportions of substances such as olive oil, the ethyl ester of oleic acid, stearic acid, linseed oil, train oils, wool fat, beef fat or the like with diethylenetriamine, triethylenetetramine or the mixt. of bases obtained by the action of  $\text{NH}_3$  on ethylene chloride under 10 atm. pressure at 80–120° to form bases  $b_1$ , 90–300°, products are obtained which are oily or solid substances suitable for use as, or for making, *wetting agents*, the mono-acyl products being sol. in dil.  $\text{HCl}$ ,  $\text{HOAc}$ , alc. and fats such as linseed oil but insol. in alkalies, the mono- or mixed mono- and di-acyl products yielding strongly lathering solns. with dil.  $\text{HCl}$  or  $\text{HOAc}$ . Various examples with details of procedure are given.

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

Contribution to the history of the French sugar industry. Anon. *Betterave* 44, No. 578, 3–5 (1933). O. W. W.

Electrical control and regulation of  $p_{\text{H}}$  in sugar factories. II. V. Khainovsky. *Arch. Suikarind.* 41, III, Mededeel.

**Proefsta. Java-Sukerind.** 1157-288(1933); cf. C. A. 28, 924<sup>5</sup>.—The theoretical foundations for the construction and functioning of the various parts of the previously described recording  $p_H$  meter are discussed in detail. The new instrument is cheaper than other app. on the market, can be built and repaired on the spot, and handled by native labor. The zero point is easily kept const., a. c. may be used as a source of current and the  $p_H$  range is large and even. F. W. Zerbán

**Warehousing of sugar.** Th. van Beneden. *Arch. Suikerind.* 42, 1-9(1934).—The advantages and disadvantages of various ways of arranging the bags are discussed from the standpoint of easy control of the quantity stored. A layer of bagasse 10 cm thick, covered by bamboo matting, is recommended for heat insulation. F. W. Zerbán

**The one-solution method of analysis of sugar products.** Frederick R. Bachler. *Facts About Sugar* 28, 420 3 (1933).—The method depends upon (a) the prepn. of a sufficient vol. of the normal wt. soln. of the sugar product (20 g. in 100 cc., without the addn. of any reagents) to provide for whatever estns. are required; (b) the use of a special modification of the dipping refractometer for estimating the dry substance in this soln.; (c) the use of Horne's dry lead for defecating where required in the other estns. The refractometer has a special prism and scale with a range from  $n_D$  1.33300 at scale reading -3.0, to  $n_D$  1.37398 at scale reading 105.0, ample for any  $n$  obtainable with the normal wt. concn. The instrument is mounted on a stand and is provided with a water-jacketed Zeiss-Goldbach flow-through tube, which operates like a continuous polariscope tube, and serves also to protect the prism from injury. The method was used exclusively and without difficulty for all routine analyses involving purity estn. at Oxnard during the campaign of 1932. The reliability of the refractive dry substance readings is indicated by the fact that 3 observers always checked within  $\pm 0.02$  Brix, while duplicate dryings by 2 analysts varied by  $\pm 0.08$  to  $\pm 0.11\%$  dry substance, Brix hydrometer readings by  $\pm 0.08$  to  $\pm 0.15$ , and polarizations by 3 observers by as much as  $\pm 0.1$  from the av. M. J. P.

**Sugar-cane cultivation and present prospects of a white-sugar industry in Burma.** A. McKerral. *Burma Dept Agr., Bull.* 28, 15 pp.(1933) K. D. Jacob

**Thermophiles in refined cane sugars and their elimination.** W. L. Owen and R. L. Mobley. *Facts About Sugar* 28, 382-5(1933).—The thermophile content of refined sugars varies widely from month to month, showing no direct correlation with the thermophile content of the raw sugar from which it is made, but tending to lag about a month behind the raw sugar entering the refinery. Filter aids reduce the numbers of thermophiles more extensively than do the char filters. The production of thermophile-free sugar depends upon (a) the attainment of effective filtration and (b) the minimizing of thermophile spore accumulation by means of dust prevention and scrupulous cleanliness. Max J. Proffitt

**Filtration in the cane-sugar industry.** Filtration of first carbonation juices. P. Honig and W. Thomson. *Arch. Suikerind.* 41, 111; *Mededeel. Proefsta. Java-Sukerind.* 1289 343(1933); cf. C. A. 28, 925<sup>4</sup>.—The filtration formulas previously developed are applicable to first carbonation juices. Addn. of lime to satd. juices increases the filtration rate slightly, not enough to overcome the disadvantages of high alk. Addn. of raw juice to the satd. juice also has little effect. When the amt. of lime used in de Haan's carbonation method is varied, the sp. filtration const.  $C_v$  increases rapidly with the quantity of lime. The amt. of insol. dry substance in the satd. juice rises linearly with that of the lime. The total filtration const.,  $C_v \times \sqrt{1/\eta} \times \sqrt{1/R}$ , plotted against percentage of lime added, gives a curve from which each factory can find the amt. of lime to be used under given conditions to attain a desired speed of filtration. Rapid satn. and high alk. during satn. lower the filterability of the ppt. If a juice is first defecated, and then carbonated, less lime is required to attain the same filtration rate; on the other hand, if  $P_2O_5$  is added in connection

with carbonation, more lime must be used. Good correlation was found between the calcd. and observed filtration rates. The filterability is affected not only by chem. but also by mech. factors, such as the method of juice transportation to the presses and the age of the filter cloths. It is better technic to increase the pressure as the cake builds up than to work at const. pressure. The capacity of the usual filter-press station in Java factories is too small. F. W. Zerbán

**$p_H$  control of limed sugar-cane juices.** Jorge A. Solano. *Intern. Sugar J.* 36, 107-8(1934).—Previous attempts at Central Tuman to utilize continuous-liming devices were unsatisfactory owing to an improper mixing of lime and juice and to the dependence upon a hand-controlled stream of milk of lime. With the introduction of the Campbell Automatic Limer a thorough mixing was obtained, but it was necessary to devise a method for rapid and easy sampling of the juice, and a method of heating it in a "sample deposit box," so that it could be rapidly filtered and its lime requirements quickly ascertained. Almost complete uniformity has been obtained with this device, although the variation in the raw juice requirements for lime were as great as before. A cut of the apparatus is shown. W. L. Owen

**Use of "salfosol" in (beet) juice purification.** Emile Saillard. *Circ. hebdom. fabr. sucre Suppl.* No. 2343(1934).—The operations of 2 French beet sugar factories employing "salfosol" (a hydrosol of  $SiO_2$  and  $Al_2O_3$  with  $H_2O$ ) as a juice-purifying agent are described. O. W. Willcox

**Modified Teatini process for beet-juice purification.** Emile Saillard. *Circ. hebdom. fabr. sucre Suppl.* No. 2344 (1934).—Raw beet diffusion juice is heated to 80-85°, treated with 2.2-2.3 g. CaO per liter and then with 15 g liquid anhyd.  $SO_2$  per l., reheated to 95° and filtered; the filtrate is gassed with  $SO_2$  to reduce the alk., to 0.05 g. of CaO per l.;  $Na_2CO_3$  is added at the rate of 8 kg. to 80 hl. to throw out Ca, after which the usual routine is followed. The total amt. of CaO used is only a tenth that usually employed. O. W. Willcox

**Considerations on the Teatini process.** Pingris Priet. *Bellerave* 44, 15-17(1933).—Review, with summary of av. results. O. W. Willcox

**Juice purification by the "Mutosel" process.** K. Smoleński. *Gas. Cukrownicza* 72, 144-9(1933). The French "Mutosel" process of purifying sugar-beet juice by means of zeolites, i. e., hydrated silicoaluminates containing an interchangeable cation is a modification of earlier methods, the only innovation being the use of Al zeolites instead of the formerly used Ca zeolites. The "Mutosel" process must be regarded as still in the exptl. stage. J. Wiertelak

**Colloidal juice clarification with an alumina hydrosol.** H. C. Prinsen Geerligs. *Arch. Suikerind.* 42, 294 32 (1934); cf. C. A. 27, 3633, 4356.—This process, used in a beet-sugar factory in France, saves time, filter-press space, filter cloths and labor. It has not yet been tried on cane juice. F. W. Zerbán

**Comparative evaluation of several activated carbons.** K. Smoleński and W. Zero. *Gas. Cukrownicza* 72, 206 22, 250-63(1933).—The following activated carbons are tested: Norit Standard (I), Norit Superior (II), Carboraffin (III), Sumacarb Super Grade (IV), Hiagenit, normal (V), Hiagenit, special (VI), Carbolmel, (VII) and Hordenska (VIII). I, II and III are German, IV English, V and VI Austrian, VII a Polish charcoal prepd. from molasses, and VIII another Polish product. The results are tabulated below:

	I.	II.	III.	IV.	V.	VI.	VII.	VIII.
Moisture (air-dry)	15.50	11.91	13.46	23.05	16.13	15.38	7.30	5.40
Total ash (oven-dry)	7.42	4.31	3.13	10.85	6.87	1.22	4.75	14.07
H <sub>2</sub> O sol ash	1.85	0.34	0.83	3.51	2.08	0.41	2.02	2.80
H <sub>2</sub> O-sol substances	1.36	0.32	0.59	1.37	2.01	0.28	1.20	2.00
$pH$ of H <sub>2</sub> O extracts (H <sub>2</sub> O = 6.4)	8.6	6.1	6.1	6.2	9.4	5.4	7.4	4.1

Charcoals of the carboraffin type have a pronounced ability for adsorbing cations from solns., while those of the Norit

type adsorb only minute amts. These carbons may be divided into 3 groups: (1) those with the highest adsorption ability and the lowest filtering rate, *i. e.*, III and IV, (2) those of a medium adsorption capacity and filtering rate, *i. e.*, VII, VIII, VI, and (3) those of a low adsorption capacity and a high filtering rate, *i. e.*, II, I and V.

Conductometric pan-boiling control. S. Stare. *Facts About Sugar* 28, 451-2(1933).—See C. A. 28, 674<sup>2</sup>.

Commercial analysis of molasses. Emile Saillard. *Circ. heb. fabr. sucre Suppl.*, No. 2341(1933).—A method is described for quant. fermentation of beet molasses. S. notes that the direct polarization of the slop after defecation with Pb subacetate is equal to the acid polarization after inversion, which is held to prove that the rotation of the active nonsugar is not changed by the inversion with HCl.

Starch. II. Amylose and amylopectin. 2. Sukeharu Nishimura. *J. Agr. Chem. Soc. Japan* 9, 767-70(1933).—When malt amylase soln. was heated at 70° for 10 min. its amylolytic power decreased markedly. It converted amylose and amylopectin, in 15 min. at 25°, to H<sub>2</sub>O-sol. forms. The hydrolysis of amylose was more rapid and more complete than that of amylopectin. Cf. C. A. 26, 5783.

Molecular complexity of amylose in potato starch. J. Reilly, P. A. O'Donovan and H. Murphy. *Sci. Proc. Roy. Dublin Soc.* 21, 37-42(1934).—Amylose extd. with H<sub>2</sub>O from potato starch, pptd. with alc. and dried over CaCl<sub>2</sub>, loses 9.8% moisture on exhaustive drying, and then contains 0.85% ash, 44.24% C and 6.09% H

(ash-free basis); it gives a mean mol. wt., (cryoscopically, in AcNH<sub>3</sub>) of 342;  $[\alpha]_D^{25} = 150$  (5% NaOH soln.).

Importance of potash for the nutrition of the sugar beet (Engels) 15. Field expts. with sugar cane (Williams, Follett-Smith) 15. Nutrition of the sugar cane (van den Honert) 15. Localization of fatty oils and starch in cells of cultivated beets (Kopul-Gomolyako) 11D. Rept. of the Water Pollution Research Board [beet-sugar factory effluents] (Robertson, Calvert) 14. Deposits caused by impurities of boiler water [of a sugar plant] (Reicher) 14.

Washing and clarifying plant for sugar beet, etc. Carl Ulrich. Ger. 591,964, Jan. 30, 1934 (Cl. 89a. 2).

Vacuum pan control system adapted for use in boiling sugar juices. Walter E. Smith. U. S. 1,948,052, Feb. 20. A water boiler is provided in which a pressure identical with that in the vacuum pan is maintained; elec. resistance thermometers are located in the pan and boiler, and a temp.-difference-indicating device in circuit with the thermometers serves to indicate the b. p. elevation of the liquor in the vacuum pan. Various details of app. are described.

Cooker for sugar juices, etc. Paul Knichalik. Ger. 590,277, Dec. 29, 1933 (Cl. 89e. 2). Addn. to 579,621 (C. A. 28, 1213<sup>4</sup>).

Device for moistening sugar completely dried during refining. Zuckerfabrik & Raffinerie Aarberg A.-G. and Alois Rölz. Swiss 165,499, Feb. 1, 1934 (Cl. 32d).

## 29—LEATHER AND GLUE

ALLEN ROGERS

Chemistry of the animal skin and the problem confronting the tanner. Dorothy Jordan Lloyd. *J. Intern. Soc. Leather Trades Chem.* 18, 144-51(1934).—A review.

H. B. Merrill

Chemistry of skin and catechin tannin. M. Bergmann. *J. Intern. Soc. Leather Trades Chem.* 18, 159-65(1934).—Action of trypsin on collagen and tanned leather is used to elucidate mechanism of tanning. The "Trypsin Index" (percentage digested) of leathers varies widely. It is lower for leather tanned with natural quebracho than for leather tanned with either sulfited quebracho or a mixt. of quebracho and  $\beta$ -naphthalenesulfonic acid.

H. B. Merrill

Tannins and their behavior toward proteins. K. Wreudenberg. *J. Intern. Soc. Leather Trades Chem.* 18, 152-5(1934).—Tanning takes place in 3 steps: (1) formation of mol. compd. between phenolic OH of tannin and N group of protein; (2) permeation of tannin into the fiber; (3) polymerization of tannin to form insol. compds.

H. B. Merrill

Combination tannage for upper leather. J. A. Sago-schen. *Cuir Rech.* 23, 37-8(1934).—Unhaired and bated skins are pickled with alum and salt, tanned with gambier, lightly oiled with fish oil and neat's-foot oil and retanned with sumac, chestnut or sulfited quebracho. They are then fat-liquored with moellon, olive oil, fish oil, soap and borax, and colpred and finished.

H. B. Merrill

Use of trisodium phosphate in tanneries. M. Querciois. *Cuir tech.* 23, 57(1934).—Suggested uses are as a water softener, neutralizing agent and soaking agent for dry skins.

H. B. Merrill

Simplification of the filter method [of tannin analysis]. J. v. Schroeder. *Collegium* 1933, 631-3.—A filter tube is preferable to the Procter bell.

I. D. Clarke

Manufacture of leather cloth. A. Jones. *Synthetic and Applied Finishes* 4, 208-11(1933).—A brief description.

B. C. A.

Constitution of tannins (Russell) 10.

Tanning extracts. The Forestal Land, Timber & Railways Co. Ltd., Andrew Turnbull and Frederick B. Hobson. Brit. 402,126, Nov. 27, 1933. Vegetable tanning exts. are decolorized by treatment with a hot aq. soln. contg. H<sub>2</sub>SO<sub>4</sub> and HCOOH. A temp. of 90-95° is preferable.

Phenol ethers (tanning substances). Georg Kränzlein and Arthur Voss (to I. G. Farbenind. A.-G.). U. S. 1,948,607, Feb. 27. A substance such as a Na benzyl-chloride sulfonate is caused to react with a phenol, and the product obtained is condensed with formaldehyde to obtain a phenol ether easily sol. in water and alkalies, pptg. gelatin and giving characteristic colorations with ferric salts.

Treatment of hides or leather. I. G. Farbenind. A.-G. (Richard Alles, inventor). Ger. 592,224, Feb. 3, 1934 (Cl. 28a. 3). Addn. to 589,175 (C. A. 28, 1567<sup>4</sup>). The compds. of Cr salts with urea, used in the process of Ger. 589,175, are replaced by complex compds. of Al salts with urea. Examples are given.

Leather. I. G. Farbenind. A.-G. Brit. 401,481, Nov. 16, 1933. Tanned or nontanned hides and furs are treated with aq. solns. of compds. of formula RCOXR'SO<sub>2</sub>Z, in which R is an aliphatic radical having more than 8 C atoms, X is O, NH, N-alkyl, N-aryl or N-aryl, R' is an aliphatic radical and Z an alkali metal, NH<sub>4</sub> or H. R and R' may be substituted, but R' must not contain a sulfonic group. Such compds. have a tanning and greasing effect, but addnl. tanning agents and greasing agents may be added. The compds. readily emulsify oils and fats and may be used in dye baths, whereby the leather is both dyed and tanned. They may also be used in tanning with basic dyes. In examples (1) sheep pelt, pretreated and bated in a soln. contg. H<sub>2</sub>SO<sub>4</sub> and NaCl, is treated in a bath contg. the reaction product of the fatty acid chloride of train oil and hydroxyethanesulfonic acid, and (2) chrome-tanned cowhide is greased with an emulsion comprising mineral oil, neat's-foot oil, soap, H<sub>2</sub>O and the reaction product of (1), the emulsion being added to a dye bath or forming a sep. bath. The provisional application

- also covers the subject matter abstracted in Fr. 743,517 (C. A. 27, 3851) and U. S. 1,927,910 (C. A. 27, 6012).
- Tempering leather.** Horace S. Pochin. U. S. 1,948,984, Feb. 27. The leather is immersed in water and subjected to a vacuum, the vacuum is broken during immersion and is subsequently reestablished before immersion is completed, and the leather is finally withdrawn from the water and the vacuum gradually broken. App. is described.
- Reducing frothing in operations such as leather dressing,** etc. Arthur Macarthur and Alexander Stewart (to Imperial Chemical Industries Ltd.). U. S. 1,947,725, Feb. 20. An antifothing agent is used contg. a water-insol. soap such as Al stearate and a mixt. of the liquid (c)-contg. compds. b. 195° and higher obtainable as a by-product in the synthesis of MeOH from CO under pressure.
- Leather substitute.** Seiichi Yamamoto. U. S. 1,949,034, Feb. 27. The bark of *Artocarpus kunsi* ("Kavutaru") is opened, and the resulting coarse network is pasted together with rubber material which forms a coating for the product, which is suitable for floor covering or various uses as a leather substitute, etc.
- Artificial leather.** Soc. anon. Prodotti salpa e affini S. A. P. S. A. Austrian 136,258, Jan. 25, 1934 (Cl. 28b). Waste hide or leather is neutralized, e. g., with borax or NaHCO<sub>3</sub>, and comminuted in water to form a fibrous suspension, which is treated with a tanning agent, e. g., sumach, and then with latex and a salt, e. g., NaCl, and finally worked into a sheet on a paper-making machine. Not more than 1 hr. should elapse between the addn. of the latex and the production of the sheet. K-Na tartrate and an oil or fat, with or without an emulsifying soap, may be added to the suspension before addn. of the tanning agent. Specific compns. are described.
- Suede leather having a high polish.** Meyer Weyner. U. S. 1,949,384, Feb. 27. Suede leather is prepd. with a content of less than 1% of fat liquor and a wax polish upon the nap.
- Oxidized linseed oil suitable for use in making "artificial leather,"** etc. Alexander Schwarzman (to Spencer Kellogg and Sons, Inc.). U. S. 1,949,028, Feb. 27. A product sol. in turpentine substitutes and miscible in all proportions with mineral oils is prepd. by quickly and briefly heating linseed oil to about 315° (the heat treatment being insufficient to produce substantial bodying and to decrease the I value) and then rapidly cooling the heated oil to about 160° and air-blowing it.
- Apparatus for making small pieces of gelatin or glue.** G. Eberlein's Sohn. Ger. 592,333, Feb. 6, 1934 (Cl. 24, 8).

### 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

- Scientific progress in the field of rubber in 1929-1933.**
- A. Natural rubber.** R. Pummerer. *Angew. Chem.* 47, 111 19(1934). A review dealing with latex, rubber as cheap raw material, its fractionation and crystn., its state in solns., phys. tests for detg. its mol. wt., its chem. reactions, the addn. of halogens, its reaction with C(NO<sub>2</sub>)<sub>4</sub> and PhNO, its thermal decompn., O<sub>2</sub> splitting, autoxidation, protection against aging, vulcanization and polymerization. Seventy references. K. K.
- Nonangular thin rubber fibers from latex.** Review of the most important methods of preparation. W. Schlitt. *Kolloid-Z.* 66, 252 4(1934).—Patent review. Arthur Fleischer
- Dipped goods from latex solutions.** George D. Kratz. *India Rubber World* 89, No. 6, 33-4(1934).—A discussion of the chemistry and technology of dipped goods manuf. leads to the conclusion that latex will eventually displace cements for most dipping processes. C. C. Davis
- Some experiences with chlorinated rubber.** Wilhelm Krumblhaar. *Official Digest Federation Paint Varnish Production Clubs* No. 133, 33-8(1934). The best solvents for chlorinated rubber are the aromatic hydrocarbons, the best plasticizers are the soft alkyds, chlorinated naphthalenes and some synthetic oils. The advantages and disadvantages of chlorinated rubber coatings are discussed. G. G. Sward
- Physical properties of rubber at low temperatures.** S. Ilvostovskaya and V. Margaritov. *J. Rubber Ind.* (U. S. S. R.) 10, 231-41(1933).—A simple app. was constructed to det. the mech. properties of rubber at -20°—-80°. A series of tests with various rubber mixts. was made. The most important conclusions are that total loss of elasticity takes place at temps. below -55°; a shorter time of vulcanization at relatively high temps. increases the resistance of rubber to cold; generally, fillers reduce the resistance to low temps.; mixts. with the best cold-resisting properties are obtained with ZnO and chalk. James Sorrell
- The electrodeposition of rubber on a zinc anode.** B. Dogadkin and D. Sandomirsky. *Rev. gén. caoutchouc* 10, No. 97, 17-20(1933).—During the electrophoresis of rubber on a Zn anode in a weakly alk. latex (below 2% NH<sub>3</sub>) there is a sudden drop in the current and a corresponding diminution of the rate of deposition of rubber, and after a short time the deposition practically ceases. On the other hand, in a strongly alk. bath, i. e., above 3% NH<sub>3</sub>, the rate of deposition remains practically const.
- The addn. to the latex of salts whose anions form sol. compds. with Zn reduces considerably the magnitude of this drop in the current. This was true of NaCl, KNO<sub>3</sub>, Na<sub>2</sub>SO<sub>4</sub>, KSCN and NaOAc, which form salts that diffuse into the rubber film, as shown by ash detns. of the latter. The electrodeposition of rubber on Zn electrodes surrounded by a plaster or glass diaphragm takes place at a practically const. rate, independent of the concn. of alkali in the latex. Addn. to the bath of salts whose anions form insol. compds. with Zn has no influence on the electrophoresis, i. e., the rate at which rubber is deposited diminishes as suddenly as with latex contg. no NH<sub>3</sub>. This was true of Na<sub>2</sub>SO<sub>4</sub>, K<sub>2</sub>Fe(CN)<sub>6</sub>, K<sub>2</sub>HPO<sub>4</sub> and (NH<sub>4</sub>)<sub>2</sub>C<sub>2</sub>O<sub>4</sub>. The action of salts of the 2nd group and the action of alkalis are explained by the nature of the phenomenon at the anode and by the structure of the film of rubber deposited, i. e., by the formation of a compact, nonconducting film of rubber and insol. Zn salts, combined with proteins and other serum substances by adsorption. C. C. Davis
- The temperature coefficients of viscosity of liquids in relation to the structure of rubber in solutions.** Warrey F. Busse and Enoch Karrer. *Kolloid-Z.* 65, 211-23(1933).—Dunn's (cf. C. A. 21, 1388) equation,  $\log 1/\eta = A/T + B$ , where  $\eta$  is the viscosity,  $T$  the abs. temp., and  $A, B$  are const., is derived from the Maxwell viewpoint that viscosity is a measure of the velocity with which the potential energy, stored in the material by the shear force under conditions of laminar flow, is transferred to heat. This energy factor is represented by  $A$ , while  $B$  is a factor depending on the weight, form, size, etc., of the moving mols. or complexes. The equation applies only to reversible thermal changes. The irreversible changes were held as small as possible in the expts. The results on rubber solns. are expressed as kinematic values, whose temp. coeff. is not appreciably different from the abs. values, since the expansion coeff. is small. For 0.25 and 5% solns. of bleached crepe rubber, milled 15 min. under 200 lb. load, the equation applied from -10° to 60°, in toluene, turpentine, toluene-turpentine mixts., bromobenzene, CHCl<sub>3</sub>, and xylene, but not for ether solns. which are slowly transformed to a white firm mass on cooling.  $A$  increases with concn., while  $B$  decreases. Fluidity is practically a linear function of mech. working of the rubber. After prolonged heating at high temp. the viscosity does not return to the original value on cooling because of the effect of traces

of  $O_2$  left in the solvent. Since the equation does not contain a mol.-wt. term, changes in viscosity cannot be ascribed to rubber polymerization or to  $\alpha$ - $\beta$  transformation. When the equation does not apply, the change is due to changes in the no. of mol., and degree of solvation or aggregation. The validity of the equation does not form a criterion as to whether the soln. is a true soln., or contains solvated mol., micelles or mech. mol.

Arthur Fleischer

**The transformation of rubber during "rest."** B. Dogadkin and K. Berezan. *J. Rubber Ind.* (U. S. S. R.) 9, 198-205 (1933).—The extent of recovery of "nerve" in smoked sheet during rest was studied. Smoked sheet milled from 5 to 23 min. was allowed to rest. Samples were taken from each large sample after 0.5 to 10 hrs. and placed at once in  $C_6H_6$  in dark bottles, which were shaken from time to time, soln. taking 4-5 days. The capillary test of Greinert and Behre (cf. *C. A.* 20, 2095) was used with 9.5%  $C_6H_6$  solns. The nerve, expressed as sq. mm. area of filter paper wet by the soln., was 7500 for unrolled sheet, 5000 for sheet rolled 15 min. and 4450 for sheet rolled 23 min. The recovery of nerve during rest was found to be very slight, and occurred during the first 2-3 hrs. Similar results were obtained by viscosity tests with 0.8% solns. in  $C_6H_6$  at 25° in an Ostwald viscometer, with a pressure-gage connection. This test was based on the decrease in viscosity at increased pressures shown by colloid solns. which contain non-spherical dispersed particles. Calculs. were made by the formula of de Woele-Ostwald.  $dl/dt = RP^2/\eta$  ( $P$  = pressure;  $\eta$  = viscosity at pressure  $P$ ;  $t$  = time,  $l$  = distance) for structural colloids. The plotted results showed a flattening of the curves for samples taken from sheets that were milled longer, indicating a loss of nerve and a tendency to recover the original shape for samples taken from sheets after rest. Surface-tension detns. were made by a stalagmometer, but the results were unsatisfactory.

James Sorrell

**The resistance of anisotropic rubber sheets to cutting and to tearing.** F. Kirchhof. *Kautschuk* 9, 130-4 (1933). Expts. with films prep'd. from latex are described, a technic which made it possible to avoid the effects of mastication. Films from latex contg. shellac resin NII, soaps showed considerable resistance in all directions to tearing, but after repeated elongations became anisotropic and could be cut and torn more easily longitudinally. Films which after being stretched were warmed to 80° behaved similarly. This anisotropy brought about by stretching is also manifest in x-ray diagrams. In contrast to this, films which contained no shellac but which had been racked and warmed showed no anisotropy, while in the racked condition there was a ready sepn. into fibers, as observed by Feuchter (cf. *C. A.* 20, 1149). Shellac must, therefore, fix in position the rubber particles deformed by stretching. It is proposed to distinguish the resistance of a unidirectional anisotropic rubber sheet to tearing in this direction from its resistance to cutting by characterizing the former as the resistance to sepn. The latter can be expressed in g. per mm. of thickness. Shellac also had a great reinforcing and stiffening effect on evapd. latex films, and increased considerably the permanent elongation after stretching.

With high proportions of shellac, the mixts. resembled balata. This toughening effect of shellac does not persist through vulcanization, and the mere heating of a raw film to 80° destroys it to a large extent, with formation of thermoplastic products. These phenomena are explained by the fact that in rubber-shellac mixts. each latex particle is enveloped by an adsorbed shellac film, which makes a structure which is isotropic in all directions.

On stretching, the particles are deformed, and the enveloping films are ruptured and coagulated by internal friction. The less the adsorption and degree of dispersion of the shellac, the less the disturbance of the cleavage planes (boundary of the particles) in the direction of stretching, with resulting greater tendency to rupture and less resistance to tearing in this direction. Conversely the greater the adsorption, the greater the absorption of

energy by the rubber and the stronger the latter. Though true calender grain is to a large extent destroyed by heat before vulcanization, the mill grain persists after vulcanization because of the rigidity of the oriented particles, so that anisotropy as judged by cutting, tearing, tensile strength and extensibility is found in some vulcanized sheets. A technic for measuring the tensile strength and resistance to tearing of thin calendered sheets is described.

C. C. Davis

**The oxidation of rubber. III. The Russell effect from rubber.** A. van Rossem and J. H. B. Hessels. *Kautschuk* 9, 181-4 (1933); 10, 4-7 (1934); cf. van R. and Talen, *C. A.* 25, 5795; 26, 334.—The object was to det. whether the Russell effect (R. e.) will detect the 1st stages of oxidation of raw rubber, and whether it can be utilized to detect incipient oxidation in vulcanized rubber. The samples were placed in direct contact with very sensitive photographic plates for 17-18 hrs., then developed and fixed. After raw rubber has been exposed to light and air, its ability to show a pos. R. e. depends upon: (1) the components of the smoke; (2) its tackiness and (3) its acetone ext. Smoked sheet gives a strong R. e. as a result of the presence of substances acquired from the smoking, whereas Para gives no R. e. because the particular smoke does not contain the requisite active compds. Most crepes (nontacky) show only a slight R. e., but after acetone extn. and then long exposure they become tacky and show an increased R. e. The acetone ext. of rubber shows a strong R. e., and its addn. to unextd. rubber increases the R. e. of the latter. However, rubbers whose acetone exts. give a strong R. e. do not necessarily show any R. e. themselves, perhaps because the concn. of acetone-sol. components is insufficiently high. At 80° rubber loses most of its R. e., indicating the volatility or decompn. of the active compds. After exposure to  $O_2$  (instead of light) rubber loses its R. e. from 30° to 60°, indicating that the peroxides are different in the 2 cases. Antioxidants do not influence the R. e., but  $NaHSO_3$  diminishes it considerably ( $Na_2SO_3$  has no effect). Neither mastication nor heating previous to exposure to light influences the R. e., nor does the addn. of S, ZnO or most org. accelerators influence it, but the simultaneous presence of S and most accelerators almost destroy the R. e. Only mercaptobenzothiazole weakens it without the aid of S. On the other hand, treatment with S and accelerator after exposure to light does not influence the R. e., showing that the active compds. are formed by light and air. Vulcanized rubber (normal, over-cured or oxidized naturally) of various compns. shows a very weak R. e., so that the latter is of no value for detecting incipient oxidation or a tendency to oxidize. On the other hand, after exposure to air contg.  $O_3$  (below 1.01%  $O_3$ ) both raw rubber and vulcanized rubber showed a very strong R. e., and therefore Hg-vapor quartz lamps are not suited to expts. on the R. e., because  $O_3$  is formed.

C. C. Davis

**Experimental study of "Agerite" as an antiaging agent in rubber.** N. Chesnokov. *J. Rubber Ind.* (U. S. S. R.) 9, 400-13 (1933).—The values of aldol- $\alpha$ -naphthylamine ("Agerite") as an antiaging agent for rubber and as a softening and dispersing agent for C black rubber mixts. are discussed. Light crepe of different consignments varied considerably in aging, independently of the resin content or acid number. "Tau-saguz" (Russian plant rubber) was inferior to smoked sheet and hard Para rubber in its resistance to aging, but showed a marked increase in resistance with Agerite. Rubber with the highest resistance to tearing does not make an article with the longest life. At the proper state of vulcanization, a rubber mixt. should have a fair resistance to tearing and the highest resistance to aging. Phenyl- $\beta$ -naphthylamine had the same action on rubber as did Agerite.

James Sorrell

**Titanium fillers in rubber mixtures.** V. Kreps. *J. Rubber Ind.* (U. S. S. R.) 9, 305-7 (1933).—The distribution and extent of Ti ores of industrial importance in U. S. S. R. are estd. Because of the properties of Ti white, and for economic considerations, its manuf. and

use by the U. S. S. R. rubber industry are urged.

**Compounding of benzene-resisting and oil-resisting rubber mixtures.** V. Kartzev and A. Golubev. *J. Rubber Ind.* (U. S. S. R.) 10, 301-11(1933).—A study of the swelling of rubber in org. solvents and the effect of the compn. of the rubber on its resistance to swelling. Mixts. contg. different ingredients were immersed in benzene (for 24 hrs.) and in lubricating oils (for 48 hrs.); the extent of swelling was detd. and expressed as the percentage gain in wt. The ingredients tested included "GET" black, "Maikop" black, kaolin, ZnO, CaO, MgCO<sub>3</sub>, MgO, chalk, lithopone, talc, infusorial earth, S, horn dust, mica, graphite, animal glue, etc. The results of these tests are given in 48 diagrams and show that to prep. benzene- and oil-resisting rubber mixts. the S should not exceed 10-15%; the addn. of "GET" black, Se, "Neozon D" and "Agerite" gives excellent results; and lime, lithopone, infusorial earth and horn dust are of no benefit.

**Combination of gas black and inorganic fillers in SKB rubber mixtures.** A. Ermolaev and A. Bobrov. *J. Rubber Ind.* (U. S. S. R.) 10, 130-6(1933).—The possibility of substituting kaolin, lithopone, ZnO, talc, infusorial earth and molten chalk for gas and lamp blacks in Na-butadiene rubber mixts. is studied. Addn. of 15-25 vols. of kaolin to rubber contg. 10 vols. of black increased the resistance to tearing. Addn. of 15-25 vols. of kaolin to mixts. contg. 20-25 vols. of black had no effect on the resistance to tearing, while further addn. of kaolin reduced it. Addn. of 15-25 vols. of lithopone to mixts. contg. 10 vols. of black had no effect on the resistance to tearing of rubber, while the same vol. in 20-25 vols. of black mixt. reduced it. Addn. of talc and ZnO in combination had the same effect as lithopone. Addn. of infusorial earth and chalk reduced the resistance to tearing.

**Determination of sulfur in rubbers by oxidation with aqua regia.** A. Serebrennikov. *J. Rubber Ind.* (U. S. S. R.) 10, 243-6(1933).—To det. S in raw rubber, add to 0.5-g. sample of finely cut rubber 15 cc. of aqua regia (HNO<sub>3</sub>, d. 1.4; HCl, d. 1.19), heat, evap. to the consistency of honey, add 3-5 cc. of HCl, evap. to dryness; dissolve in dil. HCl soln., filter, dilute, neutralize with NH<sub>4</sub>OH, acidify with HCl and ppt. from hot soln. with 1% BaCl<sub>2</sub>. The detn. of S in vulcanized rubber is carried out with some minor modifications, e. g., MgO is added to the sample before treatment.

**Asphalt-rubber-mixtures.** F. C. van Heurn and M. A. Begheyn. *Kolloid Z.* 66, 219-28(1934); cf. C. A. 25, 5810; 26, 4731.—The types of mixts. which are possible are classified on the basis of their method of prepn. and are, (1) mill-mixed with less than 20% of rubber, (2) mill-mixed with greater than 20% rubber, (3) mixing latex and asphalt emulsions, then drying or coagulating, (4) evapn. of a mixt. of molten asphalt and rubber soln. and (5) direct soln. of finely divided rubber in molten asphalt. Mixes were prepd. by method five. The soly. time decreased from 480 min. at 160° to 40 min. at 260°. There is a linear decrease in free rubber content by the ebontite test, with increased temp. The tendency to flow is least for mixts. prepd. at 140°. Flow was measured by the distance moved in 20 hrs. when a coated plate was placed at an angle of 45° in an oven at 100°.

**Apparatus for studying the effect of cold on rubber.** Jeannin and Maugras. *Rev. gén. caoutchouc* 10, No. 97, 3-4(1933).—The app. which is described and illustrated will chill small samples to -35° by the forced evapn. of a very volatile liquid, e. g., Et<sub>2</sub>O, from an insulated jacket surrounding the chamber contg. the samples. The loss of liquid by pumping is replenished automatically, and it is possible to cool the samples in any gas. The app. is also useful for studying the freezing of salt solns. and of oils and for measuring eutectic points.

**Adhesion of rubber to metal objects.** Lucien Ernaux. *Rev. gén. caoutchouc* 10, No. 97, 5-9(1933).—Tests of various methods of adhering rubber to metals showed that

the best general method is to coat the metal with brass by the galvanoplastic process. Preliminary sanding gives poor adhesion, and it is recommended to clean the surface by successive immersions in electrolytic alk. (hot) and acid baths, and a final rinsing in a cyanide bath, with inversion of the current twice per min. for 4-5 min. Brass-plating is then effected in a cyanide bath at 38° with a c. d. of 0.5-0.6 amp. per sq. dm. until the film is 0.00125-0.00150 mm. thick, after which the surface is washed with boiling water and dried at 65°. No As, Sb, Bi or Pb should be present in the bath. The surface should be rubberized immediately or else protected by a varnish. The best results are had with electrolytic brass contg. 70% Cu, and both a little below and above this value, the adhesion becomes poorer. Not all types of rubber mixts. adhere to the same degree, and it was found that the inclusion of considerable ZnO, some white, factice and diphenylguanidine or mercaptobenzothiazole as accelerator gives favorable results. A technic for measuring the adhesion is described.

**Standardizing and control instruments in the rubber and cable industries, and vulcanization by pressure and temperature.** M. J. Mohr. *Kautschuk* 10, 1-4(1934).—A review and discussion.

**Wire and cable stocks. The evolution of rubber insulation compounds.** F. B. Wilson. *India Rubber World* 89, No. 6, 28(1934).—Historical, including present-day chem. developments.

**Rubber printing plates.** Joseph Rossmann. *India Rubber World* 89, No. 4, 37-8; No. 6, 35-6(1934).—A review of various patents.

**A shearing-disk plastometer for unvulcanized rubber.** Melvin Mooney. *Ind. Eng. Chem., Anal. Ed.*, 6, 147-51(1934).—In the new app., the sample is sheared between the surfaces of a rotating disk and a stationary chamber surrounding the disk. To prevent slippage the rubber is kept under a confining pressure and the surfaces which shear it are roughened. The stator chamber is made in 2 sections which close together by a powerful lever system, and in doing so they automatically cut and form the sample of rubber. A complete plasticity measurement, including heating the sample, can be made in 3 min. The measurement obtained, called the *shearing viscosity*, is proportional to the mean abs. viscosity of the sample.

**Rubber erasers.** A. Hutin. *Rev. gén. caoutchouc* 10, No. 97, 26-7(1933).—Various formulas are given to obtain products of different qualities.

**Isoprene and rubber. XLI.** The hydrogenation of rubber and balata. H. Staudinger and E. O. Leupold. *Ber.* 67B, 304-11(1934); cf. C. A. 27, 2843.—The viscosity of solns. and therefore the chain length of rubber or balata remains const. upon partial or complete hydrogenation under mild conditions. The purified hydrocarbons were hydrogenated at 100 atm. and 100° in dil. O-free hexahydrotoluene solns. with 5-10 times their weight of Ni catalyst. Hydorrubber possesses the elastic properties of rubber. Both hydorrubber and hydrobalata are relatively resistant to oxidation but the former deteriorates upon 1 yr. of exposure to air and light.

**The heat treatment of synthetic sodium butadiene rubber.** M. Farberov and F. Merzlikin. *J. Rubber Ind.* (U. S. S. R.) 10, 123-5(1933).—A preliminary report on expts. to reduce plasticity of synthetic Na butadiene rubber (produced by U. S. S. R. plants), a property which makes its milling in the usual way impossible. Treatment of this rubber with dry steam in a vulcanizer and then drying in a vacuum drier were tried in order to reduce plasticity. A gas black mixt. from this product had a plasticity 20% lower, no longer had a disagreeable odor, was calendared without difficulty, and showed a 5-10% increase in its resistance to tearing.

**Scorching of mixtures of sodium butadiene and SKB rubber.** P. Kaplin. *J. Rubber Ind.* (U. S. S. R.) 10, 139-41(1933).—Expts. showed that Na butadiene and "SKB" rubber and their mixts. are inclined to scorch. The degree of scorching depends on the plant equipment

and the heat treatment of the synthetic rubber.

**Organic accelerators in mixtures with "Tau-saguiz" rubber.** V. Maslov. *J. Rubber Ind.* (U. S. S. R.) 10, 147-57 (1933).—The elasticity and the resistance to tear of "Tau-saguiz" (Russian plant rubber) contg. 0.5% diphenylguanidine were approx. those of medium crepe, but were considerably lower with 1.0% of this accelerator. The rate of vulcanization of "Tau-saguiz" is about the same as with crepes, while aging properties are poorer.

**Accelerators of vulcanization.** F. Jacobs. *Caoutchouc et gutta-percha* 30, 16669-71 (1934); cf. C. A. 28, 2217. Diithiocarbamates are reviewed.

**Low-temperature vulcanization.** T. E. H. O'Brien. *Trop. Agr.* (Ceylon) 81, 361-5 (1933).—The exptl. prepn. of self-vulcanizing crepe rubber is described. Dil. the fresh latex to 3 lb. of dry rubber/gal. and treat with 1 part of  $\text{NaHSO}_3$ , added in the form of 5% soln., to 200 parts of rubber. The vulcanizing ingredients are 3 lb. of  $\text{ZnO}$ , 1.5 lb. of S, 0.75 lb. of accelerator ( $\text{Zn}$  or  $\text{Na}$  diethyldithiocarbamate) and 0.5 lb. of coloring matter (Vulcafor). The wetting ingredients are 0.25 lb. of vulcastol A paste or 1.25 lb. of saponin dissolved in 1.5 gal. of  $\text{H}_2\text{O}$ . The coagulant is 3.25 lb. of alum in 3.25 gal. of  $\text{H}_2\text{O}$ . Thoroughly grind the vulcanizing ingredients into a cream with the soln. of wetting agent and slowly add the cream to the latex with vigorous stirring. Add the alum soln. and stir until thickening occurs. After 1 hr. the thick paste forms a coagulum when stirred. It is preferable to machine the coagulum within a few hrs. but it can be left overnight. The rubber is made into lace crepe and air dried within 3-4 days. Dry rolling is done 12-14 days after prepn. and the rubber is made into laminated sheets by the usual Ceylon sole crepe method. The product, suitable for table mats, bath mats, etc., resists heat and sunlight and absorbs  $\text{H}_2\text{O}$  less readily than raw rubber. Tests showed that alum was a better coagulant than  $\text{HCO}_2\text{H}$  for this type of mixing and that  $\text{NaHSO}_3$  assisted vulcanization and improved the color of the product.

**Heat changes in the vulcanization of rubber.** I. Qualitative test by way of comparison. Hukio Horie and Kikuo Morikawa. *J. Soc. Rubber Ind. Japan* 7, 5-11 (1934).—To 100 parts untreated raw rubber (I), a substance (II) free from resin and pure raw rubber (III), 5, 10, 15 and 20 parts of S, resp., are added; they are milled 10 times on rolls and pressed to 0.5 mm thickness. Samples are then heated in an oil bath at  $180 \pm 0.2^\circ$  and the change in temp. is noted. There was little or no change in temp. in samples without S. In samples compounded with S, there was but 1 exothermic point during the heating and the max. temp. attained by  $\text{I} > \text{II} > \text{III}$ ; the time required to reach a max. temp. by  $\text{III} > \text{I} > \text{II}$  and it was shortened by an increased use of S, except that of a sample with 10% S. The presence of nitrogenous matter was rather injurious to the vulcanization process until it reached 5% combined S, but it was necessary to obtain more than 5% of combined S. It is evident that the substance which accelerates the vulcanization process is a nitrogenous substance and not a resinous substance.

**Accumulation of rubber in the roots of Tau-saguiz** Novikov, et al. 11D. Rubberized cloth (Fr. pat. 757,230) 25. Creping rubberized material (U. S. pat. 1,948,138) 25. App. for controlling the working of rubber (U. S. pat. 1,949,199) 1. Plastic materials (Fr. pats. 757,432 and 757,485) 18. Protective coating for golf balls (U. S. pat. 1,948,292) 18. Disazo dyes [for rubber] (Brit. pat. 402,920) 25.

**Fischer, Emil J.:** Guttapercha und Balata, ihre Ersatzstoffe und technischen Gemenge. Berlin Lichterfelde: Allgemeine Industrie-Verlag. 181 pp. M. 9; bound, M. 10.

**Rubber.** Hermann Playson. Swiss 163,330, Oct. 16,

1933 (Cl. 81). In coagulating rubber latex, the latex is subjected to strong mech. agitation during coagulation. The latex may be mixed with water before coagulation.

**Rubber.** J. R. Geigy A.-G. Swiss 163,553, Nov. 1, 1933 (Cl. 41). The resistance of rubber masses to chem. and elec. influences is increased by adding 2-naphthol-glycol ether to the mass with the filling material, before vulcanization.

**Rubber.** J. R. Geigy A.-G. Swiss 165,709 to 165,713, Feb. 1, 1934 (Cl. 41). Addns. to 163,553 (preceding abstr.). The resistance of rubber masses to chem. and elec. influences is increased by adding 2-naphtholglycerol ether prior to vulcanization (165,709). The latter ether may be replaced by *o*-cresol glycol ether (165,710), by the glycerol ether of a com. mixt. contg. 3 isomeric cresols (165,711), by a resin obtained from phenol glycerol ether, urea and  $\text{CH}_3\text{O}$  (165,712) or by a resin obtained from phenol glycerol ether and phthalic anhydride (165,713).

**Rubber.** Soc. anon. des pneumatiques Dunlop. Fr. 757,335, Dec. 23, 1933. A cellular or spongy rubber, the particles of which have dimensions below 12.7  $\mu$ , is obtained by submitting cellular or spongy rubber to a succession of shocks having a cutting action.

**Rubber low in albumin.** Hermann Miedel (to Revertex Ltd.). U. S. 1,947,949, Feb. 20. See Brit. 363,193 (C. A. 27, 1546).

**Rubber compositions.** Soc. anon. des pneumatiques Dunlop. Fr. 757,680, Dec. 30, 1933. Comps. are made by forming a dispersion of rubber, etc., in a plastic substance or substances which then constitute the continuous phase and mixing the dispersion thus prepd. with further amts. of rubber, etc., under such conditions that this dispersion itself disperses in the rubber used in the 2nd place.

**Use of rubber dispersions in forming irregular ornamental surfaces.** Edward A. Murphy and Eric W. B. Owen (to Dunlop Rubber Co. Ltd.). U. S. 1,947,870, Feb. 20. A dispersion of rubber material contg. about 25-30% total solids and of an alky. equal to 0.5% of  $\text{NH}_3$  is superficially contacted with a 5% HIOAc soln. as a coagulant to produce a coagulum of such low mech. strength as to permit the superficial gathering of the coagulated layer to simulate wave-like contours, this layer being suitable for ornamental purposes simulating alligator leather, etc.

**Preserving rubber and like materials.** Hugh M. Bulbury, Wm. J. S. Naunton and Keith W. Palmer (to Imperial Chemical Industries Ltd.). U. S. 1,949,240, Feb. 27. A small proportion of a mercaptophenol such as 1-mercapto-2-naphthol is added.

**Apparatus for cutting rubber and other tubes into lengths.** The India Rubber, Gutta Percha and Telegraph Works Co. Ltd., Frank C. Matthews, Frederick E. Brown and John W. Pengelly. Brit. 402,077, Nov. 9, 1933.

**Rubber threads, filaments and tubes from aqueous dispersions.** Edward A. Murphy and Robert G. James (to Dunlop Rubber Co. Ltd.). U. S. 1,947,871, Feb. 20. A shaped jet of an aq. dispersion is caused to flow into contact with a liquid dehydrating and setting medium having a continuous penetrative osmotic action and comprising a concd. soln. of a largely dissoed. hydrolyzable salt of a weak acid such as  $\text{NH}_4\text{OAc}$  and a free weak acid such as  $\text{HOAc}$  in such amt. that the  $p_H$  is not lower than 5.0, and there are added to the aq. dispersions before contact substances such as  $\text{NH}_4$  oleate which are substantially inactive to the dispersions and capable of being decompd. when brought into contact with the weakly acid medium into substances inducing coagulation in the dispersions.

**Rubber bands.** John R. Gammeter (to Revere Rubber Co.). U. S. 1,949,465, March 6. Rubber is deposited from a liquid on a surface formed with an endless groove and with sharp edges at each side so that the rubber will collect in the groove and will deposit quite thinly over the sharp edges, and pressure is applied to facilitate sepn. and removal of the rubber deposit so that a tube of loosely joined bands is obtained. U. S. 1,949,500 (Roger Weston,

to Revere Rubber Co.) relates to a generally similar process.

**Hollow rubber articles such as football bladders directly from aqueous dispersions.** Andrew Szegvari (to American Anode, Inc.). U. S. 1,949,502, March 6. The cavity of a divided mold is coated with a coagulant, the parts of the mold are separately immersed in a coagulable dispersion of rubber, and are united beneath the surface of the liquid. App. is described.

**Mold for manufacture of rubber articles such as inner tubes of tires.** Ernest Hopkinson (to U. S. Tire Co.). U. S. 1,949,473, March 6. Mech. features.

**Molding rubber heels, etc.** Wilhelm Rischer (to Wingfoot Corp.). U. S. 1,948,344, Feb. 20. Mech. features.

**Rubber half-sole for shoes with a united layer of Canton flannel.** Charles P. Mebane (to National Glove Co.). U. S. 1,948,390, Feb. 20. Various details of manuf. are described.

**Conveyer belts of rubberized fabric.** Raymond S. Carter (to Wingfoot Corp.). U. S. 1,948,332, Feb. 20. Various details of manuf. are described.

**Hydrocarbon polymerization products.** I. G. Farbenind. A.-G. (Georg Ebert, Friedrich A. Fries and Paul Garlsch, inventors). Ger. 592,096, Feb. 1, 1934 (Cl. 39b. 4.01). Addn. to 575,439 (C. A. 27, 3638). Butadiene hydrocarbons are polymerized by treatment with an alkali or alk. earth metal or hydride, or an organometallic compd., in the presence of a small proportion of an unsatd. compd. (other than an unsatd. ether) which is capable of displacing a metal from an organometallic compd. Suitable addnl. compds. are thiophene, HCN,  $\text{CH}_2\text{CHCN}$ ,  $\text{PhCH}_2\text{CN}$  and  $\text{MeC}\equiv\text{CH}$ . Oily or plastic products are obtained. Examples are given. Cf. C. A. 27, 5330.

**Rubber-like composition.** Waldo L. Semon (to The B. F. Goodrich Co.). Can. 339,377, Feb. 13, 1934. A resilient rubber-like compn. is manufd. by dissolving 1 part of insol. polymerized vinyl chloride at an elevated temp. in 0.5-4.0 parts of a solvent contg. *o*-nitrodiphenyl ether 2 parts, dinitrobenzene 1 part and dinitrotoluene 1 part, and causing the compn. to gel by cooling. The compn. is an excellent insulator, of high dielec. strength and is corrosion-resistant.

**Machine for mixing plastic materials, e. g., rubber** The Firestone Tire and Rubber Co. Brit. 401,981, Nov. 23, 1933. Addn. to 362,357 (C. A. 27, 1237).

**Coated fabrics.** John C. Emhardt (to Sidnev Blumenthal & Co., Inc.). Brit. 402,269, Nov. 30, 1933. Material for floor coverings, etc., consists of fabric upon which a thin layer of resilient cellular rubber is formed from an aq. dispersion of rubber after application thereof to the fabric. The dispersion may be (artificial) latex, mixed with modifying and vulcanizing ingredients and including a small amt. of added  $\text{H}_2\text{O}$ ; it may also include a filler. After application of the mixt. to the back of a pile fabric by a doctor blade, the material is passed into a chamber heated above  $100^\circ$ , the  $\text{H}_2\text{O}$  imparting, by boiling, a cellular structure to the rubber which is simultaneously vulcanized and caused to adhere firmly to the fabric.

**Article of cellular rubber and ebonite with closed cells.** Maurice P. H. L. Raepsaet (to Soc. belge du caoutchouc mousse). U. S. 1,948,046, Feb. 20. In the production of articles such as ice boxes, plates for floor coverings and tubes sheathed with metal, the crude rubber is subjected to a first partial vulcanization in a mold in an autoclave charged with a gas under high pressure, with a following expansion, coating of the metal with a rubber soln., assembly of the expanded rubber with the metal and a supplementary vulcanization.

**Cellular rubber and ebonite.** Ugo Pestalozza and Società italiana Pirelli. Brit. 402,067, Nov. 21, 1933. In the manuf. of cellular rubber or ebonite from aq. rubber dispersions, e. g., latex, the dispersion is gasified dur-

ing coagulation by effecting fermentation of material, e. g., glucose, molasses, in the mass with consequent evolution of gas, which is preferably insol. or slightly sol. in the dispersion. Among examples a mixt. of 100 g.  $\text{NH}_4$ -free latex concd. to 50% dry rubber content, 10 cc. of a 50% aq. soln. of sugar contg. 2 g. yeast, 1.5 g. each of crystd.  $\text{MgSO}_4$  and  $(\text{NH}_4)_2\text{SO}_4$  in 10 cc.  $\text{H}_2\text{O}$  and 15 cc. of a 5% aq. soln. of glue, having suspended therein S 1, Zn dimethyldithiocarbamate 0.5, ZnO 0.2 and pumice stone 2 g., is fermented 6 hrs. at  $30^\circ$ , the mass transferred to a network mold coated with rubber soln., enclosed in a suitable container and immersed in boiling  $\text{H}_2\text{O}$  1.5 hr. for vulcanization. The cage is then left in cold  $\text{H}_2\text{O}$ , dried and the mass removed.

**Rubber-vulcanization accelerator.** Lorin B. Schrell and Albert M. Clifford (to Wingfoot Corp.). U. S. 1,948,317, Feb. 20. An accelerator is used such as the dithiocarbamate of dibutyl ethylenediamine or various compds. of the general formula  $\text{R-NH-X-NH-R'}$ , in which the groups R, X and R' are aliphatic hydrocarbon residues (R and R' contg. each not less than 2 C atoms).

**Dithiophosphate compounds (rubber-vulcanization accelerators).** Charles J. Romieux and Kenneth D. Ashley (to American Cyanamid Co.). U. S. 1,949,629, March 6. Accelerators are produced by the reaction of  $\text{S}_2\text{Cl}_2$  or a similarly reactive Cl compd. upon a dithio phosphate such as di-isopropyl, di-ethyl, or glycol di-isopropyl dithiophosphates or their salts or esters (several examples with details of procedure being given). Cl. C. A. 27, 1721, 2124.

**Apparatus for vulcanizing molded strip material** Clarence E. Siegfried (to Construction Materials Patents, Inc.). U. S. 1,948,011, Feb. 20. Mech. features.

**Apparatus for vulcanizing rubber belting.** James C. Heintz. U. S. 1,949,275, Feb. 27. Structural and mech. features.

**Apparatus for continuous vulcanization of rubber hose, belting, etc.** Archibald L. Wallace. U. S. 1,949,226, Feb. 27. Structural and mech. features.

**Electric vulcanizing apparatus, particularly applicable to the treatment of the insulation of electric cables.** The Macintosh Cable Co. Ltd. and Robert F. D. Milner. Brit. 401,486, Nov. 16, 1933.

**Vulcanizing rubber.** Wm. B. Wiegand. Ger. 501,951, Jan. 30, 1934 (Cl. 39b. 5). Rubber is vulcanized by adding inactive gas soot. The usual active gas soot is added and is inactivated by heating to  $600^\circ$  in a non-oxidizing atm. The soot is heated till its content of volatile constituents is not greater than 4%. In an example, rubber is vulcanized with gas soot, S, ZnO and diphenylguanidine.

**Vulcanizing rubber.** The Goodyear Tire & Rubber Co. Fr. 757,442, Dec. 26, 1933. Nitro hydroxy aromatic compds. are used as premature vulcanization retarders. Such compds. include 2,4-dinitrophenol, 2,2-di-(3-nitrohydroxyphenyl) propane, -dinitro-4-hydroxydiphenyl and nitrated methylenedi- $\beta$ -naphthol.

**Vulcanizing stretched and twisted rubber.** Edward N. Cunningham (to B. F. Goodrich Co.). U. S. 1,947,751, Feb. 20. For producing rubber thread, strip rubber of polygonal cross section is stretched to several times its unstretched length and twisted until it has a substantially circular cross section, and in this condition is vulcanized, with compds. of S with H, P or Cl such as S chloride, to a point at which it permanently retains at least most of its elongation and twist. App. is described.

**Manufacture of vulcanized rubber articles such as tires.** Charles W. Leguillon (to B. F. Goodrich Co.). U. S. 1,949,057, Feb. 27. The major portion of an article such as a tire is formed including masticated rubber at the surface and a surfacing layer is applied comprising unvulcanized rubber relatively non-flowing at vulcanizing temp., and the article is vulcanized while holding it distended by fluid pressure applied directly to the surfacing layer (which may be the inner layer of a tire).

# CHEMICAL ABSTRACTS

Vol. 28

MAY 20, 1934

No. 10

## 1—APPARATUS AND PLANT EQUIPMENT

W. L. RADGER

**The manipulation of apparatus in laboratory work.** P. Fuchs. *Chem. Fabrik* 1934, 97-9. —Notes on devices for expediting filtrations, pipeting, siphoning, condensing, etc., with 6 references. J. H. Moore

**Apparatus for the laboratory purification of gases.** T. P. Hoar. *Chemistry and Industry* 1934, 244-5. —The app. described purifies and stores a quantity of gas which can then be delivered at a speed not affecting its purity. W. J. Peterson

**Standard and normal measuring and mixing cylinders.** F. Friedrichs. *Glas u. App.* 14, 9-11 (1933); *J. Soc. Glass Tech.* 17, 196A; cf. *C. A.* 27, 3359. —Mixing cylinders for dilg. liquids are calibrated for making up vols. to various vols. The sepn. of scale divisions is 1 mm. up to 25 cc. capacity, and the divisions have to have a length from 0.5 to 1.0 times the circumference. The error permissible is the vol. corresponding to half a division, in the case of a 250-cc. cylinder. The cylinder height has to allow 20 mm. above the highest scale marking, and the min. foot diam. is to be 0.35 of the total height of the cylinder. It is not necessary for the glass to be of the 3rd hydrolytic class, since the liquid is only retained in the cylinder for a short time. Full details are given in tabular form for cylinders of from 5 to 2000 cc. capacity. G. G.

**Calibrated and standard measuring flasks.** F. Friedrichs. *Glas u. App.* 14, 17-19 (1933); *J. Soc. Glass Tech.* 17, 199A. —A comparison is made between the specifications and standards of the State Institute of Technical Physics (P. T. R.), the Bureau of Standards, Washington, and the Duchena specifications. G. G.

**Calibrated and standard pipets.** F. Friedrichs. *Glas u. App.* 14, 25-6 (1933); *J. Soc. Glass Tech.* 17, 197A. —F. tabulates the limits and specifications given by 3 authorities for pipets of the usual type, delivering a single measured quantity of liquid. No new proposals are made. G. G.

**Calibrated and standard graduated pipets.** F. Friedrichs. *Glas u. App.* 14, 33-5 (1933); *J. Soc. Glass Tech.* 17, 196-7A. —The new proposals for standard app. compare the requirements of the chemist and of the State Institute of Technical Physics with those of the glass industry for com. production. A table gives the permitted limits of error for graduated pipets for complete and partial delivery of the contents. G. G.

**Calibrated and standard burets.** F. Friedrichs. *Glas u. App.* 14, 41-2 (1933); *J. Soc. Glass Tech.* 17, 198A. —Comparisons of the P. T. R., Bureau of Standards and DIN. Denog specifications embody some new proposals which are tabulated. G. G.

**Calibrated and standard gas burets.** F. Friedrichs. *Glas u. App.* 14, 57-8 (1933); *J. Soc. Glass Tech.* 17, 198-9A. —The specifications of the State Institute of Technical Physics (P. T. R.), are compared with those of DIN. Denog, 56, 57 and 58, and some new proposals made for gas burets of 3 types: Hempel, Bunte and Dickschmidt. Proposals were also made to specify inner length and width, and that all be graduated in divisions of 1/10 cc. G. G.

**Manufacturing glass filters.** M. F. Lifshitz and B. L. Goshman. *Keram. i Steklo* 9, No. 9, 4-5 (1933); cf. *C. A.* 28, 2221<sup>1</sup>. —Basic operations for obtaining glass filters are described. Four kinds of filters with a diam. of pores from 120 to 10 microns are manufactured in the U. S. S. R. M. V. Kondoldy

**Fractional distillation.** R. G. W. Eadie. *Chemistry &*

*Industry* 1933, 618. —Modifications of McIntyre's app. (*C. A.* 27, 4002) are suggested. B. C. A.

**A fractionating column with fritted glass plates.** S. T. Schicklitz. *Bur. Standards J. Research* 12, 259-61 (1934) (Research Paper No. 651); cf. *C. A.* 26, 877. —This paper describes a fractionating column with fritted glass plates which has a higher plate efficiency than the usual lab. bubble-cap column. The efficiency of this type of plate is approx. 98% as compared to 87% for the bubble-cap plate. R. Rowman

**A pipet bulb.** Pels Leusden. *Munch. med. Wochschr.* 81, 100 (1934). —A rubber bulb with 3 valves arranged for filling a pipet without loss of fluid and without danger of infection is described. Milton Levy

**How can the chemist see more?** Haus Kropelin. *Chem. Fabrik* 1934, 93-5. —K. advocates a wider use of the microscope, spectroscope, stroboscope and camera. Eighteen references. J. H. Moore

**Automatic densimeter, automatic gas analyzer and universal apparatus for studying the permeability of solid bodies.** Paul Walter. *Bull. soc. encour. ind. natl.* 133, 31-44 (1934); cf. *C. A.* 27, 5582. —The densimeter is a hydrostatic balance with which a detn. can be made in 10 secs. The gas app. depends on the absorption of the various gases by atomized solvents which are condensed, and the elec. cond. is measured automatically. The app. for the detn. of the permeability, porosity and aging of wood, leather, rubber, cement, etc., are described with 3 cuts and 11 graphs showing results under various conditions of temp., pressure and gas. J. H. Moore

**Microbalance of glass.** Horacio Damianovich. *Anales inst. investigaciones cient. tecnol.* (Univ. nacl. litoral) 2, 85-90 (1933). —A sensitive and easily constructed microbalance is described in which a glass fiber is substituted for the quartz fiber of the common-type balance. An improved optical system with a mirror at the center of oscillation, a graduated scale and an eye glass are provided. M. McMahon

**An extractor for fluid systems.** Wm. F. Bruce. *Science* 79, 253-4 (1934). —The app. consists of a boiling flask with a 2-hole stopper, 1 connected to an elevated condenser and the other to the higher end of an inclined tube, the condenser discharge being connected to the lower end of this tube which is filled with the soln. to be extd. and through which the drops of lighter solvent pass while returning to the flask. It may be arranged for solvents heavier than the soln. (cf. *C. A.* 27, 633). J. H. M.

**Calculation of bubble towers for periodical operation.** S. N. Ohryadchikov and P. A. Khokhryakov. *Neftyanoe Khozyaistvo* 26, No. 1, 50-3 (1934); cf. *C. A.* 27, 5951. A. A. Boettlingk

**A screenless universal chamber for measurement of x-ray dosages.** Robert Jaeger. *Physik. Z.* 35, 184-7 (1934); cf. *C. A.* 28, 2205<sup>1</sup>. —A new universal chamber is described which has no Pb screen and which must be fully irradiated. Having a diam. of only 2 cm. it can be irradiated simultaneously with a comparison chamber. For hard rays the dependence on direction is so small that in the short-wave region the app. approaches in behavior a spherical chamber. The new chamber is independent of wave length, without change of the window, from the limiting radiation, 6 kv. or  $\lambda$  approx. 0.2 A., to the hard therapeutic rays, 190 kv. or  $\lambda$  approx. 0.15 A. Calvin Brous

**Improved method for the construction of quartz spirals.**

L. M. Pidgeon. *Can. J. Research* 10, 252-3(1934).—Quartz spirals for the McBain-Bakr sorption balance (*C. A.* 20, 1151) are made by winding softened quartz filaments on a slightly tapered fluted C rod. Local fusion is obviated by the use of a comparatively large cool flame.

J. W. S. Test of the Dräger carbon monoxide meter. *Chemisch-Technische Reichsanstalt. Draeger-Heft* No. 170, 2430-41(1934).—The percentage of CO in air is measured by measuring the heat of oxidation of CO as the air passes through a catalyst. Concns. of CO as low as 0.004% can be measured or at least detected with certainty. Concns. between 0.01 and 0.1% can be measured with an accuracy of  $\pm 0.005\%$ . Below 0.01% CO the accuracy is 0.002 to 0.003%. Above 0.1% CO the error is relatively smaller than for 0.1%. Variations in velocity of the air current through the meter do not affect the results materially. The presence of H or CH<sub>4</sub> does not affect the results up to a CO content of 0.3% which was the highest CO content tested. At this concn. the temp. rise caused by the oxidation of CO was approx. 15°.

A. L. Kibler Use of the photoelectric cell in nephelometry. E. Canals and A. Hortala. *Bull. soc. chim. biol.* 15, 1535-51 (1933); cf. *C. A.* 27, 928.—In nephelometry by transmitted light the photoelec. cell is far superior to the eye. Curves showing the relation of concn. to transmission are given for suspensions of mastic, AgCl and argyrol, with several different colors of monochromatic light. The shapes of the curves vary greatly. For AgCl violet light of about 410 m $\mu$  gives the most accurate results. Green light is preferable for argyrol.

L. E. Gilson Rotary electromagnetic viscometer. Guillermo Berraz. *Anales inst. investigaciones cient. tecnol. (Univ. nac. litoral)* 2, 79-84(1933).—A new rotary electromagnetic viscometer in which the viscosity varies directly with the current intensity and inversely with the speed of rotation, other factors remaining invariable, is described and illustrated.

M. McMahon Falling-sphere viscometer for opaque liquids. A. Zart. *Chem. Fabrik* 1933, 266.—To the 25-mm. diam. sphere is attached a straight wire 1 mm. diam. and 500 mm. long with 2 marks 60 and 300 mm. from the sphere. The sphere is placed in the liquid and the time detd. between the passage of the marks through a slit in the cover of the jar. The error due to the wire is about 2%.

J. H. M. The Höppler viscometer—preliminary report. W. Knop. *Z. Ver. deut. Zuckerind.* 83, 932-41(1933).—The time required for an oval ball to fall through 100 mm. in an inclined column of the fluid is the basis for the measurement. Balls of various sizes are used. The dynamic viscosity ( $\eta$ ) = (time of fall)  $\times$  (sp. gr. of the ball - sp. gr. of the fluid)  $\times$  (const.). Values are given for the constns. of the balls. The results ( $\eta$ ) are accurate to within  $\pm 0.5\%$ ; hence the instrument is more reliable than the other viscometers used in the sugar industry. The range of applicability is very great, i. e., about 1 to 15,000 centipoises. For molasses, the rate of change of viscosity with temp. ( $d\eta/dt$ ) dropped with increasing temp. Thus at 84° Brix the values of  $d\eta/dt$  were 12.7 and 8.7% at 35° and 51°, resp.

F. Camps-Campins Ball milling. Alexander M. Gow, M. Guggenheim, A. B. Campbell and Will H. Coghill. *Am. Inst. Mining Met. Engrs. Tech. Pub.* No. 517, 52 pp.(1934).—The fundamental principles of ball milling are discussed on the basis of lab. and plant studies. The difference between slow-speed grinding (attrition) and higher speed (impact) is one of degree rather than kind. The effect of slipping and amt. of ore in the mill on power consumption is shown. A method and formula are developed whereby the power required by a cylindrical mill of any size and operating under any conditions may be calcd. The effect on power and grinding of the following are discussed: size and design of mill; amt. and size of ball charge; the size, type, feed rate and pulp density of the feed; speed of rotation efficiency of classification in closed circuit; slipping and amt. of material in mill at any instant. Ball paths and trajectories cannot ex-

plain power requirements or grinding capacity of a mill. The percentage of over-all circulating load is not necessarily indicative of the amt. of stage grinding. Rationing of feed rate to ball action (power) and of ball size to grain size are necessary for good operation. Proper ball size is independent of the hardness of ore. Grinding may be made proportional to the power expended. Means for measuring the degree of stage grinding and suggestions for amt. of circulating load for good stage grinding are offered. The necessity for thorough classification is pointed out, and the efficacy of hydraulic classifiers and tables for desliming and the efficiency of rolls in fine-grinding are illustrated.

Alden H. Emery The practice of lining with acidproof stone. L. Kogel. *Chem. Fabrik* 1934, 77-82.—Suitable materials for the prepn. of the stone and cement, the construction of the forms and the applications of the linings are discussed, with 5 cuts.

J. H. Moore Sandstone blocks for pickling baths. C. Campbell. *Sands, Clays and Minerals* 2, No. 1, 43-4(1934).—Tank constructed of slabs of sandstone are particularly effective in resisting acid corrosion under almost all circumstances. Practical points in the selection of sandstone for this purpose are given.

M. V. Kondoidy Sodium lamp. W. A. N. Markwell. *Perfumery Essent. Oil Record* 24, 294 5(1933).—Two glow electrodes (W), surrounding an electron-emitting material, are contained in an atm. of inert gas together with some Na. The electrodes provide the necessary heat during the starting period (20 sec.), and are then switched off. The discharge then takes place through the Na. The emitting surface is about 10  $\times$  15 mm. and of the total intensity about 99% is due to Na D line. Little heat is generated and radiation is const. in intensity.

B. C. A. The problem of the production of an exact indicating colored-liquid thermometer which is constant with time. Walter Grundmann. *Z. tech. Physik* 15, 119 26(1934), cf. *C. A.* 28, 2574.—The influence of the following sources of error is discussed and a no. of recommendations are made: thermal lag in the thermometer as a whole, compressibility, gas absorption or evolution, adhesion and viscosity of the liquid, influence of coloring matter and of the gas above the liquid.

J. B. Austin Experiences with regulators. Gustav Neumann. *Arch. Eisenhüttenw.* 7, 490-503(1934).—The theory of regulators and controllers is illustrated by example of regulation of a gas container, water level of a steam boiler, steam pressure before the steam engine of a rolling mill, pressure, pulsating flow and furnace temp.

Eleven references. M. Hartenhem A gas thermostat. A. J. Bailey. *Science* 79, 277 (1934).—A description, with 1 cut, of an easily constructed device that will hold an air bath within less than 0.1° of a desired temp.

J. H. Moore Thermostats for temperatures between 5° and 20°. L. M. Pidgeon. *Can. J. Research* 10, 252(1934). A small Dewar flask in which the usual evacuated space is filled with Hg constitutes the thermostat liquid and thermoregulator. The heating element is resistance wire wound around the flask giving 5-10 ohms resistance. Temp. variations are not more than 0.005°.

J. W. S. Method [and app.] for detn. of diolefin hydrocarbons (Korotkov) 7. Impregnated asbestos cement for chem. equipment (Borodulin) 20.

Tongue, Harold: The Design and Construction of High-Pressure Chemical Plant. London: Chapman & Hall, Ltd. 420 pp. 30s.

Rectification columns. Jacob Rosin. *Fr.* 758,741, Jan 22, 1934. The vapor is progressively and continuously cooled by a cooling agent circulating in a closed cycle in the opposite direction to the vapor.

Manometers. Percival R. Boulton. *Brit.* 403,687, Dec. 18, 1933.

Viscometer (flow type). Glasplakatefabrik Union

G. m. b. H. Ger. 593,095, Feb. 20, 1934 (Cl. 421.7.01). 1  
Tray for bubble towers suitable for absorption or  
fractionation operations. Daniel Irwin. U. S. 1,950,247,  
March 6.

Apparatus for effecting exothermic catalytic gas re-  
actions. "L'Air liquide" (Soc. anon. pour l'étude et  
l'exploitation des procédés Georges Claude). Ger.  
593,360, Mar. 2, 1934 (Cl. 12g.4.02). See Brit. 307,039  
(C. A. 23, 5280).

Electric thermometer. A. T. Kuchugin. Russ.  
31,610, Oct. 31, 1933. Construction details of a thermom-  
eter of the type of a balanced Wheatstone bridge.

Distant-reading thermometers. King-Sceley Corp.  
Brit. 402,875, Dec. 14, 1933.

Temperature-indicating apparatus suitable for use with  
apparatus at a distance. Herbert Hastings. U. S.  
1,950,141, March 6. Mech. details.

Thermocouple. A. S. Mikhelson. Russ. 31,658, Oct.  
31, 1933. A thermocouple placed in an Fe tube has one  
branch made of constantan while the other branch is  
made of an alloy of Cu and Al or a similar compn., so  
that the oxidizability of both branches is lower than that  
of the Fe tube.

Thermocouples. Ya. Sh. Averbukh. Russ. 31,513,  
Oct. 31, 1933. The cold joints of thermocouples are  
selected from a metal whose c. m. f. coincides with the  
basic thermoelectromotive force of the bridge to com-  
pensate the decrease of the latter caused by the heating of  
the joints.

Graphite and tantalum carbide thermocouple for  
measuring high temperatures. Allgemeine Elektrizitäts-  
Ges. Ger. 593,022, Feb. 20, 1934 (Cl. 421.8.01).

Filters. Dario Teatini. Fr. 758,073, Jan. 10, 1934.  
The filter cloth or material has an undulating or corrugated  
form, and the perforated surfaces supporting the cloth are  
also corrugated.

Filters. Anciens établissements C. I. M. E. and Daniel  
Pétrier. Fr. 758,345, Jan. 15, 1934. The filtering  
element is composed of closely packed wires or piled  
plates, with grooves therein running at right angles to  
the direction of flow of the liquid. Part of the sediment  
becomes lodged between the wires or in the grooves and  
acts as a filter for the rest of the liquid.

Edge filters. N. V. Maatschappij tot Exploitatie van  
"ten Bosch" Oerfouwen. Brit. 402,070, Nov. 14, 1933.

Glass filter. Jenaer Glaswerk Schott & Gen. Fr.  
758,950, Jan. 26, 1934. The funnel and plate are made  
separately and afterward joined. The holes in the plate  
are enlarged in the direction of flow of the liquid.

Filters for liquids. Soc. industrielle du traitement des  
liquides par les gaz. Fr. 759,193 and 759,194, Jan. 30,  
1934. Means for cleaning the filter beds or cloths is  
described.

Rotary drum filter for press juices, etc. Bergedorfer  
Eisenwerk A.-G. Astra-Werke. Ger. 590,659, Jan. 8,  
1934 (Cl. 12d.15.02).

Air and gas filters. Sturtevant Engineering Co. Ltd.  
and Maurice F. Stevens. Brit. 403,069, Dec. 11, 1933.

Tube filters for air. Soc. Bühler Frères. Fr. 758,640,  
Jan. 20, 1934. Automatic cleaning means is described.

Apparatus suitable for filtering water of engine-cooling  
systems. Gilbert Lien. U. S. 1,950,254, March 6.

Apparatus for cleaning filtering layers. Adrien Chabal.  
Fr. 758,249, Jan. 12, 1934.

Filter press. Soc. pour l'ind. chim. à Bâle. Ger. 590,710,  
Jan. 9, 1934 (Cl. 12d.5.01).

Apparatus for hydraulic removal of dust from gases.  
André Rigollet. Fr. 758,997, Jan. 26, 1934.

Apparatus for separating dust from gas. Percy G. Ryder.  
Brit. 402,075, Nov. 20, 1933.

Apparatus for separating dust particles from gases or  
grading dust particles. Joseph L. Musgrave and Richard  
Cuttall & Co. Ltd. Brit. 402,476, Dec. 7, 1933.

Sifting apparatus. Windham F. Carey and Imperial  
Chemical Industries Ltd. Brit. 402,402, Nov. 28, 1933.

Sifting apparatus. Frank Pascall. Brit. 402,673, Dec.  
7, 1933.

Vibratory-screen sifting apparatus. Wilfred Barker.  
Brit. 403,210, Dec. 21, 1933.

Centrifugal machine for cleaning or purifying liquids.  
Johann Bányay. Brit. 403,042, Dec. 14, 1933.

Centrifuge for the treatment of granular or fibrous  
material, e. g., that obtained from animal raw materials  
by decomposition. Gustav Honnicke. Brit. 403,031,  
Dec. 14, 1933.

Servo-motors for initiating the various operations of a  
centrifuge, e. g., the filling of the drum, the washing, the  
emptying of the drum, etc. Gustav ter Meer. Brit.  
402,840, Dec. 11, 1933.

Low-temperature evaporators for liquids. Edwin J. R.  
Drake. Fr. 758,476, Jan. 18, 1934.

Drying-apparatus. John H. Morton. Brit. 403,398,  
Dec. 12, 1933.

Pneumatic driers. Paul Rosin. Brit. 402,707, Dec. 7,  
1933.

Vertical tower for drying malt or the like. Giuseppe  
Pellegrino and Mario Pellegrino. U. S. 1,950,263, March  
6. Various structural and operative details are described.

Apparatus for drying and distilling fine grain material  
at a low temperature. Ludwig Honigmann. Fr. 750,133,  
Jan. 29, 1934.

Combined drying and grinding apparatus for clay,  
brown coal, gypsum, etc. Ernst C. Loesche. Ger.  
593,122, Feb. 21, 1934 (Cl. 82a.25.01).

Furnaces. Soc. anon. des établissements A. Valuy.  
Fr. 758,027, Jan. 9, 1934. Construction of walls and roofs  
is described.

Gas-fired muffle furnaces. The Gas Light and Coke  
Co., W. Dieterichs, David J. Davies and Peter Lloyd.  
Brit. 403,112, Dec. 13, 1933.

Shaft furnace. Vereinigte Stahlwerke A.-G. Fr.  
758,139, Jan. 11, 1934. Form of blower is given.

Rotatable tuyères for shaft furnaces. Vereinigte  
Stahlwerke A.-G. Brit. 403,321, Dec. 21, 1933.

Hollow air-cooled furnace walls. The Morgan Crucible  
Co. Ltd. and John Walker. Brit. 401,768, Nov. 23, 1933.

Burner blocks for rotary or semi-rotary furnaces.  
Wm. F. Wiltshire. Brit. 402,712, Dec. 7, 1933. Divided  
on 400,956 (C. I. 28, 18983).

Gas burner for open-hearth furnaces. George R. Mc-  
Dermott (to Surface Combustion Corp.). U. S. 1,950,007,  
March 6.

Stirring device for furnace for drying coal, salts, etc.  
Erma J. G. Lindner. Ger. 593,362, Feb. 24, 1934  
(Cl. 82a.12.02).

Rotary kilns. Johan S. Fastang. Brit. 403,447, Dec.  
28, 1933.

Recuperator. Didier-Werke A. G. Ger. 590,681, Jan.  
8, 1934 (Cl. 24c.5.02).

Recuperators. Soc. anon. fours et appareils Stein.  
Brit. 402,649, Dec. 7, 1933.

Plate heat-exchangers. Harrison Radiator Corp.  
Brit. 402,241, Nov. 30, 1933.

Tubular heat-exchangers, e. g., surface condensers.  
Benoit Elie Chamayou. Brit. 402,628, Dec. 7, 1933.

Combined heat-exchanger and centrifugal dust ex-  
tractor, particularly for preheating air by and separating  
dust from flue gas. Metallgesellschaft A.-G. Brit.  
402,693, Dec. 7, 1933.

Continuous combustion apparatus for estimating oxygen  
in gas mixtures. Siemens & Halske A.-G. (Heinz Grüss,  
inventor). Ger. 593,157, Feb. 22, 1934 (Cl. 421.4.05).

Röntgen-ray apparatus. C. H. F. Müller A.-G. Brit.  
403,010, Dec. 14, 1933.

High-tension devices, e. g., Röntgen-ray tubes. C. H.  
F. Müller A.-G. Brit. 402,691, Dec. 7, 1933. Structural  
features.

Cathode-ray tubes. Electric & Musical Industries  
Ltd. Brit. 402,460, Dec. 4, 1933.

Cathode-ray tubes. Siemens-Schuckertwerke A.-G.  
Brit. 402,781, Nov. 30, 1933.

Cathode-ray tubes. Allgemeine Elektrizitäts-Gesell-  
schaft (to International General Electric Co., Inc.).  
Brit. 403,018, Dec. 14, 1933.

Cathode-ray tubes. Radioaktiengesellschaft D. S.

- Loewe and Kurt Schlesinger. *Fr.* 758,576, Jan. 19 and 1 758,616, Jan. 20, 1934.
- Light-sensitive cells.** Franz Rother. *Brit.* 403,041, Dec. 14, 1933. In making Cu oxide light-sensitive cells of the "suppression-layer" type by heating Cu and scraping off the outer layer of CuO, the Cu is, by sputtering, electrolysis, spraying, etc., finely coated with a metal, *e. g.*, Au, before being heated. An alloy may be used instead of Cu, and coatings of more than 1 metal may be applied.
- Photoelectric cell.** Compagnie française pour l'exploitation des procédés Thomson-Houston. *Fr.* 758,270, Jan. 13, 1934. Means for regulating the operation of a control circuit is described.
- Photoelectric cells.** N. V. Philips' Gloeilampenfabrieken. *Fr.* 758,665, Jan. 22, 1934. See *Brit.* 396,348 (*C. A.* 28, 380<sup>u</sup>).
- Discharge devices.** Clifton G. Round and Willem F. Westendorp (to The British Thomson-Houston Co. Ltd.). *Brit.* 403,428, Dec. 12, 1933. In a pos.-column discharge device having a plurality of auxiliary anodes located at intermediate points between the anode and cathode and connected to the main anode by resistances, the value of each resistance is inversely proportional to the distance between the cathode and the corresponding auxiliary anode. These resistances and a ballast resistance in series with the device may be incandescent filaments located within the device.
- Discharge tubes.** Telefunken Ges. für drahtlose Telegraphie m. b. H. *Fr.* 758,726, Jan. 22, 1934.
- Electric discharge tubes.** Edward A. Leach (to The British Thomson-Houston Co. Ltd.). *Brit.* 402,703, Dec. 7, 1933.
- Electric discharge tube suitable for rectifiers or "wireless" purposes.** Karel M. van Gessel and Jan H. de Boer (to Radio Corp. of America). *U. S.* 1,949,849, March 6. A thermionic metallic cathode which may be formed of W is used with a surrounding anode and with an intervening control electrode having a surface of coherent Zr.
- Electric vacuum tubes, particularly whole-wave rectifiers.** Ferranti, Ltd., and Arthur L. Chilcot. *Brit.* 402,503, Dec. 7, 1933. Structural features.
- High-vacuum production in electric discharge devices.** Arthur Mutscheller (to Westinghouse X-Ray Co.). *U. S.* 1,950,008, March 6. Various details of procedure are described.
- Means for adjusting from outside the position of an electrode within a vacuum.** Ferranti Ltd. and John L. Miller. *Brit.* 402,748, Nov. 30, 1933.
- Electron tubes and their circuits.** Compagnie française pour l'exploitation des procédés Thomson-Houston. *Fr.* 757,986, Jan. 4, 1934.
- Grids for electron-discharge tubes.** N. V. Philips' Gloeilampenfabrieken. *Brit.* 402,294, Nov. 30, 1933. A grid consists of a no. of parallel wires of about 100  $\mu$  thickness, or less, spaced apart by cross-members, the wires and cross-members, which are secured to each other, being coated, at least at their points of attachment, with a layer of a material substantially less refractory than the material of the members and the wires. Thus wires of 80  $\mu$  diam., consisting of Mo with a Ni sheath, are laid longitudinally on a solid Fe core and a grid wire of 40  $\mu$  diam. is wound around the assembly. Two Ni or Ni-sheathed Mo stays are welded along the grid to serve as supports and cooling members. The grid is then heated a few minutes at 1100° to sinter the wires to the cross-members, and the core is removed.
- Cathodes for discharge tubes.** The M-O Valve Co. (*Ger.* 593,491, Feb. 27, 1934 (*Cl.* 21g. 12.01)). Cold cathodes for gas-filled discharge tubes are made by coating Fe or Ni with Ba(NO<sub>3</sub>)<sub>2</sub> and applying heat, *e. g.*, at 750° *in vacuo*, until the coating is reddish brown. The cathodes are not affected by air.
- Incandescent cathode for vacuum discharge apparatus.** Akt.-Ges. Brown, Boveri & Cie. *Fr.* 758,525, Jan. 18, 1934.
- Discharge electrodes for electrical precipitation apparatus.** Metallgesellschaft A.-G. *Brit.* 403,665, Dec. 27, 1933.
- Thermionic apparatus, *e. g.*, lamps and ultra-violet radiators.** Compagnie des lampes. *Brit.* 402,566, Dec. 7, 1933.
- Thermionic valves.** Radioröhrenfabrik G. m. b. H. *Brit.* 402,650, Dec. 7, 1933.
- Thermionic valves.** Telefunken Gesellschaft für drahtlose Telegraphie m. b. H. *Brit.* 403,298, Dec. 31, 1933. Means for cooling is described.
- Evacuated electric discharge vessels (thermionic valves).** The M-O Valve Co. Ltd. and Colin J. Smithells. *Brit.* 402,207, Nov. 30, 1933.
- Device for estimating the water in solids, especially salts.** I. G. Farbenind. A.-G. (Karl Ackermann and Albert Krust, inventor). *Ger.* 590,826, Jan. 11, 1934 (*Cl.* 42f. 9.50).
- Apparatus for determining the boiling curve of liquid mixtures.** Reichskraftsprit G. m. b. H., Cuno Conrad and Carl O. Ostwald. *Ger.* 593,026, Feb. 20, 1934 (*Cl.* 42f. 18.04). Addn. to 537,151 (*C. A.* 26, 1046).
- Device, using a light-sensitive element, for suppressing or reducing froth or scum formation on liquids.** The Distillers Co. Ltd. and John Everett. *Brit.* 402,826, Dec. 11, 1933.
- Apparatus and process for crystallizing liquids by evaporative cooling in stages under increasing vacuum in presence of culture crystals.** Metallgesellschaft A.-G. and Wilhelm Gensecke. *Brit.* 402,324, Nov. 30, 1933.
- Apparatus for atomizing liquids.** Arthur J. Adam. *Brit.* 402,437, Nov. 27, 1933.
- Apparatus for atomizing liquids.** Francis Nazari. *Brit.* 402,525, Dec. 7, 1933.
- Treating liquids with gases in the treatment of water or sewage with chlorine.** Wm. H. Fulton (to Paradox Co.). *U. S.* 1,949,934, March 6. Various details of app. and operation are described.
- Tank with internal pockets for separating liquids and gases such as oil and gas by centrifugal action.** Richard Battle and Floyd I. Ross (to Hanlon-Waters, Inc.). *U. S.* 1,950,285, March 6. Structural details.
- Gas-pressure regulator suitable for use with gas-supply systems.** Garnet W. McKee. *U. S.* 1,950,120, March 6. Structural and mech. details. *U. S.* 1,950,121 also relates to gas-pressure regulators.
- Device for controlling the flow of gas.** Frederick I. Smith. *U. S.* 1,949,885, March 6. Structural details.
- Gas washer.** Hermann Kleibren and Alfred J. Elmer (to Freyn Engineering Co.). *U. S.* 1,950,020, March 6.
- Centrifugal gas cleaner or steam drier.** Frederick K. O. Moynan. *Brit.* 402,455, Dec. 4, 1933. Addn. to 341,532 (*C. A.* 25, 4447).
- Cylindrical metal containers for storing gas under pressure.** Walter Kidde & Co., Inc. *Brit.* 402,795, Dec. 11, 1933.
- Apparatus for a fractional combustion of gases.** P. K. Sakmin. *Russ.* 31,668, Oct. 31, 1933. Construction details of a modified Rasfeld app. for the detn. of H<sub>2</sub>, CH<sub>4</sub>, C<sub>2</sub>H<sub>2</sub>, etc.
- Apparatus for removing solid particles suspended in gases.** Charles M. Stein (to Soc. anon. fours et appareils Stein). *U. S.* 1,950,069, March 6. Structural details.
- Air-humidifying apparatus.** The Imperial Tobacco Co. (of Great Britain & Ireland) Ltd. and Charles F. Shanahan. *Brit.* 403,649, Dec. 20, 1933.
- Humidifying apparatus for the air in incubators and other enclosed structures.** Edwin T. Brace. *Brit.* 403,099, Nov. 30, 1933.
- Grid-work for cooling-towers.** L. G. Mouchel and Partners Ltd. and Robert B. Elmer. *Brit.* 402,857, Dec. 14, 1933.
- Cooling apparatus for high-voltage discharge apparatus, *e. g.*, Röntgen-ray tubes.** C. H. F. Müller A.-G. *Brit.* 402,242, Nov. 30, 1933.
- Apparatus and method for transforming molten material into the form of solid round bodies such as pellets.** Aktieselskapet Ferrosan. *Brit.* 402,611, Dec. 7, 1933.

- Jigging conveyors.** Ernest Hughes. Brit. 402,233, Nov. 30, 1933.
- Jigging conveyors.** Tage G. Nyborg and Mark F. Higgins. Brit. 403,490, Dec. 28, 1933.
- Ball mills with means for indicating the level of the charge therein.** Foster Wheeler Ltd. Brit. 402,655, Dec. 7, 1933.
- Ball-and-ring grinding mills of the air-borne type.** James J. C. Brand and Leo St. J. Colley. Brit. 402,854, Dec. 14, 1933.
- Roller and breast mills.** The Gas Light and Coke Co. and Edward Eric Calvert. Brit. 402,481, Dec. 7, 1933.
- Apparatus for treating granular and other substances with fluids, the substance to be treated being contained in one or more cells arranged to be rotated.** Cyrille A. Delemme. Brit. 403,642, Dec. 19, 1933.
- Rotary washing drum for gravel, sand, etc.** Eduard Friedrich. Ger. 693,434, Feb. 27, 1934 (Cl. 1a. 12.01).
- Apparatus for the production of binding materials, dressings, etc., e. g., dextrins, glutens, including a device for mixing, direct spraying, drying, calcining and cooling.** Adolf Dreyer and Fred Kutzner. Brit. 402,601, Dec. 7, 1933.
- Bell gas holders with sliding seals.** Maschinenfabrik Augsburg-Nürnberg A.-G. Brit. 401,911, Nov. 23, 1933. Addn. to 361,798 (C. A. 27, 870).
- Machine for spreading plastic material upon articles, e. g., grease or grease and graphite upon jointing material.** Frank C. Fulcher. Brit. 402,756, Dec. 1, 1933.
- Apparatus for transferring rolled material from the cooling bed to a train of delivery rollers.** Bruno Audrieu (to Fried. Krupp Grusonwerk A.-G.). Brit. 401,975, Nov. 23, 1933.
- Extrusion press, especially for lead-coating cables.** Siemens-Schuckertwerke A.-G. Brit. 403,108, Dec. 14, 1933.
- Ultra-violet testing apparatus, particularly for detecting forgery in documents, etc.** Alexander Callo. Brit. 402,136, Nov. 27, 1933.
- Chamber for protection against toxic gases, with air-circulating and -regenerating means, sanitary apparatus and means for detecting toxic gases in the external atmosphere.** Ernest A. Payen. Brit. 403,097, Dec. 5, 1933.
- Flashlight lamps.** John F. Crowley. Brit. 403,427, Dec. 19, 1933. A bulb contg. a flashlight charger of powder, gas, vapor or metal strip, foil, wool or dust, or mixts. thereof, is provided with a disruptible seal to be pierced by the stem of an igniting device.
- High-pressure acetylene generator.** Josef Muller. Fr. 759,084, Jan. 29, 1934.

## 2-GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

- Prof. Fran Bubanovic—in honor of his fiftieth birthday.** S. S. Miholić. *Bull. soc. chim. roy. Yougoslav.* 4, 127 8 (1933).—A brief biographical sketch. G. S. Stamatoff
- Fritz Haber.** M. Bodenstein. *Z. Elektrochem.* 40, 113 15(1934).—Obituary, with portrait. G. G.
- Charles Porcher.** E. Nicolas. *Bull. soc. chim. biol.* 16, 160-5; *Lail* 14, 113 24(1934).—Obituary. L. E. Gilson
- Harold C. Urey, the man.** T. R. Hogness. *Chem. Bull.* 21, 87-8(1934). B. H.
- A letter from Justus v. Liebig.** Pincus. *Munch. med. Hochschr.* 81, 114(1934).—Dates from 1860. M. L.
- Etymological explanation of the names applied to the most important elements and minerals.** Walter Meyer. *Apoth. Ztg.* 49, 363 8(1934). Some 72 elements and 144 minerals are listed. W. O. E.
- Chemistry in the libraries.** Gino Testi. *Chim. ind. agr. Mol.* 10, 26 9(1934).—Several damages of the ancient books and manuscripts are examd., especially the books carbonized by dehydration of cellulose. Several books stained by Fe were bleached with alc. solns. of NaClO and NH<sub>4</sub>OH. G. A. Bravo
- The electrical nature of iron sparks emitted from a grinding wheel.** Ukichirō Nakaya. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 23, 185 201(1934). It is well known that the appearances of sparks emitted from Fe took upon sharpening with a grinding wheel are quite different for tools of various constituents. E. Pitois (cf. C. A. 19, 2018) found that a sample of pure Fe gave a straight form of spark (a molten drop of Fe heated to a red-hot state by the heat of oxidation), while one contg. C gave a branched form, the general appearance becoming more complicated as the C content became greater (branching caused by the explosive combustion of C in the Fe). The present report deals with (1) results of former expts. on the nature of the spark (cf. Nakaya and Sakiguchi, *Bull. Inst. Phys. Chem. Research (Tokyo)* 6, 1083(1927)); (2) the elec. nature of the spark (it is positively charged at its earlier stage and negatively charged at the stage near its end, changing the sign of charge on its way); (3) the detn. of ions emitted from the Fe spark (both pos. and neg. ions are actually emitted at the same time); and (4) the calcn. of  $e/m$  of the spark from the photograph of the track (curves of  $e/m$  obtained show that the pos. charge accumulates at the earlier stage and reaches a max. value; then the sign changes rapidly and the neg. electricity thus obtained is again lost gradually). R. Roseman
- Rhenium.** M. Piettre. *Bull. soc. chim.* 53, 669 81 (1933).—A lecture on the extrn., properties, detn. and compds. of Re. B. C. A.
- Distribution of ozone in the atmosphere.** D. Barbier. *Compt. rend.* 198, 1060 2(1934). Theoretical. A new method of calcn. is given, and Gauzit's results are criticized (cf. C. A. 26, 3186; 28, 2580). C. A. Silberrad
- Use of charcoal in maintaining high vacua.** C. H. Collic. *Proc. Phys. Soc. (London)* 46, 252-5(1934). The limiting pressures obtainable with com. SiO<sub>2</sub> gel, a special SiO<sub>2</sub> gel freed from adsorbed salts by prolonged dialysis, birchwood charcoal, gas-mask charcoal, Norlite and other special charcoals were detd. The most effective procedure is to cool the exhausted charcoal with liquid H<sub>2</sub>. E. R. Rushton
- Black-body radiation a rational basis of pyrometry.** Marcel Berthou. *Ceram. verriere emaille* 2, 7-11(1934). Alice W. Epperson
- Degrees alpha.** Giuseppe Siboni. *Nomenclatura chim.* 3, 37 8(1933). New scale of absolute temperatures. *Ibid.* 4, 53(1934); cf. C. A. 26, 5797. A. M. P.
- New methods of obtaining low temperatures.** E. Justi. *Z. Physik* 87, 273 6(1933).—The method of obtaining low temp. by adsorption and desorption of H and Ne which was advanced by Simon (C. A. 21, 3532 3) does not work as shown by theoretical and exptl. considerations. The success obtained by Meidelsohn (C. A. 26, 2089) is due to the Joule-Thomson effect. The method is useful only for maintaining temps. between the fixed points. Franz Simon. *Ibid.* 815-18.—Polemic. Egon Bretscher
- Thermomolecular pressure differences, especially at lower temperatures.** Sophus Weber and W. H. Keesom. *Rapports et Communications, No. 6, Congr. intern. froid, Buenos Aires, Communications Kamerlingh Onnes Lab. Univ. Leiden No. 223*, 9-31(1932); cf. C. A. 27, 5597.—On the basis of known data, the effect of thermomol. pressure differences in gas thermometry, especially in the range of very low temps. such as that of liquid He, is discussed. A systematic investigation was made of this effect in the cases of Ne, H<sub>2</sub>, A, O<sub>2</sub>, N<sub>2</sub> and especially He. Earlier expts. on H<sub>2</sub> and O<sub>2</sub> at higher temp. are correlated with measurements at low temp. A complete correlation of the results with the theory is promised. C. E. P. J.

The correction for thermomolecular flow. P. C. Tompkins and D. E. Wheeler. *Trans. Faraday Soc.* 29, 1248-54 (1933).—For the accurate measurement of pressure it is important to calibrate any app. contg. parts at different temps. (e. g., liquid-air traps or furnaces). In a liquid-air trap at 90°K., with  $H_2$  at  $1 \times 10^{-3}$  cm. and tubing 1 cm. in diam. the pressure was nearly 20% lower than in the rest of the app. This difference decreased to 0 at  $1.4 \times 10^{-3}$  cm. The effect was greater at 90°K. than at 193°K. The correction becomes essential as soon as the pressure is such that the mean free path of the gas approaches the diam. of the tube at the temp. gradient. Inlet and outlet tubes of the traps must be of the same diam. When the bulb is filled with a powder the time necessary to attain pressure equil. is very great. With CO and A at  $1 \times 10^{-3}$  to  $1 \times 10^{-2}$  cm. the results are the same as for  $H_2$  at pressures at which their mean free paths are equal.

Janet E. Austin

Valence-theoretical calculation of energy of aromatic compounds. Hidechiko Tamaki. *Proc. Phys.-Math. Soc. Japan* 16, 52-66 (1934) (in English).—The combining energy of some aromatic compds. is calcd. by means of the Heitler-Weyl theory of chem. valency, and their stabilities are examd.; Rumer's idea is extended. The energy level of a hexagonal ring of trivalent radicals is about equal to that of 3 pairs of them. If directional valency is also considered it may be possible to explain why the  $C_6H_6$  ring is more stable than the  $C_6H_5$  mol.

Gerald M. Petty

Molecular theory of the chemical bond. Yu. B. Rumer. *Uspekhi Fiz. Nauk* 14, 35-62 (1934).—Theoretical-mathematical. Simple and polyatomic mols., and *cis-trans* isomerism are discussed on the basis of the theories of Hund, Hertzberg and Mulliken.

F. H. Rathmann

Compounds of bivalent carbon. M. S. Ashkinazi. *Uspekhi Khim.* 2, 700-13 (1933).—A review on the results of phys. methods (parachor, dipole moments, Raman spectra, thermochem. data, etc.) as applied to the study of the compds. of bivalent C.

F. H. Rathmann

Shapes of molecules. N. V. Sidgwick. *Proc. Roy. Inst. Gr. Brit.* 28, 35-46 (1934).—A general discussion. There are 3 possible deformations of the mol.; twisting of the groups around the lines of a link, stretching and compressing the links and bending them. Rotation around the line of a single link is always possible, but not with a double link. Absorption spectra show that the resistance of a double link to stretching and compression is about twice as great as for a single link, and, for a triple link, 3 times as great. It is about 5 times as easy to bend a link as to stretch it to the same extent.

E. R. R.

Magnetic investigations of insoluble amorphous materials. I. Magnetic susceptibilities of various iron salts. Laxmi Bhargava and Satya Prakash. *Z. anorg. allgem. Chem.* 217, 27-32 (1934).—The magnetic susceptibilities of arsenates, phosphates, molybdates, borates, tungstates, oxalates and benzoates of Fe were measured. The susceptibility increased much more on heating than would correspond with the loss in wt. The Fe oxide resulting from heating ferrous oxalate is strongly paramagnetic, while the corresponding oxides prepd. from ferric oxalate and benzoate are ferromagnetic. Ferric phosphate is very sol. in  $(COOH)_2$ ; the  $(COOH)_2$  soln. has a proportionally higher paramagnetic value than the corresponding solns. of the same concn. in HCl or  $H_2SO_4$ . Addnl. expts. on the Curie const. and the effect of temp. on these materials are in progress.

M. McMahon

The magnetic investigation of organic radicals. Helmut Katz. *Z. Physik* 87, 238-44 (1933).—The magnetic susceptibilities  $\sigma$  of the following org. radicals were detd. in the range of 1-95°: (the first figure in brackets means  $\sigma$  in units of  $10^{-6}$ , the second, the Curie temp., the third, the no. of Weiss magnetons  $n$ ): (*p*- $MeOC_6H_4$ ) $_2NO$  (115.5, -13°, 8.4) and  $ON(SO_3K)_2$  (115.0, 2°, 8.4); (*p*- $MeC_6H_4$ ) $_2N^+ClO_4^-$  (105.5, 2°, 7.8), *p*- $Me_3NC_6H_4N^+Me_3(CIO_4^-)$  (104.5, -17°, 8), *dihydro-p-naphthophenazinium perchlorate* (102.7, 7, 8), *dihydropyocyanin* (48.8, —, —), *tetra-p-tolylhydrazinium perchlorate* (48.4, —, —),  $\alpha,\alpha'$ -*diphenyl-p-trinitrophenylhydrazyl* (32.8, -20°, 4.5). Ac-

cording to theory the no. of magnetons should be const. = 8.0 because the no. of electrons can always be assumed to be 1.  $n$  is obtained from the slope  $1/c$  of the  $1/\sigma$  vs.  $T$  curve:  $n = 14.06 \cdot \sqrt{c}$ .

Egon Bretscher

Magnetic susceptibility of liquid ozone and of mixtures thereof with liquid oxygen. P. Lainé. *Compt. rend.* 198, 918-19 (1934), cf. C. A. 27, 3367.—By use of similar methods the sp. magnetic susceptibility of liquid  $O_3$  at temps. near that of liquid air is about  $1.5 \times 10^{-7}$  and the thermal variation thereof is less than  $1/3$  of that required by the Curie law. The thermomagnetic method of detg. the amt. of  $O_3$  present is verified. By maintaining a vacuum above an agitated mixt. of liquid  $O_2$  and  $O_3$ , liquid  $O_3$  contg. less than 0.01%  $O_2$  is obtainable.

C. A. Silberrad

Magnetic rotation of hydrogen selenide. R. de Malle-mann and P. Gabiano. *Compt. rend.* 198, 1030-1 (1934).—Verdet's const. for  $H_2Se$  ( $\lambda$  5780) is  $61 \times 10^{-6}$ , the mol. rotation  $40 \times 10^{-6}$ , giving for the at. rotation of Se  $36 \times 10^{-6}$  (perhaps a little low because of decompn. of  $H_2Se$  in light).

C. A. Silberrad

Diamagnetism of nitroso compounds. E. Bright Wilson, Jr. *J. Am. Chem. Soc.* 56, 747 (1934).— $NOCl$ ,  $PhNO$  and *p*- $Me_2NC_6H_4NO$  are diamagnetic; the conclusion is that these compds. at least are in singlet states (cf. Pauling, C. A. 25, 2910), and this indicates that they do not have the similarity to O previously suggested.

C. J. West

Study of the dielectric constants of substances containing water. J. Tausz and H. Rumm. *Kolloid-Beihfte* 39, 58-104 (1933). The dielec. properties of sucrose, starch (potato, rice, wheat), silicic acid, tobacco (fibers and dust), borax, lithographic slate and lignite were studied, as a function of the moisture content. Water is present in a solid and a liquid fraction. The effect of temp., packing vol., structural properties and frequency was detd. The dielec. const. of dried materials can be measured by an isodielec. method: the materials are suspended in a mixt. of liquids of the same dielec. const. The dielec. const. of sucrose and starch in the literature could not be confirmed, because previous investigators had not dried these substances properly. Substances of higher moisture content were placed between the condenser plates in powder form. Dielec. values were thus obtained, from which dielec. const. can be calcd. Dielec. measurements are a convenient way of detg. moisture content. Substances contg. moisture in the form of solidified water show a low temp. coeff. of the dielec. const. At room temp. 9% of the water in cut tobacco is present in the solidified form. Water in  $SiO_2$  is mostly in the liquid state. The dielec. const. varies considerably with frequency, if the water content is liquid. The lithographic slate of Solnhof shows an abnormally high dielec. const. of 1000-1100 at a frequency of 1100. After drying, i. e., removal of 0.7% moisture, the dielec. const. is 14 (John-son-Rahbeck effect). This is due to capillary water which is rocked back and forth by a. c. The capacity of Se increases when illuminated.

Frank Urban

Study of the dielectric properties of Rochelle salt by Röntgen rays. Hans Staub. *Helv. Phys. Acta* 7, 3 (1934).—An ionization chamber for x-rays employing electrometer tubes to register the ionization current was used to det. the changes in reflective power of Rochelle salt for x-rays when an elec. field was applied to the crystal. A very marked intensity variation was observed which was due to a shift of the ions. The high dielec. const. of Rochelle salt is therefore due to displacement of the ion. The effects of moisture and space charges are discussed. A very suitable method of cutting Rochelle salt crystals is given as well as a detailed theory for the elimination of fluctuations of the app.

Egon Bretscher

Determination of dipole moments in solution. S. Sugden. *Nature* 133, 415-16 (1934).—Substances the mols. of which contain a large permanent dipole markedly decrease the measured values of the mol. polarization in soln. as the concn. of the soln. increases. This effect is too large to be due to chem. assocn. Mol. polarization is

plotted against the vol. polarizability for solns. of PhCN, PhNO<sub>2</sub>, and PhCl in a no. of non-polar solvents. All the points for each compd. lie near a straight line.

Gerald M. Petty

**Dipole moments of acetic anhydride and some fatty acids.** A. Piekara and B. Piekara. *Compt. rend.* 198, 1018-20 (1934).—From the mol. polarization,  $P$ , of Ac<sub>2</sub>O in CS<sub>2</sub> soln. for concn. not more than 10%  $P_{\infty}$  is deduced (196.5 at 5°, 187.5 at 25°), and hence the dipole moment,  $\mu = 2.82 \times 10^{-18}$  (or  $2.46 \times 10^{-18}$  if deduced from the temp. variation of  $P_{\infty}$ ).  $P$  of AcOH and propionic acid in hexane soln. at 10° and 30° increases with both concn. and temp., but  $P_{\infty}$  (22 and 26, resp.) is independent of temp.; the mean values of  $\mu$  deduced therefrom are 0.38 and 0.64. The dielec. consts. of AcOH, propionic, butyric and isobutyric acids are, resp., at 10° 6.430 (liq.), 3.296, 2.980 and 2.705; and at 40° 6.529, 3.435, 3.036 and 2.730 (cf. C. A. 24, 2649, 3683; 27, 4453).

C. A. Silberrad

**The relation between dipole moment and cohesion forces.** IV. A. E. van Arkel. *Rec. trav. chim.* 52, 1013-27 (1933); cf. C. A. 27, 4973.—The relation among mol. structure, dipole moment and b. p. may be used in certain cases for the detn. of structure. The method is of special value in cases where the chem. detn. of structure does not give clear results, e. g., with the *cis-trans* isomers of ethene derivs. V. A. E. van Arkel and J. L. Snoek. *Ibid.* 53, 91-4 (1934).—The dipole moments of 7 diazine derivs. were measured, to furnish exptl. proof of assertions made concerning the dipole moments of compds. contg. N in place of 1 or more CH groups of C<sub>6</sub>H<sub>6</sub> or C<sub>10</sub>H<sub>8</sub>. The moments were detd. as exactly as possible only when this seemed necessary in the course of the reasoning, e. g., with the following compds.: 2,5-dimethylpyrazine, d<sub>20</sub> 0.9887, b. 154.5°, m. 15°, picrate m. 154°, dipole moment = 0; 2,6-dimethylpyrazine, d<sub>20</sub> 0.9647, b. 155.6°, m. 39°, picrate m. 173.5°, dipole moment =  $0.53 \times 10^{-18}$ . VI. A. E. van Arkel. *Ibid.* 246-56.—In unsatd. compds. the b. p. is affected in the same way by the kind and position of substituent groups as in satd. ones. However, in the transition of an alkyl group from an aliphatic union to an unsatd. one, the b. p. rises; the b. p. falls when a halogen atom goes through this transition.

Louise Kelley

**Measurements of the indexes of water by an interferential method.** O. Jasse. *Compt. rend.* 198, 163-4 (1934).—By means of the interferential method (cf. *Ibid.* 185, 1268 (1927))  $n_D$  of H<sub>2</sub>O (in comparison with air) were detd. for the Hg radiations 579, 577, 546 and 436 m $\mu$  at 0-93.53°. The max. error does not exceed 8 units in the 6th decimal place.

Reuben Roseman

**A critical test for the purity of gases.** Martin Shepherd. *Bur. Standards J. Research* 12, 185-91 (1934) (Research Paper No. 644); cf. Washburn, C. A. 22, 522.—This paper reports a method by which the purity of gases (and liquids having normal b. ps. below room temps.) may be critically tested. It involves 1 approx. isothermal distn., whereby a small initial distillate, a middle cut and a small final residue are obtained. The pressures of these 3 fractions are compared by means of a simple differential manometer and form the basis for indicating impurities of higher and lower b. ps. than that of the approx. pure substance. The method eliminates the exacting temp. requirements of the widely used criterion of constancy of pressure during an isothermal condensation or vaporization, offers more information than the isothermal condensation, and is suitable for testing mixts. contg. more than 2 components. In many cases the order of magnitude of the impurities may be calcd. Like the isothermal condensation, it is not suitable for studying azeotropic mixts.

R. Roseman

**Experimental determination of the thermal conductivity of air between 0° and 100°.** S. W. Milverton. *Phil. Mag.* 17, 397-422 (1934).—The hot-wire method was used. The value at 0° is  $581.0 \times 10^{-7}$  cal. cm.<sup>-1</sup> sec.<sup>-1</sup> deg.<sup>-1</sup>. The data are represented within 1% by  $K = 5.626T^{1/2}/(1 + (165/T))10^{-7}$  in which  $K$  is the thermal cond. and  $T$  is the mean abs. temp. of the air. The radiation loss

from a bright Pt wire is represented by  $E = 5.88 (T_1^{1.22} - T_2^{1.22})10^{-12}$  in which  $E$  is the rate of radiation loss in cal. sec.<sup>-1</sup> per sq. cm. of wire surface and  $T_1$  and  $T_2$  are the abs. temps. of the wire and the wall, resp.

E. J. Rosenbaum

**Compressibility of certain gases at low pressures.** T. Batuecas. *J. chim. phys.* 31, 65-75 (1934).—Reply to Cawood and Patterson (C. A. 27, 4454).

L. K.

**Fractionation of hydrogen by diffusion through palladium.** V. Lombard and C. Eichner. *Compt. rend.* 198, 932-4 (1934); cf. C. A. 27, 2079; 28, 2246.—The rate of re-diffusion through Pd of H<sub>2</sub> that has once diffused through it is approx. 19% greater than that of diffusion of the portion that did not diffuse. Accumulation of impurities being very improbable, a genuine fractionation of H<sub>2</sub> into 2 allotropic modifications appears to have taken place to at least some extent. (Cf. Farkas, C. A. 28, 1922.)

C. A. Silberrad

**Interfacial tension of mixtures of organic liquids.** A. G. Nasini and C. Rossi. *Atti IV Congr. naz. chim. pura applicata* 1933, 524-36.—The Bartell and Mack rule for interfacial tension of mixts. of 2 liquids (C. A. 26, 1494) is confirmed. In 2 liquids of very low soly., the mixt. curve is apparently a straight line.

R. M. S.

**The surface tension at the interface of two immiscible liquids.** III. Constantin Belcote. *Bul. soc. române fis.* 35, 119-25 (1933); cf. C. A. 22, 1509.—To verify the previous hypothesis that a lowering of the surface tension is caused by OH ions, the inverse phenomenon was studied in dil. HCl solns. The capillary method was applied to a study of the hydrolysis of NaOPh, NH<sub>4</sub>OAc, NH<sub>4</sub>Cl, HCOONH<sub>4</sub> and NaHCO<sub>3</sub>. IV. Conductance ratio and activity coefficient for ammonium hydroxide solutions. *Ibid.* 157-9.—The variation with concn. of cond. ratio ( $\gamma = \Lambda/\Lambda_{\infty}$ ) and true activity coeff.,  $\alpha$ , for solns. of NH<sub>4</sub>OH was measured. The cond. measurement detg.  $\gamma$  is equiv. to the activity of the ions at great diln. only. The activity varies with the concn. in a manner differing according to the substance studied. With increasing concn. the value of  $\alpha$  passes through a min. while  $\gamma$  undergoes only a gradual decrease.

Calvin Brous

**Application of Bachinskii's formula to viscosities of molten salts at elevated temperatures.** M. P. Volarovich. *Bull. acad. sci. U. R. S. S., Classe sci. math. nat.* 1933, 1431-7. Exptl. results of Dantuna (C. A. 23, 557) on viscosities of molten KNO<sub>3</sub> and NaCl conform to Bachinskii's formula (C. A. 7, 3060; 8, 277) which holds for non-assoc. liquids. The formula of LeChatelier (C. A. 19, 2114) modified by Lazarev (C. A. 21, 3506) should be used for expressing viscosities of assoc. liquids.

V. A. Kalichevsky

**Measurements of the viscosity of basalt glass at high temperatures.** I. Koichi Kani. *Proc. Imp. Acad. (Tokyo)* 10, 29-32 (1934).—The viscosity was measured by the rotation of a cylinder immersed in molten glass. The true viscosity was obtained by comparison with rice jelly, with which the accuracy of the method was checked.

E. R. Rushton

**The mobility of the molecules in the surface layer.** S. E. Bresler, B. A. Talmud and D. L. Talmud. *Physik. Z. Sowjetunion* 4, 864-72 (1933).—Layers of cetyl alc. and oleic acid were forced through a "flat capillary" onto a water surface. The curve of surface tension against time shows a period of slow variation indicating a low mobility. A relation between rate of flow, viscosity of the film, and the resistance of the base is calcd.

Louis Goldman

**The structure of the surface layer of a liquid.** V. P. Berdennikov, S. E. Bresler, I. L. Zelmanov and E. A. Strauf. *Physik. Z. Sowjetunion* 4, 873-84 (1933).—The orienting effect of the surface extends to within  $10^{-6}$  cm. as shown by the thickness of bubbles in paraffin 2-3° above its m. p. and the thickness of a paraffin film that prevents the coalescence of 2 Hg layers. Electron interference diagrams for Hg show a quasi-cryst. structure for the surface.

Louis Goldman

**Temperature variation of the orthobaric density of unassociated liquids.** Allan Ferguson and J. T. Miller.

*Proc. Phys. Soc. (London)* 46, 140-7(1934).—A formula connecting the orthobaric d. of a liquid and its temp. is developed:  $\rho = 2\rho_c[A(1 - m)^{0.5} + (1 - 1/Am)]$ , in which  $m$  is the reduced temp. and  $A$  is a const. that varies slightly from liquid to liquid, and may be taken to have a mean value of 0.91. This long-range formula was tested for 30 pure org. substances and applied to the evaluation of expansion coeffs. and to show the variation of free and total mol. surface energies with temp. E. R. R.

Distribution of molecules in liquids. E. Amaldi. *Nuovo cimento* 9, cxli-cii(1932).—Theoretical.

Theory of anisotropic liquids. XX. Simplest cases of the symmetry of free energy of molecules and their orientation. C. W. Oseen. *Arkiv Mat. Astron. Fysik* 24A, No. 14, 18 pp.(1933); cf. C. A. 27, 4974.—Math. analysis from group theory is given. C. D. W.

Anisotropic liquids in an electric field. III. Measurements of the dielectric losses of *p*-azoxyanisole. W. Kast and P. J. Bouma. *Z. Physik* 87, 753-62(1933); cf. C. A. 26, 5805.—The dielec. losses of the cryst. liquid phase of *p*-azoxyanisole increases rapidly with temp. The usual explanation of dielec. losses of dipole mols., which supposes that the rotational friction of the dipoles in the liquid causes the losses, does not explain the abnormally high temp. coeff. of the observed dielec. losses. Similar observations are made with the substance in the cryst. solid state which are interpreted in the same way as Debye has explained the dielec. behavior of ice.

Egon Bretscher  
Registrations of the transparency of anisotropic melts of *p*-azoxyanisole in a magnetic field. (A contribution to the swarm theory of liquid crystals.) W. Kast and L. S. Ornstein. *Z. Physik* 87, 763-7(1933).—The transparency of layers of *p*-azoxyanisole of various depths was studied as a function of the time interval that elapsed after a magnetic field of 1600 gauss was switched off. The results seem to support the swarm theory of liquid crystals.

Egon Bretscher  
A case of periodic efflorescence of alums. F. M. Shemyakin. *J. Gen. Chem. (U. S. S. R.)* 3, 1005-6(1933).—The periodic efflorescence of a mounted crystal of  $K_2C_2(SO_4)_4 \cdot 24H_2O$  under a glass jar is described. C. B.

Paramagnetism of salts. C. J. Gorter. *Physica* 11, 171-82(1931).—A discussion. B. C. A.

Application of a new statistical method for calculating magneto-mechanical phenomena. N. A. Kulov and E. Kondorskii. *J. Exptl. Theoret. Phys. (U. S. S. R.)* 1933, 109-14. The distribution function of the axis of spin in elastically deformed monocrystals is worked out as a function of the external field and of the tension. The relations so obtained are used for calcg. the magnetostriction of elastically deformed monocrystals for any direction of the tension and field relative to the axis of the monocrystal. The possibility of a change in length in ferromagnetic materials as a result of the reorientation of the axis of spin, due to the effect of the elastic tension (which can also be present in the absence of an external field, e. g., mechano-contraction) is established. It follows that Hooke's law does not hold strictly for ferromagnetic substances. The  $E$  effect is attributed to the diminishing of the mechano-contraction as the magnetization is increased.

Marie Goyer  
Magneto-thermoelectric effects in nickel and iron: theoretical interpretation. A. Pernier and T. Kousmine. *Compt. rend.* 198, 920-1(1934); cf. C. A. 28, 2582.—Theoretical inferences are drawn from the thermoelec. anisotropy ( $\Delta E_{\parallel} - \Delta E_{\perp} = 43.7 \times 10^{-8}$  v./° for Ni and  $14.8 \times 10^{-8}$  for Fe) deduced from the previous results; in particular that both  $\Delta E_{\parallel}$  and  $\Delta E_{\perp}$  are intrinsic properties of the metals independent of contact potential, and that there is no simple relation between  $\Delta E$  and the intensity of magnetization. C. A. Silberrad

Measurements with the help of liquid helium. XXIII. Superconduction of vanadium. W. Meissner and H. Westerhoff. *Z. Physik* 87, 206-9(1933); cf. C. A. 27, 4976.—The temp. of transition to supercond. is  $4.3-4.4^\circ$ .

Egon Bretscher

1 The primary crystallization of metals. The effect of temperature gradients on the orientation of zinc monocrystals. V. D. Kuznetsov and D. D. Saratovkin. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 248-51 (in German 251-5)(1934).—Crystal formation was observed in a Zn-filled glass tube as it slowly moved out of a furnace. Up to a velocity of 90 cm. per hr. monocrystals result; above that polycrystals. Angular orientation of monocrystals is independent of the speed.

F. H. Rathmann  
Modification of form of crystals grown in solutions containing foreign material. L. Royer. *Compt. rend.* 198, 949-51(1934); cf. C. A. 28, 2234.—(Figures in brackets give the lattice dimensions in A. of the similarly spaced faces.) Although  $NaNO_3$  [ $5.07 \times 8.67$ ] and  $NH_4I$  [ $5.09 \times 8.70$ ] exhibit epitaxy on muscovite [ $5.15 \times 8.02$ ], succinic acid [ $5.06 \times 8.90$ ] neither does so, nor affects in any way the crystn. of  $NaNO_3$  or  $NH_4I$  from a soln. contg. it; this is attributed to differences in sign of the ions or incompatibility in the linkings in the crystals. C. A. Silberrad  
Liquid crystals. Wm. Bragg. *Nature* 133, 445-56; *Proc. Roy. Inst. Gr. Brit.* 28, 57-92(1934).—A review.

B. W.  
Liquid crystals obtained by rapid evaporation of an aqueous solution. P. Gaubert. *Compt. rend.* 198, 951-3(1934); cf. C. A. 28, 1239.—Both liquid and solid crystals of tartrazine are hydrated. The birefringence of its smectic state is not less than that of calcite, and greater than that of its nematic state. Addn. of various dyes to a soln. of tartrazine increases the polychroism, but does not otherwise affect the formation of liquid crystals unless not less than about 5% is present, when the smectic state is suppressed. Some dyes, e. g., Na alizarinsulfonate, increase the stability of the nematic state, causing it to persist for several hrs. A soln. of brilliant croceine (Na benzeneazobenzeneazo- $\beta$ -naphtholdisulfonate) gives rise to a viscous birefringent liquid.

C. A. Silberrad  
Work function of metals. I. Lamar and D. Blokhintzev. *J. Exptl. Theoret. Phys. (U. S. S. R.)* 1933, 77-100; cf. C. A. 27, 3135.—The method of deriving the work function of a metal given in the *J. Exptl. Theoret. Phys.* (U. S. S. R.) (31-33) is more fully developed on the assumption that an ideal potential barrier exists at the surface of the metal. The following formula is derived for the work function in electron v.  $\chi = 4.0(z/\gamma)^{1/4}$  in which  $z$  is the no. of free electrons per atom and  $\gamma$  is the vol. of a g. atom. If the method of Fermi and Thomas is used for obtaining the potential at the surface of a metal, the work function is equal to the mean kinetic energy of the electrons at zero abs. in accordance with the theory of Sommerfeld. This leads to the formula  $\chi = 15.6(z/\gamma)^{1/4}$ . In this case the model assumed is an infinitely long metal with a smooth surface. Both the formulas give values of the work function of the right order of magnitude and in both cases the graphs of  $\chi$  plotted against  $(1/\gamma)^{1/4}$  roughly follow the course of the value of the work function of the various metals (for  $z = 1$  and  $z = 2$ ) through the periodic system. The second formula gives values in closer agreement with expt. Thus the work done in removing electrons from a metal can be explained not by the potential jump at the surface but by the elec. image force. A table of values of the effective valency is also calcd. from the second formula for Ag, Au, Ta and W, but the results are not as good as might be expected. Marie Goyer

Measurement of small dilatations: dilatation of fused silica. L. Dunoyer. *Compt. rend.* 198, 909-11, 1132-4 (1934).—Various methods of detg. the coeff. of dilatation are discussed; that adopted as suitable for use at ordinary temp. depends on the detn. of the form of the meridian line of a tube of the material when a definite temp. difference is maintained between 2 opposite generatrices of the tube. Applied to glass and fused  $SiO_2$  it gave as the coeff. for temp. approx.  $0-40^\circ$ ,  $6.9 \times 10^{-6}$  and  $-6.6 \times 10^{-6}$ , resp.

C. A. Silberrad  
The thermal expansion of calcite. J. Weigle and H. Saini. *Helv. Phys. Acta* 7, 267-68(1934).—The thermal

expansion of the crystal lattice was detd. with x-rays. The coeffs. of expansion are  $\alpha_{||} = 2.10 \times 10^{-5}$  and  $\alpha_{\perp} = -0.380 \times 10^{-4}$ . Egon Bretscher

Thermal expansion of sodium nitrate determined with the help of x-rays. H. Saini and A. Mercier. *Helv. Phys. Acta* 7, 267-72(1934). The coeff. of thermal expansion in the direction parallel to the axis of symmetry is:  $\alpha_{||} = \alpha_0 (1 + 7.53 \times 10^{-4} + 2.56 \times 10^{-7} t^2)$ , perpendicular to it  $\alpha_{\perp} = \alpha_0' (1 + 8.8 \times 10^{-4} + 2.7 \times 10^{-7} t^2)$ .  $\alpha_1$  is at  $20^\circ$  5.060 A.,  $\alpha_2$  16.784 A. Egon Bretscher

Measurement of a hexagonal crystal lattice: Zinc. J. Weigle. *Helv. Phys. Acta* 7, 51 6(1933).—The parameter of the base of Zn is 2.6585 A. Egon Bretscher

Crystal structure and orientation in zinc oxide films. G. I. Finch and A. G. Quarrell. *Proc. Phys. Soc. (London)* 46, 148-62(1934); cf. *C. A.* 27, 4978. A new type of electron-diffraction camera is described. Partially and completely oxidized Zn films were exand. and a ZnO pseudomorphic with Zn was found to be formed by oxidation at room temp. It is converted to normal ZnO by heat, but is still sepd. from the metal by a layer of the pseudomorphic oxide. The corrosion-resistant properties of Zn seem to be due mainly to this coating of pseudomorphic oxide. E. R. Rushton

Structure of oxide films on nickel. G. D. Preston. *Phil. Mag.* 17, 466-70(1934). Electron diffraction patterns were obtained of very thin oxide films on Ni. The film structure is identical with that of NiO in massive form, with parameter 4.10 A. E. J. Rosenbaum

The structure of metallic layers formed by condensation of metallic vapor on a cold surface. M. Ya. Gen. I. Zelmanov and A. I. Shalnikov. *Physik. Z. Sowjetunion* 4, 825 34(1933) (in German). Investigation of layers of Ni, Fe, Cd and Hg by electron refraction by the reflection method, show that the layers consist of small crystals differing from the ordinary metals only in having a higher degree of dispersion. The lower-melting metals form the larger crystals. Louis Goldnan

The recrystallization of dispersed quartz. S. I. Bresler, E. A. Strauf and I. L. Zelmanov. *Physik. Z. Sowjetunion* 4, 909-10(1933).—A film of amorphous quartz formed by condensation of the vapor recrystallizes at about  $400^\circ$  as compared with  $1000^\circ$  for the recryst. of quartz glass. Louis Goldnan

Softening of vitreous substances. E. Rencker. *Compt. rend.* 198, 934 6(1934); cf. *C. A.* 28, 2234. Differential cooling curves for  $B_2O_3$ ,  $HPO_3$ , etc., show that at the transformation or softening point there is merely a change in the sp. heat, coincident with that in the coeff. of dilatation (cf. *C. A.* 15, 155; 22, 1881; 24, 4210). C. A. Silbergard

The vicinal faces of topaz. St. Krutz. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1933A, 169 72. Goniometric measurement of several crystals reveals many reflections vicinal to {120} as well as to other forms in the {001} zone. Structure examn. by the Laue and Bragg methods gives no evidence of these vicinal faces, which are thus to be attributed to anomalies of growth rather than of structure. C. D. West

Space group of tourmaline. W. H. Barnes and A. V. Wendling. *Trans. Roy. Soc. Can.* III, 27, 169-75(1934). An x-ray examn. of a green tourmaline through Laue photographs established the space group as  $C_{2v}$ . J. W. Shipley

Investigation of symmetrical triphenylbenzene with Röntgen rays. B. P. Orelkin. *J. Gen. Chem. (U.S.S.R.)* 3, 643-51(1933).—Detn. of the magnitudes of the  $C_6H_5$  nucleus in  $C_6H_5Ph_3$  produced mean results for  $o$ -,  $m$ - and  $p$  distances, resp., of 0.79 A., 1.12 A. and 1.38 A. These values fully correspond with the Sachs structure of  $C_6H_6$ , because  $0.79:1.12:1.38 = 1:2:3$ . Though the mol. has only 1 true plane of symmetry, it nearly possesses a triple axis of symmetry also. Chas. Blanc

Guanidine *d*-tartrate. Crystallographic study. A. Swaryczewski. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1933A, 359-65.—Guanidine *d*-tartrate is prepd. from equimol. mixts. of *d*-tartaric acid and guanidine carbonate in an aq. soln. From the N content

the formula is  $[(CN_2H_5)_2(C_6H_5O_6)] \cdot 1\frac{1}{2}H_2O$ . The crystals are tabular, wedge-shaped or columnar. By optical measurements the symmetry is monoclinic with  $a:b:c = 0.7056:1:0.3366$ ,  $\beta = 104^\circ 57'$ , and  $n_\alpha = 1.5186$ ,  $n_\beta = 1.5470$ ,  $n_\gamma = 1.5900$  for Nap. Rotating-crystal x-ray photographs give  $a_0 = 9.88 \pm 0.02$ ,  $b_0 = 14.77 \pm 0.15$ ,  $c_0 = 4.78 \pm 0.01$  A. with 2 mols. per elementary cell. Victor Hicks

Crystal form and crystal optics of the optically active methylpropylcarboxymethylarsine sulfide. David Malmqvist. *Bull. Geol. Inst. Univ. Uppsala* 24, 243-55(1933).

The 2 optically active forms crystallize in large, brittle, colorless, transparent plates with a vitreous luster, having monoclinic-sphenoidal symmetry, with  $a:b:c = 1.4176:1.14488$ , and  $\beta = 104^\circ 50'$ . The angles between the observed faces, and the etch figures, show the 2 forms to be morphotropic. The optical orientation is:  $\alpha = c$ ,  $\gamma = b$ ,  $\beta:a = 15^\circ$ . The optical constants for both forms are:  $V_\gamma = 13.1^\circ$ ;  $n_\alpha = 1.601$ ,  $n_\beta = 1.603$ ,  $n_\gamma = 1.645$ , for Nap; birefringence, 0.0405. Victor Hicks

A crystal study of nitropentaminocobaltic chloride. Lester W. Strock. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1933A, 366 73; cf. *C. A.* 28, 943.

A reinvestigation of the crystal form of this compd. shows the symmetry to be not higher than monoclinic hemimorphic, because twinning of 2 di-habit crystals occurs on the {101} and on the {001} faces. The axial ratio,  $a:b:c = 0.8834:1.08215$ , with  $\beta = 92^\circ 08'$ , obtained with a new orientation is in approx. agreement with the values of F. M. Jaeger (*Z. Krist.* 39, 555(1904)) when calcd. for J.'s orientation. Crystals are strongly pleochroic and show strong double refraction with  $\gamma = c$ ,  $\alpha = b$ ,  $\beta = a$ .  $d_{22} = 1.832$ . Victor Hicks

The crystalline structure of naphthazarin. J. Palacios and R. Salvia. *Anales soc. espan. fis. quim.* 32, 49-52 (1934). From Weissenberg diagrams of a revolving crystal, the elementary structure is monoclinic-sym.,  $a_0 = 3.85 \times 10^{-8}$ ,  $b_0 = 8.02 \times 10^{-8}$ ,  $c_0 = 14.5 \times 10^{-8}$  cm.,  $\beta = 97^\circ 6'$ . The no. of mols. in the lattice is 2, grouping  $C_{2h}$ , the mol. having a center of symmetry. E. M. Symmes

Crystal structure and composition of cubic chromium carbide. Arne Westgren. *Jernkontorets Ann.* 117, 501-12(1933); cf. *C. A.* 27, 5228, 5697. The carbide phase of stainless steel with 13% Cr and 0.1-0.4% C has the same structure as the lowest Cr carbides have. This is face-centered cubic with a lattice parameter of 10.638 A. and the nearest stoichiometric compn. is  $Cr_3C$ . A re-examination of the grouping shows that it is in fact  $Cr_2C$ . The space grouping is  $O_h^h$  and the at. positions in Wyckoff's notation are 4 Cr at 4 (a); 32 Cr at 32 f; 8 Cr at 8 (c); 48 Cr at 48 h, 24 Cr at 24 (e), with  $u = 0.385$ ,  $v = 0.165$  and  $w = 0.275$ . In a Cr W carbide, the W atoms are mainly at 8 (c) and therefore have the formula  $Cr_{12}W_4C_4$ . In low-W and low-Mo steels, the carbides are analogous to cubic Cr carbide. These substances may be considered to be  $Fe_{21}W_2C_8$  and  $Fe_{21}Mo_2C_8$ , in which W and Mo are largely replaced by Fe. H. C. Duus

Crystal structure of barium nickelocyanide. H. Brasseur, A. de Rassenfosse and J. Piérard. *Compt. rend.* 198, 1048 50(1934); cf. Bozorth and Pauling, *C. A.* 26, 2300.—This salt contains  $4H_2O$  and not 3 (cf. Weselsky, *Wien. Akad. Ber.* 60, 261(1869)). It is monoclinic  $a:b:c = 0.8722:1:0.4940$ ,  $\beta = 104^\circ 50'$ ,  $d^{20} = 2.383$ . X-ray examn. gives  $a$  11.89,  $b$  14.08,  $c$  6.54,  $\beta$   $103^\circ 42'$ , with  $4[BaNi(CN)_4 \cdot 4H_2O]$  in the unit cell, and a structure identical with that of  $BaPt(CN)_4 \cdot 4H_2O$ .  $[Ni(CN)_4]^{2-}$  is therefore plane, with Ni in the center of a square formed by 4(CN). C. A. Silbergard

Structure and formula of 12-phosphotungstic acid. J. F. Keggin. *Proc. Roy. Soc. (London)* A144, 75-100 (1934); cf. *C. A.* 27, 5228.—The formula was found to be  $H_{12}P(W_{12}O_{40})_4$ , which agrees with most chem. evidence. The prepn. and dehydration of the acid are described. E. R. Rushton

Vapor pressure of mixtures of light and heavy hydrogen. Gilbert N. Lewis and W. T. Hanson, Jr. *J. Am. Chem. Soc.* 56, 1000-1(1934).—Preliminary results indicate that

mixts. of  $H_2$  and  $H_2$  approximate closely Raoult's law, in which the total vapor pressure is plotted against the mole fraction of  $H_2$  at 18.05°K. The temp. at which freezing begins also proved to be nearly linear with the mole fraction. There appeared to be no great difference in vapor pressure before and after treatment with a hot Pt filament for 30 hrs. C. J. West

**Vapor pressure of solid and liquid heavy hydrogen.** Gilbert N. Lewis and W. T. Hanson, Jr. *J. Am. Chem. Soc.* 56, 1001-2 (1934).—The ratio of  $p_2$ , the vapor pressure of  $H_2$ , to  $p_1$ , that of  $H_2$  (para) is plotted and tabulated as a function of  $p_1$ . The measurements are extremely sensitive to an impurity of light H. The triple point of  $H_2$  is 18.66°K. Treatment with charcoal caused no change in the vapor pressure. C. J. West

**Some properties of heavy water.** Hugh S. Taylor and P. W. Selwood. *J. Am. Chem. Soc.* 56, 998-9 (1934).—The max. d. attainable by the electrolytic method of prepn. of  $H_2O$  is believed to be higher than that reported by Lewis and Macdonald (*C. A.* 27, 4147); the ratio of  $d_{H_2O}^{25}$  of  $H_2O$  and  $H_2O$  is found to be 1.1079 (L. and M., 1.1056); the difference in  $n_D$  is -0.00462 at 20°. Such  $H_2O$ , subjected to prolonged electrolysis, gives fractions varying in d. from 1.100 to 1.1059; the ratio of sp. rates of discharge of light and heavy H at these high concns. is about 6.  $H_2O$  must be treated as an anhyd. liquid; a sample with  $d_{25}^{20}$  of 1.1038, exposed to the air overnight, had d. 1.1016. The f. p. of max. d.  $H_2O$  is 3.82° and  $\eta_{20}$  12.6 millipoises. Prolonged fractional freezing of 90%  $H_2O$  yielded no concn. The ratio of  $H_2O/H_2O$  in natural water is about 1 in 5000-6000. C. J. West

**Vapor pressure of liquid and solid deuterocyanic acid [deuterium cyanide].** Gilbert N. Lewis and Philip W. Schutz. *J. Am. Chem. Soc.* 56, 1002 (1934); cf. *C. A.* 28, 1587. The vapor pressure of HCN(l.) can be expressed by the equation  $\log_{10} p = 7.795 - 1467/T$ ; for the solid,  $\log_{10} p = 9.372 - 1877/T$ ;  $H^2CN(l.)$ ,  $\log_{10} p = 7.695 - 1440/T - 175/T^2$ ; solid,  $\log_{10} p = 9.476 - 1907/T$ . There is very little difference between the vapor pressures of the liquid forms of HCN and  $H^2CN$ . The f. p. of HCN is calcd. to be 259°K.; of  $H^2CN$ , 261°K. C. J. West

**Ionization constant of deuteracetic acid [deuterium acetate].** Gilbert N. Lewis and Philip W. Schutz. *J. Am. Chem. Soc.* 56, 1002-3 (1934).— $AcOH^2$  in 97%  $H_2O$  at 25° and concns. of 0.0722 and 0.1444 *M* has sp. cond. of 1.83 and  $2.59 \times 10^{-4}$ , both giving for the ionization const. the value  $0.59 \times 10^{-4}$ ; the  $H_2O$  used had a sp. cond. of  $2.3 \times 10^{-4}$ . The const. is less than  $1/3$  that of  $AcOH$  in  $H_2O$ . C. J. West

**The heat of adsorption of carbon monoxide on copper.** Ralph A. Beebe and Edwin L. Wildner. *J. Am. Chem. Soc.* 56, 642-5 (1934); cf. *C. A.* 27, 882. In a calorimeter designed to eliminate all the known sources of error, the differential heats of adsorption of CO on Cu at 0° and pressures between 0 and 0.3 mm. were measured; the differential heat of adsorption was about 20,000 kg.-cals. per mol. for the first gas adsorbed and decreased rather sharply to about 13 kg.-cals. for the last quantities of gas added. P. H. Emmett

**Adsorption of carbon dioxide and hydrogen on bare and oxygen-covered silver surfaces.** Leonard C. Drake and Arthur F. Benton. *J. Am. Chem. Soc.* 56, 500-11 (1934).—On bare Ag,  $CO_2$  showed only an instantaneous phys. adsorption at -78° and 0°, with a heat of adsorption of about 5 kg.-cals.; complete covering of the surface requires about the same amt. of  $CO_2$  as of  $O_2$ . On Ag surfaces occupied by adsorbed O, activated adsorption of  $CO_2$  occurred between 0° and 200°, the energy of activation being about 5 kg.-cals.; also, some phys. adsorption occurred at 0°. Ag surfaces occupied by  $Ag_2O$  reacted with  $CO_2$  to form  $Ag_2CO_3$  at temps. as low as 56°, the energy of activation being 13 kg.-cals., the heat of formation 17.3 kg.-cals. Phys. adsorption of  $H_2$  was very small even at -183° on bare Ag; some activated adsorption appeared at about 200°. P. H. Emmett

**Adsorption of hydrogen by zinc oxide, zinc chromite and zinc oxide-molybdenum oxide.** Hugh S. Taylor

and Corneille O. Strother. *J. Am. Chem. Soc.* 56, 588-90 (1934).—On ZnO,  $H_2$  undergoes 3 types of adsorption (1) a van der Waals adsorption between -190° and -78°, (2) an activated adsorption over the temp. range 0° to 100° having an energy of activation of about 5 kg.-cals. and (3) an activated adsorption in the temp. range 100° to 300° having an energy of activation of about 12 kg.-cals. A ZnO- $Cr_2O_3$  catalyst had only 1 type of activated adsorption; the energy of activation was low, the rate being appreciable at -78°. Activated adsorption, on a ZnO-Mo oxide catalyst occurred at about 200°, the energy of activation being about 17 kg.-cals. P. H. Emmett

**Adsorption of hydrogen.** Thomas D. Phillips. *Phys. Rev.* 45, 215 (1934).—The rate of adsorption by charcoal, which starts soon after outgassing, rises to a max. in about 30 sec. This effect is explained by assuming that the adsorption occurs at the boundaries of "puddles."

Louis Goldman

**The sorption of iodine vapor by some inorganic substances.** Ernst Beutel and Artur Kutzelnigg. *Monatsh.* 63, 99-116 (1933).—Numerous inorg. substances of different periodic groups absorb I vapor. Those absorbing most rapidly are  $MgO$ ,  $ZnO$  (from basic Zn carbonate at 300°),  $Ca(OH)_2$  and  $SiH_4O_2$ . These were powdered and ground with solid I or heated with its vapor. The method of prepn. and condition of surface are important. The color of the sorbate varies from yellow to black, depending on the amt. sorbed. Sorption at room temp. in I vapor is slow because the air film on the powd. substances was not removed by evacuation. Much greater sorption was obtained by heating or grinding. The only case of definite chem. action with the vapor observed was  $HgCl_2$ . Channing Wilson

**Kinetics of adsorption. I. Velocity of adsorption of gaseous nitrous oxide and nitric oxide by glass walls.** M. Crespi. *Anales soc. españ. fis. quim.* 32, 30-42 (1934); cf. *C. A.* 28, 1243. Exptl. results of velocity of adsorption of  $N_2O$  and  $NO$  gases on glass walls are given. Equations of velocity of adsorption are deduced from the Langmuir and Freundlich isotherms of velocity of condensation and evapn. It is probable that gas follows a different course, represented by  $dy/dt = k(a - y)(y_0 - y)/y$ , in which  $y$  = concn. of adsorbed gas in adsorbent,  $t$  = time to adsorb quantity  $y$ ,  $y_0$  = final concn., and  $a$  = initial concn. in the gaseous phase. E. M. Symmes

**Adsorption at high pressures. I.** Albert S. Coolidge. *J. Am. Chem. Soc.* 56, 554-61 (1934).—The phenomenology and thermodynamic theory of adsorption systems are generalized and made applicable to the entire range of conditions within which the adsorbed substances normally exists as a fluid. Special attention is devoted to the corrections required when expts. are performed at high pressures. The conclusion is reached that several different methods of defining adsorption can advantageously be adopted. The consequences of adopting each of these definitions are followed in some detail and illustrated by computations based upon the Polanyi theory. II. Albert S. Coolidge and Holmes J. Fornwalt. *Ibid.* 56, 561-8. Adsorption equil. between charcoal and  $CO_2$ ,  $N_2O$  and  $SiF_4$  was measured over the temp. range -100° to about 100° and the pressure range 0.01 to 100 atm., particular attention being paid to the region near the crit. point. The results are of the general nature anticipated. In the case of  $CO_2$  the Polanyi theory was applied successfully. P. H. Emmett

**Adsorption capacity of silica gel precipitated from metallic salts.** V. K. Markov. *Ukrain. Khim. Zhur* 8, No. 1, Wiss. Teil 16-20 (1933).—Benzene was used as the adsorbed agent. The following combinations were studied:  $SiO_2$  and  $Al_2O_3$ ,  $Cr_2O_3$ ,  $Fe_2O_3$ ,  $NiO$  +  $Ni_2O_3$ ,  $CoO$  +  $Co_2O_3$ ,  $CuO$ ,  $SnO$  and  $Sb_2O_3$ . A complete table is given presenting the adsorption efficiency in percentage at various concns. and at 25°. B. S. Levine

**The absorption of dyestuffs by cellulose. I.** The kinetics of the absorption of sky blue FF on viscose sheet, in the presence of various amounts of sodium chloride. S. M. Neale and W. A. Stringfellow. *Trans. Faraday*

*Soc.* 29, 1167-80(1934).—Methods are described for accurately measuring the amt. of sky blue FF, absorbed by regenerated sheet cellulose and for rendering the amts. reproducible within about 2%. The effect of the variations in the concn. of NaCl and dyestuff upon the rate of absorption and upon the satn. absorption was studied. Absorption of the dyestuff from pure aq. soln. was negligible but it increased rapidly with the addn. of salt. Results obtained for the rate of absorption are explained in terms of the math. theory of diffusion. It is assumed that the outside of the sheet is dyed immediately on immersion, the color then diffusing towards the center at a rate proportional to the gradient of concn. in the cellulose phase. In agreement with this assumption it was found that cellulose sheets of half the usual thickness dyed to a given fraction of satn. in one quarter of the time. The diffusion const. of sky. blue FF through Cellophane immersed in water at 100° was found to be of the order of  $10^{-7}$  sq. cm./min. It rose to a max. and then fell with increasing salt concn. but appeared to be independent of the concn. of dyestuff within the limits studied.

L. H. Reyerson

**Linear phenomena. II. • Linear adsorption isotherms.** B. A. Talmud. *Physik. Z. Sowjetunion* 4, 854-60 (1933); cf. *C. A.* 27, 1798, 5607.—Surface tension vs. mol. area is plotted for a diethylcellulose layer on water and solns. of various org. acids and alcs. The linear adsorption increases with mol. wt. Satn. of linear adsorption occurs sooner than satn. of the surface layer.

Louis Goldman

**Thin films on a water surface.** R. G. Whitmore, R. Richmond and H. A. McTaggart. *Trans. Roy. Soc. Can. III*, 27, 113 23(1933); cf. *C. A.* 24, 2351. The conditions under which liquid films of triolein and oleic acid pass from the unimol. state to a state showing droplets with Brownian movement were studied. The transition occurs at a lower pressure when the temp. is raised but the films remain liquid in both states. The vol. of the droplets appears to be that of a sphere of diam.  $0.5 \mu$  and their shape lens-like. Films of palmitic and stearic acids show Brownian movement at low pressures but become rigid at higher pressures while mixts. of triolein and palmitic acids give films that seem partly liquid and partly rigid. The Brownian movement appears when a solid film of tripalmitin is heated to its m. p. Benzyl benzoate on water forms a film which on compression exhibits the Brownian movement. Substances that form rigid films exhibit no other phenomenon at the point of collapse than the crumpling up of a solid but those that remain liquid require further study.

J. W. Shipley

**Spreading of ovalbumin.** G. Th. Philipp. *Rec. trav. chim.* 53, 81-90(1934). Ovalbumin spread on weak buffer solns. in the  $p_H$  range 4.0-5.5 does not spread over the whole available surface but forms a unimol. layer of coherent structure and of practically always the same size. The surface of this "coherent film" is 1.3 sq. m./mg. At  $p_H > 5.7$  homogeneous films could not be obtained. For  $p_H < 3.9$  the coherent film breaks apart. The surface occupied is larger the further the  $p_H$  of the substrate is below 3.9. In certain  $p_H$  ranges the surface p. d. becomes const. at a definite degree of compression and always at the same surface, 0.7 sq. m./mg. It is concluded that in these compressed films the amino acids, which are linked to polypeptides, protrude from the surface, the polypeptide backbone lying tightly packed in the plane of the surface; in the coherent film the amino acids lie, tightly packed, flat on the surface. Structures are proposed for the coherent and compressed states of the film. The linkages in the coherent state are mainly ascribed to the attraction of oppositely charged groups in various polypeptide chains.

Louise Kelley

**Several instructive routine lessons for colloidchemical courses.** A. Lottemoser. *Kolloid-Z.* 66, 188-91(1934).—HgS sol can be prepd. by pouring a soln., made by adding dropwise  $\text{Na}_2\text{S}$  soln. to 1 cc. of satd.  $\text{HgCl}_2$  soln. until the ppt. just redissolves, into 1 l. of distd.  $\text{H}_2\text{O}$ . If a large excess of sulfide is used, HgS ppts. because of the low velocity of decompn. of the higher complexes. Tap water

causes a fairly rapid coagulation of the sol. Sol formation by soly. decrease may be illustrated by pouring  $\text{MgCO}_3$  solns. of S into  $\text{H}_2\text{O}$ . To illustrate change in dispersity, ppt. various dilns. of  $\text{H}_2\text{AsO}_4$  with  $\text{H}_2\text{S}$ . Slow titration of KI with  $\text{AgNO}_3$  illustrates pos. and neg. sols, with coagulation at the neutral point. The system pyridine-water is convenient for detn. of surface tension-concn. curve with the Traube stalagmometer. A. F.

**Dust and smoke.** R. Whytlaw-Gray. *Proc. Roy.*

*Inst. Gt. Brit.* 28, 149-63(1934).—Various smokes were formed inside a tank of 1 cu. m. capacity and the particles counted with the slit ultramicroscope. The wt. concn. was found by the increase in wt. of small asbestos filters. In all cases the no. of particles per cc. diminished very rapidly for the first 20 min., then more slowly; at the end of 2 hrs., the rate of decrease was nearly const. The corresponding wts. changed only slowly with time, showing that coagulation is the main factor in the disappearance of smoke from a closed space. Microscopic examn. of the deposits showed characteristic structures, depending on the nature of the material and the method of formation. Curves showing the decrease in the no. of particles with time for  $\text{MgO}$ , resin and stearic acid are given. Straight lines are obtained by plotting the reciprocals of the no. of particles against time, and the no. of particles present can be calcd. from the equation  $1/n - 1/n_0 = Kt$ , in which  $n$  is the no. of particles in the smoke  $t$  min. after formation,  $n_0$  is the initial no. and  $K$  is a const. that does not vary much for different smokes. A table for  $K$  is given which shows that  $K$  is much greater for very small units (nuclei and small ions) as predicted by H. S. Patterson's modification of Smoluchowski's equation. Initially homogeneous smokes coagulate more slowly than others. Coagulation apparently occurs at every chance encounter of the particles.

E. R. Rushton

**Foams.** A. V. Dumanskii, T. A. Granskaya and N. V. Novikov. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* (U. S. S. R.) 3, 361-91 (1933). Exptl. studies of foams showed the descending order of foaming power in hydrophilic colloids to be: saponin, molasses, peptone, gelatin, albumin, pectin, casein. For albumin the max. occurs just below the coagulation temp.; max. foam stability was found at  $p_H$  4.7. Replacing air by  $\text{CO}_2$  or  $\text{SO}_2$  decreases the stability but not the amt. of the foam.

Julian P. Smith

**Emulsions. I. Proteins and allied substances as emulsifiers for phenolic liquids.** R. M. Woodman. *J. Soc. Chem. Ind.* 53, 57-60T(1934).—Proteins, proteincontg. substances, and their degradation products often yield dual types of emulsions with phenolic liquids. Gels are formed in certain systems, making verification of the type difficult. The formation of gels is discussed. Results indicate that some measure of swelling in  $\text{H}_2\text{O}$  is necessary before emulsoid colloids can emulsify;  $\text{H}_2\text{O}$  must therefore be present for emulsification in these instances.

C. B. Jenni

**Gelatinized emulsions.** S. R. Bresler, M. Katz and L. Kremnev. *Physik. Z. Sowjetunion* 4, 889 93(1933).—The prepn. of gelatinized emulsions is described. They contain up to 99% by vol. of an org. liquid which in the emulsion has a frothy structure.

Louis Goldman

**Physicochemical nature of emulsions.** G. R. Vishnevskaya and A. G. Kniga. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* (U. S. S. R.) 3, 392-405(1933).—Emulsifying power for  $\text{C}_{12}\text{H}_{26}$  in  $\text{H}_2\text{O}$  was measured with agar, saponin, albumin, pectin, gelatin, lecithin and casein. Results are plotted in triangular coordinates to show emulsification and coagulation ranges. Large concns. of sugar favor emulsification. Hitherto unobserved double emulsions with lecithin are described. Use of 2 emulsifying agents, e. g., lecithin and casein, may lessen the stability of the emulsion.

J. F. S.

**A method for determining colloids in aqueous solutions.** A. V. Dumanskii and A. P. Dumanskaya. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* (U. S. S. R.) 3, 406-22(1933).—Breaking aq. emulsions with  $\text{EtO}-\text{EtOH}$  mixts. can be utilized for detn. of colloids in hydrosols, within 0.5-2%; but no generally exact

procedure can be specified because optimum conditions must be ascertained for each hydrosol, preferably by plotting the area of complete coagulation on triangular coordinates. For albumin sols the optimum  $pH$  is about 6. Sugars do not affect accuracy in sols of albumin, gelatin, starch, dextrin, etc. Results for these 4 colloids are described.

Julian F. Smith

**Separation of constituents of clays.** P. Urbain. *Compt. rend.* 198, 904-7(1934). -Electrolytes are removed by suspension in  $H_2O$  and centrifuging 3 times. The solids are then suspended in  $H_2O$  in an inverted cylindrical vessel closed by a cap, and subjected to a vertical elec. field of about 100 v./cm., pos. below, neg. above, the neg. colloids being subsequently sepd. from the cryst. solids (with which they have settled) by a similar method while the pos. colloids remain in suspension. All trace of electrolytes is finally removed by electrodialysis, and 4 fractions are thus obtained: cryst. solids, pos. colloids (metallic hydroxides), neg. colloids (Al silicates) and a saline soln.

C. A. Silberrad

**A sedimentation method for determining the particle size of finely divided materials (such as hydrated lime).** Dana L. Bishop. *Bur. Standards J. Research* 12, 173-83 (1934) (Research Paper No. 642). -Pyrex glass spherules, fractionated so that most of the particles had a diam. within  $2\mu$  of the av. diam. of the fraction, were dispersed in a liquid and weighed as they settled out of suspension with an automatic weighing device. From this sedimentation record the particle size distribution was calcd. The same sample was then used to det. the particle size distribution by measuring the diams. of several hundred particles with a microscope. Here the spherules were mounted in liquids of various  $n$ s; it was found that differences in  $n$  of the mounting medium produced appreciable changes in the apparent diam. (more than 20% in some cases). The microscopic and sedimentation measurements showed similarly shaped distribution curves but there was some variation between them. Particle-size distributions of hydrated lime are also reported.

R. Roseman

**Formula for the variation in the scattering of light in colloids during aging and slow coagulation.** K. Krishna murti. *Current Sci.* 2, 206-7(1933). Aging properties of sols vs. time give S-shaped curves. Equations for the curves take the form  $I = c + [k/(1 + be^{at})]$ .

G. B. Taylor

**Magnetic study of sols and gels.** I. Satya Prakash. *Indian J. Physics* 8, 243-58(1933). -The paramagnetic susceptibilities of  $FeCl_3$  and  $CrCl_3$  solns., with and without  $NaOAc$  added, were detd.  $Fe_2(HAsO_4)_3$ ,  $Fe_2(HPO_4)_3$ , ferric borate,  $Fe_2(WO_4)_3$ ,  $Fe_2(MoO_4)_3$ ,  $Cr_2(HPO_4)_3$  and  $Cr_2(HAsO_4)_3$  in the colloidal state, produced by adding the K salt to the chlorides, had a slightly higher paramagnetic value than in the powd. form. The susceptibility of  $Fe_2(HPO_4)_3$  sol was not much changed when it was converted to a gel. The opalescent gels of  $Al(OH)_3$  and  $Zr(OH)_4$  increased in diamagnetic value on aging.

E. R. Rushton

**Viscosity curves of lyophile colloids and some other curves.** F. M. Shemyakin. *J. Gen. Chem.* (U. S. S. R.) 3, 13-16(1933). A theoretical discussion of the effect of salts, such as  $MgSO_4$ ,  $CaCl_2$ ,  $(NH_4)_2SO_4$ , etc., on viscosity of linseed-oil emulsions. Curves show that with increase of salt concn. the viscosity passes through a min., after which it increases gradually above the value of pure linseed oil.

S. L. Madorsky

**Absolute viscosity measurements with the aid of the Brownian molecular movement.** VII. The effect of light on the viscosity of the cell fluids. J. Pckarek. *Protoplasma* 20, 359-75(1933); cf. C. A. 28, 1369. -The effect of light and darkness on the viscosity of the cell juices of the protonema cells of *Leptobryum piriforme* (L.) Schpr. and the epidermal cells of *Rheum palmatum* L. was studied. The viscosity of the cell juices of protonema cells of *Leptobryum piriforme* that have been submitted to the action of light is, in round nos., 1.9 times greater than that from protonema cells that have been in the dark for a long time and, in round nos., 1.5 times greater

than the viscosity of  $H_2O$  at the same temp. The viscosity of juices of these substances held in the dark is on the av. 20% less. The viscosity decrease of *Leptobryum piriforme* in the dark is a reversible one—one undergoing a recurrent periodical daily rhythm. The viscosity of the cell juices of the epidermal cells of *Rheum palmatum* undergoes no change in viscosity through light and darkness, the cell juice viscosity being a const. and independent of any light factor and is, in round nos., 1.9 times greater than that of  $H_2O$  at the same temp. In the protonema cells of *Leptobryum piriforme*, the light factor is not the primary cause of the viscosity changes in the dark but the changes are due probably to the increase in acidity of the cell juices in the dark, in consequence of the lack of  $CO_2$  assimilation. The "light" value is to be regarded as the normal viscosity condition of the cell juices. Also the viscosity of the cell juices of the protonema cells of *Leptobryum piriforme* is not primarily increased in the light, but lowered in the dark. The phenomena observed are understandable only on the assumption that colloids are present. Arguments for this assumption are presented. Twenty-two references.

F. L. Dunlap

**Liesegang gas layers.** D. L. Talmud. *Physik. Z. Sowjetunion* 4, 861-3(1933). Lens-shaped bubbles formed in a gel are interpreted as Liesegang gas layers as indicated by the fact that the bubbles assume shapes similar to the gel-acid interface.

Louis Goldman

**Wave theory of periodic reaction.** F. M. Shemyakin, V. K. Nikiforov and P. F. Mikhalev. *S. Gen. Chem.* (U. S. S. R.) 3, 798-801(1933). -By applying the equation  $\lambda v = \text{const.}$  to 2 periodic reactions on gelatin and agar, (1)  $2AgNO_3 + K_2C_2O_4 \rightleftharpoons Ag_2C_2O_4 + 2KNO_3$ , and (2)  $Pb(NO_3)_2 + 2KI \rightleftharpoons PbI_2 + 2KNO_3$ , it was experimentally confirmed that the product of velocity of field diffusion and the distance between the rings is a const. The value of the const. apparently depends upon the electrolytes, upon the age of gelatin, and upon the nature of the gel, and under various conditions it deviates within a relatively small range.

W. P. Briggs

**The mobility of chlorine and hydrogen ions in the presence of gelatin.** S. A. Shchukarev and V. M. Vdovenko. *Physik. Z. Sowjetunion* 4, 804-905(1933) (in English). The decrease in cond. of a 0.1 N soln. of HCl on addn. of gelatin at 40° depends on the selective binding of the H ions as shown by the rapid drop in its activity. The transference no. of Cl (values given correct to 10-12%) rises because of this selective action and because the mobility rises to a max. as the gelatin concn. increases.

Louis Goldman

**Electrical resistance of gel-forming mixtures during setting.** R. K. Upadhyaya and Mata Prasad. *Current Sci.* 2, 216(1933). -The elec. resistance of solns. of silicate and HOAc or citric acid does not change on gelation.

G. B. Taylor

**Cryotropic behavior of some inorganic jellies.** Satya Prakash. *Indian J. Physics* 8, 231-42(1933); cf. C. A. 27, 5611. -Jellies that are again converted into a sol after freezing in liquid air and warming to room temp. are called *cryotropic*. The sol, on standing, is again converted to jelly, and the process can be repeated indefinitely. The same substance may give a cryotropic or noncryotropic jelly according to the method of preparation. Jellies that have developed marked agglomeration tendency are noncryotropic. Ferric phosphate and arsenate,  $Al(OH)_3$  and  $Zr(OH)_4$ , and Th molybdate and phosphate are cryotropic and  $Fe(OH)_3$ ,  $Cr(OH)_3$ , Th arsenate and phosphate are not.

E. R. Rushton

**Fundamental principles involved in determining jelly strength with instruments commonly used.** S. Gradshteyn and H. Mendel. *Kungsidninger u. Leim* 30, 312-13(1933). -The authors derive equations for calcg. the true const. of elasticity of jellies from data obtained with the Greiner glutinometer or the Bloom gelometer. Errors in previous work (cf. C. A. 23, 5059; 24, 4184) are corrected.

J. W. Peitz

**Elastic properties of glycerol-gelatin gels and of gelatin gels hardened with formaldehyde.** Emil Hatschek. *Trans. Faraday Soc.* 29, 1108-31(1933). -Methods are

described of detg. Young's modulus on specimens of gelatin in compression and of prepg. accurate test pieces for this purpose. Results show that (a) gels contg. between 8 and 14% of dry gelatin have a well-defined modulus for stresses up to 45 g./sq. cm., and (b) the values of the modulus from 2 detns. at different stresses on the same test piece, and at the same stresses on duplicates having the same history agree within about 3%. Both cane sugar and glycerol raised the modulus above aq. gels, but there was no simple relation between the increase and the sugar or glycerol concn. The modulus of carefully kept glycerol gels increased for 2 months and probably longer. Test pieces were permanently compressed and the modulus was detd. in the direction of compression and in the direction of dilatation at right angles to it. The former retained about the same value as the original gel while the latter was found to be greater. Increases in the modulus due to hardening by  $\text{CH}_2\text{O}$  were measured against time. Evidence appeared to show that more  $\text{CH}_2\text{O}$  was removed than could be accounted for by reaction with  $\text{NH}_2$  groups. The formation of condensation products is tentatively suggested. L. H. R.

**Calcium acetate gels.** Herbert Henstock. *Trans. Faraday Soc.* 29, 1101-7 (1933).— $\text{Ca}(\text{OAc})_2$  gels were made by adding abs. alc. to concd. solns. of the salt. The gels usually began to liquefy after 24 hrs. with part of the salt crystg. out in contact with the satd. soln. When an excess of the anhyd. salt was boiled with  $\text{MeOH}$  for about 30 sec. and filtered, solid, elastic, water-clear gels set on the addn. of about twice its weight of (1) the normal or isomeric alcs. up to heptyl alc., except  $\text{EtOH}$ , (2) simple ethers, (3) esters, (4) benzene or toluene, (5)  $\text{Et benzoate}$ . These gels persisted for periods of from 48 hr. up to 6 months in closed vessels. Many other org. substances produced thinner gels. Water was not necessary for the formation of these colloids. Heat tends to break the jellies. Optical properties,  $n_D$  and elec. cond. of these gels were studied. By use of methods of Zsigmondy the radius of the gel capillaries was found to be  $7.06 \times 10^{-7}$  mm. L. H. Reyerson

**The solubility of silicon in hydrofluoric acid.** H. Funk. *Ber.* 67B, 464 (1934). F. criticizes the work of Bédell (C. A. 28, 1243<sup>1</sup>) in that B. measures the soly. of Si in HF by loss of weight of the Si, thus including the soly. of  $\text{SiO}_2$ , whereas F. (C. A. 24, 5654) detg. soly. by  $\text{H}_2$  production. W. B. Keighton, Jr.

**The solubility of urea in water. The heat of fusion of urea.** F. W. Miller, Jr., and H. R. Dittmar. *J. Am. Chem. Soc.* 56, 848-9 (1934).—The soly. of urea in water from 70° to 132.7° was detd. by the synthetic method. From these data the heat of fusion of urea was calcd. to be 3.47 kg.-cal. per mol. F. D. Rossini

**Solubility of glucose in methanol.** J. Gillis and H. N. Nachtergaele. *Rec. trav. chim.* 53, 31-3 (1934); cf. C. A. 18, 1117.—The soly. of anhyd. glucose in pure  $\text{MeOH}$  was detd. between 0° and 128.5°. The temp. for the transition  $S_{\text{anhyd}} \rightarrow S_{\text{anhyd}} + L$  (soln.) deduced from the soly. curve is 108°. Louise Kelley

**A study of the solubility of strong electrolytes in concentrated solutions.** Gösta Åkerlöf and Henry C. Thomas. *J. Am. Chem. Soc.* 56, 593-601 (1934).—If one of a group of electrolytes of the same valence type is chosen as a reference substance, the logarithm of the ratio of the activity coeff. of any other electrolyte varies linearly with the molality: i. e.,  $\log \gamma/\gamma_R = k.m(I)$ . It holds for uni-univalent electrolytes with  $\text{HCl}$  as reference substance. The behavior of a given strong uni-univalent electrolyte in mixed soln. with another electrolyte of the same valence type is completely analogous to its behavior in pure solns. The meager data available for strong electrolytes of higher valence type are in harmony with the statement that in a series of solns. with 2 electrolytes present at const. total ionic strength the slope of the curve obtained for  $\log \gamma$  of either one of them as plotted against their resp. concns. should be independent of the total concn. The relation holds not only for mixts. of strong electrolytes of the same, but also of different valence

types. Soly. measurements of  $\text{Ag}_2\text{SO}_4$  in  $\text{H}_2\text{SO}_4$  and sulfate solns. justify the conclusions: (1) that a variation similar to I should hold for a third strong electrolyte present in small quantities; and (2) that if one of the first 2 electrolytes is only partially dissoed. with the result that the actual ionic strength of the soln. differs from its stoichiometrical value, a deviation from the linear variation is obtained for  $\log \gamma$ . These conclusions suggest a very simple method for calcg. the compn. of satd. mixed solns. of highly sol. strong electrolytes. The method is tested for  $\text{HCl-KCl-H}_2\text{O}$  and for  $\text{CoCl}_2\text{-KCl-H}_2\text{O}$ . W. C. Fernelius

**Volumes of compounds in the free state and in solutions.** I. I. Zaslavskii. *J. Gen. Chem.* (U. S. S. R.) 3, 897-903 (1933). Study of the changes of vols. of solns. in relation to the total vols. of the solvent and the dissolved substance prior to soln. led to the following conclusions: (1) On dissolving a no. of nonelectrolytes in  $\text{H}_2\text{O}$  there was contraction, in some cases of considerable magnitude. Electrolytes showed a considerably greater diversity in the change in vol. during soln. in  $\text{H}_2\text{O}$  with cases of expansion and very considerable contraction. Thus on dissolving  $\text{LiOH}$ ,  $\text{NaOH}$ ,  $\text{KOH}$ ,  $\text{Na}_2\text{S}$ ,  $\text{Na}_2\text{CO}_3$ , and  $\text{Na}_3\text{PO}_4$  in  $\text{H}_2\text{O}$  at low and in some cases at higher concns. there was so much contraction that the vol. of the soln. was smaller than the vol. of  $\text{H}_2\text{O}$  used as a solvent. (2) A series of solns. of Na salts demonstrated the relative effect of anions on the vol. changes of solns. For the explanation of these phenomena the theory of electrostriction (Nernst, *Z. physik. Chem.* 15, 79 (1894)) often proved inadequate. Halides, nitrates and sulfates conclusively demonstrated a parallelism in the vol. changes of solid compds. and of the corresponding aq. solns. There is a close relation between the vol. changes of solns. and the chem. nature of anions. The relative character of the vol. changes in a series of compds. with chemically analogous structure depends only slightly upon the concn. of the solns. The chem. interpretation of the phenomena of solvation and the theory of electrostriction are not contradictory but supplementary. Chas. Blanc

**Accelerated diffusion in dye solutions.** Samuel Lenhet and J. Edward Smith. *J. Am. Chem. Soc.* 56, 999-1000 (1934).—When an aq. soln. of the Na salt of *p*-sulfo-benzeneazobenzeneazo-6'-benzoylamino-1-naphthol-3-sulfonic acid and  $\text{NaCl}$  is allowed to stand 1 month at 25°, the rate of diffusion of the color ion is markedly affected by the presence of  $\text{NaCl}$  in the soln. into which diffusion occurs. Measured increases of 25-50% in the diffusion const. of aged dye solns. into dil.  $\text{NaCl}$  soln., as compared with diffusion into  $\text{H}_2\text{O}$ , were observed. The diffusion rate into more concd.  $\text{NaCl}$  solns. is increased several fold. In the aged soln. the dye has adsorbed a large portion of the electrolyte originally added. C. J. West

**Negative viscosity of solutions.** H. N. Desai, D. B. Naik and B. N. Desai. *Current Sci.* 2, 206 (1933).— $\text{KCl}$ ,  $\text{KI}$ ,  $\text{KNO}_3$ ,  $\text{NH}_4\text{Cl}$ ,  $\text{NH}_4\text{I}$ ,  $\text{NH}_4\text{NO}_3$  in  $\text{H}_2\text{O}$  show neg. viscosity (less than solvent) in certain concn. ranges. In  $\text{CH}_3\text{OH}$  and  $\text{C}_2\text{H}_5\text{OH}$ ,  $\text{KCl}$  and  $\text{NH}_4\text{Cl}$  show neg. viscosity. In  $\text{PrOH}$  only  $\text{KCl}$  shows neg. viscosity. G. B. Taylor

**Cryoscopic determination of hydration of ions of strontium chloride.** E. Rouyer. *Compt. rend.* 198, 1156-8 (1934); cf. C. A. 28, 2596<sup>3</sup>.—The hydration of the ions in 0.5 *M* and 0.25 *M*  $\text{SrCl}_2$  corresponds with  $\text{SrCl}_2 \cdot 26.7 \text{ H}_2\text{O}$  and  $\text{SrCl}_2 \cdot 30.3 \text{ H}_2\text{O}$ , resp. C. A. S.

**Cryoscopic studies in anhydrous acetic acid.** Wm. C. Eichellberger. *J. Am. Chem. Soc.* 56, 799-803 (1934).—The app. and procedure are described. The f.-p. depression was measured in anhyd.  $\text{AcOH}$  solns. of  $\text{NH}_4\text{NO}_3$  from 0.005 to 0.044 *M* and of  $\text{H}_2\text{SO}_4$  from 0.02 to 0.08 *M*.  $\text{NH}_4\text{NO}_3$  behaves as though assocd. into at least binary ion pairs.  $\text{H}_2\text{SO}_4$  is appreciably dissoed. at low concns. but assocd. (in the Bjerrum sense) above 0.1 *M*. F. D. Rossini

**The cryoscopic study of certain aliphatic alcohols.** T. J. Webb and C. H. Lindsley. *J. Am. Chem. Soc.* 56,

874 8(1934).—By means of a rapid method, the procedure for which is described and the accuracy of which (estd. to be 0.1%) was checked by expts. with aq. solns. of  $\text{Pb}(\text{NO}_3)_2$ ,  $\text{NaCl}$  and mannitol from 0.01 to 0.1  $M$ , exptl. data were obtained on the f.-p. depressions for the following aq. solns.:  $\text{MeOH}$ ,  $\text{EtOH}$ , iso- $\text{PrOH}$ ,  $\text{BuOH}$ , 0.01–0.5  $M$ ;  $\text{PrOH}$ , iso- $\text{BuOH}$ , *sec*- $\text{BuOH}$ , 0.01–0.2  $M$ ; *tert*- $\text{BuOH}$ , 0.02–0.15  $M$ ; isopentanol, benzyl alc., 0.02–0.1  $M$ . F. D. Rossini

Statistical theory of solutions. A. Ganguli. *Current Sci.* 2, 212–13(1933).—Math. G. B. Taylor  
Nonelectrolyte solutions. Geo. Scatchard. *J. Am. Chem. Soc.* 56, 995–6(1934).—A reply to Hildebrand (*C. A.* 28, 955<sup>2</sup>). Reply. J. H. Hildebrand. *Ibid.* 996. C. J. West

The conductivity of titanium, tin and silicon tetrachlorides in nonaqueous solutions. Eugen Wertyporoch and Bernhard Altmann. *Z. physik. Chem.* A168, 130(1934).—The molar conductivities of  $\text{Ti}$ ,  $\text{Sn}$  and  $\text{Si}$  tetrachlorides in  $\text{MeOH}$  and  $\text{EtOH}$  resemble those of true salts in soln. and increase with diln. The values are in the order:  $\text{SiCl}_4$ ,  $\text{TiCl}_4$  and  $\text{SnCl}_4$ .  $\text{Et}_2\text{O}$  gives a yellow ppt. with  $\text{TiCl}_4$ , a white ppt. with  $\text{SnCl}_4$  and no ppt. with  $\text{SiCl}_4$ . Salt-like solvates seem to be formed as is the case in  $\text{EtBr}$ ,  $\text{PrCl}$  and iso- $\text{PrCl}$ .  $\text{AcH}$  is decompd. by the 3 chlorides.  $\text{Me}_2\text{CO}$  forms salt-like solvates with small concns. of  $\text{TiCl}_4$ ; on the addn. of more  $\text{TiCl}_4$  an addn. compd. ppts. The solns. of  $\text{SnCl}_4$  and  $\text{SiCl}_4$  remain clear. The molar conductivities were const. at all concns. tested, showing that solvates are not dissocd. on diln. Solns. of  $\text{TiCl}_4$  in acetonitrile showed high cond.  $\text{SiCl}_4$  had no effect but  $\text{SnCl}_4$  formed solvates. The solns. in benzonitrile were colored and showed low molar conductivities. R. H. B.

The conductivity of aluminum bromide in nonaqueous solutions. Eugen Wertyporoch and Bruno Adamus. *Z. physik. Chem.* A168, 31–44(1934); cf. *C. A.* 27, 887. Aromatic hydrocarbons readily dissolve  $\text{AlBr}_3$ . The solns. are nonconducting. Passing in  $\text{HCl}$  or  $\text{HBr}$  results in the sepn. of a thick oil consisting of 3 components that have high conductivities. Of the 4 monohalogen derivs. of  $\text{C}_6\text{H}_6$ , only  $\text{C}_6\text{H}_5\text{F}$  and  $\text{C}_6\text{H}_5\text{I}$  solns. of  $\text{AlBr}_3$  conduct. The mol. cond. decreases upon diln. Molten *p*- $\text{C}_6\text{H}_4\text{Cl}_2$  does not conduct nor does its soln. of  $\text{AlBr}_3$  but *o*- $\text{C}_6\text{H}_4\text{Cl}_2$  behaves like  $\text{C}_6\text{H}_5\text{F}$ . The  $\text{MeC}_6\text{H}_4\text{Cl}$  and  $\text{MeC}_6\text{H}_4\text{Br}$  conduct, especially the *m*-compds. Nitro derivs. and nitriles form addn. compds. with  $\text{AlBr}_3$  that will not take part in the Friedel-Crafts reaction. The max. mol. cond. is found at low concn. Acetonitrile dissolves  $\text{ZnCl}_2$  upon the introduction of  $\text{HCl}$  gas and forms strongly conducting solns. contg. acids such as  $\text{HZnCl}_2$  and  $\text{H}_2\text{ZnCl}_4$ . Roy H. Baechler

Electrochemical investigation of the system  $\text{AlBr}_3$ - $\text{KBr}$  in the solid phase. V. A. Plotnikov and S. I. Yakubson. *J. Gen. Chem.* (U. S. S. R.) 3, 869–71(1933).—The sp. cond. of the complex  $2\text{AlBr}_3 \cdot \text{KBr}$  in the solid phase at 93° is  $5.6 \times 10^{-4}$ . The cond. of the system  $\text{AlBr}_3 \cdot \text{KBr}$  in  $\text{C}_6\text{H}_6$  soln. of compn. 51.5%  $\text{C}_6\text{H}_6$ , 41.5%  $\text{AlBr}_3$ , and 7%  $\text{KBr}$ , is  $61 \times 10^{-4}$ ; and of the same system in toluene soln. of identical concn. is  $4 \times 10^{-4}$ . During electrolysis of  $2\text{AlBr}_3 \cdot \text{KBr}$ , the  $\text{Al}$  anode was considerably attacked and  $\text{Al}$  was deposited on the  $\text{Cu}$  cathode. The addn. of  $\text{KBr}$  to the complex caused a slight variation in cond. W. P. Bricks

"Tension" effect with strong and weak bases. J. Schiele. *Physik. Z.* 34, 60–1(1933); cf. *C. A.* 26, 4525.—The increase in elec. cond. with increasing high-frequency a. c. potential gradient is approx. the same for weak bases as for weak acids. For 0.031  $M$   $\text{NH}_3$  soln. the increase is 12.5% at 240 kv./cm. The effect is much weaker for the stronger bases. For an agar-agar gel, the cond. increase is 77% at a field strength of 165 kv./cm. F. J. Rosenbaum

The electrophoretic effect of the concentration effect. J. Schiele. *Physik. Z.* 34, 61–4(1933).—The increase in elec. cond. at large high-frequency field strengths of dil. solns. of  $\text{LiIO}_3$ ,  $\text{Li}_2\text{SO}_4$  and  $\text{K}_2\text{SO}_4$  was compared with that for  $\text{KCl}$ . The tension effect removes the relaxation effect and also the electrophoretic effect. The limiting

value of the tension effect was not reached at a field strength of 270 kv./cm. The results confirm, at least as to the order of magnitude, the values required by the Debye-Onsager theory. E. J. Rosenbaum

Conductivities of sodium hydroxide and potassium hydroxide solutions at elevated temperatures. P. M. Korotkov and N. K. Sokolov. *J. Gen. Chem.* (U. S. S. R.) 3, 670–8(1933).—Sp. conductivities (in ohms<sup>-1</sup>) of  $\text{KOH}$  and  $\text{NaOH}$  solns. carefully prepd. from metallic  $\text{K}$  and  $\text{Na}$  are as follows:  $\text{NaOH}$  at 54.8, 63.7 and 77.0°, resp.: 14.2  $N$ , 0.517, —, 0.883; 9.9  $N$ , 0.635, —, 0.985; 9.0  $N$ , —, 0.792, 1.000; 7.9  $N$ , 0.706, —, 1.021; 7.0  $N$ , 0.723, 0.837, 1.019; 6.2  $N$ , 0.727, 0.824, 1.010; 4.4  $N$ , 0.695, 0.785, 0.928;  $\text{KOH}$  at the same temps.: 10.6  $N$ , 0.928, 1.058, 1.264; 9.2  $N$ , 0.950, 1.108, 1.312; 8.8  $N$ , 1.006, 1.127, 1.324; 7.4  $N$ , 1.016, 1.137, 1.331; 6.9  $N$ , 1.014, 1.130, 1.320; 6.1  $N$ , 1.004, 1.115, 1.291; 3.8  $N$ , 0.853, 0.937, 1.078. Expts. show that concns. of  $\text{NaOH}$  and  $\text{KOH}$  that correspond to max. cond. vary with temp. The concns. (in percentage by wt.) and max. conductivities at 18°, 50°, 55°, 64°, 77° and 100° are, resp.:  $\text{NaOH}$ : 13.8, 4.762; 19.7, 4.476; 20.5, 1.370; 21.5, 1.190; 23.0, 0.980; 27.5, 0.708;  $\text{KOH}$ : 27.2, 1.84; —, —; 31.5, 0.98; 32.0, 0.875; 33.0, 0.75; —, —. V. K.

The conductance of aqueous solutions as a function of concentration. I. Potassium bromide and lanthanum chloride. Grinnell Jones and Charles F. Heckford. *J. Am. Chem. Soc.* 56, 602–11(1934).—The elec. cond. and d. of solns. of  $\text{KBr}$  from 0.00025 to 3.75  $M$  and of  $\text{LaCl}_3$  from 0.00025 to 1.0  $M$  were detd. at both 0° and 25°. For  $\text{KBr}$  at 25°  $d. = 0.99707 + 0.08555c - 0.002006c^2$  (cf. *C. A.* 27, 1562<sup>2</sup>), and at 0°,  $d. = 0.99987 + 0.089674c - 0.003210c^2$ ; for  $\text{LaCl}_3$  at 25°,  $d. = 0.99707 + 0.22028c - 0.01179c^2$ , and at 0°,  $d. = 0.99987 + 0.23673c - 0.01567c^2$ . The Shedlovsky cond. equation (*C. A.* 26, 2911) fits the data for  $\text{KBr}$  up to 0.1  $N$  better than any other equation, but is not applicable to the data for  $\text{LaCl}_3$ . The Jones and Dole equation (*C. A.* 24, 3696) fits the data for both salts at both temps. better than any known equation. W. C. Fernelius

The optical determination of ionic equilibria in dilute alcoholic solutions. Philipp Gross, Amalia Jamock and Franz Patut. *Monatsh.* 63, 117–26(1933).—The extinction coeffs. for  $\text{NH}_4^+$  and  $\text{NMe}_4^+$  picrates in abs. alc. solns. were measured at concns. from  $2.5 \times 10^{-4}$  to  $2.9 \times 10^{-3}$  mols./l. at 4360 Å. Since they were found to be const. throughout this range it was concluded that there was complete disocn. Traces of water in the alc. had a very marked effect on the coeffs. The absorption spectrum of picrate ion and undissocd. mols. in alc. were detd. in the visible and ultra-violet regions. Changes in the extinction coeff. of picric acid and picrates with change in water concn. were followed and the equil. const. for the reaction  $(\text{EtOH} \cdot \text{H}^+) + \text{H}_2\text{O} = \text{H}_3\text{O}^+ + \text{EtOH}$  was found to be 0.0524. This is the equil. of proton distribution between water and alc. Channing Wilson

The existence of a complex in racemizing solutions. Alan N. Campbell and Alexandra J. R. Campbell. *Trans. Faraday Soc.* 29, 1240–7(1933); cf. *C. A.* 27, 889.

The d.,  $n$  and viscosity at 30° of  $M$  solns. of Rochelle salt (I) and *dl*-mandelic acid (II) and of 0.1 or 0.05  $M$  solns. of *l*-mandelic acid (III) in 0.97 to 12.15  $M$   $\text{NaOH}$  were measured together with the consts. of the  $\text{NaOH}$  solns. and the heats of soln. of I, II and III. The increase in the differences between the viscosities of the alk. solns. of I and the corresponding  $\text{NaOH}$  solns. with increasing concn. of  $\text{NaOH}$  is taken as evidence of complex formation. The decrease in  $n$  and the change in heat of soln. from a small — to a small + value may also be due to the complex. Attempts to isolate the complex gave a substance contg. 20–40%  $\text{NaOH}$ , i. e., 2, 3 or 4 mols. of  $\text{NaOH}$  per mol. of I. The viscosities of II and III also give some evidence of complex formation but the proportion must be small. The efficiency of a catalytic reaction must depend on the instability of the complex, not on the amt. present at a given time. Thus catalytic racemization is a kind of homogeneous catalysis. The

heat of hydration of  $\text{H}^+$  is +7.65 large cal. The heats of neutralization of II and III are +12.1 and +13.4 large cal., resp.

**Hydration of splute ions in relation to acidity, alkalinity and  $p_{\text{H}}$ .** Lewis H. Flint. *Plant Physiol.* 9, 107-20 (1934); cf. *C. A.* 26, 3426.—The literature of the biological sciences abounds with examples of apparent inconsistency accompanying the interpretation of  $p_{\text{H}}$  measurements involving unknowns. An examn. of the ionic velocity-charge products of many representative solute electrolytes suggests that acidity and alk. are soln. characteristics resulting from the dominant activity of pos. and neg. ions, resp., and bear no essential relation to the presence of H or OH ions. Notwithstanding the alleged specificity of the H electrode there appear to be sound reasons for associating acid-alkali reactivity with all ions present, and accordingly variable with the nature of the ions.

Walter Thomas

**Thermodynamic dissociation constant of a weak base.** Elliott J. Roberts. *J. Am. Chem. Soc.* 56, 878-9 (1934).—The method of using the cell  $\text{Ti}(\text{Hg})|\text{TiCl}_4(m_1)|\text{BCl}_4(m_2)|\text{HOH}(m_3)|\text{H}_2$ , to det. the disocn. const. of the weak base, BOH, is described.

F. D. Rossini

**Chemical constitution and the dissociation constants of monocarboxylic acids. I. Some substituted phenylacetic acids.** J. Frederick J. Dippy and Frank R. Williams. *J. Chem. Soc.* 1934, 1616. The cond. is measured and the classical and thermodynamic disocn. consts. are calcd. over wide ranges of concn. for the following acids and their Na salts: phenylacetic (I), diphenylacetic (II), *p*-chlorophenylacetic (III), *p*-bromophenylacetic (IV), *p*-iodophenylacetic (V) and *p*-nitrophenylacetic (VI). III, m. 105° (1.7 g. after recrystn. from water with charcoal) was prepd. by heating 40 g. of VI with 160 g.  $\text{SnCl}_4$ , 400 cc. concd.  $\text{HCl}$  and 320 cc.  $\text{EtOH}$  for 3 hrs. on a steam bath, diazotizing, adding to hot 10%  $\text{Cu}_2\text{Cl}_2$  and steam-distg.  $\text{PhCH}_2\text{Cl}$  (56 cc.), 28 cc.  $\text{Br}_2$  and 0.5 g.  $\text{I}_2$  yielded 55 g. *p*-bromobenzyl chloride (VII), m. 50°, b. 238°. VII (6 g. in 20 cc.  $\text{EtOH}$ ) refluxed 3 hrs. with 7 cc. of 50%  $\text{NaCN}$  gave *p*-bromobenzyl cyanide, m. 50°. Hydrolysis with  $\text{H}_2\text{SO}_4$  gave 4.5 g. IV, m. 114°. V, m. 135-6° (after recrystn. from  $\text{C}_6\text{H}_6$ -light petroleum, b. 80-100°), and then from water with charcoal) was prepd. in 10% yield similarly to III, by adding KI and powd. Cu to the diazo soln. The classical and thermodynamic consts. ( $K \times 10^3$ ) were, resp.: I 5.03, 4.88; II 11.7, 11.5; III 6.61, 6.45; IV 6.63, 6.49; V 6.74, 6.64; VI 14.3, 14.1. Mean  $\Lambda_0$  values for the same acids and for their Na salts were, resp.: 380.3, 80.7; 375.0, 75.4; 383.0, 83.4; 382.0, 83.0; 382.8, 83.2; 377.8, 78.2.

G. Calingaert

**The dissociation constants of organic acids. VIII. Phenylacetic acid.** George H. Jeffery and Arthur I. Vogel. *J. Chem. Soc.* 1934, 1668; cf. *C. A.* 28, 1502.—The mobility of the phenylacetate ion is 34.7, and the mean value of the thermodynamic disocn. const. is  $4.889 \times 10^{-5}$ . The classical disocn. const. increases with concn. and has a mean value between 0.003 and 0.01  $N$  of  $5.968 \times 10^{-5}$ . Phenylacetic acid is easily purified, and its use as standard is suggested.

G. C

**Colosimetric determination of  $p_{\text{H}}$  at high temperatures.** Walter Neumann. *Z. anal. Chem.* 96, 175-83 (1934); cf. *C. A.* 27, 5619.— $\text{NaCl}$  solns. of different concns. were treated with suitable indicators, repeatedly heated to boiling and cooled out of contact with air contg.  $\text{CO}_2$ . There tended to be a decrease in the  $p_{\text{H}}$  values as a result of such treatment, and this decrease was more marked as the concn. of the salt was low. With pure water a change of 0.96 unit was noted, but with 25%  $\text{NaCl}$  there was a loss of only 0.24 unit. The results were similar with  $\text{KCl}$  solns.

W. T. H.

**A method for determining true  $p_{\text{H}}$  values.** James N. Evans. *Combustion* 5, No. 4, 12-14 (1933).—A method for detg. true  $p_{\text{H}}$  values is described that involves addn. of small measured quantities of  $\text{NaOH}$  and  $\text{HCl}$  with the detn. of the  $p_{\text{H}}$  before and after each addn. Possible errors are pointed out.

Leslie B. Bragg

**An optical method of investigating the concentration**

**polarization during electrolysis.** A. G. Samarcov. *Z. physik. Chem.* A168, 45-58 (1934).—An optical method, based on the use of a Lebedev interferometer (*C. A.* 26, 369), is described. The concn. distribution in the diffusion layer and the thickness of this layer are shown graphically for different conditions of electrolysis. Conc. gradient, current  $d$ , and diffusion coeff. are related according to the equation:  $D = -0.895 na i / C^2$ , in which  $i$  = current  $d$ ,  $C^2 = dC/dx$  = concn. gradient, and  $D$  = diffusion coeff. In the cells:  $\text{Cu}|\text{CuSO}_4 \text{ aq.}|\text{Cu}$  and  $\text{Ag}|\text{AgNO}_3 \text{ aq.}|\text{Ag}$ , the total polarization is greater than the concn. polarization.

Don Brouse

**Evolution of gas from graphite under high temperatures.** A. P. Ievlev and I. A. Eltzin. *J. Tech. Phys.* (U. S. S. R.) 3, 1018-30 (1933). With increasing temp. the evolution of gas from graphite proceeds in two stages, the 1st rapidly from the surface, and ceasing at 1100°, and the 2nd by diffusion from within, the coeff. of diffusion decreasing.

Eino Hanninen

**The combination of hydrogen with fluorine.** Max Bodenstein and Helmut Jockusch. *Sitzber. preuss. Akad. Wiss., Physik.-math. Klasse* 1934, 27-37.—The reaction between F and H was studied in glass, quartz and Ag. In new glass at 190°, the pressure decreased from 500 to 470 mm. in 30 min.; in used glass at -190°, evacuated at -190°, the pressure decreased from 500 to 485 mm. in 30 min.; in used glass at -190°, evacuated when hot, the mixt. exploded; in used glass at 20°, the pressure decreased 1/2 in about 100 min. In quartz at -80° and -190° there was a shattering explosion in a few seconds, regardless of which element was introduced first; at 20°, the mixt. ignited and burned with a flame; at 20°, when F stood 20 min. in the quartz and was removed, and H was introduced first, the reaction resembled that in glass. In Ag, with a film of  $\text{AgF}$ , at 20° there was an explosive reaction; at -190°, the reaction was slow. Both of the reactions  $\text{F} + \text{H} = \text{HF} + \text{H}$  and  $\text{H} + \text{F}_2 = \text{HF} + \text{F}$  may occur.  $\text{F}_2$  was detd. by the increase in wt. of Ag (and of Cu tubing); a small residue reacted with  $\text{SiO}_2$  and was detd. as  $\text{H}_2\text{SiF}_6$  by titration with  $\text{KOH}$ .

Gerald M. Petty

**Equilibrium between ammonium thiocyanate and thiourea in solution.** Wm. Cre and P. A. de Lisle. *Trans. Roy. Soc. Can.* 11, 27, 105-11 (1933).—Concn. at equil. for  $\text{CS}(\text{NH}_2)_2$ ,  $\text{NH}_4\text{CNS}$  gave as the value of  $K$  0.0254 at 162.2°, 0.0341 at 178.3° and 0.038 at 184.4°. These are av. values from many detns. Discrepancies in previous detns. are attributed to side reactions in which the mea is decompd.

J. W. Shipley

**Speed of "uniform movement" of flame in mixtures of carbon monoxide and oxygen.** W. Payman and R. V. Wheeler. *Nature* 133, 257 (1934).—The results of Bone and Bell (*C. A.* 28, 1236) are not accepted as final.

C. D. W.

**A general law relating to exothermal processes.** N. Semenov. *Physik. Z. Sowjetunion* 4, 906-8 (1933) (in English).—For any reaction bearing the features of "degenerate explosions" the percentage of a substance changed equals  $100/(1 + e^{\theta'})$ , in which  $\theta'$  is the time reckoned from the time when half of the reaction is completed multiplied by a const. characteristic of the reaction. By using a suitable scale of coordinates, different reaction-rate curves are superposed on a typical curve shown.

Louis Goldman

**Kinetics of the reaction of hydrogen and oxygen.** T. A. Kontorova and A. B. Nalbandyan. *Physik. Z. Sowjetunion* 4, 758-63 (1933) (in German).—The activation energy is calcd. for the reaction  $\text{H} + \text{O}_2 \rightarrow \text{OH} + \text{O}$  as 32,000 cal. as compared with Semenov's value of 28,000 cal. (cf. *C. A.* 26, 5820).

Louis Goldman

**The kinetics of the burning of hydrogen.** A. Kovalskii. *Physik. Z. Sowjetunion* 4, 723-34 (1933) (in German).—Pressure change and reaction rate plotted against time, values for the difference of the probability of chain branching and chain breaking divided by the life of active centers, and the pressure of the remaining unburnt gas are recorded for initial pressures of 3.7-8.4 mm. at 485°, 520° and 560°. Theoretical and exptl. curves of reaction

rate plotted against quantity that has reacted are compared. The max. reaction rate is proportional to the square of the pressure of the gas burned. L. G.

**Detonation in gaseous mixtures. I. The principles of detonation characteristics of inflammable gas mixtures.** A. Sokolik and K. Shchelkin. *Physik. Z. Sowjetunion* 4, 795-817 (1933) (in English).—The predetonation length in a  $\text{CH}_4\text{-O}_2$  mixt. drops with tube length at const. pressure, rises with vol. at const. tube length, and is a min. for the compn.  $\text{CH}_4 + 1.9 \text{ O}_2$ . The velocity of the detonating wave in a stoichiometric mixt. is 2500 m./sec., const. to 3% between 100 and 500 mm. Consideration of the origin of the detonation wave shows that the ratio of the heat d. to the ignition temp. is a measure of the probability of detonation. Louis Goldman

**The mechanism of the upper limit of ignition of a mixture of ethane and oxygen (molar ratio 2:7).** P. Sadovnikov. *Physik. Z. Sowjetunion* 4, 743-6 (1933) (in German).—Curves for the pressure change against time in the explosion range show that CO is formed first and ignites after an induction period. Above the explosion range CO oxidizes slowly. Louis Goldman

**Some considerations of the theory of the upper pressure limit of ignition.** N. N. Semenov. *Physik. Z. Sowjetunion* 4, 709-22 (1933) (in English); cf. C. A. 28, 148.—It is shown theoretically that for large concns. of O, the upper limit of partial pressure of O is proportional to the square root of the pressure of the 2nd reactant. For mixts. of O with P, S and  $\text{PH}_3$  there is an upper limit of total pressure. For mixts. of H + O and CO + O,  $p_1^2/p_2 = \text{const.}$ , in which  $p_1$  and  $p_2$  are resp. the lower and upper limits of total pressure. These results check exptl. data in the literature. Louis Goldman

**The mechanism of the upper limit and the kinetics of the ignition of detonating gas.** A. Nalbandyan. *Physik. Z. Sowjetunion* 4, 747-57 (1933) (in German).—The detonation range is widened and the induction period is diminished by H or O atoms formed electrically. Similar behavior in an Al vessel shows that the upper limit is a property of the gas, not of the surface. The induction period plotted as a function of pressure drops sharply, passes through a min. and rises sharply at the upper pressure limit. Louis Goldman

**The effect of inert admixtures on the lower limit of ignition of gases.** A. A. Lavrov. *Physik. Z. Sowjetunion* 4, 787-94 (1933) (in German). The ratios of the concns. of A to those of N and He necessary to raise the lower limit of a mixt. of  $\text{CH}_4$  and air to one atm. are calcd. as 1.2 and 1.73, resp. Similarly for a mixt. of H and air, the ratios of the concns. of  $\text{CO}_2$ , HCl and He to N are 1.05, 1.06 and 0.26, resp. Louis Goldman

**The effect of the diameter of the reaction vessel on the velocity of oxidation of ethane.** P. Sadovnikov. *Physik. Z. Sowjetunion* 4, 735-42 (1933) (in English).—The rate of reaction in quartz vessels treated with  $\text{H}_2\text{F}_2$  is independent of the dimensions of the vessel. L. G.

**The effect of the surface of the oxidizing agent (iodine pentoxide) on the rate of oxidation of carbon monoxide.** Astapenya, Vapnik and Zelkin. *J. Gen. Chem. (U. S. S. R.)* 3, 839-42 (1933).—The disagreement between various investigators concerning the oxidation temp. of CO is explained by their failure to consider the effect of the surface of the oxidizing agent. The oxidizing reaction of CO according to the equation:  $\text{I}_2\text{O}_5 + 5\text{CO} = 5\text{CO}_2 + \text{I}_2$ , was investigated. *Detns. of small concns. of CO* are more conveniently made with a large surface of the oxidizing agent, which decreases the time of analysis, assures more complete oxidation, permits operation with larger vols. of the air under investigation, and hence correspondingly increases the accuracy of the analysis. W. P. Ericks

**Theory of the induction period.** T. A. Kontorova and M. B. Neumann. *Physik. Z. Sowjetunion* 4, 818-24 (1933) (in English).—Pressure change-time curves for consecutive reactions in the thermal decompn. of  $\text{EtSH}$  show that the theory of two consecutive reactions cannot explain the induction period in unimol. reactions. Louis Goldman

**Lecture demonstration showing abnormality during induced reactions.** Karl Gleu. *Z. anorg. allgem. Chem.* 215, 271-2 (1933).—A soln. of 250 ml. of 2 N  $\text{H}_2\text{SO}_4$  and 50 ml. of 0.1 M  $\text{NaVO}_3$  is not reduced by 40 ml. of 0.5 N  $\text{As}_2\text{O}_3$ . After the addn. of 5 drops of 0.01 M  $\text{OsO}_4$  and 150 ml. of 0.0167 M  $\text{KClO}_4$ , the yellow vanadic acid is instantly reduced to blue quadrivalent.

V. F. Urban

**The speed of oxidation of hydroquinone by oxygen.**

I. W. Reinders and P. Dingemans. *Rec. trav. chim.* 53, 209-30 (1934); cf. C. A. 19, 2441.—Buffered solns. of hydroquinone were kept satd. with O at const. pressure, and the oxidation was followed by the rate of absorption of O, measured in a gas buret. The reaction mixt. must be stirred vigorously enough to keep the soln. satd. with O; otherwise the factor measured is the speed of soln. of O and not the speed of oxidation of hydroquinone. The speed is proportional to the concn. of the hydroquinone, the O pressure and the square of the OH-ion concn. OH ions, however, are not consumed during the oxidation. The primary reaction product is oxyquinone, which is unstable; in alk. solns. it polymerizes to humic acid, and in neutral or acid soln. it combines with a 2nd mol. of hydroquinone to form quinhydrone. None of the reaction mechanisms previously reported can be correct. No  $\text{H}_2\text{O}_2$  is formed, and quinone is not an intermediate product. The following mechanism is proposed: (1)  $\text{C}_6\text{H}_4(\text{OH})_2 + 2\text{OH}^- \rightarrow \text{C}_6\text{H}_4\text{O}_2^{2-} + 2\text{H}_2\text{O}$ ; (2)  $\text{C}_6\text{H}_4\text{O}_2^{2-} + \text{O}_2 \rightarrow \text{C}_6\text{H}_4\text{O}_2^{--} + \text{H}_2\text{O} \rightarrow \text{C}_6\text{H}_4(\text{OH})\text{O}_2 + 2\text{OH}^-$ . By varying the buffers and using samples of hydroquinone of different histories, it was shown that the speed of the reaction is not due to catalysts accidentally introduced.  $\text{CuSO}_4$  catalyzes the reaction through the formation of a sol by the  $\text{Cu}^{++}$  and hydroquinone.  $\text{MnSO}_4$  is also active, but to a smaller extent. II. Influence of sodium sulfite. *Ibid.* 231-8.—The oxidation of either  $\text{Na}_2\text{SO}_3$  or hydroquinone is repressed by the presence of the other. The speed of oxidation of  $\text{Na}_2\text{SO}_3$  in alk. soln. is too fast to be measured; hence the solns. are buffered by adding phosphates or borates. Borates do not repress the reaction as much as phosphates giving the same  $p_{\text{H}}$ , since the former contain traces of  $\text{Cu}^{++}$ , which is a pos. catalyst for the oxidation of  $\text{Na}_2\text{SO}_3$ . As shown by color changes and e. m. f. measurements,  $\text{Na}_2\text{SO}_3$  is first attacked. The hydroquinone interferes by forming complexes with the sp. catalysts for the reaction ( $\text{Cu}^{++}$  or  $\text{Co}^{++}$ ). A chain mechanism of reactions is rejected in favor of the following series of reactions: (1)  $\text{Cu}^{++} + \text{SO}_3^{--} \rightarrow \text{CuSO}_3$ ; (2)  $2\text{CuSO}_3 \rightarrow \text{Cu}_2(\text{SO}_3)_2$ ; (3)  $\text{Cu}_2(\text{SO}_3)_2 + \text{O}_2 \rightarrow 2\text{CuSO}_4 \rightarrow 2\text{Cu}^{++} + 2\text{SO}_4^{--}$ . J. H. Reddy

**Speed of oxidation of metol by air and the effect of sodium sulfite.** W. Reinders and P. Dingemans. *Rec. trav. chim.* 53, 239-245 (1934); cf. preceding abstrs. For the  $p_{\text{H}}$  range of 6.0-6.6, the oxidation of metol ( $\text{Me-NHC}_6\text{H}_4\text{OH} \cdot \text{H}_2\text{SO}_4$ ) varies as the concn. of metol, the O pressure and the concn. of OH ions. The following mechanism is proposed: (1)  $\text{MeNHC}_6\text{H}_4\text{OH} + \text{OH}^- \rightarrow \text{MeNHC}_6\text{H}_4\text{O}^- + \text{H}_2\text{O}$ ; (2)  $\text{MeNHC}_6\text{H}_4\text{O}^- + \text{O}_2 \rightarrow \text{MeNHC}_6\text{H}_4\text{O}_2^{--}$ ; and (3)  $\text{MeNHC}_6\text{H}_4\text{O}_2^{--} + \text{H}^+ \rightarrow \text{MeN} \cdot \text{C}_6\text{H}_4\text{O}_2 + \text{H}_2\text{O}$ . Reaction (2) is the slow step, and fixes the measured velocity.  $\text{Cu}^{++}$  is a weak catalyst, and the effects of  $\text{Mn}^{++}$ ,  $\text{Ni}^{++}$ ,  $\text{Fe}^{++}$ ,  $\text{Co}^{++}$ ,  $\text{Ag}^+$  and  $\text{Sn}^{++}$  are still less.  $\text{Na}_2\text{SO}_3$  and metol mutually repress the oxidation of each other, because of removal of sp. catalysts. Again the  $\text{Na}_2\text{SO}_3$  is first attacked. No satisfactory mechanism is forthcoming. J. H. R.

**The kinetics of polymerization of butadiene in a glow discharge.** L. Rubanovskii. *J. Phys. Chem. (U. S. S. R.)* 4, 431-6 (1933).—During the action of the glow discharge on butadiene at a pressure of  $10^{-3}$  to  $10^{-1}$  mm. the pressure in the discharge tube increases to what corresponds to the cracking of the butadiene; at a pressure above  $10^{-1}$  mm. it decreases because of the polymerization of butadiene. Polymerization is also caused by the shock impact of the H atom during discharge in the mixt. of H and butadiene. The induction period of 3-7 min., typical for chain reactions, was observed in

all cases of polymerization. The chain character of the reaction is confirmed by the acceleration of the latter by admixed A and O, which hamper the diffusion and the breaking of chains on the sides of the tube, and also by the fact that the process is about 20% faster in a 10-cm. tube than in a 1.5-cm. tube. The kinetics of the process are affected neither by the characteristics of the discharge nor by the material of the electrodes. F. H. R.

**Unimolecular and intramolecular energy exchange.** C. C. Coffin. *Trans. Roy. Soc. Can.* III, 27, 161 (1934).—The generalities arising from the kinetics of gaseous reactions of the type (1)  $\text{RCH}(\text{OOCR}')_2 \rightarrow \text{RCHO} + \text{O}(\text{OCR}')_2$ , (2)  $(\text{RCHO})_2 \rightarrow 2\text{RCHO}$  are considered from the point of view of the relation of the energy of activation to the bonds concerned in the reactions. The heats concerned indicate that factors other than the exponential Arrhenius  $E$  must be taken into account in *a priori* attempts to calc. unimol. reaction velocities. An equation relating the no. of mols. reacting to the no. of mols. colliding and based upon the increased reaction probability for a sp. case is given.

J. W. Shipley.  
**Reaction velocity and mobility.** K. Posthumus. *Rec. trav. chim.* 53, 63 73 (1934); cf. *C. A.* 27, 3386.—Reaction consts. are not important for the detn. of the "mobility" or the "light or loose binding" of constituent parts of mols. The energy of activation gives a better insight into the state of binding of the atom than does the reaction const., in which factors occur that have nothing to do with the mobility. Contrary to the usual conceptions, the Na atom in  $\text{MeONa}$  is approx. as strongly bound as in  $\text{EtONa}$ ; Cl in the compds. discussed by P. is more strongly bound than Br in corresponding compds., and  $\text{NO}_2$  in  $o\text{-C}_6\text{H}_4(\text{NO}_2)_2$  is less strongly bound than in  $p\text{-C}_6\text{H}_4(\text{NO}_2)_2$ . Louise Kelley

**Calculation of reaction velocity as a function of temperature.** Anton Skrabal. *Monatsh.* 63, 23 38 (1933).—A rapid and accurate method of calcg. the consts. for a no. of the usual velocity temp. functions is described. Methods of extrapolation and extrapolation errors are considered. Channing Wilson

**The kinetics of the oxidation of picric acid by potassium permanganate in aqueous solution.** F. F. Mungrave and E. A. Moelwyn-Hughes. *Trans. Faraday Soc.* 29, 1162 7 (1933).—Kinetics of the reaction between picric acid and  $\text{KMnO}_4$  were studied in aq. soln. Picric acid was completely oxidized to  $\text{HNO}_3$  and  $\text{CO}_2$ . Permanganate ions were reduced to  $\text{MnO}_2$ . The reaction was unimol. over a wide range of conditions, the const. being independent of the concn. of H ions and only slightly affected by the addn. of electrolytes. The abs. velocity was lower than the values calcd. by making reasonable assumptions about the type and no. of activating collisions. Superficially the results resembled those found for the hydrolysis of esters. L. H. Reyerson

**Oxidation-reduction potential of the system xanthine = uric acid.** S. Filitti. *Compt. rend.* 198, 930-2 (1934); cf. *C. A.* 28, 12511. The normal potential of the reaction  $\text{C}_4\text{H}_4\text{O}_2\text{N}_4 + \text{H}_2\text{O} \rightleftharpoons \text{C}_4\text{H}_4\text{O}_2\text{N}_4 + \text{H}_2$  is  $+0.113 \pm 0.0015$  v., and  $\Delta F = 5220$  g.-cal. The heat of reaction at const. pressure is  $-12,000$  g.-cal. If the (acid) disson. of hypoxanthine ( $K_H = 2.12 \times 10^{-13}$ ) is taken into consideration,  $\Delta F$  for the reaction  $\text{C}_4\text{H}_4\text{O}_2\text{N}_4 + 2\text{H}_2\text{O} \rightleftharpoons \text{C}_4\text{H}_4\text{O}_2\text{N}_4 + 2\text{H}_2$  is 5720 g.-cal. C. A. Silberrad

**The oxidation of hydrazine by potassium ferricyanide.** I. The effect of gaseous supersaturation on the measurement of reaction velocity. Thomas N. Richardson and Kenneth C. Bailey. *Sci. Proc. Roy. Dublin Soc.* 21, 43-9 (1934).—Many reaction rates are assumed proportional to the rate of evolution of a gaseous product. When hydrazine is oxidized by  $\text{K}_3\text{Fe}(\text{CN})_6$  in alk. soln., the rate of evolution of N over an initial period depends on the efficiency of stirring. Thus stirring is required to overcome a strong tendency for supersatn. of the soln. by N. This phenomenon can easily invalidate quant. work on chem. kinetics. II. The reaction in the presence of acetone. *Ibid.* 49-56.—With  $\text{Me}_2\text{CO}$  in excess in a soln. buffered with  $\text{Na}_2\text{HPO}_4$ , oxidation of hydrazine

by  $\text{K}_3\text{Fe}(\text{CN})_6$  is slow and incomplete mainly because of formation of dimethylketazine. Hydrolysis of the latter requires H ions, while oxidation of hydrazine requires OH ions. Hence rapid simultaneous action is impossible. B. E. Anderson

**The thermal decomposition of nitrogen pentoxide at low pressures.** E. F. Linhorst and J. H. Hodges. *J. Am. Chem. Soc.* 56, 830 41 (1934).—The rate of decompn. was measured in a 22-l. flask at  $35^\circ$ ,  $45^\circ$ ,  $55^\circ$  and  $65^\circ$ , and from 0.05 to less than 0.001 mm. The reaction deviates from 1st order at about 0.05 mm. and at 0.001 mm. the order is about 1.8. A 2.5-fold change in the ratio of surface to vol. has no effect down to 0.005 mm., below which pressure the surface appears to retard the reaction slightly. The data are compared with current theories of unimol. reaction. F. D. Rossini

**Esterification velocities of alcohols in acetic acid.** II. Anton Kailan and Simche Schwebel. *Monatsh.* 63, 52 78 (1933); cf. *C. A.* 28, 1021. The velocities of esterification of the following alcs. were measured at  $25^\circ$  by means of f.-p. depression:  $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$ ,  $\text{PhCH}_2\text{OH}$ ,  $\text{Ph}(\text{CH}_2)_2\text{OH}$ ,  $\text{Ph}(\text{CH}_2)_3\text{OH}$ ,  $\text{PhCH}(\text{CH}_2\text{OH})_2$ , 2-, 3- and 4-nitrobenzyl alcs.,  $\text{PhCH}(\text{OH})\text{Me}$  and  $\text{PhCH}(\text{OH})\text{Et}$ . The solvents were dil. and concd.  $\text{AcOH}$ ,  $\text{AcOH} + \text{Ac}$  esters of the alcs., and  $\text{AcOH} + \text{HCl}$  solns. The consts. of  $\text{PhCH}(\text{CH}_2\text{OH})_2$  and secondary alcs. were uncertain, probably because of side reactions. All the alcs. were almost completely esterified under the conditions used. Channing Wilson

**Velocity of hydrolysis of simple ethers.** Anton Skrabal and Alfred Zahorka. *Monatsh.* 63, 1 22 (1933).—The velocity consts. of the hydrolysis of  $\text{Et}_2\text{O}$ , iso- $\text{PrOEt}$  and (iso- $\text{Pr})_2\text{O}$  are compared in aq. soln., between  $55^\circ$  and  $90^\circ$ , with  $p\text{-MeC}_6\text{H}_4\text{SO}_3\text{H}$  as catalyst. The unimol. consts. of the 3 ethers stand in the ratios 1:10:33. The hydrolysis of  $\text{Et}_2\text{O}$  is the slowest reaction ever measured. Its velocity const. at  $25^\circ$  is  $0.146 \times 10^{-10}$ . The velocity of hydrolysis of iso- $\text{PrOEt}$  lies between the geometric and arithmetic means of the velocities of the other two. Consts. in the expression  $\log k = -(A/T) - BT + C$  for the 3 compds. are  $A = 14,535, 13,445.6, 14592$ ;  $B = 0.057176, 0.04812, 0.06015$ ;  $C = 55.069, 49.635, 57.711$ . Channing Wilson

**Studies on ether-like compounds. XII. The determination of the velocity of acetal hydrolysis.** M. H. Palomaa and Aini Salonen. *Ber.* 67B, 424-9 (1934); cf. *C. A.* 27, 3194; 28, 4659. The rates of acetal hydrolysis as catalyzed by HCl were detd. with an improved dilatometer of very simple construction. The values obtained for  $k_{20}$ ,  $k_{30}$  and  $k_{40}/k_{20}$  (time in min.) are, resp.,  $\text{MeCH}(\text{OEt})_2$ , 76.5, 206, 3.48;  $\text{PhOCH}_2\text{CH}(\text{OEt})_2$ , 0.132, 0.512, 3.88;  $\text{CH}_2(\text{OEt})_2$ , 0.00930, 0.0387, 4.13;  $\text{CH}_2(\text{OMe})_2$ , 0.00187, 0.00853, 4.56;  $\text{CH}_2(\text{OMe})\text{OEt}$ , 0.00469, 0.0191, 4.07;  $\text{CH}_2(\text{OMe})\text{OPr}$ , 0.00471, 0.0195, 4.11. These unimol. consts. were cor. linearly to concn.  $\text{HCl} \rightarrow 1$  N. With acetals  $\text{R}'\text{CH}(\text{OR})_2$  an expansion occurs during hydrolysis, for those like  $\text{CH}_2(\text{OR})_2$  or  $\text{CH}_2(\text{OR})\text{OR}'$  contraction occurs. W. B. K., Jr.

**Reaction between solids.** Alvaro Alberto R. soc. brasil. quim. 4, 202 18 (1933). Discussion and bibliography. John Ladino

**The theory of topochemical reactions.** S. V. Izmailov. *Physik. Z. Sowjetunion* 4, 835 42 (1933) (in English).—The reaction velocity in the case of decompn. of a single crystal is initially proportional to the 3rd power of the time if it is assumed that the reaction centers appear continuously during the reaction period. The log of the time interval in which the reaction velocity reaches its max. equals  $[(2E + E_1)/3RT] + \text{const.}$  in which  $E$  is the crit. increment of the velocity at which the interface is advancing. Louis Goldman

**Critical solution phenomena.** M. Freed. *Trans. Roy. Soc. Can.* III, 27, 179-81 (1934).—Crit. soln. temp. ( $C. S. T.$ ) measurements were made on the systems (1)  $\text{MeOH}$ -hexane- $\text{H}_2\text{O}$  and (2)  $\text{AcOH}$ - $\text{C}_6\text{H}_6$ - $\text{H}_2\text{O}$ . Purification of the synthetic hexane resulted in lower values for the  $C. S. T.$  of the system, a final value for one sample giving the  $C. S. T.$  as  $34.6^\circ$ . Because of the great effect

of impurities in the hexane the Crismer method is recommended for detg.  $H_2O$  in  $MeOH$  by using the system cyclohexane- $MeOH$ . No noticeable effect of pressure on the C. S. T. of the system  $AcOH-C_6H_6-H_2O$  could be observed when the presence of moisture in the gas space above the system was accounted for. J. W. Shipley

**Note on phase equilibria in the system  $Na_2O-TiO_2$ .** Edward W. Washburn and Elmer M. Bunting. *Bur. Standards J. Research* 12, 239 (1934) (Research Paper No. 648); cf. C. A. 28, 1595<sup>2</sup>.—The following compds. are formed in the binary system  $Na_2O-TiO_2$ :  $Na_2TiO_3$ , m.  $1030^\circ$ ,  $Na_2Ti_2O_5$ , m.  $985^\circ$  and  $Na_2Ti_3O_7$ , m.  $1128^\circ$ .

R. Roseman

**The system carbon tetrachloride-water-methanol at  $30^\circ$ .** H. A. Showalter. *Trans. Roy. Soc. Can.* III, 27, 183-5 (1934); cf. Bonner, C. A. 5, 817.—The binodal curve for the system  $CCl_4-H_2O-CH_3OH$  at  $30^\circ$  was detd. by the method of titration, titration with water being employed for systems contg. less than 35%  $H_2O$  and titration with  $CCl_4$  for systems for 20-55%  $H_2O$  thus giving both methods for systems contg. 20-35%  $H_2O$ . The plait point was found at 0.018 g.  $H_2O$  and 0.187 g.  $CH_3OH$  per 1 g. sample. Especially pure alc. was not necessary in securing const. values. J. W. Shipley

**Thermal analysis of the system antipyrine-chloretone.** A. Rychterówna. *Wiadomości Farm.* 61, 95-7 (1934).—The system antipyrine-chloretone represents a simple soln. A eutectic is formed contg. 40 mols. % antipyrine and 60 mols. % chloretone. This eutectic exhibits an excellent anesthetic effect; it is used also in ointments, against neuralgia, rheumatism and arthritis. J. W.

**Physicochemical analysis of systems with diamines. III. Internal friction and melting of the systems ethylenediamine-butyl alcohols.** D. E. Dionisiev. *J. Gen. Chem. (U. S. S. R.)* 3, 976-89 (1933); cf. C. A. 25, 3908; Glinin, C. A. 23, 2345; Elgort, C. A. 24, 289. The systems  $C_4H_9(NH_2)_2$  (I) and  $BuOH$  (II),  $Me_2CHCH_2OH$  (III),  $EtMeCHOH$  (IV) and  $Me_3COH$  (V) were studied by the methods of sp. gr., viscosity at  $0^\circ$ ,  $25^\circ$  and  $50^\circ$  and melting. The data obtained by the viscosity method at  $0^\circ$  showed the formation of mol. compds. only of I-2 II and I-2 III with the viscosity maxima shifted in the direction of the more viscous alc. components. The system I IV produced no viscosity max. at  $0^\circ$ , while I-V gave a concave curve for the viscosity at  $0^\circ$ . The viscosity curves at  $25^\circ$  showed the greatest increase in viscosity for the systems I II and I III and a concave curve for I IV and I V. The viscosity curves at  $50^\circ$  formed almost straight lines, thus indicating an almost complete dissoen. of all these mol. compds. at  $50^\circ$ . The melting curves for the 4 systems produced 2 eutectics and 1 max. with the sharpness I-III > I II > I-IV, and a markedly flat max. for I-V. Data for the melting of the 4 systems and the viscosity of the systems I-II and I-III suggest that at low temps. all 4 Bu alcs. form with I mol. compds. in the proportion of 1 I to 2 alc. V. Reciprocal solubility of ethylenediamine and some hydrocarbons of the series  $C_6$ . A. S. Broun. *Ibid.* 973-5; cf. Obukhov, C. A. 25, 3908.—The reciprocal soly. of the mixts. of 100% I and hydrocarbons of the fatty and cyclic series was studied with anhyd. c. p. hexane (VI), cyclohexane (VII) and diisopropenyl (VIII). The solubilities of 4.8% I in VI and 0.9% VI in I at  $25^\circ$  slowly increased with rising temp. to 14 and 19 at  $90^\circ$ , and then rapidly with further rise in temp. to 45 and 55 at  $98.5^\circ$ . The curve of the soly. of the mixt. of I and VII is analogous to that of I and VI with the max. solv. of 22% I at  $91.5^\circ$ . In the triple mixt. of I, VI and VII the reciprocal soly. of I is decreased, reaching the max. at  $160-5^\circ$ . Expts. with the soly. of I in VIII produced inconclusive results.

Chas. Blanc

**Catalytic oxidation of butyl alcohol to butyraldehyde.** A. M. Rubinshtein, A. A. Balandin, B. A. Dolgoploska, K. A. Morozov and L. I. Vagranskaya. *J. Applied Chem. (U. S. S. R.)* 6, 278-88 (1933).—The oxidation was effected with air and with  $CO_2$ , the following catalyst being investigated: (1)  $Cr_2O_3$  catalyst in a brass tube, (2)  $Cr_2O_3 + MnO_2$  (35:65) in a brass tube, (3)  $CuO$ ,

(4)  $Cr_2O_3 + Fe_2O_3$  (1:3) in a brass tube, (5)  $MnO_2$  in a brass tube, (6)  $MnO_2 + Fe_2O_3$  (2:3) in a brass tube, (7)  $Fe_2O_3$  in a brass tube, (8) fused  $V_2O_5$ , (9) Ag (40%) on asbestos, (10) Ag (50%) on asbestos, (11) Ag (75%) on asbestos, (12) Ag (50%) on asbestos obtained by pptg. Ag on asbestos with  $HCHO$  from  $NH_3-AgNO_3$ , (13) Ag gauze in a glass tube, (14)  $Cu$  (7.5%) + Ag (42.5%) on asbestos, and (15)  $Cu$  (25%) + Ag (25%) on asbestos (50%) prep. as in (14). The reaction is accompanied by evolution of heat (with the Ag catalyst); the catalyst, however, retains its activity. With 40-75% of Ag pptd. on asbestos there is no change in the yield of aldehyde and acid. Water improves the process and the best temp. for all Ag catalysts is  $350-80^\circ$ . The most efficient catalyst is Ag (50%) pptd. on asbestos with  $HCHO$ . The yields of aldehyde and acid were, resp., as follows, with air as oxidant: with finely pptd. Ag 72 and 4%, finely pptd. mixt. of Ag and Cu on asbestos 68 and 7%, with (8) 49 and 23%, with (7) 40.7 and 6.9%, with (5) 33 and 0.3%. The highest yields were obtained with a Ag catalyst, a furnace temp. of  $350-80^\circ$  and an air velocity of 1-1.5 l. per min. through a tube 15 mm. in diam., the alc.-water mixt. (2:3) being preheated to  $85-90^\circ$ . The temp. is lower for a Ag-Cu catalyst by  $25-50^\circ$ ; for  $V_2O_5$  it is about  $400^\circ$  and for  $Fe_2O_3$   $400-550^\circ$ . The  $Cr_2O_3$ ,  $Cr_2O_3 + MnO_2$  and  $CuO$  catalysts in sticks procured from Kahlbaum were useless. Expts. on the oxidation of  $BuOH$  with  $CO_2$  in the presence of  $V_2O_5$  were quite successful when made at  $500-50^\circ$  and at an alk. temp. of  $80-95^\circ$ .

A. A. Boehlingk

**The oxidation of carbon monoxide with a silver catalyst.** Arthur F. Benton and Richmond T. Bell. *J. Am. Chem. Soc.* 56, 501-5 (1934).—The rate of oxidation of CO over Ag in the temp. range  $80-140^\circ$  is proportional to the partial pressure of CO. With 675-745 mm. of CO present, the rate is the same for 10 mm. of  $O_2$  as for 75 mm. With excess  $O_2$ , the rate per unit pressure of CO is about 5 times as great as with excess CO. The av. energy of activation is 13.3 kg.-cals.  $CO_2$  does not inhibit the reaction. Adsorption measurements reveal no adsorption of  $CO_2$ , a small adsorption of CO, and a slow irreversible activated adsorption of  $O_2$ . The catalytic reaction is considered to consist of 2 steps (1) the activated adsorption of  $O_2$  and (2) the reaction of CO with the adsorbed  $O_2$ . The rate of  $O_2$  adsorption is such as to permit about a 30-40% coverage of the surface at the steady state reached during the catalysis. P. H. E.

**The physics of the phenomenon of catalysis. Structure and genesis of catalysts.** P. D. Dankov. *Uspekhi Fiz. Nauk* 14, 63-94 (1934).—Interatomic spacing, crystal structure, surface structure, promoters, mixed catalysts are discussed as studied by x-ray and other phys. methods.

F. H. Rathmann

**Exact measurement of the specific heats of solid substances at higher temperatures. XIII. The specific heats of vanadium, columbium, tantalum and molybdenum from  $0^\circ$  to  $1500^\circ$ .** F. M. Jaeger and W. A. Veenstra. *Proc. Acad. Sci. Amsterdam* 37, 61-6 (1934); cf. C. A. 28, 1257<sup>1</sup>.—The exptl. data yield the following values for the heat capacity, in cal. per g. atom: V,  $C_p = 6.0414 + 0.1600 \times 10^{-2} - 0.34446 \times 10^{-4} + 0.7234 \times 10^{-6}$ ; Nb,  $C_p = 6.0120 + 0.722533 \times 10^{-4} + 0.21952 \times 10^{-6}$ ; Ta,  $C_p = 6.0244 + 0.38066 \times 10^{-4} + 0.19919 \times 10^{-6}$ ; Mo,  $C_p = 5.8604 + 0.11828 \times 10^{-4} + 0.9949 \times 10^{-6}$ .

F. D. Rossini

**The heat capacities of magnesium, zinc, lead, manganese and iron carbonates at low temperatures.** C. Travis Anderson. *J. Am. Chem. Soc.* 56, 849-51 (1934).—From heat-capacity data in the range  $55^\circ$  to  $300^\circ K.$ , the following values of entropy were calcd. for  $298.1^\circ K.$  in cal. mol.<sup>-1</sup> deg.<sup>-1</sup>:  $MgCO_3$  (magnesite),  $15.7 \pm 0.2$ ;  $ZnCO_3$  (smithsonite),  $19.7 \pm 0.3$ ;  $PbCO_3$  (cerussite),  $31.3 \pm 0.8$ ;  $MnCO_3$  (rhodochrosite),  $20.5 \pm 0.3$ ;  $FeCO_3$  (siderite),  $22.2 \pm 0.4$ .

F. D. Rossini

**The heat capacities and entropies of potassium bromate and iodate from  $15^\circ$  to  $300^\circ$  absolute. The entropies of bromate and iodate ions.** J. Elston Ahlberg and Wendell M. Latimer. *J. Am. Chem. Soc.* 56, 856-8 (1934).

From the heat capacity and auxiliary data the following values of the entropy were calcd. for 298.1°K.: KBrO<sub>3</sub> (c), 35.65 ± 0.1; KIO<sub>3</sub> (c), 36.20 ± 0.1; BrO<sub>3</sub><sup>-</sup> (aq., hypothetical 1 M), 37.4 ± 1.0; IO<sub>3</sub><sup>-</sup> (aq., hypothetical 1 M), 26.9 ± 1.0, cal. mol.<sup>-1</sup> deg.<sup>-1</sup>. F. D. R.

The specific heat of aqueous solutions of strong electrolytes. A. G. Samoylovich. *Physik. Z. Sowjetunion* 4, 843-53 (1933) (in English). The drop in sp. heat is due to hydration, which decreases the no. of degrees of freedom, and to depolymerization of water. Polarization increases the sp. heat, this effect prevailing in concd. soln.

Louis Goldman

The energies of the atomic linkages in methane, ethane, methanol and ethanol. Frederick D. Rossini. *J. Chem. Physics* 2, 145 (1934). Data recently obtained on heats of combustion yield for the reaction RII (gas) + 1/2 O<sub>2</sub> (gas) = ROH (gas),  $\Delta H_{298}^\circ = -30.24 \pm 0.00$  and  $-36.00 \pm 0.15$ , kg.-cal. per mole, for MeOH and EtOH, resp. These data show that the energy of the process of breaking a C-H bond in RII and inserting O to form R-OH is appreciably affected by the nature of the radical R.

F. D. Rossini

The Le Chatelier-Braun principle. Max Planck. *Sitzber. preuss. Akad. Wiss., Physik.-math. Klasse* 1934, 79-83.—From the math. formulation of the principle (C. A. 5, 3361), it is necessary to distinguish between the quant. factor (vol., entropy, mech. displacement) and the intensity factor (pressure, temp. and mech. force) expressed by 2 parameters.

E. R. Rushton

Heat of formation of the iron carbide Fe<sub>3</sub>C. Gerhard Naeser. *Mitt. Kaiser-Wilhelm Inst. Eisenforschung, Düsseldorf* 16, No. 1, 1-7 (1934).—A review of measurements of heat of formation of Fe<sub>3</sub>C shows very variable values between pos. and neg. max. It was again detd. from amorphous C and  $\alpha$ -Fe at room temp. by converting the carbide (under sepn. of C) and the pure Fe into the iodide and chloride, resp. From both methods the heat of formation was found to be  $+8 \pm 0.25$  kg.-cal./mol, which corresponds to  $44.6 \pm 1.4$  cal./g. cementite,  $47.8 \pm 1.5$  cal./g. Fe,  $668 \pm 20$  cal./g. C. The heat of combustion of finely distributed amorphous C on disintegration of carbide was found to be 107.9 kg.-cal. mol. The heat of reaction in the formation of FeS from  $\alpha$ -Fe and rhombic S was  $23.89 \pm 1.16$  kg.-cal. mol. The final result is that the heat of formation of Fe<sub>3</sub>C lies in the range of  $+8$  to  $-4$  kg.-cal./mol. according to the state of C and decreases with increasing graphitization.

Some views on the wave and electron theories. Maurice de Broglie and Louis de Broglie. *Scientia* 55, 77-85 (1934).—A non-math. discussion. L. E. Gilson

Value of  $e/m$ . W. N. Bond. *Nature* 133, 327 (1934).—Some (or possibly all) of the detns. of  $e/m$  are really measurements of  $(136/137)(1.77031 \pm 0.00014) \times 10^7$ .

E. R. Rushton

The theory of the electron and the positive. W. H. Furry and J. R. Oppenheimer. *Phys. Rev.* 45, 245-62 (1934).—A new math. formalism is given for the Dirac electron theory. A distinction is made between even and odd operators; only dynamical variables corresponding to even operators can be detd. without rendering the no. of electrons and positives in the system indeterminate; the momenta of an electron are even, but the coordinates are not. Thus the position of an electron cannot be given by a probability d.; the original Dirac theory gave false neg. energy states as a penalty for trying to localize the electron. In the new formalism the infinite d. of neg. energy states has disappeared, but the pos. electron remains. On account of the polarizability of nascent electron-positive pairs, the dielec. const. of a vacuum exceeds

that of truly empty space; the effect might be found as a deviation from the Coulomb law when  $10^8$  v. protons are scattered in H. The entire theory applies only to distances greater than  $e^2/mc^2$ . L. S. Kassel

A step forward in explaining the Pauli exclusion principle. Mitikadu Hayakawa. *Proc. Phys.-Math. Soc. Japan* 16, 67-70 (1934) (in German).—Math.

Gerald M. Petty

Relativistic theory of atoms with many electrons. J. Solomon. *Compt. rend.* 198, 1023-5 (1934).—The Thomas-Fermi theory leads to a paradox when applied in the immediate neighborhood of the origin, as the field there decreases much more rapidly than indicated by the Coulomb law (cf. Jensen, C. A. 28, 1919<sup>a</sup>). C. A. S.

The value of  $e/m$  from the Zeeman effect. L. E. Kinsler and W. V. Houston. *Phys. Rev.* 45, 104-8 (1934).—From very careful measurements of the Zeeman effect of the red singlets of Cd and Zn,  $e/m = 1.7570 \pm 0.0010$  c. m. u. L. S. Kassel

Technical and scientific uses of the diffraction of fast electrons. J. J. Trillat. *Oesterr. Chem.-Ztg.* 37, 29-33 (1934); cf. C. A. 28, 1239<sup>a</sup>.—An address. Diffraction

of electrons by metals (foils and powders), org. crystals, cellulose and gases is discussed. A. B. F. Duncan

**Diffraction of electrons by thin silver films acting as two-dimensional gratings.** Hans Lassen. *Physik. Z.* 35, 172 5(1934).—A method is given for depositing thin Ag films on polished rock-salt surfaces by condensation from the vapor. A beam of 35-kv. electrons is diffracted by some of these films as if by a two-dimensional grating of Ag atoms arranged as in the (100) plane of a single Ag crystal. C. D. W.

**Electron diffraction experiments with graphite and carbon surfaces.** R. O. Jenkins. *Phil. Mag.* 17, 457-66 (1934).—From the position of diffraction spots, the side of the C hexagon in graphite is 1.44 Å. with an inner potential of 10.7 v. The 002 lattice spacing is 3.40 Å. When a graphite surface is polished even lightly the crystals are all oriented with the main cleavage plane (001) in the plane of the surface. Polishing amorphous C results in orientation similar to that in graphite, indicating that grains of amorphous C consist of aggregates of small crystals bound together. When a piece of Fe is rubbed with a suspension of colloidal graphite in oil, an adsorbed film of graphite is formed on the metal, since washing does not eliminate the graphite diffraction pattern. When this adsorbed film is rubbed, the graphite crystals are reduced in size and become oriented, thus preventing metal-to-metal contact. E. J. Rosenbaum

**Electronic diffraction by cellulosic films.** J. J. Trillat. *Compt. rend.* 198, 1025 7(1934).—Diffraction diagrams were prep'd. by passing a monokinetic pencil of electrons of 20 25 kv. through films 50-100 Å. thick of cellulose trinitrate (13% N), triacetate, tripropionate, and tributrylate, prep'd. by allowing a drop of a suitable soln. to evaporate on Hg. A freshly prep'd. film is usually amorphous; microcrystals appear in a few hrs., and in a few days (sometimes weeks) the whole film is cryst. with some areas consisting of single crystals. With the pencil perpendicular to the film all 4 esters give identical diagrams, but with it at 35 60° they differ. The cellulosic chains lie parallel and flat in the film with equiv. atoms at the nodes of a (probably) monoclinic network with  $a$  7.10,  $b$  4.68,  $c$  2.5 or 5.0 Å. C. A. Silberrad

**Penetration of talc by fast electrons.** G. Aminoff and B. Broome. *Arkiv Kemi, Mineral., Geol.* 11B, No. 25, 5 pp.(1933). The diffraction pattern of electrons after passage through a very thin plate of talc was photographed. Whether the crystal structure was hexagonal or pseudo-hexagonal could not be det'd. From the spacing of the diffraction spots, the value of  $a$  is 5.25 Å. E. J. R.

**The role of the spin in multipole radiation.** H. C. Brinkman. *Physica* 1, 97 103(1933).—In magnetic multipole radiation the change of the magnetic spin moment of the electron with time contributes to the effect as shown from Dirac equations. B. J. C. van der Hoeven

**Negative sections of the cold-cathode glow discharge in helium.** K. G. Emelius, W. L. Brown and H. McN. Cowan. *Phil. Mag.* 17, 146 60(1934).—Cold-cathode discharges in He at 1 mm. pressure were studied by collector methods supplemented optically. Electron concns., electron temps. and potentials were det'd. in various sections of the discharge. Current-p. d. characteristics are discussed. E. J. Rosenbaum

**Investigations on positive and neutral rays. I. Neutralization of positive rays.** Antonio Rostagni. *Nuovo cimento* 11, 34-47(1934).—An app. is described for measuring the neutralization of ions of different velocities in gases and at metal surfaces. In grazing collision with a Cu plate, the percentage of A ions neutralized is very small. The effective cross sections of A, Ne, He and H<sub>2</sub> for the neutralization of their resp. ions are practically independent of the velocity between 6 v. and 400 v. The ionization of A and Ne by collision with A<sup>+</sup> occurs in the range 50 v. to 100 v. J. B. Austin

**The theory of alloys in the  $\gamma$ -phase.** H. Jones. *Proc. Roy. Soc. (London)* A144, 225 34(1934).—The zones of allowed energies for the loosely bound electrons in alloys with the  $\gamma$ -structure were investigated. The lowest group of energy levels is almost completely filled by the no. of

loosely bound electrons given by the Hume-Rothery rule. Large diamagnetic susceptibilities may be expected for alloys in this phase, and the Hall coeff. should change from large pos. to large neg. values as the comp. varies through the phase in the direction of increasing no. of loosely bound electrons. Gerald M. Petty

**Time variation of current in semiconducting material with low voltage.** G. Dechène. *Compt. rend.* 198, 1021-23(1934); cf. *C. A.* 24, 3048; 27, 4173.—With Hg electrodes and as semiconducting material yellow HgO, PbCl<sub>2</sub>, ZnO or effloresced Na<sub>2</sub>CO<sub>3</sub>, the counter c. m. f. increases slowly with the e. m. f. of the d. c. (0.28 v. with a potential of 2 v., 0.50 with one of 96); with low voltage (e. g., 4 v.) the resistance increases with time at the anode, and decreases at the cathode, but on reversal shows an increase followed by a decrease. C. A. Silberrad

**Remarks on the objections to my theory of the crystal photoelectric effect.** H. Teichmann. *Z. Physik* 87, 204-72(1933).—The criticisms of T.'s paper (*C. A.* 27, 1568, by Joffé and Joffé (*C. A.* 27, 4161), Draglio (*C. A.* 27, 4728) and Mönch and Stühle (*C. A.* 28, 31<sup>6</sup>) are discussed. Egon Bretschner

**Application of photoelectric emission laws to a barrier film photocell.** G. Liandrat. *Compt. rend.* 198, 1028-30(1934).—Recent work (cf. *C. A.* 27, 865; L. A. Wood, *Rev. Sci. Instr.* 4, 434(1933)) is discussed and the advantage of comparing the current/p. d. curves for cells unilluminated and illuminated with monochromatic light, in both cases with imposed p. d., is emphasized, the cell then functioning as a photo-resistant cell. C. A. S.

**Electronic conduction in alkali halide crystals.** R. Hilsch and R. W. Pohl. *Z. Physik* 87, 78 88(1933).—The temporal course of cond. of alkali halide crystals (artificial and natural NaCl, KCl, KBr) on irradiation reveals that the high primary photoelectric current diminishes with time because the pos. centers annihilate the field and so diminish the no. of migrating particles (center polarization). A high dark current due to high temp. neutralizes this effect. With artificial crystals another polarizing effect is observed which is due to the higher imperfection of artificial crystals (crystal cracks). Egon Bretschner

**Combinations of fields for velocity- and mass-spectrography.** Walter Hennberg. *Ann. Physik* 19, 335 41 (1934).—Theoretical study of combined elec. and magnetic fields for focusing, dispersion and sepn. of masses in beams of charged particles. E. J. Rosenbaum

**Direct experimental measurement of electron affinities.** Paul P. Sutton and Joseph E. Mayer. *J. Chem. Physics* 2, 145-6(1934).—Through measurement of the equil. const. of the reaction,  $X^- \rightarrow X + e^-$ , the electron affinity of an electroneg. gas at 0°K. can be calcd. At equil. under low pressure the electron affinity can be det'd. from the nos. of  $X^-$ ,  $X$  and  $e^-$  leaving the surface of a hot thermionic emitter. Above 1500°K., I<sub>2</sub> mols. are completely dissoc. into atoms; since very few of the atoms are converted into ions the no. of atoms leaving the surface is twice the no. of mols. impinging. For calcn. the temp. of the surface, the pressure of the gas  $X_2$ , and the ratio of currents carried by ions and electrons are necessary. Preliminary measurements on I<sub>2</sub> give a value of 74.2 kg.-cals., in good agreement with other methods. A description of the app. is included. Calvin Broun

**Attempt at a theory of  $\beta$ -rays.** Enrico Fermi. *Nuovo cimento* 11, 1-19(1934).—A quant. theory to explain the emission of  $\beta$ -rays is based on the existence of the neutron. The emission of electrons and neutrons from a nucleus in the act of  $\beta$ -disintegration is treated by methods similar to those used to describe the emission of light from an excited atom. Formulas for the half life and for the form of the continuous  $\beta$ -ray spectrum deduced from this theory give results in reasonable accord with expt. J. B. A.

**Scattering of hard  $\gamma$ -rays by lead, and the annihilation of positive electrons.** E. J. Williams. *Nature* 133, 415 (1934).—The backward scattering of hard  $\gamma$ -rays by a Pb sheet 0.1 mm. thick is increased 25  $\pm$  3% when a 3-mm. Al sheet is placed on the side of the Pb sheet away from the radiator. A wax sheet is placed between the Pb sheet

and the ionization chamber to absorb pos. electrons escaping from the Pb. This is an addnl. verification of the hypothesis of Blackett and Occhialini, that the "nuclear" scattering of hard  $\gamma$ -rays by heavy elements is due to the annihilation of pos. electrons produced by the  $\gamma$ -rays (cf. Joliot, *C. A.* 28, 1921' and Thibaud, *C. A.* 28, 1921').

**The use of the interferometer in the isotopic analysis of water.** R. H. Crist, G. M. Murphy and H. C. Urey. *J. Chem. Phys.* 2, 112-15 (1934); cf. *C. A.* 28, 897'.—The Zeiss interferometer has been applied to the analysis of  $H_2O$  contg.  $H^3$ . The instrument was calibrated with samples of  $H_2O$  whose d. had previously been detd. by means of a pycnometer. Cells 40, 10 and 1 mm. long were used, the min. quantity of  $H_2O$  required being 1.5, 0.3 and 0.05 cc., resp. With the 40-mm. cell, the precision is about 0.01%.

**Isotopic fractionation of water by distillation.** Norris F. Hall and T. O. Jones. *J. Am. Chem. Soc.* 56, 749-50 (1934).— $H_2O$  contg. about 3% of the heavier isotope on distn. gave 3 fractions with sp. gr. 1.003365, 1.003444 and 1.003546; at 10 mm. the 1st fifth of the distillate contained 32% less heavy isotope and the last fifth about 25% more.

**Electrolytic concentration of the heavy hydrogen isotopes.** R. Topley and H. Eyring. *Nature* 133, 292 (1934); cf. *C. A.* 28, 907'.—Electrolysis of  $H_2O$  with various metals as electrodes gave values for the electrolytic sepn. factor ranging between 7.9 and 2.8. \*The metals studied, in decreasing order of this factor, were: smooth Pt, Pb, Fe, Cu, Ag, Ni, W, Pt black, liquid Ga and Hg. The factor is slightly less in acid than in alk. soln. Moderate changes in c. d. have little effect. The theory of the sepn. is discussed.

**Chemical separation of the isotopes of hydrogen.** B. D. Hughes, C. K. Ingold and C. I. Wilson. *Nature* 133, 291-2 (1934).—The ratio,  $\alpha$ , for the sp. rates of discharge of  $H^1$  and  $H^2$  when metals are dissolved in  $H_2O$  is not characteristic of the metal but depends in some unknown way on exptl. conditions. For Na the ratio is 2.9 and varies very little from strongly acid to basic soln. The values for Ca and Al range between 1.3 and 1.6 and 4.0 and 4.9, resp. These depend on conditions with better results in alk. soln. For very pure Zn and com. Zn the ratios are 5.6 and 6.8, resp. Zn-Cu couples gave values as high as 8.0. This suggests that couples may be of use in sepn. D. deins. were made to det. the concn. of  $H^2$ . Various metals were studied as well as compds. forming volatile hydrides with  $H_2O$ .

**Research on heavy hydrogen at Princeton.** Hugh S. Taylor. *Science* 79, 303-5 (1934).

**Heavy hydrogen and the work of Harold C. Urey.** W. D. Harkins. *Chem. Bull.* 21, 83-7 (1934). E. H.

**Preparation of heavy hydrogen.** P. Harteck. *Proc. Phys. Soc. (London)* 46, 277-80 (1934).—The prepn. of heavy H by the electrolysis of an alk. soln. with Ni electrodes is described.

**Natural separation of the isotopes of hydrogen.** Malcolm Dole. *J. Am. Chem. Soc.* 56, 999 (1934).—Combustion of kerosene from Oklahoma oil fields gave a  $H_2O$  with a d. 7 pts. per million greater than that of ordinary  $H_2O$ ; thiophene-free  $C_6H_6$  from the destructive distn. of coal gave a product with a d. 8 pts. per million heavier;  $H_2O$  from honey showed an increase of 4 pts.

**The relative reactivities of the hydrogen isotopes with chlorine.** G. K. Rollefson. *J. Chem. Phys.* 2, 144-5 (1934).—The photochem. reaction:  $CO + H_2 + 2Cl_2 \rightarrow COCl_2 + 2HCl$  was studied with  $H^2$ .  $H^2$  is less reactive in this reaction than  $H^1$  because of the fact that the reaction with  $H^2$  has a slightly higher heat of activation.

**Exchange reactions of hydrogen atoms.** Norris F. Hall, Everett Bowden and T. O. Jones. *J. Am. Chem. Soc.* 56, 750 (1934).—Approx. 2% heavy  $H_2O$  was allowed to dissolve various substances and later sepd. from them by distn. at atm. pressure. No interchange of H was found during brief contact with KCl,  $KH_2PO_4$ , AcOK,  $BzONa$  or  $H$  gas;  $1/2$  of the  $H_2$  in the substance immediately ex-

changed in  $C_2H_5(OH)_2$ ; the extent of exchange increased markedly with the time of contact with AcOK and with  $H$  gas. The work with  $H_2$  does not yet indicate the position of equil.

**The disintegration of deuterons by high-speed protons and the instability of the deuteron.** Gilbert N. Lewis, M. Stanley Livingston, Malcolm C. Henderson and Ernest O. Lawrence. *Phys. Rev.* 45, 242-4 (1934); cf. following abstract.—Otherwise identical targets contg.  $H^1$  and  $H^2$ , resp., were bombarded with protons of  $1.5 \times 10^6$  v. energy. The  $H^2$  targets gave an excess yield of long-range protons, attributed to deuteron disintegration. The range of these protons indicates a neutron mass of about 1.001.

**The hypothesis of the instability of the deuteron.** G. N. Lewis, M. S. Livingston, M. C. Henderson and E. O. Lawrence. *Phys. Rev.* 45, 497 (1934); cf. preceding abstract.—It is suggested that the long-range protons of the former work may have been produced by  $C^{12} + H^2 \rightarrow C^{12} + H^1 + \gamma$  or a similar process; on this view, the role of  $H^2$  in the target would be to contaminate the  $(H^1)_2^+$  beam with  $(H^2)^+$ .

**Transmutation effects observed with heavy hydrogen.** M. L. Oliphant, P. Harteck and Rutherford. *Nature* 133, 413 (1934).— $NH_4Cl$ ,  $(NH_4)_2SO_4$  and  $H_2PO_4$ , in which the  $H^1$  was largely displaced by  $H^2$ , were bombarded with protons and with ions of  $H^2$ . With protons, no large differences were observed between the  $H^1$  and  $H^2$  compds.; with  $H^2$  ions, there was an enormous emission of fast protons from the  $H^2$  compds. with a range of 14.3 cm. and an energy of emission of  $3 \times 10^6$  v. An equal no. of singly charged particles of 1.6 cm. range was observed, as well as other weak groups. A slightly smaller no. of neutrons of  $3 \times 10^6$  v. energy was also observed. It seems likely that two deuterons unite to form a He atom of mass 4.0272 and charge 2. This nucleus, on account of its large surplus of energy over that of ordinary He of mass 4.0022, breaks into two components. A possible reaction is  $2H^2 \rightarrow H^1 + H^1$ ; this agrees with the ranges of 14 and 1.6 cm. which were found. Another possible reaction is  $2H^2 \rightarrow He^2 + n^1$ ; this He<sup>4</sup> particle should have a recoil of 5 mm. This group has not, as yet, been detected.

**Disintegration of the separated isotopes of lithium by protons and by heavy hydrogen.** M. L. Oliphant, E. S. Shire and B. M. Crowther. *Nature* 133, 377 (1934).—The isotopes of Li were sepd. in the nearly pure state in aunts. of 1  $\gamma$ . Ion currents of several microamp. passed through elec. and magnetic fields and the metal was collected on metal disks cooled with liquid N. It was fixed by exposure to HCl.  $Li^6$  and  $Li^7$  when bombarded with protons gave  $\alpha$ -particles of 11.5 mm. and 8.4 cm. range, resp. When bombarded with deuterons the former gave  $\alpha$ -particles of 13.2 cm. range and protons of 30 cm. range.  $Li^7$  gave  $\alpha$ -particles with ranges up to 8 cm. and neutrons.

**Production of induced radioactivity by high-velocity protons.** J. D. Cockcroft, C. W. Gilbert and E. T. S. Walton. *Nature* 133, 328 (1934).—A target of Acheson graphite was bombarded with protons, then removed and placed against a Geiger counter. The observations suggest that the unstable isotope  $N^{13}$  is produced by the addn. of a proton to  $C^{12}$ . No marked increase in the no. of counts was observed when a mixed beam of  $H^2$  and protons was substituted for the proton beam.

**Artificial production of radioactive substances.** C. C. Lauritsen, H. R. Crane and W. W. Harper. *Science* 79, 234-5 (1934).—Curie and Joliot, *C. A.* 28, 2202<sup>1</sup>, point out that if their explanation of the artificial radioactivity induced in B, Mg and Al by  $\alpha$ -particle bombardment is correct,  $N^{13}$  should be produced by bombarding C with deuterons. Targets of LiF, Bc,  $H_2BO_3$ , C, Mg and Al were bombarded for 15 min. with a 5-microampere deuteron current at 900,000 v. and promptly observed in the Geiger counter. C gave the largest effect and B next. The other substances gave appreciable effects which may have been caused by C contamination. The nature of the delayed activity was detd. by use of a Wilson cloud chamber.

Both the decay period (14 min.) and the max. energy of the electrons from C indicate that the active isotope here concerned is the same as in the case of B bombarded with  $\alpha$ -particles as reported by Curie and Joliot. About one radioactive atom is produced for about  $10^{10}$  deuterons incident on the target. Emission of  $\gamma$ -rays from C during deuteron bombardment is probably assoc. with the emission of protons and the formation of  $C^{13}$ . Formation of  $C^{13}$  accounts for about 99% of the transformations and formation of  $N^{13}$  less than 1%. Oden E. Sheppard

**Artificial transmutation of magnesium by polonium  $\alpha$ -particles.** H. Klarmann. *Z. Physik* 87, 411-24(1933).—The Rutherford-Geiger counting tube is used to study the disintegration of Mg by Po  $\alpha$ -rays. Special stress is laid on a max. of efficiency together with good geometrical conditions. Four groups of protons of 7.1, 8.5, 9.8 and 11.6 cm. range are found. They correspond to the "resonance groups" of Pose (*C. A.* 25, 248, 4178), in confirmation of P.'s observations. Egon Bretscher

**Angular distribution of protons ejected by neutrons.** N. A. Dobrotin. *Compt. rend. acad. sci. U. R. S. S.* [N. S.], 1, 179-80 (in English 180-1) (1934).—Ra-Em + Be was used as the source of neutrons. Protons were ejected from a paraffin plate placed inside a Wilson chamber so that the bundle of neutrons was approx. perpendicular to its surface. The image of the chamber was projected on ground glass, upon which the track of the proton was recorded as it appeared. The angular distributions of the projections of 77 observed protons are shown in a figure. Calcd. results are closer to those of Kurie (*C. A.* 27, 5635) than of Auger and Monod-Herzen (*C. A.* 27, 3137). E. R. Rushton

**Experiments with neutrons.** L. Meitner and K. Philipp. *Z. Physik* 87, 484-97(1933).—The tracks due to collisions of neutrons with H, A, N or O atoms are studied in a Wilson chamber. The max. neutron energy (from Be with Po  $\alpha$ -radiation) is about  $13-14 \times 10^6$  v. This gives for the mass of the neutron 1.0053-1.0042 (from the reaction:  $Be^9 + \alpha = C^{12} + n$ ). Most of the protons have an energy of  $0.19-1.9 \times 10^6$  v. The same max. energy is found for collisions of neutrons with N atoms. Some disintegrations have been observed with O and N. The 1st reaction is due to:  $O^{16} + n = C^{13} + \alpha$  with a high heat of reaction, the 2nd to:  $N^{14} + n = B^{11} + \alpha$  with no surplus of energy. The neutron mass as deduced from the last reaction is 1.0056. The scattering of the collision protons is of spherical symmetry with reference to the center of gravity of the moving particles. E. B.

**Some experiments on the production of positive electrons.** J. Chadwick, P. M. S. Blackett and G. P. S. Occhialini. *Proc. Roy. Soc. A* 144, 235-49(1934); cf. *C. A.* 27, 2873.—The emission of positrons was observed under different exptl. conditions: (1) from Pb exposed to  $\gamma$ -rays from a Th active deposit, (2) directly from a Th active deposit and (3) from Pb exposed to the  $\gamma$ -rays and neutrons emitted by Be, B and F when bombarded by Po  $\alpha$ -particles. About 4000 tracks of electrons and about 400 tracks of positrons were obtained. The energies of the positrons ejected from Pb by Th  $\gamma$ -rays support the view that a positron and an electron are produced simultaneously by the interaction of a  $\gamma$ -ray and an atom, and that the masses of positron and electron are equal. The positron and electron are probably created in the elec. field outside the nucleus. The area of cross section of the Pb atom for the production of a positron is calcd. to be  $2.8 \times 10^{-24}$  sq. cm., in good agreement with the calcs. of Heitler and Sauter (*C. A.* 28, 1921<sup>8</sup>). When  $\gamma$ -rays of high frequency pass through Pb, about  $1/4$  of the energy absorbed from a  $\gamma$ -ray of  $h\nu = 2.6 \times 10^6$  v. is used in creating a positron and an electron. Nine photographs of positron and electron tracks are shown. Gerald M. Petty

**Investigation of the secondary radiation excited by a hard  $\gamma$ -radiation.** Th. Heiting. *Z. Physik* 87, 127-38 (1933); cf. *C. A.* 28, 406<sup>3</sup>.—The  $\gamma$ -radiation scattered by Al, Fe, Cu and Pd on irradiation with the Th C'  $\gamma$ -rays ( $\mu = 4.7$  X. U.) at an angle of  $130^\circ$  is studied by an ionization method. The secondary radiation has for all

elements the same wave length of  $3.8$  X. U. This corresponds to an energy of  $h\nu = mc^2/c$ . According to Dirac's theory the following mechanism is adopted: The Th C'  $\gamma$  radiation releases a positron from the nucleus which combines with a shell electron to give 2 quanta of light of energy  $mc^2$ ,  $m$  is the mass of electron at rest,  $c$  is the velocity of light. The intensity of this radiation increases with the square of the at. no. of the scattering element. A hard component is found in the case of Pb. Contrary to Meitner (*C. A.* 26, 27, 4241) no radiation of the primary frequency is found. Egon Bretscher

**Measurements of the fluctuations of the cosmic radiation.** W. Messerschmidt. *Z. Physik* 87, 800-5(1933); cf. *C. A.* 28, 36<sup>1</sup>.—The Pb shield of the ionization chamber has an opening which is rotated every hr. by  $90^\circ$ . A 0.3% surplus of radiation is coming from the west. This points to pos. particles as constituents of the cosmic radiation. Egon Bretscher

**Ionization by cosmic-ray particles and swift  $\beta$ -particles.** Gordon L. Locher. *J. Franklin Inst.* 217, 39-58(1934).—Examm. of the cloud tracks produced by cosmic rays and by fast  $\beta$ -particles shows primary ionization and also branch tracks due to secondary ionization. These branches are of 2 kinds: "collision-branches," having a wide range of energies, and "radiation-branches," having select. groups of energies, characteristic of electron transitions of the atoms of the gas. The production of the radiation-branches is exactly similar to the Auger effect. The fact that radiation-ionization occurs produces discrepancies between the energy lost along tracks and the ionization produced, and immensely complicates the problem. Helen S. Hopfield

**The path of a secondary cosmic-ray charged particle in the earth's magnetic field.** I. S. Bowen. *Phys. Rev.* 45, 349-51(1934).—The cosmic-ray latitude effects cannot be explained by the action of the earth's magnetic field on charged secondaries produced by primary photons. L. S. Kassel

**The mechanism of cosmic-ray counter action.** Carl D. Anderson, R. A. Millikan, Seth Neddermeyer and Wm. Pickering. *Phys. Rev.* 45, 352-63(1934).—Two Geiger counters were used to actuate a cloud chamber in a strong magnetic field. Such an arrangement has a strong selective action on showers. The counters respond simultaneously when no single particle could penetrate both. Showers contain pos. and neg. electrons; in leaving the nucleus, these electrons sometimes generate an intense photon spray. This photon spray is of increasing importance in activating two counters simultaneously as the intervening Pb is increased. A light element, e. g., C, has little power to produce showers or sprays. The total energy in a shower is not larger than that which has been observed for single electrons. These effects are not entirely consistent with the Dirac theory. L. S. Kassel

**A  $\gamma$ -ray ionization chamber for use with a direct-current amplifier.** L. F. Curtiss. *Bur. Standards J. Research* 12, 167-72(1934)(Research Paper No. 641).—A new type of  $\gamma$ -ray ionization chamber, in which the source is within the central electrode, is described. The chamber is so designed with guard rings that only an annular zone of ionization about the source of  $\gamma$  rays contributes to the measured ionization current. This arrangement yields ionization currents for av. preps. of Ra of the order of  $10^{-11}$  amp. which are readily amplified by a vacuum-tube amplifier so as to be readable on a microammeter. Results obtained were accurately comparable with detns. made by means of a gold-leaf electroscope. The arrangement possesses advantages over the electroscope, and is particularly suited to the routine standardization of com. preps. of Ra and Rn. R. Roseman

**The  $\beta$ -ray spectrum of Th B + C + C'.** Kan Chang Wang. *Z. Physik* 87, 633-46(1933).—The energy distribution of  $\beta$ -rays is detd. by deflection in a magnetic field and use of an electron counter. Twenty lines are found belonging to energies between 500 and 4000 H $\mu$ . The primary spectrum of Th B has an upper limit for 2340 H $\mu$ , that of Th C at 8500 H $\mu$ . The probability of the internal photoeffect for the K, L, M and N levels is

detd. from the intensity ratio of the primary  $\beta$ -spectrum of Th B and that of the photoelec. active line of the energy  $h\nu = 3.77 \cdot 10^4$  v. Egon Bretscher

Portable detector for radium. L. F. Curtiss. *Bur. Standards J. Research* 12, 379-82(1934)(Research Paper No. 663). E. H.

Redetermination of the half life of radium. D. Ernst Walling. *Z. Physik* 87, 603-6(1933).—The half life of Ra D is  $22.3 \pm 0.4$  years. Egon Bretscher

The distribution of the radioactive thallium isotope Th C' in solutions of thallium salts. Johannes Zirkler. *Z. Physik* 87, 410(1933).—A soln. of  $TlNO_3$  made radioactive by addn. of Th C' is mixed with  $Tl(NO_3)_3$ . The  $Tl^{+++}$  is sepd. and its  $\gamma$ -activity detd. It is found to be more feeble than it should if complet. exchange is assumed. Egon Bretscher

Working formula for the age determination of a radioactive mineral. Alois F. Kovarik. *Am. J. Sci.* 27, 193-203(1934).—The hypotheses assumed for the soln. of the problem of the age of a radioactive mineral are stated. Two previously derived equations are indicated as giving a correct basis for solution. A third equation is derived, based partly on the intensities of the isotopic leads in the Pb of the mineral and in ordinary Pb and on the equation giving the amt. of ordinary Pb derived from the basic equations. Act D and ordinary Pb may be considered as Pb of at. wt. 207.2, initially present, without an error greater than observational. On this basis, equations having term: for only the U and Th quantities involving time are given. A suggested procedure is indicated and an example given. Alden H. Emery

Radioactivity of mineral springs of Greece. M. Pertessis. *Compt. rend.* 198, 1053 5(1934); cf. *C. A.* 27, 3266.—The salts, temp. and radioactivity of 32 mineral springs of Greece have been detd., and the radioactivity and compn. of the gases evolved at 4 are given. C. A. Silberrad

Biological detection of radioactivity of rocks. O. Muck. *Strahlentherapie* 46, 378 83(1933).—The reaction depends on the vasoconstriction of probed nasal mucous membrane after contact of the human body with radioactive material. B. C. A.

The quantum scattering of x-rays. I. Multiple Compton effect. H. Hulubei. *Ann. phys.* [11], 1, 5-53(1934); cf. *C. A.* 27, 3879.—(1) Expressions for the change in wave length with multiple Compton scattering are derived for the electron at rest and in motion. This scattering was studied with a Cauchy's focusing spectrograph (cf. *C. A.* 27, 464, 2622) for the K series lines of Mo and Rh scattered from paraffin and Li at angles between  $0^\circ$  and  $130^\circ$ . Double scattering was found for all angles, and triple, for some. The distribution of the intensity of the scattered rays shows that triple and higher-order scattering is not negligible. II. Non-existence of partial absorption. *Ibid.* 53-8.—No evidence was obtained of the partial absorption of Ray (cf. *C. A.* 24, 4213; 25, 2360) with absorbers of lampblack, Al and B, although exposures were sufficient to detect rays much weaker than expected for this effect. III. Weak characteristic emission lines. *Ibid.* 59-71.—Wave-length measurements obtained for the forbidden K series lines of Rh are:  $\beta_4 = 533.11$ ;  $\beta_5 = 540.12$ ; and the spark satellite,  $\beta_6 = 548.23$  X. U., and, for Mo,  $K\beta_6 = 635.65$  X. U. (cf. *C. A.* 27, 3605). Victor Hlicks

Preliminary experiments with x-rays on oxygen, acetylene and ethylene, in the solid state. H. H. Mooy. *Rapports et Communications*, No. 24, *Congr. intern. froid*, Buenos Aires, *Communications Kamerlingh Onnes Lab. Univ. Leiden* No. 223, 1-8(1932).—Debye-Scherrer spectrograms of O,  $C_2H_2$  and  $C_2H_4$  in the solid state were obtained. O was at the temp. of liquid  $H_2$  and the other substances were at the temp. of liquid air. The data did not allow a detn. of structure, but seemed to indicate the presence of inferior symmetries. C. H. P. Jeffreys

Scattering of homogeneous x-rays of 0.25 to 0.4 A. Ivor Backhurst. *Phil. Mag.* 17, 321-51(1934).—The relative angular intensity distribution at 0.31 A. was measured for Be, paraffin wax,  $H_2O$ , turpentine,  $C_6H_6$ , EtOH and Ph-

COPh. The data for Be agree closely with the wave-mech. expression. The relative proportions of modified and unmodified radiation of wave lengths 0.25, 0.31 and 0.395 A. scattered at  $150^\circ$  were detd. for Be, C, Al, S, Fe, Cu, Mo, W and Pb. The abs. value of the angular scattering coeff. at  $150^\circ$  was obtained for C and Al at 0.31 and 0.395 A. These data agree well with the values calcd. for gas scattering. E. J. Rosenbaum

Extension of the x-ray spectrograph. Spectrograph focused by a curved crystal. X-ray emission spectra of gases. Y. Cauchois. *Ann. Phys.* [11], 1, 215-66(1934); cf. *C. A.* 27, 4165. J. B. Austin

X-ray spectra of the L-series of silicon and silica. Manne Siegbahn and Torsten Magnusson. *Nature* 133, 257(1934).—Differences in the lines of Si and  $SiO_2$  at about 135 A. are described and compared with the analogous case of Al and  $Al_2O_3$ . C. D. W.

Determination of crystal orientations with the Weissenberg x-ray goniometer. J. Palacios, J. Hengstenberg and J. García de la Cueva. *Anales soc. españ. fis. quim.* 31, 811 21(1933).—An analysis of the problem and its application to wire and rolled foil of Al are described. C. D. W.

Characteristic x-rays from metals in the extreme ultra-violet. H. M. O'Bryan and H. W. B. Skinner. *Phys. Rev.* 45, 370 8(1934).—X-rays in the region 50 500 A. are studied for Li, Be, C, Na, Mg, Al, Si and Ba. The Ba band is an  $O \rightarrow N$  transition. The bands for the other metals are due to conduction electrons falling into the K or L shell. The energy spread of the bands may be calcd. from Sommerfeld's theory of metals, and permits the no. of conduction electrons to be detd.; the result is 1 for Li and Na, 2 for Be and Mg, 3 for Al, and possibly not far from 4 for Si, though the theory is not strictly applicable to it. L. S. Kassel

The spectroscopy of ultra-soft Röntgen radiation. H. Manne Siegbahn and T. Magnusson. *Z. Physik* 87, 291-309(1933); cf. *C. A.* 24, 5212. Egon Bretscher

Widths of x-ray lines from alloy targets. Lyman G. Parratt. *Phys. Rev.* 45, 364 9(1934). L. S. K.

Precision measurements of rhombohedral crystal lattices. J. Weigle. *Helv. Phys. Acta* 7, 46-50(1933). A method is developed to obtain from Debye-Scherrer patterns precise results of the dimensions of a crystal lattice even for non-cubic crystals. The method is applied to  $NaNO_3$ . Egon Bretscher

Focusing method for x-ray crystal analysis. A. Rogozinski. *Compt. rend.* 198, 953-5(1934).—The method consists essentially in arranging the substance under examn. in a hoop, the plane of which is perpendicular to the incident beam of x-rays, and of which the center lies in that beam. A small Pb screen prevents direct incidence of the beam on the photographic film. The method greatly reduces the period of exposure. C. A. S.

Photographic means of reflection of x-rays. XII. Comparison of photographic and ionization methods. J. A. Barasoain and R. Salvia. *Anales soc. españ. fis. quim.* 32, 53-61(1934).—Greatest accuracy was obtained when all lines were darkened to about the same degree. Under these conditions, both methods give the same results. E. M. Symmes

The law of photographic blackening due to very soft Röntgen radiation. H. Broili and H. Kiessig. *Z. Physik* 87, 425-31(1933).—The density of various photographic plates on irradiation with  $K_{\alpha}$  C (45 A.) or Cu (1.54 A.) radiation is proportional to the incident energy in the last case only. The plot for the C radiation is strongly curved, the sensitivity of the plate decreasing very much with intensity. This is due to the high absorption of the soft radiation. Egon Bretscher

Relative merits of film and paper for industrial x-ray work. Ancel St. John and H. R. Isenburger. *Proc. Am. Soc. Testing Materials* 33, Pt. II, 761-9(1933).—Both films and papers were exposed for 1 min. to x-rays under Pb shields varying in thickness from 0.005 to 0.080 in. in steps of 0.005 in. When the tube was operated at 150,000 v. the emulsion under the Pb strips up to 0.020 in. was over-exposed on both film and paper. Gradations

in density on both could be distinguished from 0.020 to 0.065 in. of Pb. One-in. welded boiler plate with a small plate 4% of the thickness of the boiler plate was placed between the x-ray tube and the emulsions. A hole was placed in the sheet for comparison purposes. The sheet and hole were distinguishable in both film and paper. Films may be contact-printed for comparison purposes; paper "negatives" were photostated. Papers dried in 2 hrs., films in 3. The cost of paper is less than that of film. With respect to speed and contrast, film and paper are of equal value. With respect to general convenience the balance is in favor of papers. H. E. M.

**Shift and unsymmetric broadening of absorption lines by foreign gases.** Chr. Fuchtbauer and F. Gössler. *Z. Physik* 87, 89-104(1933); cf. C. A. 28, 409<sup>4</sup>.—The broadening effect of He, Ne, Ar and N<sub>2</sub> on the Cs doublet 4555 and 3876 Å. is detd. independently of pressure and temp. as well as the shift of the absorption max. and the dissymmetry of the line due to the addn. of gas. The half width of the Cs line is found to be about 25% larger than that of K. The broadening increases from Ne, N<sub>2</sub>, Ar and He to the max. with H<sub>2</sub>. Egon Bretscher

**The nuclear moment of xenon.** Hans Kopfermann and Eva Rindal. *Z. Physik* 87, 460-9(1933).—Xe<sup>130</sup> has an angular moment of  $I = 1/2$  and a neg. magnetic moment, Xe<sup>131</sup> has  $I = 3/2$  and a pos. magnetic moment. Egon Bretscher

**Non-Ritzian nature of the <sup>3</sup>S terms of mercury.** I. Walerstein. *Nature* 132, 139(1933). G. G.

**The anomalous Zeeman effect of some single hyperfine structure components of the mercury resonance line 2537 Å.** I. The  $\pi$ -components. Anton Žvironas. *Helv. Phys. Acta* 7, 224-56(1933); cf. C. A. 28, 40<sup>8</sup>.—The method of taking resonance curves due to Malinowski modified by Schein (C. A. 23, 4888) is used in combination with Mrozowski's procedure (C. A. 27, 229, 890) to study the Zeeman effect of some hyperfine components of Hg 2537 Å. The results are complicated because the Zeeman splitting is of the same order of magnitude as the hyperfine structure. The results are in agreement with the observations by Schüler on the hyperfine structure carried out with interference spectroscopes and those calcd. by Inglis (C. A. 28, 408<sup>7</sup>). Egon Bretscher

**The Paschen-Back effect. I. L-S coupling; the <sup>3</sup>P<sup>3</sup>D multiplets of zinc and cadmium.** J. B. Green and D. E. Gray. *Phys. Rev.* 45, 273-6(1934). L. S. K.

**The fine structure of the Balmer lines.** W. V. Houston and Y. M. Hsieh. *Phys. Rev.* 45, 263-72(1934).—A new method of treating interferometer patterns of doublets is used to det. the sepns. of the centers of gravity for the 1st 5 Balmer lines. The exptl. sepns. are less than expected from the theory, giving a calcd. fine-structure const. of  $(1/\alpha) = 139.9$ . The difficulty must be in the theory of the H atom, possibly in the neglected interaction of the electron with the radiation field. L. S. Kassel

**Arc spectrum of tellurium.** S. Gopala Krishnamurty. *Current Sci.* 2, 210(1933).—Note on an arc spectrum from the visible to  $\lambda$  1600. G. B. Taylor

**Perturbation in the spectrum of Se II.** K. R. Rao and S. Gopala Krishnamurty. *Nature* 133, 328(1934). A perturbation in intensity, obviously due to the mutual interaction of adjacent spectral lines, is found. The other characteristics are generally analogous to those of As I or S II. Details will be published shortly. E. R. R.

**The arc spectrum of radium.** Ebbe Rasmussen. *Z. Physik* 87, 607-15(1933).—The arc spectrum of Ra is studied in the region 3000-10,000 Å. The ionization potential is 5.176 v. Egon Bretscher

**Pressure shift of the iron multiplets. Comparison of two independent methods.** Erwin Beglinger. *Helv. Phys. Acta* 7, 149-69(1933).—The pressure shift of 2 multiplets of the arc spectrum and of some spark lines of Fe are detd. by visual and photometric methods. Egon Bretscher

**Absorption spectra resulting from the excitation of the inner electrons. III. The cadmium spectrum between 1100 and 600 due to excitation of the (4d)<sup>10</sup> shell of Cd I<sup>0</sup>.**

H. Beutler. *Z. Physik* 87, 19-27(1933); cf. C. A. 28, 1266<sup>9</sup>.—Thirty absorption lines are observed which correspond to transitions  $(4d)^9(5s)^2, {}^1S_0 \rightarrow (4d)^9(5s)^2m^2P_1, {}^3P_1, {}^3D_1$  or  $(4d)^9(5s)^2m^2P_1$  or  ${}^3P_1$ . The terms agree well with the arc spectrum of the succeeding element (In). The lowest terms are diffuse because they only differ a little energetically from the series limit of Cd I. The  $m^2D_1$  (not diffuse) and the  $m^2P_1$  terms (diffuse) converge to the  ${}^3D_1(4d)^9(5s)^2$  level of Cd<sup>+</sup>. IV. The zinc spectrum between 1150 and 700 Å. obtained by excitation of the  $3d^{10}$  shell (Zn I<sup>0</sup>). Supplement: Comparison of the terms of Hg I<sup>0</sup>, Cd I<sup>0</sup> and Zn I<sup>0</sup>. H. Beutler and K. Guggenheimer. *Ibid.* 176-87. V. The doublet at 660 Å. due to the excitation of the  $(3p)^4$  shell of potassium. (K I<sup>0</sup> resonance lines.) *Ibid.* 188-91. E. B.

**Investigation in the Schumann region. III. The spectra of iron, cobalt and nickel in the spectral region from 2000 to 1670 Å.** R. Gräfin zu Dohna. *Z. Physik* 87, 616-32(1933). Egon Bretscher

**Studies of series spectra. IV. Molybdenum. I. Miguel A. Catalán and Pilar de Madariaga. Rev. acad. cienc. Madrid 30, 621-59(1933); cf. C. A. 28, 908<sup>8</sup>.—644 lines are classified into 120 quintet and septet levels and many terms are assigned. A no. of analogies to the spectrum of Cr I are pointed out. A general method of fixing series limits is given. The fundamental limit given by Kiess for Mo (50,660, cf. C. A. 17, 3453) gives results incompatible with those of Cr I and other elements of this period. The value 57,200  $\pm$  200 gives better results and leads to an ionization potential of 7.06 v. J. B. A.**

**The spectrum of fluorine, F II, F III, F IV.** I. S. Bowen. *Phys. Rev.* 45, 82-6(1934).—A no. of lines are classified, and the ionization potentials detd. to be 34.81, 62.35 and 87.34 v., resp. L. S. Kassel

**Large electronic isotope effects in molecular spectra.** Herrick L. Johnston. *Phys. Rev.* 45, 79-81(1934). Curves are given showing the isotopic shift in the spin doublet sepn. for BO and OH; the sepn. is zero for zero  $K$ , increases to a max. of 2 cm.<sup>-1</sup> for B<sup>10</sup>O<sup>16</sup> — B<sup>10</sup>O<sup>18</sup> and 20 cm.<sup>-1</sup> for O<sup>16</sup>H<sup>2</sup> — O<sup>16</sup>H<sup>18</sup>, and decreases as  $K$  increases further. The isotope effect is fitted by the theoretical treatment of Hill and Van Vleck (C. A. 23, 34) though the separate doublets are not given correctly. Other curves show the isotopic effect in the  $\Delta$ -doublets for <sup>11</sup>B<sup>11</sup> and <sup>11</sup>B<sup>10</sup>, of OH, which are not accounted for by theory. No appreciable isotope effect exists for the  $\Sigma$  level. L. S. K.

**A relation between internuclear distances and bond force constants.** Richard M. Badger. *J. Chem. Phys.* 2, 128-31(1934).—For diat. mols. the relation between the bond force const.,  $k_{\text{ex}}$ , and the internuclear distance,  $r_e$ , is accurately expressed by the equation:  $k_{\text{ex}}(r_e - d_{11})^{-1} = 1.86 \times 10^6$ . The const.,  $d_{11}$ , depends only on the  $\alpha$  in the periodic table in which the elements of the mol. are located. The equation is applicable not only to the normal state but also with a few possible exceptions to all excited states. Uses of the relation are discussed and the extension to polyat. mols. is suggested. Calvin Broug

**Rotation-vibration coupling in diatomic molecules.** C. L. Pekeris. *Phys. Rev.* 45, 98-103(1934).—The wave equation for a rotating-vibrating mol. with a Morse potential energy is solved. It is found that  $\alpha_v = 2x_e B_v [3(B_v/x_e \omega_e)^{1/2} - (3B_v/x_e \omega_e)]$ , the factor in brackets having been added by the rotation. This factor has an av. value of 0.7 for 93 mols.; the exptl. values scatter considerably, but have nearly the same av. L. S. Kassel

**Investigations on the continuous spectra of atomic and molecular hydrogen.** Daniel Chalange. *Ann. phys.* [11], 1, 123-214(1934); cf. C. A. 27, 4169.—The continuous spectrum of at. H was obtained by a condensed discharge in H; the continuous mol. spectrum was produced by an uncondensed discharge. The distribution of energy in the at. spectrum as a function of wave length is represented by a curve with 2 level stretches, one assoc. with the Balmer series and beginning where the series ends, the other assoc. with the Paschen series. The interat. Stark effect is important in this spectrum. The continuous mol. spectrum increases in intensity from the red to the blue, reaches

a max. at 2350 Å., then falls off rapidly in the Schumann region. The results are explained by the theory of Winans and Stueckelberg (*C. A.* 23, 1054). These continuous bands are also found in the spectra of stars of types A and B. J. B. Austin

**Predissociation in the first positive group of nitrogen.** A. van der Ziel. *Nature* 133, 416-17 (1934).—The electronic level diagram of the normal  $N_2$  mol. is shown. Transitions between mol. levels and between electronic levels are given. Gerald M. Petty

**Active nitrogen and the auroral spectrum.** Joseph Kaplan. *Nature* 133, 331 (1934); cf. *C. A.* 28, 970<sup>2</sup>, 1271<sup>4</sup>.—A photograph is given of the afterglow in N, which resembles the auroral spectrum and shows a trace of the second pos. bands. E. R. Rushton

**Hydrocarbon bands in the solar spectrum.** R. S. Richardson. *Astrophys. J.* 77, 195-211 (1933). G. G.

**The visible absorption spectrum of iodine and the induced predissociation of the iodine molecule.** V. Kondrat'ev and L. Polak. *Physik. Z. Sowjetunion* 4, 764-86 (1933) (in German).—The absorption curves of I in the range 6500-5100 Å. for various pressures of  $N_2$ ,  $O_2$ , HCl and of  $I_2$  are recorded, showing 3 maxima corresponding to the levels in the excited mol. corresponding to the vibrational quantum nos., 22, 29 and 39. The effective cross section of N was calcd. to be 30 times the cross section from kinetic theory. The effect of added I on the adsorption spectrum resembles that of other gases. L. G.

**Absorption effect in the M-series [of tungsten and tantalum].** V. Kunzl. *Nature* 132, 139 (1933). G. G.

**The spectrum of MgF.** F. A. Jenkins and Rafael Grinfeld. *Phys. Rev.* 45, 229-33 (1934)<sup>2</sup>; cf. *C. A.* 27, 4170.—Measurements of the band heads and of the partially resolved rotational structure are used to evaluate  $\nu_{00}$ ,  $B_0'$  and  $B_0''$  for the  $^2\Sigma$ ,  $^2\Pi$  and  $^2\Sigma$  systems of MgF. For the normal state,  $\nu_0'' = 1.75 \times 10^4$  cm.<sup>-1</sup>. L. S. K.

**The absorption spectrum of water vapor in the region below 2000 Å.** Gert Rathenau. *Z. Physik* 87, 32-56 (1933).—The conditions for obtaining an intense continuous spectrum below 2200 Å. are stated. The results are used to study the absorption spectrum of  $CO_2$  and water in the extreme ultra-violet. Predissoc. bands of  $H_2O$  begin at 1780 and 1340 Å. Continua were found at 10, 17.8, 16 and 24.5 v. The last two are new. The absorption of  $CO_2$  is perceptible only for light of  $< 10^4$  v. Three regions of continuous absorption are found between 600 and 900 Å. Egon Bretscher

**The vibrational energy level system of the linear molecule HCN.** Arthur Adel and E. F. Barker. *Phys. Rev.* 45, 277-9 (1934)<sup>2</sup>; cf. *C. A.* 28, 1925<sup>7</sup>.—New measurements of the absorption spectrum of HCN give the 3 fundamental frequencies as 2037.0, 712.1 and 3364.2 cm.<sup>-1</sup>; the 7 second-order anharmonic consts. are also given. The frequencies for  $H^{13}C$  are predicted to be 1920, 570, 2580 cm.<sup>-1</sup>, with a probable accuracy of 1%. L. S. Kassel

**Electromagnetic waves of 1.1 cm. wave length and the absorption spectrum of ammonia.** C. F. Cleaton and N. H. Williams. *Phys. Rev.* 45, 234-7 (1934).—By means of a magneto-static oscillator as a source, the absorption spectrum of  $NH_3$  gas was mapped between wave lengths of 1.06 and 3.8 cm. Max. absorption is at 0.8 cm.<sup>-1</sup>; this absorption is due to transition between the 2 lowest states of  $NH_3$ , which exist because the N atom has 2 equiv. positions. The frequency as detd. by the far infra-red measurements of Wright and Randall (*C. A.* 27, 5247) is 0.67 cm.<sup>-1</sup>. The difference is at least partially due to the dissymmetry of the line. L. S. Kassel

**The band spectrum of phosphorus nitride.** P. N. Ghosh and A. C. Datta. *Z. Physik* 87, 501-4 (1933).—The wave no. of the emission spectrum of PN is given by:  $\nu = 39818.2 + [1100.5(v' + 1/2) - 6.8(v' + 1/2)^2] - [1337.0(v'' + 1/2) - 7.0(v'' + 1/2)^2]$ . The heats of disson. for the states with  $v' = 0$  and  $v'' = 0$  are 5.4 and 7.9 v., resp. Egon Bretscher

**Remarks on the publication by A. Petrikala and J. Hochberg: The molecular spectra of some indium and gallium halides.** E. Miescher and M. Wehrli. *Z.*

*Physik* 8, 310-11 (1933); cf. *C. A.* 28, 411<sup>4</sup>, 1273<sup>4</sup>.

Egon Bretscher

**Photographing in the infra-red region of the spectrum by the method of the extinction of a phosphorescing screen.** V. L. Levshin, V. V. Antonov-Romanovskii and D. A. Tunnerman. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 276-8 (in French 278-9).—Some data on Zn phosphide screens are given. F. H. Rathmann

**Infra-red absorption of organic compounds. III.** Albert Roth. *Z. Physik* 87, 192-205 (1933).—The infra-red absorption between 0.8 and 2.6  $\mu$  is detd. for the following compds.: *PrCl*, *iso-PrCl*, *formic acid*, *Me formate*, *Et formate*, *benzotrìchloride*, *benzoyl chloride*, *Me benzoate*, *anisole*, *anisaldehyde*. The absorption maxima are collected in a table revealing the correspondence of valency bonds and infra-red absorption maxima. E. B.

**The Raman effect of nitrobenzene.** H. F. Hertlein. *Z. Physik* 87, 744, 8 (1933).—Raman spectra of nitrobenzene are studied above and below the transition point observed by Wolfke and Mazur (*C. A.* 26, 637, 2358). No difference is found. Egon Bretscher

**Raman spectrum of heavy water.** R. W. Wood. *Nature* 133, 106 (1934); cf. *C. A.* 28, 1602<sup>6</sup>. M. McM.

**Raman frequencies of the  $NH_4$  group.** I. Ramakrishna Rao and C. Sambasiva Rao. *Current Sci.* 2, 209 (1933).

**Raman spectra of  $NH_4$  salts, solid and in soln., show a band due to  $NH_4$  radical, not  $H_2O$  as claimed by some workers.** G. B. Taylor

**The Raman spectrum of lead tetramethyl.** A. B. F. Duncan and John W. Murray. *J. Chem. Physics* 2, 146 (1934).—For the Raman spectrum of  $PbMe_4$  the following lines were found: 135 (8 hr), 458 (10), 472 (8), 766 ( $1/2$ ), 930 (0), 1155 (3), 1169 (2), 2021 (8), 3000 (3) cm.<sup>-1</sup>. Lines 2021 and 3000 are assigned to vibrations of the C—H bond; 930 is probably a harmonic of 458. The other lines are attributed to bending and stretching motions of a tetrahedral pentatomic mol., the 3 lowest to bending and the others to stretching. Calvin Brous

**The Raman spectrum of arsenic trifluoride and the molecular constants of arsenic trifluoride, arsenic trichloride, and phosphorus trichloride.** Don M. Yost and John E. Sherborne. *J. Chem. Physics* 2, 125-7 (1934).—The Raman frequencies of  $AsF_3$  were found to be:  $\omega_1(1)$ , 707;  $\omega_2(1)$ , 341;  $\omega_3(2)$ , 614<sup>2</sup> and  $\omega_4(2)$ , 274 cm.<sup>-1</sup>. The atoms describe a regular triangular pyramid with the As atom at the vertex. The bond angles for  $AsF_3$ ,  $AsCl_3$  and  $PCl_3$  were established from electron-diffraction data. The entropies of the 3 trihalides were calcd. The standard free energies of formation of  $AsCl_3(l)$  and  $AsCl_3(g)$  at 25° were detd. to be -65,190 cal. and -62,718 cal., resp. Calvin Brous

**Changes in the Raman spectrum of sulfuric acid on dilution.** L. A. Woodward and R. G. Horner. *Proc. Roy. Soc. (London)* A144, 129-43 (1934).—Microphotometer curves of the Raman spectra of  $H_2SO_4$  are reproduced for 6 concns. ranging from 10 to 100%. The characteristic frequencies are:  $H_2SO_4$ , 381, 555.5, 910, 978 and 1121;  $HSO_4^-$ , 595, 895.5 and 1036;  $SO_4^{--}$ , 452 and 982; while 417 and 1195 cm.<sup>-1</sup> are common. The inherent breadth of the lines is about 25 cm.<sup>-1</sup>. Measurements on solns. of  $MgSO_4$  give no evidence for a variation of the  $SO_4^{--}$  frequency (982 with concn. Cf. also Nisi (*C. A.* 24, 3437), Woodward (*C. A.* 25, 2918) and Bell and Fredrickson (*C. A.* 25, 5005). Gerald M. Petty

**Study of electrolytic dissociation by the Raman effect. II. Nitrates.** I. Ramakrishna Rao. *Proc. Roy. Soc. (London)* A144, 159-65 (1934); cf. *C. A.* 24, 3952, 5577; 28, 954<sup>2</sup>.—Raman frequencies of the nitrates of Li, Na, K, NH<sub>4</sub>, Mg, Ca, Sr, Ba and Pb are given; in the crystal state they differ for different cations, but in soln. they are all the same, being 725, 1049 and 1357 cm.<sup>-1</sup>. Frequencies are higher in the crystal state, except for  $NH_4NO_3$  and possibly  $KNO_3$ . The spectra of concd.  $NaNO_3$  and  $NH_4NO_3$  solns. did not reveal a trace of any addnl. line due to undissoc. mols. The intensity of the nitrate line is proportional to the concn. in  $NaNO_3$  solns. Conclusion: Nitrates are completely dissocd. in aq. soln., even at

high concns. This disagrees with results obtained from cond. data.

Gerald M. Petty

Continuous spectrum in the light scattered by glycerol and other liquids. O. H. Howden and W. H. Martin. *Trans. Roy. Soc. Can. III*, 27, 91-6 (1933); cf. *C. A.* 26, 2656.—The continuous spectrum in light scattered by glycerol was found to be due to a fluorescent impurity which was produced by photochem. decompn. caused by the Hg line 4047 Å. or shorter wave lengths and which fluoresced when excited by 4358 Å. Glycerol recrystd. 4 times gave a continuum about  $1/4$  of its original intensity but after irradiation for 24 hrs. with the whole Hg spectrum the purified sample showed so much continuum as to mask the Raman lines almost completely. J. W. S.

Magneto-optical dispersion of organic liquids in the ultra-violet region of the spectrum. VII. The magneto-optical dispersion of isobutyl formate, methyl butyrate and ethyl malonate. R. H. Lavery and E. J. Evans. *Phil. Mag.* 17, 351-69 (1934); cf. *C. A.* 27, 5646.—Values of  $n$  and the Verdet const.  $\delta$  were obtained in the wavelength range 6678-2961 Å. For iso-Bu formate at  $10.7^\circ$   $n^2 = 1.9038 + 0.944 \cdot 10^{-3}/\lambda^2 - (0.1083)^2$  and  $n\delta = 5.38 \cdot 10^{-3} \lambda^2/[\lambda^2 - (0.1083)^2]$ . For Me butyrate at  $12.25^\circ$   $n^2 = 1.9082 + 0.914 \cdot 10^{-3}/\lambda^2 - (0.1076)^2$  and  $n\delta = 5.114 \cdot 10^{-3} \lambda^2/[\lambda^2 - (0.1076)^2]$ . For Et malonate at  $18.5^\circ$   $n^2 = 1.9701 + 0.979 \cdot 10^{-3}/\lambda^2 - (0.1124)^2$  and  $n\delta = 5.25 \cdot 10^{-3} \lambda^2/[\lambda^2 - (0.1124)^2]$ . The values of  $e/m$  in e. m. u. ( $e$ , the charge and  $m$ , the mass) are: iso-Bu formate  $0.99 \cdot 10^7$ , Me butyrate  $0.98 \cdot 10^7$  and Et malonate  $0.94 \cdot 10^7$ . It is assumed that the same absorption band is responsible for ordinary dispersion as well as magneto-optical dispersion. E. J. Rosenbaum

The rotatory power and the absorption of isosteric molecules. Magnetic rotatory dispersion of thiophene, furan, pyrrole and benzene. Peter Preiswerk. *Helv. Phys. Acta* 7, 203-23 (1933).—The absorption and rotation of benzoin, methyldeoxybenzoin and desyl chloride are detd. The rotation is anomalous in the absorption band itself. The contribution of this band (due to the C—O bond) to the total rotation is calcd. from Kuhn's theory. The magneto-rotatory power of thiophene, pyrrole, furan and benzene is followed to the beginning of absorption. E. B.

Light absorption and double bonds. K. W. Hauser. *Z. tech. Physik* 15, 10 (20) (1934).—The absorption spectra of complx. contg conjugated double bonds are given for the region 750-200  $m\mu$  (mol. absorption coeff. plotted against frequency): Me(CH=CH) $_n$ CO $_2$ H ( $n = 1, 2, 3, 4$ ) in abs. alc. (and for  $n = 4$  at  $-190^\circ$  as well as at room temp.), Ph(CH=CH) $_n$ CO $_2$ H ( $n = 1, 2, 3$ ), O—CH=CH—

CH=CH(C(CH=CH) $_n$ CO $_2$ H ( $n = 0, 1, 2, 3, 4$ ), Ph(CH=CH) $_n$ —

Ph ( $n = 1, 2, 3, 4, 5, 6, 7$ ) in C $_6$ H $_6$  at room temp. and at  $-190^\circ$ , crocetin, carotene, lutein, zeaxanthin, physalien, taraxanthin, violaxanthin, methylloxin, lycopene and the indolenine dyes

( $n = 0, 1, 2, 3$ ). The fluorescence emission spectra of the diphenylpolyenes and the Raman spectra of Me(CH=CH) $_n$ CO $_2$ H ( $n = 1, 2, 3, 4, 5$ ) and their mono-( $n'$ ) and di-Me( $n''$ ) derivs. in EtOH, BuOH or CCl $_4$  are also given. The strongest absorption band increases in intensity and is shifted to the longer wave lengths with increasing no. of double bonds ( $n$ ). The dependence of the position of the band on  $n$  is shown by the simple curve obtained by plotting the max. frequency (corr. for solvent action) against  $n$  plus the color equivs. of the other chromophors in the compd. (cf. *C. A.* 24, 343). Isolated double bonds appear to have no effect. All but the ionizable compds.

(indolenine dyes, cyanidin chlorid $^f$  and polyenes in concd. H $_2$ SO $_4$ ) are of the same spectral type and show a cleavage of the band at the max. which appears more clearly the larger  $n$  is, the lower the temp., or the more sym. the mol. The fluorescence emission spectra are almost mirror images of the absorption spectra, but according to Stokes' law are displaced to the smaller frequencies. This frequency difference is brought about by the loss of energy by absorption and emission and by a solvent effect. The emission spectra of diphenyloctatetracene in various solvents are practically the same but the absorption spectra vary considerably. The cleavage in both emission and absorption is controlled by the frequency (about 1600 cm $^{-1}$ ) of the C double bond. This frequency is also obtained from the Raman spectra. The principle Raman lines are for  $n = 1, 1655; 2, 1644; 2', 1639; 3, 1618; 2'', 1608; 3', 1601; 4, 1599; 5, 1576$  cm $^{-1}$ . This decrease with increase of  $n$  shows that the conjugated double bonds form a simple system which acts as a whole optically as well as chemically. The intensity of the Raman lines increases strongly with increase in  $n$  for similar concns. Janet E. Austin

Polarimetric investigations on narcotine. Pariselle. *Compt. rend.* 198, 928-30 (1934).—Measurements of  $[\alpha]$  are for the green, of dispersion,  $\Delta$ , for the indigo and yellow lines of Hg at  $17^\circ$ . In HCl aq. soln.  $[\alpha]$  of narcotine (I) increases with addn. of HCl to  $+240^\circ$  for 1 mol. (I) + 30 HCl,  $\Delta$  to 1.35. In CHCl $_3$   $[\alpha]$  of (I)  $[\alpha]_{D_1}$  is  $+050^\circ$ ,  $\Delta$  1.96; of (I)'  $[\alpha] = -1006^\circ$ ,  $\Delta$  2.44. (I) dissolved in excess of aq. NaOH has  $[\alpha] +273^\circ$ ,  $\Delta$  1.94; on adding HCl  $[\alpha]$  diminishes until with formation of the hydrochloride of the Na salt it is  $-587^\circ$ ,  $\Delta$  1.9; further addn. of HCl causes mutarotation,  $[\alpha]$  after 48 hrs. becoming  $+230^\circ$ . The changes of sign of  $[\alpha]$  are attributed to rotation of the meconic group around its linking with the isoquinoline nucleus. C. A. Silberrad

The chemical action of light. Fritz Lieben. *Oesterr. Chem.-Ztg.* 37, 20-3 (1934).—A historical review from the biochem. standpoint. The effect of ultra-violet light on sp. amino acids and proteins is given qualitatively.

A. B. F. Duncan

Photochemical action of complex radiations. M. Padoa and N. Vita. *Z. wiss. Phot.* 32, 185-95 (1933); cf. *C. A.* 27, 4173.—It is explained that the thickness of the green filter (NiSO $_4$  soln.) was not 1 cm. but 8.2 cm., and Winther's criticism (*C. A.* 27, 5645) regarding its light absorption accordingly fails; his other objections are also met, and several sources of error in his own expts. are pointed out. E. R. Bullock

The permeability of the atmosphere and glass to ultra violet radiations. J. Doetsch. *Anales, soc. esp $^n$ . fis. quim.* 32, 65-71 (1934). E. M. Symm

Action of light on diiodo hydrocarbons: diiodoethylenes. G. Emschwiller. *Compt. rend.* 198, 1151-4 (1934).—as-Diiodoethylene is prepd. by the action of NaOH on an Et $_2$ O-EtOH soln. of CH $_2$ CH $_2$ I $_2$ , as a colorless, pleasant-smelling liquid,  $d^{20}_4$  2.94,  $b^{20}_D$  61° or  $b^{20}_m$  about 165° with decompn. and, after a short time, detonation. It combines readily with HI to MeCl $_2$ . Kaufmann's supposed CH $_2$ Cl $_2$  (*C. A.* 16, 2302) was a mixt. of (CHI) $_2$  and C $_2$ H $_4$ . It is decompd. by ultra-violet light: 2CH $_2$ Cl $_2$  + (HI)  $\rightarrow$  C $_2$ H $_4$  + C $_2$ I $_4$  + 2HI; 2C $_2$ I $_4$   $\rightarrow$  C $_2$  + C $_2$ I $_6$ ; CH $_2$ Cl $_2$  + (HI)  $\rightarrow$  MeCl $_2$ ; and also small quantities of CH $_4$  and C $_2$ H $_4$ . Though (CHI) $_2$  is not oxidized in ultra-violet light CH $_2$ Cl $_2$  is so completely with formation of HCO $_2$ H, a trace of HCHO, I $_2$  and gas (57% CO + 23% CO $_2$  + 20% C $_2$ H $_4$ ) (cf. *C. A.* 28, 2271 $^b$ ). C. A. Silberrad

The emission of electrons under the influence of chemical action. II. Some general conclusions and a further study of the case of carbonyl chloride. A. K. Demisoff and O. W. Richardson. *Proc. Roy. Soc. (London)* A144, 46-75 (1934); cf. *C. A.* 25, 5097.—The emission of electrons caused by the reaction of K $_2$ Na with 22 gases has been investigated; with 15, the emission was sufficiently large that the distribution of kinetic energy among the electrons was detd. at pressures near  $10^{-6}$  mm. of Hg. The energy distribution is usually not of the Maxwellian type. The distribution curves all pass from a small value at zero energy ( $V = 0$ ) through a max. at a certain energy

( $V = V_m$ ), then fall to zero at a certain max. energy  $E_m$ . The curves have a "tail," and approach  $E_m$  gradually; the practical max. energy  $E_m$ , obtained by disregarding the "tail," includes 91.9% of the electrons. Distribution curves for energies between  $V_m$  and  $E_m$  are closely represented by  $N(V)dV = Ae^{-k(V-V_m)^c}$ ,  $A$ ,  $k$  and  $c$  being consts. For the most energetic reactions this equation is a fair approximation from zero energy to  $E_m$ . For Cl compds.,  $E_m + D = \text{const.}$ , where  $D$  is the disson. energy of the relevant reaction (the data for other compds. are insufficient). At low pressures electron emission is proportional to the pressure of the reacting gas; as the pressure rises the emission usually, but not always, passes through a sharp max.; but in COS, for example, the emission steadily diminishes to zero. The yield of electrons diminishes rapidly as the available chem. energy diminishes. It is assumed that a polar bond is formed between the gas and the metal, which involves a rearrangement of the electronic systems of the atoms concerned; the bond is stabilized by a 3-body collision with a free metallic electron which carries away all the reaction energy. The equation  $E_m + D = \text{const.}$  then becomes  $E_m = E_e - \phi$ , where  $E_e$  is the energy of the corresponding elementary chem. reaction responsible for  $E_m$  and  $\phi$  is the work function of the metal. This relation appears to be general and is similar to the fundamental law of photoelectricity.

**The excitation of alkali halide crystals.** M. V. Savost'yanova. *Compt. rend. acad. sci. U. R. S. S.* [N. S.], 1, 113-15 (in German 115-18) (1934).—Absorption curves are given for KCl, KBr and KI crystals colored by atomically dispersed K metal before and after excitation (decrease of absorption coeff. caused by exposure to light). There is no direct connection between excitation and luminescence of such crystals.

**Photographic measurement of the transmission of fluorite in the extreme ultra-violet.** E. G. Schneider. *Phys. Rev.* 45, 152-3 (1934).—The transmission of a piece of colorless fluorite for wave lengths between 124 and 160  $m\mu$  was measured photographically, and the results were compared with those obtained by a photoelec. method.

I. M. Lowry

An intensity filter for the mercury line at 253.7  $m\mu$ .

H. W. Melville and H. J. Walls. *Trans. Faraday Soc.* 29, 1255-9 (1933).—A filter consisting of S-free  $\text{CCl}_4$  mixed with hexane or cyclohexane purified for spectrographic use may be used to alter the intensity of the 253.7  $m\mu$  line of a Hg-arc lamp. The solns. obey Beer's law. Cyclohexane is slightly to be preferred because its b. p. is nearer that of  $\text{CCl}_4$  and errors from evapn. are small. A filter was not used for more than 15 min. since some decompn. was shown when solns. contg. 2.78 moles per l.  $\text{CCl}_4$  in each solvent were exposed for 4 hrs.. By use of the filter the rate of the photochem. chain reaction between  $\text{H}_2$  and  $\text{N}_2\text{O}$  at high and low pressures was shown to be proportional to the sq. root and to the first power of the intensity, resp., as predicted.

Janet E. Austin

**Photochemistry of endothermic Ag compds. (Arcus, Eggert) 5.** Light quantum yield in chromate gelatin processes (Biltz, Eggert) 5. #### 4—ELECTROCHEMISTRY

COLIN G. PINK

**The chemist in the electrical field.** T. H. Chisholm. *Can. Chem. Met.* 18, 48-9, 59 (1934). An address.

W. H. Boynton

**The high-frequency furnace and its use for the manufacture of steel castings.** T. R. Middleton. *Proc. Inst. Brit. Foundrymen* 25, 608-23 (1931) 1932). E. H.

**Electric steel practice in 1933.** Viktor Stobie. *Iron & Steel Ind.* 7, 125-8 (1934); cf. *C. A.* 28, 1929<sup>b</sup>. E. H.

**Rational operation of electric arc furnaces.** E. Decherf. *Rev. universelle mines* 10, 1 6, 37-44 (1934). See *C. A.* 28, 413<sup>b</sup>.

M. Hartenheimer

**The current-conducting properties of slags in electric furnaces.** I. Axel Wejnarth. *Trans. Electrochem. Soc.* 65, 11 pp. (preprint) (1934); cf. *C. A.* 28, 414<sup>b</sup>.—The elec. conductivities of series of meta-, ortho- and sesquiosilicates of Fe and Ca-Fe were detd. in an especially constructed Fe crucible heated in an elec. furnace. A sharp break in cond. was found at the f. ps. of these slags. The higher the CaO content, the poorer the cond. The sesquiosilicates show a lower cond. than the monosilicates. Data are tabulated and plotted.

C. G. F.

**Equalization of temperature in electric ovens.** F. G. H. Tate. *Analyst* 59, 108-70 (1934).—By the use of an elec. fan it was possible to obtain equality in temp. of all parts of an elec. oven. Without the fan the temp. at different parts varied 20° when the heating was adjusted to 100°.

W. T. H.

**Process innovations of the German aluminum industry; production of aluminum from clay.** Freitag. *Oberflächen-*

*tech.* 11, 27-8 (1934). A new method of producing Al from  $\text{Al}_2\text{S}_3$  has been developed; fused rock salt is used as electrolyte. An Al-Fe-Si alloy is at first made in the elec. furnace from clay and while in the molten state is treated with pyrite to produce  $\text{Al}_2\text{S}_3$ , which is then electrolyzed into Al and S; the decompn. voltage is 1 v. less than for bauxite.

M. Hartenheimer

**The electrochemical production of oxide films on aluminum.** I. Electrolysis in sulfuric acid solutions. D. V. Stepanov, T. G. Lyapunova, D. I. Kamkin, D. I. Berdichevskaya, G. A. Shchepetil'nikov. *J. Phys. Chem.* (U. S. S. R.) 4, 395-405 (1933).—The peculiarities in behavior of Al electrodes were studied in  $\text{H}_2\text{SO}_4$  solns. in relation to various elec. and chem. factors with the object of obtaining oxide layers of good insulating properties. Both d. c. and a. c. were tried. The curves for increase in the overvoltage in the baths during the process of formation of oxide films were obtained. The relationship of the gap overvoltage of films to the concn. of electrolyte, c. d., etc., was detd. Films obtained had a gap overvoltage of 600 v. on formation by a. c. and of 800 v. on formation by d. c. Qualitatively it was shown that films produced by a. c. had a large elasticity. Addn. to the electrolyte of  $\text{Al}_2(\text{SO}_4)_3$  had no influence on gap overvoltage and elasticity but reduced the c. d. permissible and raised the overvoltage.

G. Farrman

**Electrical properties of oxide insulation on aluminum.** S. S. Gutin. *J. Tech. Phys.* (U. S. S. R.) 3, 1185-90 (1933); cf. *C. A.* 27, 5652.—Oxide layers obtained in

$\text{H}_2\text{C}_2\text{O}_4$  are cryst., being the  $\gamma$  modification, and those in  $\text{H}_2\text{SO}_4$  are of very fine cryst. structure. Size of structure influences dielec. coeff. only. The layers are very porous, absorbing water up to 32.6% by vol. Sp. vol. resistivity is  $10^9$  ohm/cc. Cond. and dielec. loss up to  $140^\circ$  depend chiefly on absorbed water, at  $250^\circ$  they are very satisfactory, but at higher temps they increase rapidly. The oxide layers are brittle, increasingly so with increasing thickness. Low dielec. strengths are due to absorbed water, but may be increased several times by compounding with org. compds. and filling the pores with N. It is possible to obtain layers with thicknesses of tenths of a mm. having a dielec. strength of thousands of volts.

•Bino Hanninen

**Fluorine-preparation cell.** L. M. Dennis and E. G. Rochow. *J. Am. Chem. Soc.* 56, 879 (1934); cf. *C. A.* 26, 657. A trap is fitted to the anode side which catches any  $\text{KF}\cdot\text{HF}$  which may foam over when the cell is operated at 80% efficiency.

•A. L. Henne

**Electrodeposition of rhodium.** R. H. Atkinson and A. R. Kaper. *Metal Ind.* (London) 44, 191 4; *Metal Ind.* (N. Y.) 32, 119 21 (1934).—After describing the historical development of Rh plating and pointing out the properties of Rh coatings, the authors give directions for preplating salts, especially  $\text{NH}_4$  rhodinitrite. One l. of soln. contg. 5 g. Rh as chloride is boiled with 40 g.  $\text{NaNO}_2$  until light yellow; then 3 g.  $\text{Na}_2\text{CO}_3$  is added to remove traces of Bi, and the soln. is filtered. After cooling, 50 cc. of satd.  $\text{NH}_4\text{Cl}$  soln. is added and the ppt. of  $\text{NH}_4$  rhodinitrite filtered and washed with cold  $\text{H}_2\text{O}$ . The salt (8.52 g., contg. 2 g. Rh) is fumed down with 33 cc. concd.  $\text{H}_2\text{SO}_4$  and after cooling dil. to 1 l. The best conditions for deposition are: Pt electrodes,  $40^\circ$  and a c. d. of 5 amp. per sq. ft. The deposits are very white, bright and almost free from porosity. The cathode current efficiency is about 45%. Plating for 15 min. gives 4.5 mg. Rh per sq. in. A few applications for Rh plating are cited.

A. E. Beilich

**Examination of electrolytic silver deposits by x-rays.** G. R. Levi and M. Tabet. *Att. acad. Lincei* 18, 463 7 (1934). Bright deposits of Ag were examd. The Ag is deposited in isodiametric particles, whereas Cr is deposited as plates (*C. A.* 27, 5251). This is proof that plate structure is not a necessary condition for producing bright deposits.

A. W. Contier

**The electrodeposition of indium from cyanide solutions.** Daniel Gray. *Trans. Electrochem. Soc.* 65, 4 pp. (preprint) (1934). Aq. solns. of In cyanide dissolved in an excess of cyanide are not very stable. There is a marked tendency for  $\text{In}(\text{OH})_3$  to sep. out. This pptn. may, however, be avoided and the bath rendered very stable by adding a very weak acid, such as glucose or glycine ( $1\frac{1}{2}$  g. glucose per g. In content of bath). Soft silver-white deposits of In are obtained from this bath of 30–60 g./l. In, at c. d. of 1–16 amp./sq. dm. and at room temp. C. G. F.

**The electrodeposition of copper, nickel and zinc alloys from cyanide solutions.** I. Charles L. Faust and G. H. Montillon. *Trans. Electrochem. Soc.* 65, 12 pp. (preprint) (1934).—Cu-Ni-Zn may be simultaneously deposited from KCN solns. of the metals, as an alloy. Zn is more readily deposited than Cu, and both of these metals are much more readily deposited than Ni. The percentage of Cu in the deposit is relatively greater than the percentage of Cu in the bath. The Ni in the deposit is relatively much less than the Ni in the bath. The Zn in the deposit is more nearly the same as that in the bath. Increase in c. d. favors deposition of Zn and Ni over Cu. However, Zn deposits more readily than Ni with increase in c. d. Increase in temp. causes an increase in the percentage of Cu in the deposits. Increase in temp. causes relatively a greater decrease in the Zn in the deposit than the Ni. At about  $50^\circ$  there is a rearrangement of the factors controlling deposition. This causes a reversal in the slope of the curves plotted for the percentages of Cu and Zn in the deposit versus the percentages of these metals in the bath. The same effect is noticed upon the ternary curves giving the compn. of the deposits. C. G. F.

**Electroplating copper on manganin.** C. R. Cosens.

*J. Sci. Instruments* 10, 256 (1933).—Surface "demanganization" by making the wire alternately anode and cathode in concd. aq. NaOH, and following this by treatment in  $\text{H}_2\text{SO}_4$ , allows an adherent Cu plating suitable for soft-soldering to be deposited subsequently. B. C. A.

**Practical regulation of chrome-plating baths in the shop.** J. Loiseau. *Usine* 43, No. 11, 27 (1934).—A review.

M. Hartenheim

**Chromium-plating literature.** XXIII. L. H. Decker. *Platers' Guide* 30, Mar. 13–15 (1934); cf. *C. A.* 28, 2274.

W. H. Boynton

**Chrome plating.** Max Schlötter. *Oberflächentechn.* 11, 40–1 (1934).—The fact that on chrome-plated brass, especially often-used handle bars, railings, etc., the fact that the Cr peel's off must be ascribed to a layer of H formed during plating between the brass surface and the Cr plate; an intermediate layer of Ni does not help very much, as Ni, too, dissolves H, so that a H layer comes between Ni and Cr, and H diffuses through the Ni layer to the basis if there is not enough Ni to absorb all H. The pressure with which H diffuses through electrolytically deposited Ni may amount to 10 atm., and this easily explains the fact that the Cr deposit is cracked and thrown off. The Ni layer must be thick enough to absorb all H generated in Cr plating; the different expansion coeffs. are not the cause of the peeling. Degreasing by electrolysis is not to be recommended; bright Ni plating should be applied, so that the object can be brought directly into the Cr-plating bath.

M. Hartenheim

**Nickel-chromium plating technic.** Maurice Cook and B. J. R. Evans. *Metal Ind.* (London) 44, 279–81, 320–31 (1934).

E. H.

**Ductility and adhesion of nickel deposits.** F. P. Romanoff. *Trans. Electrochem. Soc.* 65, 16 pp. (preprint) (1934).—The ductility of electrodeposited Ni is a function of the crystal structure and of the contained basic salts and gases.

Hard fibrous or columnar Ni structures have an apparent hardening effect on a ductile base even when very thin. This apparent hardening of the base disappears upon removing the deposit. Full ductile conical Ni structures of any thickness will not affect the base adversely. Ductile Ni can be hardened by absorption of H through action as a cathode in alk. or acid solns. Cr deposition on Ni has the same effect. Part of this hardening can be overcome through vacuum or heat treatment, or by Cr plating under conditions which prevent the absorption of too much H. Testing for adhesion by the Erichsen extruded cup test, or modifications thereof, is shown to be unreliable. A modified cup test is given which will always detect poor adhesion. C. G. F.

**Heavy hydrogen and heavy water in electroplating**

H. M. Forstner. *Oberflächentechn.* 11, 39 (1934). Since  $\text{H}_2$  and "heavy" water can be produced most conveniently by electrolysis, and particularly by electrolysis with Ni electrodes in  $\text{NaOH}$  soln., possibly many of the difficulties and failures connected with Ni plating can be traced to the accumulation of heavy water in the electrolyte. M. Hartenheim

**Accelerated tests of electroplated metal coatings on steel.** P. W. C. Strausser. *Monthly Rev. Am. Electroplaters' Soc.* 20, No. 5, 6 16 (Jan., 1934).—This study was to det. the relation between accelerated and atm. tests, and to select methods and conditions useful in the specifications and inspection of electroplated coatings.

Companion specimens to those employed for the atm. exposure tests (cf. *C. A.* 26, 5534; 27, 900, 2628) were taken. The solns. and conditions used in the 3 tests studied, viz., ferroxyl, salt-spray and intermittent immersion (in 20% NaCl) tests, are given. Conclusions: The ferroxyl test yields, in a short time, results for Ni and Cr finishes that correspond approx. to their behavior in the atm. Being a porosity test, it readily distinguishes between very good and very bad coatings whose protective value is related to their porosity, e. g., coatings contg. Cu, Ni and Cr. The salt spray and intermittent immersion tests yield results that represent roughly the relative order in a marine atm., provided the relative extent of rust constituting initial

failure, or the proportion of rust at the end of a specified period, is at least approx. defined, for example, by the system used for atm. ratings. In general, the accelerated tests failed to develop the same kind and distribution of rust spots as are found in atm. corrosion, even in marine locations; no simple test includes all the factors involved in atm. corrosion, and exact test specifications for electro-deposited coatings are, at present, impossible.

**Electrolytic oxidation. IV. Anodic polarization in halide solutions.** S. Glasstone and A. Hickling. *J. Chem. Soc.* 1934, 10-18; cf. *C. A.* 27, 5253.—With app. previously described, (*C. A.* 27, 407) the variation with time of the potential of a Pt anode in the electrolysis of chloride solns. at const. c. d. was studied under a variety of conditions. Two potential stages were observed, one corresponding approx. to that for reversible Cl-ion discharge, the other being about 0.6 v. higher. The change from the lower to the upper potential condition was favored by increased c. d., lower concn. of halide, increase of  $p_H$ , and the presence of catalysts for the decompn. of  $H_2O_2$ . Two similar stages were found when the anode potentials at a series of c. d.s. were measured at short intervals of time in chloride, bromide and iodide solns., the case of onset of the polarization corresponding to the higher electrode potential decreasing in the order given. The addn. of  $H_2O_2$  catalysts tended to suppress the lower potential condition. The potential of a platinized-Pt anode did not, normally, rise appreciably above the reversible value for Cl-ion discharge, but in the presence of  $H_2O_2$  catalysts, or if the electrode was previously polarized anodically (cf. *C. A.* 27, 5253), the 2 stages of anode potential were readily observed. Increase of temp. (from 18° to 60°) favored the polarization to the upper potential condition in certain Cl and I solns., but had little effect on the polarization in Br solns. The current efficiency for halogen liberation at the anode was, in some cases, markedly decreased by the addn. of  $Mn^{++}$  salts to the electrolyte. The results are discussed in the light of the theory that there is, in addn. to the reversible discharge of halogen ions at the anode, the irreversible formation of  $H_2O_2$  resulting from the combination of discharged OH ions. The peroxide is able, under certain conditions, to oxidize the halide ions to form free halogen, or else it may decompose, yielding O. The relative extent to which these 2 processes occur det. the influence of the nature of the halide, the effect of concn. of the halide, current strength,  $p_H$  of the electrolyte, temp., and the presence of catalysts for peroxide decompn., on the onset of the higher potential condition. E. B. Sanigar.

**Electrolytic reduction potentials of organic compounds. XI Reduction potentials of nitroanilines.** Masuzo Shikata and Eiichi Taguchi. *Mem. Coll. Agr. Kyoto Imp. Univ.* No. 29, 17 pp. (1934).—See *C. A.* 27, 1280.

**Alkaline anodic pickling of high-speed steel.** Raymond R. Rogers. *Trans. Electrochem. Soc.* 65, 4 pp. (preprint) (1934).—High-speed steel parts are anodically treated at 2.7 amp./sq. dm. in an alk. bath contg. 115 g./l. NaOH + 15 g./l. citric acid. When the gas evolution is entirely uniform, the pickling has been completed. The parts are then washed and dipped for an instant into a HCl soln. The alk. anodic treatment causes W to go into soln. with comparative ease, whereas in the older HF dip, the interaction with W compds. was unsatisfactory. C. G. F.

**Antimony electrodes.** Arvid Holmquist. *Svensk Kem. Ind.* 46, 2 10 (1934); cf. *C. A.* 26, 5853.—The potentials of Sb rods are very different from Sb powder and these electrodes in HBr or HCl are not like those in  $H_2SO_4$  or  $HClO_4$ . Plotting  $p_H$  against acid concn. gives different types of curves. There are tables giving oxidation-reduction potentials for  $Sb^{III}$  and  $Sb^V$ , also partition data for  $SbCl_3$  in  $H_2O/Et_2O$ . A. R. Rose.

**Silver electrodes.** Werner Hiltner. *Z. anal. Chem.* 96, 193 (1934); cf. Hahn, *C. A.* 28, 1278.—Polemical. W. T. H.

**Cell: lead | lead sulfate | cupric sulfate | copper.** M. Quintin and A. Lebetre. *Compt. rend.* 198, 1140-1 (1934).—Comparison of the normal potentials of the cells:

$1 - Pb(amalgam\ 2\ phases) | PbSO_4(s) | CuSO_4(c) | Cu(amalgam\ 2\ phases)^+ (I)$  for  $c = 0.105 - 0.00105$  and  $Cu(amalgam\ 2\ phases) | CuSO_4(c) | Hg_2SO_4(s) | Hg^+(II)$  shows that the irregularities in II when  $c < 0.003 M$  are due to the soly. of  $Hg_2SO_4$ . Similar irregularities are exhibited by I if  $c$  is  $< 0.001 M$  (cf. *C. A.* 27, 3873).

C. A. Silherrat.

**The history of the development of electroanalysis.** In memory of Alexander Classen. Hellmut Fischer. *Angew. Chem.* 47, 129 30 (1934). Karl Kammermeyer.

**The electrolytic valve action of columbium and tantalum on alternating-current circuits.** D. P. Calhane and A. J. Laliberte. *Trans. Electrochem. Soc.* 65, 7 pp. (preprint) (1934).—Oscillograph records are presented showing the film behavior of Ta and Nb on a.-c. circuits. Ta gives fairly efficient rectification of a. c. in  $H_2SO_4$  soln., while Nb, even at 2.5 v. a. c. shows very little electrolytic valve action. At 7 v. a. c., the valve action of Nb fails nearly entirely. The oscillographic curves for current and voltage give an interesting visual record of the momentary progress of film behavior on each half cycle. Data on the comparative rectifying abilities of Ta and Nb are presented. C. G. F.

**The mechanism of rectification.** W. Ch. van Geel and H. Emmens. *Z. Physik* 87, 220 30 (1933); cf. *C. A.* 25, 5100. From current and capacity measurements of electrolytic Al rectifiers it is concluded that the emission theory advanced for solid  $Cu_2O$  rectifiers also holds in this case. The great difference of electron d. in the metal and the solid oxide layer is, therefore, responsible for the rectifier action. This is also evident from the fact that the emission formula for the current  $i$  is  $i = A F^2 e^{-h/F}$ , in which  $F$  = field strength. Impurities such as Fe and Cu salts are dangerous, as metal is deposited and the rectifying action destroyed. Egon Bretscher.

**The development of gaseous conduction lamps.** L. J. Buttolph. *Trans. Electrochem. Soc.* 65, 14 pp. (preprint) (1934). Recent developments in gaseous conduction lamps have involved new principles of electrode design and operation, the use of vapors and gases not previously found practical, and the adaptation of the glass compn. of the tubes or bulbs to the vapors used. Sources of line and band spectra are of recent interest because of their use as efficient sources of ultra-violet, as sources of colored light of high purity, and of subjective colors of unique characteristics. C. G. F.

**Electric condenser.** Jesse T. Curtis (to Curtis Continental Corp.). U. S. 1,950,352, March 6. Spaced metal plates, including Al, Mg or Ta plates are used with an interposed electrolyte formed with  $(\text{NH}_4)_2\text{CO}_3$ ,  $\text{H}_2\text{BO}_3$  and an alc. of low hygroscopicity such as ethylene glycol.

**Electrolytic condenser.** Julius B. Lilienfeld (to Ergon Research Laboratories, Inc.). U. S. 1,950,119, March 6. Structural features of a condenser which may have cathodes of nonfilming metal such as Cu and an electrolyte such as  $\text{H}_2\text{RO}_2$  or salicylic acid soln. and a cathodic Al container.

**Electrolytic condenser.** Elektrizitats A.-G. Hydrazwerk. Fr. 758,220, Jan. 12, 1934. Silk cloth is used between the metallic sheets.

**Electrolytic deposition of metals.** Anaconda Copper Mining Co. Fr. 758,205, Jan. 12, 1934. The vat contains a principal and an auxiliary cathode; a current is maintained through the mass of electrolyte from the anode to those parts of the principal cathode where a deposit is desired; and a current is maintained from those parts of the principal cathode where a deposit is not required to the auxiliary cathode through a 2nd electrolytic mass practically isolated from the first.

**Electrodeposition of cobalt as powder.** Société générale de constructions électriques et mécaniques (Alsthom) (to The British Thomson-Houston Co. Ltd.). Brit. 403,281, Dec. 21, 1933. See Fr. 750,097 (C. A. 28, 4207).

**Tarnish-resisting metal.** Blasius Bart (to The Precious Metals Developing Co. Inc.). Can. 340,007, Mar. 13, 1934. Tarnishable metal is rendered nontarnishing by electrodepositing over it a coating of Ni and then electrodepositing over the Ni from an acid bath a coating of Rh. Cf. C. A. 28, 22791.

**Coating aluminum.** Aluminum Colors Inc. Fr. 758,545, Jan. 18, 1934. Al or its alloys is coated by anodic treatment in a bath of  $\text{H}_2\text{SO}_4$  of 35-60% by wt. and under such conditions that the anode is kept at a low temp.

**Protecting aluminum.** Aluminum Colors Inc. Fr. 758,363, Jan. 15, 1934. Al and its alloys are protected by a layer of oxide formed by a soln. of  $\text{H}_2\text{SO}_4$  in an electrolytic cell, Al being the anode.

**Apparatus for electrolysis of brine.** David J. Evans. Fr. 758,303, Jan. 15, 1934.

**Temperature-compensated apparatus for estimating and controlling the composition of electrolyte solutions by measuring their electric resistance.** Wilhelm Schmidts. Ger. 593,023, Feb. 20, 1934 (Cl. 421.3.04).

**Effecting chemical reactions.** René C. Sabot. Brit. 402,419, Nov. 17, 1933. In carrying out nonexplosive chem. reactions between liquids and (or) solids and liquids and (or) solids and gases, a gaseous suspension of the said solids and (or) liquids, physically stabilized by ionization of the gaseous medium, is prepd. and used to effect the required reaction. Known ionizing agents may be initially used, and a high-frequency elec. discharge is used to maintain the ionized condition. According to an example dyes may be stably suspended, as such or in soln., in a previously ionized gaseous medium and may be pptd. on the body to be dyed by electrostatic means. The coloring effect may be localized by the interposition of suitably shaped dielec. screens.

**Synthesis of nitrogen oxides.** Gutehoffnungshütte Oberhausen A.-G. Ger. 593,063, Feb. 21, 1934 (Cl. 121.26). A mixt. contg. N and O is passed in contact with a solid substance, *e. g.*, granular  $\text{Fe}(\text{OH})_3$  of asbestos, arranged between electrodes to which current of high frequency and high tension is supplied, the frequency and the tension and the distance between the electrodes being adjusted so that the solid is highly heated while the formation of sparks is avoided as far as possible.

**Annealing razor blades.** Herbert L. Claiss. Brit. 403,537, Dec. 28, 1933. Addn. to 401,366 (C. A. 28, 26287). In the process of 401,366 the current is passed through the blades in the transverse direction.

**Hardening metals.** Paul Mouravieff. Fr. 758,323, Jan. 15, 1934. Metal objects, particularly steel, are hardened by moving them in a continuous manner in contact with an incandescent electrode, *e. g.*, an anode, contg. in its compn. the substances it is desired to incorporate in the metal. The heating is regulated to provoke, on the one hand, on the surface of the object a fusion of the metal allowing the formation of an alloy with the disaggregation materials of the electrode, and on the other hand a deeper softened zone in which the particles of the substance forming the electrode become incorporated, the core of the metal being unaltered by heating.

**Colloidal suspensions.** Maurice C. L. Borne and Gabriel J. A. Pelletier. Fr. 758,797, Jan. 23, 1934. Pure colloidal suspensions of various substances are prepd. by the action of a cathodic bombardment in a vacuum or rarefied gas, the particles being collected in a liquid in which the suspension is desired.

**Boron.** Jean L. Andrieux. Ger. 593,425, Feb. 26, 1934 (Cl. 40c. 13). A fused mixt. of Mg borate (or  $\text{B}_2\text{O}_3$  and  $\text{MgO}$ ) with a fluoride is electrolyzed. A suitable mixt. contains  $\text{B}_2\text{O}_3$  140,  $\text{MgO}$  40 and  $\text{MgF}_2$  62 parts, and may be treated at  $1100^\circ$  and 10-15 v.

**Boron carbide.** Raymond R. Ridgway (to The Norton Co.). Can. 339,873, Mar. 6, 1934. A resistance furnace is charged with a mixt. of 2 mol. equivs. of anhyd.  $\text{B}_2\text{O}_3$  which is substantially free from Fe, Al and Si, and 7 mol. equivs. of C. An elec. current is passed through the furnace, raising the temp. of the inner zone of the mixt. in an atm. of CO above the m. p. of boron carbide. There is thus formed an ingot of boron carbide which is characterized by a continuous crystal structure substantially devoid of free graphite and having substantially the formula  $\text{B}_4\text{C}$ .

**Chlorine and alkali hydrates.** Electrochlor. Fr. 757,871, Jan. 5, 1934. An electrolytic cell for Cl and hydrates has anodic and cathodic compartments mounted alternately in filter-press fashion and sepd. by diaphragm permeable to the ions but almost impermeable to liquids. The brine circulates through all the anodic compartments mounted in series, then through all the cathodic compartments also in series. One or more anodic and cathodic elements are mounted in a vat constructed of reinforced cement which has on one of its walls baffled saturators into which the salt is introduced directly.

**Nitrogen.** Emile Briner and Charles H. Wakker. Ger. 590,806, Jan. 13, 1934 (Cl. 121.26). N and air or hydrocarbon vapors are converted to N oxide mixts. or N hydrocarbon mixts, by subjection to a luminous arc between electrodes of Cu or Fe alloyed with alkali or alk earth metals.

**Electric arc furnace.** Demag-Elektrostahl G. m. b. H. Fr. 758,537, Jan. 18, 1934. A vessel is described for charging metal to the furnace.

**Induction furnaces.** The Roessler & Maschlacher Chemical Co. Brit. 402,824, Dec. 11, 1933. An app. for effecting gas reactions requiring a supply of heat comprises a reaction chamber of small cross section the walls of which form the secondary circuit of a step-down transformer.

**Electric induction muffle furnaces for heating fluids or solids.** Edwin F. Northrup (to Electric Furnace Co. Ltd.). Brit. 402,988, Dec. 14, 1933.

**Induction fusion furnace.** Heinz Ilberg. Fr. 758,972, Jan. 26, 1934.

**Induction furnaces for fusing metals.** Victor Stobie. Fr. 758,937 and 758,938, Jan. 26, 1934.

**Induction furnace crucible.** Siemens & Halske A.-G. (Heinz Siegel, inventor). Ger. 590,597, Jan. 5, 1934 (Cl. 31a. 3.01).

**Etching plates for electrolytic converters and for photocells.** A. A. Ivanov and N. G. Roslyayev. Russ. 31,516, Oct. 31, 1933. Cu plates covered with a layer of Cu<sub>2</sub>O are etched with HCl and washed with an aq. soln. of a Cl salt of any alkali or alk. earth metal.

**Graphite resistor bodies suitable for thermostatic heaters, etc.** Sterne Morse. U. S. 1,950,089, March 6. Graphite particles are suspended in a liquid and sedimentation of the particles is permitted to form a cake which is compacted and portions of the cake material are formed in a press. App. is described.

**High-emission cathodes.** Radioaktiengesellschaft D. S. Loewe and Ernst Waldschmidt. Fr. 758,750, Jan. 22, 1934. On a wire support is produced a compact and coherent intermediate layer which contains one or more alk. earth metal oxides as well as the oxide of the metal of the support, and this layer is powd. with a light metal such as Ba.

**Spark-plug electrodes.** Harry D. DeLong (16% to Paul J. Weitkam). U. S. 1,949,955, March 6. A spark-plug center electrode is provided with a sleeve of conducting material which attains and retains a relatively high degree of heat, such as equal proportions of bronze, brass and "red aluminum."

**Electric conductors.** The International Latex Processes Ltd. Fr. 757,849, Jan. 5, 1934. Conductors are insulated by treating them with aq. dispersions of rubber which have been partly or wholly freed from sol. substances other than the rubber, e. g., by dialysis or electro-dialysis.

**Electric contacts.** P. R. Mallory & Co., Inc. Brit. 402,888, Dec. 14, 1933. In the manuf. of make-and-break contacts of W the material is treated to increase the size of the surface granules or reduce the amt. of amorphous material between the granules, a single crystal or large granule, in the limit, being used as the contact. Such single-crystal contacts may be formed by crystal growth around a single-crystal wire so as to form a slug or bar which is cut into individual contact points. In 1 method

contacts already mounted, and subjected or not to a preparatory treatment, are electrolytically conditioned in a soln. of KOH or K or Na carbonate or bicarbonate, but preferably in a soln. contg. NaOH 40, Na<sub>2</sub>WO<sub>4</sub> 4 and H<sub>2</sub>O 1000 parts.

**Electrical purification of gases.** Siemens-Schuckertwerke A.-G. Brit. 402,423, Nov. 23, 1933. In the elec. sepn. of suspended particles from gases by a nonhomogeneous nondischarging field, the gases are treated under superatm. pressure. App. is described.

**Apparatus for ionizing gases, especially for the electrical purification of gases.** George Brion and Arthur J. Krutzsch. Brit. 403,431, Dec. 17, 1933.

**Grids for electric discharge valves.** Telefunken Gesellschaft für drahtlose Telegraphie m. b. H. Brit. 403,003, Dec. 14, 1933.

**Discharge rectifiers with gas or vapor filling.** Soc. anon. Hewittie and Marcel Demontvignier. Brit. 403,126, Dec. 15, 1933.

**Discharge lamps.** Nikolaus Lebedenko, Rudolf Levy and Wladislaw Zeitlin. Brit. 403,208, Dec. 21, 1933.

**Discharge lamps.** Rudolf Zaddach. Brit. 402,747, Dec. 4, 1933. An elec. gaseous arc discharge lamp, provided with hot actuated electrodes between which an elongated arc is produced, is provided with a filling of rare gas or metal vapor having a comparatively high ionization potential and a comparatively high pressure during operation, with at least 1 addnl. metal vapor of lower ionization potential and vapor pressure which serves as a source of light, the other part of the filling not participating perceptibly in the light emission. Metal vapors, e. g., of Na, Li, K, Zn, Cd, Hg, etc., at about 200-300° and pressures of 0.1-10 mm. are brought to light emission within an auxiliary gas or vapor, e. g., Ar, Ne, Hg vapor, at pressures up to 1000 mm. The lamp bulbs or tubes may consist of borate glass or have a SiO<sub>2</sub> content of less than 60%. Preferably about 5-15% Al<sub>2</sub>O<sub>3</sub>, ZrO<sub>2</sub> or BaO is incorporated to make them resistant to the action of the hot metal vapors.

**Electric discharge lamp.** "Osa" Participations Industrielles (Soc. anon.). Fr. 758,622, Jan. 20, 1934. The lamp contains an amalgam of Na contg. not more than 10% of Hg.

**Base cut-out for electric lamps.** Daniel S. Gustin (to Westinghouse Lamp Co.). U. S. 1,950,028, March 6. A wall of compressed Cu powder and Na silicate closes one end of a metal cylindrical shell and supports a contact member spaced from the shell. When the filament is broken, current is by-passed.

**Incandescent-lamp bulbs.** Egyesült Izzólámpa és Villamosági R. T. Brit. 402,690, Dec. 7, 1933. Addn. to 359,749 (C. A. 27, 672). The gas-filled lamp of 359,749 is provided with a glass bulb, e. g., of quartz glass, which is permeable to ultra-violet rays.

**Device for feeding wires, e. g., filaments for electric incandescent lamps, toward a point of operation.** N. V. Philips' Gloeilampenfabrieken. Brit. 403,215, Dec. 21, 1933.

## 5—PHOTOGRAPHY

E. P. WIGHTMAN

**The Agfa bipack motion-picture photography.** A. v. Biehler. *Veröffentlich. wiss. zentral-Lab. phot. Abt. 1gfa 3*, 221-33(1933).—The 2-color process is simpler and requires less light in photography and in projection than the 3-color process, and gives for many purposes satisfactory color reproduction. Extinction curves for the usual orange and green filters of the 2-color process are compared with the filter of the Agfa front film. The bipack process, in which 2 film strips are placed together with the emulsions facing, is described with reference to photography and the printing and color process. The Agfa front film is sensitized for the green spectrum and carries a special orange-red filter. The back film is panchromatic. The characteristic and rate-of-development

curves are given for front and back films and for dipole films. The conversion of the Ag images into colored images proceeds in general with the aid of toning methods, virage methods and relief or bleaching processes. The extinction curves of the different agents used for these purposes are given.

**Comparison of film and paper in Röntgen photography.** Richard Herz. *Veröffentlich. wiss. zentral-Lab. phot. Abt. 1gfa 3*, 234-44(1933).—Because of reflection the paper can be practically as sensitive as the film, but at high density it falls far behind the film. The density range is less for the paper than for the film. The range of exposure time is also appreciably less for the paper. Photometric measurements show that the film gives greater

contrast than the paper. On the basis of phys. and technical considerations it is deduced that no fundamental technical improvement of Röntgen paper is possible.

Paul S. Roller

**The Schwarzschild effect in Röntgen photography.** Fritz Luft. *Veröffentlich. wiss. zentral-Lab. phot. Abt. Agfa 3*, 245-7(1933).—The ordinary reciprocity law  $It = k$ , where  $I$  is the light intensity,  $t$  the time of exposure and  $k$  a const., holds for equal density by pure x-rays. The Schwarzschild law,  $I^p t = k$  holds when the rays are passed through foil, the range of intensity and of time varying by a factor of 1000 and 10,000, resp.;  $p$  is a const. which may be greater or less than 1. P. S. R.

**A photographic paper of constant form ("Correctostat").** Walter Kahts. *Veröffentlich. wiss. zentral-Lab. phot. Abt. Agfa 3*, 312-13(1933).—Ordinary photographic paper after drying shrinks linearly 0.3-0.5%, while the shrinkage of Correctostat is less than 0.01%. This result is obtained by impressing the blank paper with Al foil, on which a clear varnish is then painted. The emulsion is poured on the varnish layer. Paul S. Roller

**The nature of the latent image in physical development.** Hans Arens. *Veröffentlich. wiss. zentral-Lab. phot. Abt. Agfa 3*, 32-40(1933); cf. C. A. 27, 5663.—A review. Paul S. Roller

**The alteration during storage of the latent image in silver halide-gelatin layers.** Erwin Heisenberg. *Veröffentlich. wiss. zentral-Lab. phot. Abt. Agfa 3*, 47-51(1933).—At a  $pH$  of 7.5 a sensitive panchromatic AgBr-AgI emulsion showed an increase in latent image after 4 weeks' storage of the exposed layer. On reduction of the  $pH$  to 5.7 by the addn. of dil.  $H_2SO_4$  before sensitization, the emulsion showed a marked retrogression after the same length of storage. The strengthening of the latent image on storage appears to be due to the sensitization. Paul S. Roller

**Theory of sensitization.** Erwin Heisenberg. *Veröffentlich. wiss. zentral-Lab. phot. Abt. Agfa 3*, 115-24(1933).—Gelatin had little effect on the adsorption of pinacyanol by a AgBr emulsion. At optimum sensitization of the dried and undried photographic film the amt. of added dye is considerably less than the max. possible adsorption by the AgBr; furthermore the adsorption of the added dye is practically complete, leaving but a small percentage in the gelatin layer. The same result was obtained for different emulsions and dyes. On the addn. of larger quantities of pinacyanol there is a decrease in sensitivity. This is due not only to increased light absorption by the dye but to an actual desensitization of the individual grain. Paul S. Roller

**Standardization of the measurement of color sensitivity.** Martin Biltz and Herbert Blandes. *Veröffentlich. wiss. zentral-Lab. phot. Abt. Agfa 3*, 85-92(1933).—The color convertibility of a photographic film is defined as the ratio of the photographic to visual efficiency for a given color. Nomograms are set up for detg. the color convertibility in terms of the photographic action for yellow, red, green and blue. A nomogram for detg. the extension factor of exposure is given for yellow filters in terms of the color sensitivity. Paul S. Roller

**Determination of the sensitivity of photographic films.** Martin Biltz and Erwin Heisenberg. *Veröffentlich. wiss. zentral-Lab. phot. Abt. Agfa 3*, 75-84(1933).—From a practical standpoint the sensitivity is best characterized by the reciprocal of the quantity of light necessary to produce a predetd. density between 0.1 and 0.3, or by the reciprocal of the quantity of light at which an angle of  $11.3^\circ$  to the abscissa has been reached in the characteristic curve. The former method is preferable because of better reproducibility. P. S. R.

**A direct positive-forming photographic layer.** Hans Arens and John Eggert. *Veröffentlich. wiss. zentral-Lab. phot. Abt. Agfa 3*, 166-9(1933).—See C. A. 28, 2631.

Paul S. Roller

**The graininess and resolving power of photographic layers.** Alfred Küster. *Veröffentlich. wiss. zentral-Lab. phot. Abt. Agfa 3*, 93-105(1933).—The graininess,  $K$ , of a developed layer was detd. by the relation  $K = 100$

$\log Q_{0.5}$  where  $Q_{0.5}$  is the ratio of the densities in parallel light to that in diffused light.  $K$  varied in this way from 5 to 31. The photographic broadening of a slit image increases with the max. density at equal development. The broadening is widely independent of the width of the slit. At equal densities the greater the degree of development the less the photographic scattering. The loss of contrast is independent of the degree of development and of the density provided the density is not taken at a strongly bent part of the characteristic curve. The loss depends, however, on the contrast of the object. There is a great difference in resolving power of different photographic films in spite of equal size of the AgBr grains and equal graininess. Paul S. Roller

**Recent research on solarization.** Hans Arens. *Veröffentlich. wiss. zentral-Lab. phot. Abt. Agfa 3*, 52-66(1933); cf. C. A. 27, 4182.—A review. P. S. R.

**The solarization of photographic plates.** Alexander Smakula. *Z. Physik 87*, 231-7(1933).—The solarization of AgBr plates has a max. for light of 400  $m\mu$ . This is explained as a re-formation of AgBr mols. from Ag under the action of excited Br atoms. Egon Bretscher

**The photochemistry of endothermic silver compounds.** Hans Arens and John Eggert. *Veröffentlich. wiss. zentral-Lab. phot. Abt. Agfa 3*, 67-74(1933).—The prepn., development and fixation of gelatin emulsions of  $Ag_2C_2O_4$ ,  $AgN_3$  and  $Ag_2C_2$  are described. Absorption by the 3 colorless compds. and the sensitivity lie in the same region as for AgCl, except that there is a rapid decline of sensitivity for  $AgN_3$  and  $Ag_2C_2$  towards the shorter wave lengths. Despite the endothermic nature of the compds. the amt. of Ag liberated on equal light absorption is of the same order. The sensitivity to x-rays and  $\alpha$ -rays is much less than that of AgCl except for  $AgN_3$ , which is 15 times as sensitive to  $\alpha$ -rays. The decompn. of the Ag azide yields  $N_2$  at high light intensity and  $HN_3$  at low intensity, and of the  $Ag_2C_2$  free C. Paul S. Roller

**The light-quantum yield in chromate gelatin processes.** Martin Biltz and John Eggert. *Veröffentlich. wiss. zentral-Lab. phot. Abt. Agfa 3*, 294-302(1933).—Chromated Agfa-Pinatype plates were exposed to monochromatic light,  $\lambda$  436, and the amt. of  $NH_4$  chromate (I) converted into an insol. form detd. analytically, and the amt. of gelatin (II) rendered nonswelling detd. by comparison with an unilluminated plate. The quantum yield of I decreases continuously with time. This is due to absorption by the insol. compd. that is formed. The quantum yield of I corrected to zero time is  $\phi = 0.5 \pm 0.05$ , or 2 quanta absorbed per mol. of reacted  $(NH_4)_2CrO_4$ . A similar time decrease in  $\phi$  holds for II. Corrected to zero time,  $\phi = 0.3 \pm 0.07$  for II, or 3 quanta absorbed per mol. of converted gelatin. The compn. of the insol. product of I corresponds to  $(CrO)_2CrO_4$ , the II for reduction presumably coming from the gelatin. A yield of  $\phi = 0.3$  for II signifies that 2 mols. of gelatin unite with one mol. of the insol. chromic chromate to give a nonswelling adsorption copolymer. Paul S. Roller

**Chief factors in trichrome carbros.** Frank R. Newens. *Brit. J. Phot. Suppl.* 28, 5-6(1931).—Success in trichrome carbros depends more upon satisfactory bromide prints than upon any other factor. The factors controlling the quality of the bromide print are: (1) correctly exposed and (2) correctly developed negatives, (3) correctly exposed and (4) correctly developed bromide prints, (5) inclusion, whenever possible, of a "wedge" or neutral graded strip of black, gray and white in the picture. These factors are discussed. E. P. Wightman

**Development with *p*-phenylenediamine.** Rudolf v. Erhardt. *Am. Phot.* 27, 656 (6); *Brit. J. Phot.* 80, 663-4(1933).—A combined developer consisting of *p*-phenylenediamine and metol has been investigated. A metol developer is first used to develop the shadow portions. This is: metol, 0.5 g.;  $Na_2SO_3$ , 75 g.;  $H_2O$ , to 500 cc. Develop for only about 8 min. at  $21^\circ$ . Prolonged development gives graininess. Subsequently, develop 20 min. at  $21^\circ$  in *p*-phenylenediamine 5 g.;  $Na_2SO_3$ , 30 g.;  $H_2O$  to 500 cc. Wash between developments for about 5 min. in running water. E. P. W.

**Streamer markings in tank development.** F. Luft. *Brit. J. Phot.* 81, 75-4 (1934).—A method has been worked out for studying the streamer currents which cause streaks in film. With film which has not been previously washed in water, streaks occur down from the parts which yield in the developing process and are more pronounced the heavier the d. obtained. With washed film the streaks rise upward and are weaker the greater the d. produced. It can be plainly shown that in stagnant tank development, the currents which have been assumed to exist, but which previously had not been made visible, are in fact present. These facts are in agreement with assumptions previously made and hence lead to the same conclusions. E. P. Wightman

**Intermediates and dyes [useful as photographic sensitizers]** (Fr. pat. 757,708) 25. Photographically printing designs on textile piece goods (Brit. pat. 403,001) 25.

**Wall, E. J.:** The Photographic Darkroom. Boston: Am. Photographic Pub. Co., 107 pp. Bound, \$1.50. Reviewed in *Ghimie & industrie* 31, 630 (1934).

**Photography.** August Boettger and Michael Kronschnabel. *Brit.* 402,082, Nov. 20, 1933. To obtain finer gradations of color or of light and shade, without retouching, negatives and diapositives are obtained by exposing a light-sensitive surface through photographic masking negatives or diapositives of the original and following the masked exposures with unmasked exposures. Thus, for black-and-white pictures the original is photographed through a neg. mask to record the finer shades, the mask removed and a brief exposure made to record the highlights. For color-printing plate negatives, a panchromatic layer is successively exposed through a series of masking negatives, with appropriate filters, and the unmasked exposure is also made through an appropriate filter.

**Color photography.** Thomas T. Baker, Charles Bonamico, Ralph A. S. Grist and Spicers Ltd. *Brit.* 401,719, Nov. 20, 1933. To prevent the screen dyes of a multicolor screen film from wandering from the screen layer into the emulsion layer, a layer of synthetic resin, which may contain a plasticizer, is interposed between said layers.

**Color photography.** Durkoppwerke A.-G. *Brit.* 402,599, Dec. 7, 1933. See Fr. 747,337 (*C. A.* 27, 4748).

**Color photography.** Anna Weckfort. *Brit.* 402,231, Nov. 30, 1933. Addn. to 332,797 (*C. A.* 27, 5666). The color screen elements are supported upon or incorporated with a permeable top coating, e. g., of gelatin, superimposed upon the light-sensitive coating, or some elements may be supported upon the coating and incorporated therewith. The local selective sensitization may be limited to certain screen elements, e. g., blue, the portions under the remaining elements, e. g., green and red, being panchromatically sensitized. The screen may be made by applying fatty inks or substances which give off color to the coating; or by dyeing the coating between resists. To allow access of developing and fixing solns., impermeable screen elements may be removed by a solvent, e. g.,  $C_6H_6$ .

**Color photography.** Béla Gáspár. Fr. 757,376, Dec. 26, 1933. In using several layers one on the other, a part of which contain dyes or dye-forming substances, and the other part only substances sensitive to light, preferably Ag halide, chem. actions forming or destroying the dye are brought about in the latter layers, after the development of the image, these reactions acting on one of the neighboring layers to produce or destroy the dye. (*C. A.* 28, 720).

**Color photography.** Béla Gáspár. Fr. 757,417, Dec. 26, 1933. In producing color images in layers contg. dyes or dye-forming substances, the Ag image is transformed into a compd. which exercises a chem. action contrary to that of the treating baths forming or destroying the dye, which compd. prevents or slows down locally the action of the subsequent treating baths, destroying or forming the dye.

**Color photography.** Kalle & Co. A.-G. (Wilhelm Krieger, inventor). Ger. 593,251, Feb. 23, 1934. A component image colored with a water-insol. azo dye is first formed in known manner in a layer sensitized with a diazo compd. Other component images are then formed by imbibition. An example is given.

**Color cinematography.** Wm. van D. Kelley. *Brit.* 402,113, Nov. 23, 1933. A positive film is made from a pair of color-component negatives, alternate frames of the positive being made from the respective negatives, and 1 series of frames only being tinted corresponding to 1 color component, the positive being projected at twice the normal speed. The negatives may be made by exposing alternate frames through complementary color filters from superposed sensitive emulsions, 1 sensitive, the other insensitive to red, or by using a double or triple film for simultaneous presentation to the lens. The positive may be made by using stock coated with a dye insol. in the developing baths. When developed and fixed, the color-component frames corresponding to the dye color are coated with a colorless transparent waterproofing material, and the dye is bleached out of the other series of frames. The positives may also be made by coating alternate frames with a colored transparent waterproof coating material. Benzopurpurine, Congo red, eriochrome and neptune green SGX may be used as dyes. Suitable bleaching solns. include  $Na_2O_2$  or  $Na_2S_2O_4$ . The soln. for waterproofing may comprise celluloid dissolved in Am or Et lactate.

**Color printing.** Eduard Warnecke. *Brit.* 401,556, Nov. 16, 1933. In a process for making correctly colored printing forms for multicolor printing where a set of positive or negative half-tone part-pictures is produced from the original and the pictures retouched to obtain correct color values, each negative or positive part-picture is produced on a sep. light-sensitive layer applied to a white substratum carried by a nonexpandable body. The carrier may be a metal or glass plate coated with a white layer, e. g., baryta white, or a glass plate colored white throughout may be used. Alternatively, a sep. white layer may be dispensed with if a light-sensitive paper is used as the sensitive layer. In this case an intermediate layer, e. g., of water glass or of gelatin hardened with chrome alum may be applied to the carrier and the paper secured thereto by an adhesive of spirit varnish contg. gum elemi.

**Color photographs.** Béla Gáspár. *Brit.* 397,150, Aug. 16, 1933. In the production of reversed dye images from diffusely colored photographic and cinematographic metal deposit images the dye is decolorized, bleached or destroyed at the points of the metal deposit image by a reagent which is itself incapable of destroying the dye during the normal time of treatment but which decolorizes, etc., by the formation of reaction products or complex compds. of the metal. Suitable classes of reagents are: (a) nitrogenous org. compds., e. g., KCNS, cystein salts, phenylhydrazine, (b) compds. of the urea group, e. g., thiocarbamide, semicarbazide, thiosemicarbazide, guanidine, amidoguanidine, (c) indifferent inorg. S compds., e. g.,  $Na_2S$ , Ca polysulfide and (d) and (e) indifferent org. S compds. or indifferent acids, e. g., thiodiglycolic acid. The action may be increased or accelerated by the addn. of acids, phenols, aminophenols or their substitution products, aldehydes or sugar or by adding catalytically acting salts, e. g., of V, U, Mo or Fe. Azo dyes, particularly acid and substantive dyes, are most suitable. In applying the invention to color photography and cinematography a no. of differently colored and sensitized layers may be poured 1 over the other, or the dyes may be impressed, sprayed or otherwise applied to the support in the manner of a screen, admixed with sensitizers and filter dyes. Suitable dyes for a 3-color material are Diamine Pure Blue FF, Mordant Yellow GG and Diamine Fast Pink BBF. The colors are preferably fixed by mordant formation or deposition. Double tones may be produced by using dyes which bleach at different speeds. Dyes may be used which form colored reaction products at the points of the image, e. g., alizarin viridine.

Films coated on both sides and colored red on 1 side and blue-green on the other may be used. Transparencies for printing purposes may be obtained from negatives by coloring with a dark dye and performing subsequent reversal. Ag and Hg images are mentioned. In 397,188, Aug. 16, 1933, divided on 397,159, multicolor photographic images and cinematograph films are obtained by causing oxidizing agents to act simultaneously on a plurality of colored layers which contain deposit part-images. Thus 3 Ag halide emulsions are formed 1 on another, the lower contg. a blue dye and sensitive to red, the middle layer contg. a red dye and sensitive to green and the uppermost contg. a yellow dye. After exposure or printing the layers are developed, fixed and treated in a bath comprising (1)  $\text{NaClO}_2$ ,  $\text{HCl}$  and  $\text{H}_2\text{O}$  or (2)  $\text{KBrO}_3$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{CuSO}_4$ ,  $\text{KI}$  and  $\text{H}_2\text{O}$ . When the desired coloration is obtained, the image is further fixed in  $\text{Na}_2\text{S}_2\text{O}_3$ . Reversed dye images are obtained. In 397,192, Aug. 16, 1933, divided on 397,159, oxidizing agents are used immediately after development of the metal-deposit part-images in the plurality of superimposed and differently colored and sensitized layers. After treatment in the oxidizing bath, *e. g.*, (1) of 397,188 or a bath comprising  $\text{Ca}$  hypochlorite and  $\text{AcOH}$  (which gives a pos. image), the images are fixed in the usual manner. Cf. C. A. 28, 720<sup>4</sup>.

**Photographic diazotype processes.** Philippe Frangioli and Robert Lantz. Brit. 402,883, Dec. 14, 1933. A diazosulfonate of an aromatic monoamine contg. an alkoxy group is used, and fixation is effected by a reagent which chemically suppresses the sensitiveness to light, *e. g.*, an aldehyde or an acid. In an example a support is impregnated with a mixt. of a soln. of *p*-anisidine diazosulfonate and the Na salt of  $\text{H}$  acid, and the exposed print is fixed by gaseous  $\text{HCl}$  or  $\text{HCOOH}$  or by an aldehyde, *e. g.*,  $\text{CH}_3\text{CHO}$ ,  $\text{AcH}$  or glyoxal. Cf. C. A. 27, 925.

**Photographic toning processes.** Emil Mayer and Nikolaus Benedik (trading as E. Mayer & Benedik). Brit. 401,648, Nov. 16, 1933. See Fr. 751,594 (C. A. 28, 982<sup>3</sup>).

**Photographic development.** Fritz J. Hepner. U. S. 1,949,911, March 6. Photographic Ag halide emulsions are developed by horizontal placement for several hrs. in an aq. metol or glycine developer of a concn. of about 0.06-0.25% contg. water-sol. sulfite but substantially free from alkali.

**Photographic emulsion.** Soc. pour l'ind. chim. à Bâle. Swiss 165,523, Feb. 1, 1934 (Cl. 40b). At least two emulsions of different degrees of ripeness are mixed and the whole ripened. In an example, the following are mixed: (1) a soln. contg. water,  $\text{AgNO}_3$ ,  $\text{NH}_4\text{OH}$  and citric acid; (2) water, gelatin,  $\text{KBr}$ ,  $\text{KI}$ ,  $\text{Na}_2\text{CO}_3$  and erythrosin soln.; (3) water, soft gelatin and medium gelatin; (4) water, soft gelatin, medium gelatin and  $\text{KBr}$ ; (5) alc.,  $\text{Cr}$  alum soln. and tartrazine soln. These solns. are mixed to give a photographic emulsion.

**Photographic emulsions.** Deutsche Maizena Ges. m. b. H. Fr. 757,451, Dec. 27, 1933. A binder for emulsions contains starch capable of being disaggregated, gelatins and a hardening agent such as  $\text{Cr}$  alum. The starch is heated with water, the  $\text{Cr}$  alum is added and to the slightly cooled mass a soln. of gelatin is added.

**Photographic emulsions.** Opticolor A.-G. Fr. 758,130, Jan. 11, 1934. In developing emulsions, where a solvent for the Ag salt, *e. g.*,  $\text{NH}_3$ , is added to the developer, the emulsion is treated in a preparatory bath to render the action of the developer and solvent regular. Such a bath may comprise a soln. of solvents for the Ag salt, or a soln. of  $\text{Na}_2\text{SO}_3$  or  $(\text{NH}_4)_2\text{SO}_3$ .

**Photographic sensitizers.** I. G. Farbenind. A.-G. Brit. 402,458, Dec. 4, 1933. Carbocyanine dyes suitable for displacing the max. of sensitivity of Ag halide emulsions toward the long-wave region of the spectrum are obtained by condensing a quaternary salt of a 2-methyl- $\alpha$ -naphthothiazole-*contg.* a nuclear alkoxy group with an alkyl ester of orthoacetic acid. The dyes may be added to the emulsion at any stage of its production or after it has been coated, *e. g.*, in alc. soln. In an example 1-methyl-6-methoxy- $\alpha$ -naphthothiazole- $\text{EtI}$  is condensed with  $\text{Et}$

orthoacetate to yield a dye which imparts to a  $\text{AgBr-AgI}$  emulsion a range of sensitivity from 520 to 670  $\mu$ . The halides, perchlorates, *p*-toluenesulfonates, alkylsulfates and nitrates of the dyes are mentioned.

**Photographic sensitizers.** I. G. Farbenind. A.-G. Brit. 402,521, Dec. 7, 1933. A Ag halide emulsion is sensitized to red by incorporating in the emulsion a dialkyl or diarylaminoindocarbocyanine dye. The dyes sensitize for the range 545-750  $\mu$ , permit of photography of distant objects with use of a red filter with a short exposure, are used as the bromide, iodide, perchlorate, etc., and are prepd. by treating a quaternary  $\text{NH}_4$  salt of a 2-methyl-3-dialkylindole, substituted by a dialkylamino or a diarylamino group, with an ester of an orthocarboxylic acid. In an example 2-methylketol is treated with  $\text{CH}_3\text{I}$  and the quaternary  $\text{NH}_4$  salt nitrated; reduction and ethylation give a 4-diethylamino-2,3,3-trimethylindole iodide which is heated in pyridine with triethyl orthoformate. Esters of higher orthocarboxylic acids yield dyes substituted in the central C atom of the trimethine chain by an alkyl or aryl residue.

**Photographic sensitizers.** Kodak-Pathé. Fr. 757,313, Jan. 5, 1934. New dyes which are sensitizers for emulsions are prepd. by condensing 2 heterocyclic rings contg. N, in the presence of a strong org. base ( $\text{Et}_3\text{NH}$ ,  $\text{Et}_3\text{N}$ , piperidines, triethanolamine), quinoline or a quinoline deriv. to neutralize the acids. Examples are given of the prepn. of halides of 1,1'- and 2,1'-diethylo-, 2,1'-diethylthio-, 2,1'-diethylseleno- and 1,3,3,1'-tetramethylindolo-pseudocyanine, 1,1'-dimethyl-5,6-benzo-2,1'-diethylthio-2', 1,1'-dimethyl-2,2', 4,1'-dimethyl-3-ethylthiazolo-2' and 3,4,1'-trimethylselenasolo-2'-pyridocyanine, 2,1'-diethylseleno-, 2,1'-diethylthio- and 7-methyl-2,1'-diethylthio-isocyanine, 8-methyl-2,2'-diethyl-, and 2,2'-dimethyl-8-ethyl-oxocarbocyanine, 9-bromo-2,2'-diethylthio-, 9-bromo-2,2'-diethyl-5,6,5', 6'-dimethio-, 11-bromo-1,1'-diethyl-2,2', 11-bromo-1,1'-diethyl-4,4'- and 3-methyl-2'-ethyl-8-bromothiazolinthio-dicarbocyanine, 2,2'-diethyl-, 1,1'-diethyl-2,2', 1,1'-diethylseleno-, 1,1'-diethyl-4,4', 3,3'-diethylthiazolino-, 3,3'-diethylthiazolo- and 3,4,3,4'-tetramethylthiazolo-tricarbocyanine. Cf. C. A. 27, 3677.

**Photographic films.** I. G. Farbenind. A.-G. Fr. 758,695, Jan. 23, 1934. In making photographic films contg. bleaching dyes, partially hydrolyzed cellulose esters or ethers are used as binders for the dyes.

**Apparatus for developing photographic films with ammonia gas or other vapor.** Benjamin J. Hall. Brit. 401,406, Nov. 16, 1933.

**Photographic films, etc.** Kalle & Co. A.-G. (Oskar Süss, inventor). Ger. 591,517, Jan. 23, 1934 (Cl. 57b 12.05). Light-sensitive films are prepd. from Fe salts, especially ferric citrate and ovalate or their double salts. The layers contain also unsatd. carboxylic acids. Thus, a sensitive film may contain green ferric ammonium citrate,  $\text{K}_2\text{FeC}_6\text{N}_6$  and maleic acid. Other examples are given.

**Photographic films and plates.** Kodak A.-G. Ger. 502,398, Feb. 8, 1934 (Cl. 57b 17.03). See Brit. 387,015 (C. A. 27, 5015).

**Lenticular films.** Siemens & Halske A.-G. Fr. 758,225, Jan. 12, 1934. Prints for color projection are formed on lenticular films by using a copying film provided with an emulsion of  $\text{AgBr}$  which, after development of the Ag, gives a colored image layer, preferably brown, the shade or tone of this layer being, in the complementary colors, compensated by a corresponding shading of the color filters, preferably filters serving for the reproduction.

**Lenticular film and color filter for color photography.** Carl L. Gregory (to Kislun Corp.). U. S. 1,949,714, March 6. Structural and optical details.

**Photographic prints.** Kalle & Co. A.-G. (Maximilian P. Schmidt, Wilhelm Krieger and Eduard Sprüngers, inventors). Ger. 502,603, Dec. 23, 1933 (Cl. 57b 12.05). Light-sensitive layers giving a positive print from a positive are obtained by coupling a dye with a diazo compd. in alk. soln., and placing the product on the film, etc., in an acid or neutral medium. Thus, the diazo compd. from 1'-amino-4'-piperidyl-3'-benzoyl-1-amino

**8-naphthol-3,6-disulfonic acid** (obtained by condensing 1,8-aminonaphthol-3,6-naphthalenedisulfonic acid with 1-nitro-4-chloro-3-benzoyl chloride, treating the product with piperidine and reducing) is dissolved in water and tartaric acid. The soln. is spread on paper and dried. After exposure, the print is developed with gaseous  $\text{NH}_3$  to give a blue-violet print.

**Photographic prints.** I. G. Farbenind. A.-G. Ger. 590,919, Jan. 12, 1934 (Cl. 57b. 14.02).—Optically transparent Ag prints are prepd. by bleaching an ordinary Ag print with acidified I-KI soln. and developing with an org. soln. such as metol-hydroquinone.

**Photographic prints.** N. V. Philips' Gloeilampenfabrieken. Fr. 758,019, Jan. 9, 1934. Prints are obtained from negatives with a luminous source emitting ultra-violet radiations by means of a sensitive material contg. a mixt. of an uncolored oxidizing compd. and a phenol, the mixt. giving by irradiation with ultra-violet light a colored oxidation product, but being almost completely insensitive to light of the visible spectrum. Several examples are given. Cf. C. A. 28, 1292<sup>4</sup>.

**Treating photographic prints.** Gevaert Werke G. m. b. H. (to Gevaert Photo-Producten N. V.). Brit. 401,961, Nov. 23, 1933. To minimize the loss of clarity of the prints during drying, they are treated with a toning soln. in such concn. or for so short a time that no visible toning is produced. In examples (1) a soln. contg. 40 g.  $\text{NH}_4\text{CNS}$  and 40 cc. 1%  $\text{AuCl}_3$  soln. in 1 l.  $\text{H}_2\text{O}$  and (2) 0.1 g. Na selenite in 1 l. fixing soln. are used.

**Diazotypes.** N. V. Chemische Fabriek L. van der Grinten. Ger. 591,969, Jan. 30, 1934 (Cl. 57b. 12.05). Diazotypes are obtained by exposing a sensitized carrier sizing, and developing in a soln. contg. an alkali such as alkali carbonate soln. The developer may contain size. In an example, paper is sensitized with an aq. soln. contg. 1-diethylaminobenzene-4-diazonium chlorostannate,  $\text{H}_3\text{PO}_4$ , and gelatin. The paper is exposed and developed with a soln. contg. phenolglucinol,  $\text{K}_2\text{CO}_3$ , and Na stearate, to give a positive.

**Diazotypes** Kalle & Co. A.-G. Fr. 757,863, Jan. 5, 1934. See Ger. 588,994 (C. A. 28, 1944<sup>3</sup>).

**Apparatus for the development of photographic papers by ammonia.** Jean Breton. Brit. 402,949, Dec. 14, 1933.

**Light-sensitive paper.** V. P. Petrov and I. I. Levkov. Russ. 31,763, Oct. 31, 1933. A stable compd. of diazo aromatic compds. of the secondary or tertiary amines and their derivs. together with hydroxy derivs. of the aromatic series is placed on the paper.

**Preparing drawings for contact printing.** S. G. Gurevich. Russ. 31,762, Oct. 31, 1933. Drawings are made with pencil or ink on paper that has been impregnated with a colloidal soln. of Ag. The Ag is then made light-sensitive by halogenation, exposed from the side of the drawing to an actinic light and developed in the usual manner.

**Photographic tanned colloid images.** Kalle & Co. A.-G. Brit. 409,898, Nov. 23, 1933; cf. Ger. 581,007 (C. A. 28, 983<sup>3</sup>). The support may be glass, metal or films of  $\text{H}_2\text{O}$ -insol. cellulose esters or ethers or regenerated cellulose instead of paper.

**Projection apparatus and process for printing on non-lenticular sensitive material separate monochrome records from a multicolor record taken on a linear lenticular film in a camera having an objective fitted with a color-band filter.** I. G. Farbenind. A.-G. Brit. 402,902, Dec. 14, 1933.

**Photomechanical printing surfaces.** Albert Nadin. Brit. 402,332, Nov. 30, 1933. A color printing process for use in newspaper or other high-speed printing work consists in superimposing prints in selected colors by a no. of half-tone blocks each of complete subject but adapted to produce prints of different strengths. From the original subject a half-tone block is prepd. photographically to produce a print in black or dark color and one or more "ghost" half-tone blocks for printing in lighter colors are prepd. in exactly the same way but in a form adapted to produce faint prints. These "ghost" blocks may be produced by photographing the subject through a semi-transparent mask of frosted or tinted glass or mat celluloid, and parts of these blocks may be modified by darkening or whitening corresponding parts of the masks or by applying local patches of resist to the blocks during the etching operations.

**Photochemical production of forms or patterns for planographic printing.** Hans Weil (to Bekk & Kaulen Chemische Fabrik G. m. b. H.). U. S. 1,948,604, Feb. 27. Various details of procedure are described.

## 6—INORGANIC CHEMISTRY

A. R. MIDDLETON

**Constitution of dysprosium, holmium, erbium, thulium, ytterbium and lutecium.** F. W. Aston. *Nature* 133, 327 (1934); cf. C. A. 28, 983<sup>3</sup>.—Examn. by the method of anode rays showed that Dy (86) consists of mass nos. 161, 162, 163, 164;  $\text{Ho}$  (67), simply 165; Er (68) (pure sample), 166, 167, 168 and a weak 170; Tm (69), simply 169; Yb (70), 171, 172, 173, 174, 176 (174 strongest); Lu (71) simply 175. No isobars were shown. A full account will be published.

**Boron hydrides.** XVIII. Preparation of  $\text{B}_2\text{H}_6$  from boron chloride and hydrogen. Alfred Stock, Hans Martini and Walther Sütterlin. *Ber.* 67B, 396-407 (1934); cf. C. A. 27, 911.—In studying the method by Schlesinger and Burg (C. A. 26, 663) for the prepn. of  $\text{B}_2\text{H}_6$  from  $\text{BCl}_3$  and H by means of elec. discharges, the authors found that only  $\text{B}_2\text{H}_5\text{Cl}$  is apparently formed at first. This decomposes into  $\text{B}_2\text{H}_6$  and  $\text{BCl}_3$ . Treatment with K was found to be a convenient, practical and fast method for complete sepn. of  $\text{B}_2\text{H}_6$  from HCl. Elec. discharges in mixts. of much  $\text{BCl}_3$  and little H yielded little  $\text{B}_2\text{H}_6$  among the products of reaction.  $\text{BH}_3\text{Cl}$  and  $\text{BHCl}_2$  were not observed.  $\text{B}_2\text{H}_6$  and HCl form  $\text{B}_2\text{H}_5\text{Cl}$  and an equil.:  $6\text{B}_2\text{H}_5\text{Cl} \rightleftharpoons 5\text{B}_2\text{H}_6 + 2\text{BCl}_3$ . Small amts. of HCl or  $\text{B}_2\text{H}_6$  disappear practically completely. The reaction is much faster in  $\text{B}_2\text{H}_6$ -HCl mixts. obtained in prepg.  $\text{B}_2\text{H}_6$  than in mixts. of pure  $\text{B}_2\text{H}_6$  and HCl. A catalytic admixt. of unknown nature seems to be present in the first mixt. Hg does not affect the speed of reaction.  $\text{BBr}_3$  is more suit-

able than  $\text{BCl}_3$  for practical prepn. of  $\text{B}_2\text{H}_6$ . XIX. Preparation of  $\text{B}_2\text{H}_6$  from boron tribromide and hydrogen. Alfred Stock and Walther Sütterlin. *Ibid.* 407-11.— $\text{BBr}_3$  and H form (analogously to the Cl compd.)  $\text{B}_2\text{H}_5\text{Br}$  which decomposes (slower than the Cl compd.) to  $\text{B}_2\text{H}_6$  and  $\text{BBr}_3$ . The advantages of the Br method are: (1) a liquid starting material instead of a gas; (2) no cooling bath is necessary; (3) smoother reaction in the discharge chamber; (4) little B and solid hydrides are formed (5) the second procedure to produce  $\text{B}_2\text{H}_6$  is very simple; (6) the  $\text{HBr}$  from the first distillate contains practically no  $\text{B}_2\text{H}_6$  and (7)  $\text{B}_2\text{H}_6$  and  $\text{HBr}$  are easier to sep. A. E. B.

**The significance of the hydrides of the carbonyls of iron and cobalt.** Arthur A. Blanchard and Manly M. Windsor. *J. Am. Chem. Soc.* 56, 826-7 (1934).—The electronic structure proposed for  $\text{Ni}(\text{CO})_4$  (C. A. 20, 1570) also exists in  $\text{Fe}(\text{CO})_5$  (C. A. 26, 935, 3198) and  $\text{Co}(\text{CO})_4\text{H}$  (C. A. 28, 106<sup>6</sup>), where H furnishes the extra electrons necessary to complete the  $\text{Ni}(\text{CO})_4$  pattern. In nitrosyl carbonyls and polymeric carbonyls the same electron pattern is completed. W. C. Fernelius

**Active oxides.** LXXII. The course of reactions in the solid state. Emil Rosenkranz, Bela Steiner, Herbert Kittel and Gustav F. Hüttig. *Z. anorg. allgem. Chem.* 217, 22-6 (1934); cf. C. A. 28, 398<sup>4</sup>.—The course of the reaction  $\text{MgO} + \text{Fe}_2\text{O}_3 \rightarrow \text{MgFe}_2\text{O}_4$  was followed by studying its catalytic action upon a heated mixt. of CO and  $\text{O}_2$ . The max. catalytic activity is given by a mixt. which

had been preheated to 525°, the temp. at which the formation of crystd. aggregates of spinel first begins. Lower temps. for a longer time will probably lead to the same result. MgO, prepd. by thermal decompn. of MgCO<sub>3</sub> or MgC<sub>2</sub>O<sub>4</sub>, also catalyzes CO<sub>2</sub> formation from CO and O<sub>2</sub>. If the MgO is heated for different lengths of time at 700°, the catalytic activity decreases with increasing length of preheating. If the MgO is obtained from a mineral contg. Fe, like magnesite, catalytic activity first falls with increasing time of preheating, but with a great increase in time it commences to rise again and then again falls off in the usual manner.

**Oxides of manganese.** M. Le Blanc and G. Wehner. *Z. physik. Chem.* A168, 59 7b(1934).—Expts. in synthesis were made by adding O<sub>2</sub> to reactive MnO together with expts. in disintegration by the removal of O<sub>2</sub> from MnO<sub>2</sub>. The products resulting were investigated analytically and röntgenographically. MnO is very active and can take up O<sub>2</sub> to MnO<sub>1.12</sub> without change of lattice and without the appearance of a new solid phase. Mn<sub>2</sub>O<sub>3</sub> can absorb O<sub>2</sub> up to MnO<sub>1.12</sub> and Mn<sub>2</sub>O<sub>3</sub> to MnO<sub>1.12</sub> without change. A new modification was obtained from Mn<sub>2</sub>O<sub>3</sub> by synthesis; by tempering it can be changed to the known modification. Mn<sub>2</sub>O<sub>3</sub> can give off no O<sub>2</sub> without the appearance of the Mn<sub>2</sub>O<sub>3</sub> lattice. A mixed-crystal formation between the individual oxides could not be established; instead a two-phase system appeared.

**Thallous oxide.** I. Halla, H. Tompa and L. Zimmermann. *Z. Krist.* 86, 303 5(1933).—TlOH was obtained in white needles by evap. its aq. soln. *in vacuo*; these turn yellow below 100°. Its powder diagram is incompatible with the cubic form, and so lends no support to the existence of Pb<sub>2</sub>O (C. A. 27, 3499). Six days' heating *in vacuo* failed to remove CO<sub>2</sub> from Tl<sub>2</sub>CO<sub>3</sub>; if Tl<sub>2</sub>CO<sub>3</sub> is melted *in vacuo* in a SiO<sub>2</sub> vessel a bright yellow solid soln. of Tl<sub>2</sub>O in Tl silicate is obtained on the walls. Tl<sub>2</sub>O is distinctly volatile *in vacuo* at 300°. It is not obtained by heating Tl<sub>2</sub>O<sub>3</sub>. Decompn. of Tl<sub>2</sub>C<sub>2</sub>O<sub>4</sub> yields Tl.

**Oxidation by oxygen of the tellurides, selenides and sulfides of sodium in liquid ammonia.** R. L. McCleary and W. Conrad Fernelius. *J. Am. Chem. Soc.* 56, 803-4 (1934).—The following schemes represent the action of O upon liquid-NH<sub>3</sub> soln. of the salts given: Na<sub>2</sub>Te(Se, S) → Na<sub>2</sub>Te(Se, S)O<sub>2.4</sub> (little reaction with S); Na<sub>2</sub>Te(Se, S) → Na<sub>2</sub>Te(Se, S)O<sub>2.1</sub> + (x-1)Te(Se); Na<sub>2</sub>S<sub>2</sub> → Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>; Na<sub>2</sub>S<sub>x</sub> (x > 2) → Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> + (x-2)S. Solns. of S and S<sub>2</sub>N<sub>4</sub> similarly treated give small amts. of S<sub>2</sub>O<sub>4</sub>.

**Compounds of germanium and hydrogen: Some of their reactions and derivatives. I. Preparation of monogermene. II. Sodium trihydrogermanides.** Charles A. Kraus and E. Seaton Carney. *J. Am. Chem. Soc.* 56, 765-8(1934).—By a method described in detail, 60 70% yields of mixed germanes are obtained. The highest germanes are then converted to GeH<sub>4</sub> of 99.7% purity by Na in NH<sub>3</sub> followed by NH<sub>4</sub>Br. GeH<sub>4</sub> and Na in NH<sub>3</sub> give NaGeH<sub>3</sub> quantitatively. Its properties are given. At -33° the solid phases of the system NH<sub>3</sub>-NaGeH<sub>3</sub> are: NaGeH<sub>3</sub>·6NH<sub>3</sub>; NaGeH<sub>3</sub>·4.5NH<sub>3</sub>; NaGeH<sub>3</sub>·2NH<sub>3</sub>; and NaGeH<sub>3</sub>.

**Formation of aluminum nitride from aluminum and amines.** V. A. Plotnikov and P. T. Kalita. *J. Gen. Chem.* (U. S. S. R.) 3, 872 3(1933).—In treating the fused monamine of AlCl<sub>3</sub> with Al, H is evolved and a complex compd. is formed according to the equation: AlCl<sub>3</sub>·NH<sub>3</sub> + Al = AlCl<sub>3</sub>·AlN + 3/2H<sub>2</sub>. The complex compd. formed is so stable that complete decompn. does not take place even when heated to a glow.

**Double decomposition of ammonium nitrate and sodium chloride in the presence or absence of ammonia.** L. Hackspill, A. P. Rollet and Lauffenburger. *Compt. rend.* 198, 1231-3(1934).—By representing the state of the system NaNO<sub>3</sub>·NaCl-NH<sub>4</sub>NO<sub>3</sub>-NH<sub>4</sub>Cl-H<sub>2</sub>O at 20° by Lowenherz's method (*Z. phys. Chem.* 13, 459(1894)) the possibility is demonstrated of obtaining crystn. (either of pure NaNO<sub>3</sub> in the presence of excess of NH<sub>3</sub> (10-12 N, which increases the soly. of NH<sub>4</sub>NO<sub>3</sub> and NH<sub>4</sub>Cl), or, on

at least partial removal of NH<sub>3</sub>, of NH<sub>4</sub>Cl. Simultaneous addn. of 2 mols. NaCl and NH<sub>4</sub>NO<sub>3</sub> causes crystn. of 2 mols. each of NaNO<sub>3</sub> and NH<sub>4</sub>Cl, the concn. of NH<sub>3</sub> having been simultaneously reduced from 12 (d. 8 N. If KCl replaces NaCl, KNO<sub>3</sub> is obtained (cf. C. A. 15, 1445; 16, 3423)).

**Dissociation of alkaline earth nitrites.** M. Tzvetnirshver and W. Piskelny. *Bull. intern. acad. polonaise Classe sci. math. nat.* 1933A, 380 96.—The nitrite decomposes into the oxides, NO and NO<sub>2</sub>. The latter oxidizes more nitrite to nitrate, being reduced to NO. This reaction is not reversible; thus the decompn. sets in very sharply. The temp. depends on the superimposed (inert) gas pressure. Ca, Sr and Ba nitrites decompose at 316°, 389°, 362° under 1 atm. An equation relating pressure and temp. is given.

**The so-called red hydrogen chloride.** Erich Tiede and H. Reinicke. *Ber.* 67B, 492-4(1934).—The red compd. which v. Antropoff (C. A. 26, 5863) described as K<sub>1</sub> chloride was found to be an addn. compd. of NO and HCl, formed from small traces of air in the app. A red modification of HCl does not exist. Expts. made by Giauque and Wiebe (C. A. 22, 719) were repeated with purer reagents. The red compd. could not be observed when NO was completely removed. Traces of NO *in vacuo* yielded a pink compd. which turned dark red with increasing amts. of NO.

**Comments on our work: Preparation of pure hydrogen sulfide, its vapor tension and density.** A. Kilmsted and O. Bankowski. *Z. anorg. allgem. Chem.* 217, 62 4(1934).—A reply to criticism by Batuecas (C. A. 27, 5288).

**The compound of stannic chloride and ether.** Sapwei Ai. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 107 (1934).—SnCl<sub>4</sub> combines energetically with Et<sub>2</sub>O, evolving a large amt. of heat and forming white crystals. The compd. was prepd. by a variety of methods, by adding Et<sub>2</sub>O to SnCl<sub>4</sub>, or *vice versa*, at room temp. and also by adding cooled SnCl<sub>4</sub> to cold Et<sub>2</sub>O. The analysis agreed quite well with the formula SnCl<sub>4</sub>·2(C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>O. The compd. burns weakly without explosion and volatilizes at ordinary temp. without decompn.

**New hydroxy-nitrogen compound of phosphorus.** P. Renaud. *Compt. rend.* 198, 1159 61(1934).—When PN [C. A. 28, 984] is heated with H<sub>2</sub>O for 15 days at 100° in N<sub>2</sub> or a sealed tube it hydrolyzes with a 90% yield of PNO<sub>2</sub>H<sub>2</sub>: 5PN + 6H<sub>2</sub>O → 2RH<sub>2</sub> + 3PNO<sub>2</sub>H<sub>2</sub> + N<sub>2</sub>·2PNO<sub>2</sub>H<sub>2</sub>. forms large white tetragonal crystals, a:c = 1:1.004, n<sub>D</sub> 1.522, n<sub>F</sub> 1.579; (x-ray) a 7.60, c 7.57 Å, and 6PNO<sub>2</sub>H<sub>2</sub> in the unit cell. It dissolves unchanged in H<sub>2</sub>O to form a slightly conducting soln., m. 195°, decompn. at 210°, or on heating with aq. KOH *in vacuo* at 50° with evolution of NH<sub>3</sub>: 3PNO<sub>2</sub>H<sub>2</sub> = 2NH<sub>3</sub> + PNO + P<sub>2</sub>O<sub>5</sub>. To bring all P into soln. it must be heated for 200 hrs. with H<sub>2</sub>SO<sub>4</sub>. It dissolves in aq. NH<sub>3</sub>, apparently with production of new cryst. substances.

**Calcium aluminate hydrates and their double salts.** C. R. W. Mylius. *Acta Acad. Abornsis. Math. et Phys.* 7, No. 3, 147 pp.(1933); *Bldg. Sci. Abstracts* 6, 124.—This investigation was undertaken to discover whether the retardation of setting of cement caused by gypsum is connected with the formation of the Ca sulfogaluminate compd. and whether corresponding compds. of other Ca salts can be produced. A series of di-, tri- and tetra-Ca aluminate hydrates obtained is tabulated; and double salts with Ca chloride, nitrate, bromide, iodide, chlorate, iodate and acetate are described. These compds. are highly unstable and are produced only in solns. of definite concn. On account of their slight soly. and marked instability, optical examn. of the crystals provides the only practicable method of analysis. Tabulated results of such examns. are given. The Ca salts that retard setting form sparingly sol. compds. which crystallize well. The constitution of the aluminates is discussed. A table of analyses and dehydration curves for the isolated substances and a bibliography are included.

**Substitution of O<sup>17</sup> by F<sup>19</sup> in aluminates and silicates.**

B. Kordes. *Fortschr. Mineral. Kryst. Petrog.* 17, 432 3 (1932).—Fusion of  $\text{SiO}_2$  with NaF and LiF does not lead to compd. formation. NaF and  $\text{Al}_2\text{O}_3$  afford needles of undetd. compn. Substitution of MgO in  $\text{MgO} \cdot \text{Al}_2\text{O}_3$  by LiF affords crystals of the spinel type, m. above  $1400^\circ$ , d. 3.6.  $\text{CaF}_2$  and  $\text{Al}_2\text{O}_3$  afford at least one cryst. compd. B. C. A.

The preparation of hydrazine sulfate by the Raschig method. J. Henrion. *Bull. soc. chim. Belg.* 43, 115 16 (1934).—Dissolve 5 g. NaOH in 100 cc. water; feed Cl slowly to the soln. cooled in a freezing mixt. up to a 4-g. increase in weight. Allow the soln. to stand in the open for at least 12 hrs., to remove all free Cl. Add it to a mixt. of 200 cc. of satd.  $\text{NH}_4\text{OH}$  and 20 cc. of 5% gelatin soln. Boil vigorously, reducing the vol. to half its original. Cool thoroughly; allow a cool mixt. of 10 cc. of coned.  $\text{H}_2\text{SO}_4$  and 50 cc.  $\text{H}_2\text{O}$  to drip in; add ethanol until a slight ppt. forms; hydrazine sulfate ppts. on standing. A. L. Henne

Reaction of pyridine with Cleve's salt and Gérard's salts. I. I. Chernyayev and A. M. Rubinshteyn. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 187-9 (in English) 189 92 (1934).—When pyridine reacts with Cleve's salt,  $(\text{NH}_4)_2\text{Cl}_2\text{Pt}$ , a replacement of the mols. of  $\text{NH}_3$  by pyridine takes place and  $(\text{PyCl})_2\text{Cl}_2\text{Pt}$  is formed; with Gérard's salt,  $(\text{NH}_4)_2\text{Cl}_2\text{Pt}$ , pyridine replaces 2 ions of Cl to form  $(\text{NH}_4)_2(\text{PyCl})_2\text{PtCl}_2$ . These reactions may serve as a qual. reaction for these salts. Three geometrical isomers of the tetramine of the compn.  $[(\text{NH}_4)_2(\text{Py})_2\text{PtCl}_2]\text{X}_2$  have been obtained. E. R. Rushton

The reduction of silver salts with hydroxylamine. M. L. Nichols. *J. Am. Chem. Soc.* 56, 441 5 (1934).  $\text{H}_2\text{NOH}$  (I) reacts with  $\text{AgBr}$  in the presence of NaOH to give a mixt. of N and  $\text{N}_2\text{O}$ :  $2\text{I} + 2\text{AgBr} = 2\text{Ag} + \text{N}_2 + 2\text{HBr} + 2\text{H}_2\text{O}$ ;  $2\text{I} + 4\text{AgBr} = 4\text{Ag} + \text{N}_2\text{O} + 4\text{HBr} + \text{H}_2\text{O}$ . With ammoniacal  $\text{AgNO}_3$ , I gives pure N.  $2\text{I} + \text{Ag}_2\text{O} = 2\text{Ag} + \text{N}_2 + 3\text{H}_2\text{O}$ . With alk.  $\text{AgNO}_3$  in the presence of  $\text{Na}_2\text{SO}_3$ , I gives a mixt. of N and  $\text{N}_2$ , but the N return is low because of a coupled or induced reaction between the  $\text{Ag}_2\text{O}$  and  $\text{Na}_2\text{SO}_3$ . The relative amts. of N and  $\text{N}_2$  vary with temp. and concn. of alkali. W. C. F.

Basic salts. III. Equilibria in the system  $\text{CuO} \cdot \text{CrO}_3 \cdot \text{H}_2\text{O}$ . Erich Havelk. *Z. anorg. allgem. Chem.* 216, 315 20 (1934); cf. C. A. 27, 1838. —In the system  $\text{CuO} \cdot \text{CrO}_3 \cdot \text{H}_2\text{O}$ , the solids  $2\text{CuCrO}_7 \cdot 3\text{H}_2\text{O}$  (I),  $\text{H}_2\text{O}$  (II) and  $\text{CuCrO}_4 \cdot \text{Cu}(\text{OH})_2$  (III) are present, and in soln.  $\text{CuCrO}_4$  is found. I is a yellowish brown powder which loses  $\text{H}_2\text{O}$  over  $\text{CaCl}_2$ . II exists in 2 forms, a copper red and a chocolate brown to lilac black. The first of these, heated with  $\text{H}_2\text{O}$ , is hydrolyzed to a yellowish brown basic salt. The dark form is believed to have each hydroxide mol. surrounded by chromate, while in the red form the hydroxide mols. are on the outside. H. Stoertz

Preparation of ductile tantalum by thermal dissociation of  $\text{TaCl}_5$ . W. G. Burgers and J. C. M. Basart. *Z. anorg. allgem. Chem.* 216, 223-7 (1934).—A very ductile form of Ta can be prepd. by thermal disocn. of  $\text{TaCl}_5$  on a glowing filament. Care must be taken to exclude foreign gases,  $\text{TaCl}_5$  being sublimed in a vacuum for this reason. Ta prepd. in this manner has a temp. coeff. of dec. resistance given by the expression  $10^6\alpha = 364$  and a sp. resistance of  $10^6\rho_0 = 0.124 \Omega \text{ cm}$ . For lattice const.  $a = 3.296 \pm 0.0005 \text{ \AA}$ . Ch prepd. in the same manner shows  $a = 3.294 \pm 0.001 \text{ \AA}$ . H. Stoertz

Formation of high-melting metallic carbides by igniting a carbon filament in the vapor of a volatile halogen compound of the metal. W. G. Burgers and J. C. M. Basart. *Z. anorg. allgem. Chem.* 216, 200 22 (1934).—The reaction produced when a C filament was ignited in vapors of  $\text{TiCl}_4$ ,  $\text{ZrCl}_4$  or  $\text{TaCl}_5$  was studied by means of the changes in the resistance of the wire and with the aid of an x-ray study. The compds.  $\text{TiC}$  and  $\text{ZrC}$  are formed, while with  $\text{TaCl}_5$  both  $\text{TaC}$  and  $\text{Ta}_3\text{C}$  are produced, and Ta also seps. At  $2500^\circ$  the formation of Ta and  $\text{Ta}_3\text{C}$  can be avoided. The carbide phases contain a certain amt. of the metal in excess in solid soln. In order to obtain the pure carbides, the reaction product must be heated either in a vacuum or in a hydrocarbon atm. The carbide wires prepd. in this

manner have the form of hollow tubes. Lattice consts. are given. H. Stoertz

Reactions in liquid ammonia. I. Sulfides of germanium. Warren C. Johnson and A. C. Wheatley. *Z. anorg. allgem. Chem.* 216, 273-87 (1934).—Both amorphous and cryst.  $\text{GeS}$  and  $\text{GeS}_2$  were prepd. from germanite ore. Crystd.  $\text{GeS}_2$  is a white, needle-like powder, converted into  $\text{GeO}_2$  by long heating. It is slowly hydrolyzed by water at room temp.,  $\text{H}_2\text{S}$  being evolved by heating the soln.  $\text{GeS}_2$  is quite sol. in  $\text{NH}_4\text{OH}$  and moderately sol. in liquid  $\text{NH}_3$  at  $-33^\circ$ . Cryst.  $\text{GeS}$  forms black plates which are red in transmitted light and steel-gray in reflected light. Heated in air or treated with  $\text{HNO}_3$  it easily oxidizes. It is sol. in 10%  $\text{KOH}$ , from which amorphous  $\text{GeS}$  is pptd. by addn. of  $\text{HCl}$ . This is a reddish brown powder, rapidly hydrolyzed by  $\text{H}_2\text{O}$ , easily sol. in  $\text{NH}_4\text{OH}$  and only slightly sol. in liquid  $\text{NH}_3$ . These sulfides are not ammonolyzed in liquid  $\text{NH}_3$ . They are reduced by Na in liquid  $\text{NH}_3$  to  $\text{Na}_2\text{Ge}_2$ . This is decompd. by  $\text{NH}_4\text{Br}$  as follows:  $\text{Na}_2\text{Ge}_2 + 4\text{NH}_4\text{Br} = 4\text{NaBr} + 4\text{NH}_3 + \text{GeH}_4 + (x-1) \text{Ge}$  and  $\text{GeH}_4 = \text{Ge} + 2\text{H}_2$ . H. Stoertz

Thermometric study of formation of inorganic complexes. P. Mondan-Monval and R. Paris. *Compt. rend.* 198, 1151-3 (1934). By plotting the temp. rise against the amt. of aq. KI added to aq.  $\text{HgCl}_2$  (cf. C. A. 16, 3011), breaks occur in the curve corresponding with formation of  $\text{HgI}_2$  and  $\text{K}_2\text{HgI}_4$  (C. A. 27, 677). Similarly when aq. KCN is added to aq.  $\text{NiSO}_4$ ,  $\text{ZnSO}_4$  or  $\text{CoSO}_4$  breaks indicate formation of (1)  $\text{M}(\text{CN})_2$ , and (2)  $\text{K}_2\text{Ni}(\text{CN})_4$ ,  $\text{K}_2\text{Zn}(\text{CN})_4$  and  $\text{K}_2\text{Co}(\text{CN})_6$ , resp. (cf. C. A. 4, 1723; 18, 2662). C. A. Silberrad

Stereochemistry of complex inorganic compounds. I. The Walden inversion as exhibited by diethylenediaminocobaltic compounds. John C. Bailar, Jr. and Robert W. Auten. *J. Am. Chem. Soc.* 56, 774 6 (1934). An unquestionable example of Walden inversion of an inorg. compd. is found. 1-Dichlorodithylenediaminocobaltic chloride (I) reacts with  $\text{K}_2\text{CO}_3$  to give the d-carbonato compd. (II),  $\text{Ag}_2\text{CO}_3$  gives the l-carbonato compd. Either  $\text{K}_2\text{C}_2\text{O}_4$  or  $\text{Ag}_2\text{C}_2\text{O}_4$  with I gives the dextro oxalato compd. (III).  $\text{HCl}$  and II give I, but  $\text{H}_2\text{C}_2\text{O}_4$  and II give III. Foster Dec Snell

Aminoformates of copper and zinc, relatively stable internal complexes involving four linkings. G. Gutzeit and R. Duckert. *Compt. rend. soc. phys. hist. nat. Geneve* 50, 168 73 (1933) in *Arch. sci. phys. nat.* 15, July-Aug. —The formulas  $(\text{NH}_2\text{COO})\text{M}^{\text{II}}$  are established. B. C. A.

Constitution of Stromholm's double salts  $2\text{MCl} \cdot \text{M}_2\text{Cr}_2\text{O}_7 \cdot 4\text{HgCl}_2 \cdot 2\text{H}_2\text{O}$ . G. Spacu and C. G. Macarovici. *Z. anorg. allgem. Chem.* 216, 263 72 (1934).—The following salts were prepd.:  $2\text{KCl} \cdot \text{K}_2\text{Cr}_2\text{O}_7 \cdot 4\text{HgCl}_2 \cdot 2\text{H}_2\text{O}$  (I),  $2\text{KCl} \cdot \text{K}_2\text{Cr}_2\text{O}_7 \cdot 4\text{HgCl}_2 \cdot 2\text{H}_2\text{O} \cdot 6\text{C}_6\text{H}_5\text{NH}_2$ ,  $2\text{KCl} \cdot \text{K}_2\text{Cr}_2\text{O}_7 \cdot 4\text{HgCl}_2 \cdot 2\text{H}_2\text{O} \cdot 8\text{C}_6\text{H}_5\text{NH}_2$ ,  $2\text{KCl} \cdot \text{K}_2\text{Cr}_2\text{O}_7 \cdot 4\text{HgCl}_2 \cdot 2\text{H}_2\text{O} \cdot 8\text{C}_6\text{H}_5\text{N}$ ,  $2\text{KCl} \cdot \text{K}_2\text{Cr}_2\text{O}_7 \cdot 4\text{HgCl}_2 \cdot 2\text{H}_2\text{O} \cdot 10\text{NH}_3$ ,  $2\text{NH}_4\text{Cl} \cdot (\text{NH}_4)_2\text{Cr}_2\text{O}_7 \cdot 4\text{HgCl}_2 \cdot 2\text{H}_2\text{O} \cdot 8\text{C}_6\text{H}_5\text{NH}_2$ ,  $2\text{NH}_4\text{Cl} \cdot (\text{NH}_4)_2\text{Cr}_2\text{O}_7 \cdot 4\text{HgCl}_2 \cdot 2\text{H}_2\text{O} \cdot 10\text{NH}_3$ . These double salts are obtained by the action of (I) on solns. of the basic compd. in  $\text{C}_6\text{H}_6$ . (I) is believed to have the

structure  $\begin{array}{c} \text{Hg} \text{---} \text{Cl} \\ | \\ \text{K}_2 \text{---} \text{H}_2\text{O} \end{array} \quad \text{Hg} \text{---} \text{Cr}_2\text{O}_7 \text{---} \text{Hg} \quad \begin{array}{c} \text{Cl} \text{---} \text{Hg} \\ | \\ \text{H}_2\text{O} \text{---} \text{K}_2 \end{array}$ . For the

other compds. similar coordination formulas are given in which the central group is the same and the nitrogen bases are represented as being bound to the 2 Hg atoms outside the central group. H. Stoertz

Constitution of potassium antimonyl tartrate and related antimony compounds. K. Bodendorf. *Pharm. Presse* 48, Wiss.-prakt. Heft 8 9 (1933).—Reihlen's formula is supported by therapeutic properties and analogies. Formulas are given for  $\text{NH}_4$  Sb dipyrocatechol oxide and  $\text{K} \cdot (\text{K} \text{ Sb bispyrocatechol disulfonate})$ . B. C. A.

## 7—ANALYTICAL CHEMISTRY

W. T. HALL

The development of analytical chemistry. P. F. 2 Thompson. *Chem. Eng. Mining Rev.* 26, 213-17 (1934).—A historical lecture

W. H. Boynton Laboratory instructions for students of quantitative analysis. I. Gravimetric determination of iron. A. H. Kunz and G. Sterling Bailey. *J. Chem. Education* 11, 247-9 (1934).—A series of 68 analyses proves that a double pptn. of  $\text{Fe}^{+++}$  by  $\text{NH}_4\text{OH}$  in the sepn. of  $\text{Fe}^{+++}$  from sulfate is unnecessary (cf. Pattinson, *J. Soc. Chem. Ind.* 24, 7 (1905)). W. T. H.

A series of simple basic indicators. III. The zero point of the acidity function scale. Louis P. Hammett and Martin A. Paul. *J. Am. Chem. Soc.* 56, 827-9 (1934); cf. *C. A.* 27, 39.—By measuring the ionization in dil. HCl of some azobenzene indicators, a zero of the scale of acidity functions was established. This  $H_0$  value is 0.29 unit below the zero adopted provisionally by Hammett and Deyrup. Acidity functions were detd. for HCl and  $\text{HNO}_3$  solns. up to 7 and 9.5 N. W. T. H.

Metric units of volume. W. O. Kermack. *Chemistry & Industry* 1934, 227 8 Because of the possible presence of the heavy isotope of H in water, it is claimed that the legal definition of the liter is faulty. W. T. H.

Conrady system of weighing as an aid to the chemist. W. H. J. Vernon. *Chemistry & Industry* 1934, 211-14. See *C. A.* 16, 2623. W. T. H.

Simultaneous standardization of tenth-normal hydrochloric acid and sodium hydroxide using calcite. A. J. Hammer. *J. Chem. Education* 11, 245-7 (1934). W. T. H.

Complete combustion in gas analysis. R. S. Yakovlev. *J. Applied Chem.* (U. S. S. R.) 6, 333-47 (1933).—The temp. required for a complete combustion of gas is about  $1050^\circ$ ; the use of a quartz tube is recommended. The combustion of  $\text{CH}_4$  requires more time than any other gas, and gas mixts. contg.  $\text{CH}_4$  need 7-10 min. for combustion. The soly. of various gas components (especially  $\text{CO}_2$ ) in the liquid seals is a source of error. The use of NaCl soln in the seals is recommended. For complete combustion  $\text{CO}_2$  should be absorbed after each transfer, and a gas high in CO should be passed 3-4 times through a  $\text{CuCl}_2$  soln. A. A. Bochtimsk

Reactions of Nessler's solution. M. L. Nichols and C. O. Willits. *J. Am. Chem. Soc.* 56, 769-74 (1934).—The color developed in Nessler's soln. by  $\text{NH}_3$  is due to negatively charged colloidal particles of  $\text{NH}_4\text{HgI}_2$ . The compn. was substantiated both indirectly and by analysis. With the soln. 3 N in NaOH the range of permanent color is increased by addn. of stabilized alk. ash-free gelatin as a protective colloid. F. D. S.

Separation of the components of the ammonium sulfide group. Johannes Kunz. *Helv. Chim. Acta* 17, 369-72 (1934).—In the procedure previously recommended (*C. A.* 26, 4552) it was assumed that Co could be sepd. from Ni by pptg.  $\text{Co}(\text{OH})_2$  with Br aq. in a well-buffered soln. This assumption is false, although the dark color produced is an excellent qual. test for Co and the depth of color gives a good indication of how much  $\text{KNO}_3$  is necessary in the pptn. of  $\text{K}_2\text{Co}(\text{NO}_3)_6$ . In the filtrate from this nitrite complex, Ni can be pptd. as  $\text{Ni}(\text{OH})_2$  by NaOH, or better as  $\text{Ni}(\text{OH})_2$  by NaClO and NaOH. In the analysis of the portion of the  $(\text{NH}_4)_2\text{S}$  ppt. that dissolves in dil. HCl, it is advantageous to ppt. Fe, Mn, Zn, Cr and Al by pouring the oxidized soln. into 100 cc. of boiling 3%  $\text{Na}_2\text{CO}_3$  soln. Then after filtering and drying the ppt., mixing with  $\text{KNO}_3$  and fusing with NaOH in a crucible of Ag, a melt is obtained from which  $\text{Na}_2\text{CrO}_4$ ,  $\text{Na}_2\text{ZnO}_4$  and  $\text{NaAlO}_2$  can be extd. with water. Any  $\text{MnO}_4^{--}$  that dissolves can be pptd. as  $\text{MnO}_2 \cdot \text{H}_2\text{O}$

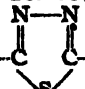

by adding  $\text{H}_2\text{O}_2$  to the alk. ext. The tests for Al, Cr and Zn are essentially as described in the former paper. In the analysis of the ppt. contg.  $\text{MnO}_2$  and  $\text{Fe}_2\text{O}_3$ , a 10% soln. of  $\text{K}_2\text{S}_2\text{O}_8$  is recommended for dissolving the  $\text{MnO}_2$ . From the soln.  $\text{MnO}_4^{--}$  can be formed by treatment with NaClO and alkali hydroxide. W. T. H.

The benzoate method. A new procedure for the separation of iron, aluminum and chromium from the other ions of the third group and the alkaline earth ions. I. M. Kolthoff, V. A. Stenger and B. Moskovitz. *J. Am. Chem. Soc.* 56, 812-15 (1934).—To 100 cc. of soln. contg. 0.05-0.2 g. of ions to be pptd., add  $\text{NH}_4\text{OH}$  until the ppt. that first forms redissolves very slowly on stirring. Then add 1 cc. of AcOH and enough  $\text{NH}_4\text{Cl}$  to make the total content at least 1 g. Slowly stir into the soln. 20 cc. of 10%  $\text{NH}_4$  benzoate soln. for every 65 mg. of Al, 126 mg. of Fe or 125 mg. of Cr, heat until boiling starts and keep at this temp. 5-20 min. according to whether Cr is absent or present. Filter and wash the ppt. with hot 1%  $\text{NH}_4$  benzoate soln. contg. 2% AcOH. For very precise work, dissolve the ppt. in acid and repeat the above procedure. Fe, Al and Cr are pptd. as basic salts. The sepn. is said to be more satisfactory than the classic basic acetate treatment, but, although no exact data are given concerning phosphate, it is said to divide between the ppt. and filtrate. W. T. H.

Determination of traces of arsenic by the method of Cribier. I. Experimental study of the mechanism of the technic. Henri Griffon and Maurice Buisson. *J. pharm. chim.* 18, 422-37 (1933); cf. *C. A.* 16, 35, 2385. —A crit. exptl. study of the exactness of the method is made. Results: (a) Whether 0.1 mg. or 0.0001 mg. As is employed, the colored band reaches its max. length simultaneously with the max. concn. of H evolved; this takes place within less than 20 min. Further evolution of  $\text{AsH}_3$  results in merely deepening the color of the stain. (b) The progressive increase of the length of the stain as a function of the total quantity of As employed thus depends on the manifest relation between the simultaneous evolution of maximal quantities of  $\text{AsH}_3$  and H. (c) Contrary to the belief of C., only about 33% of the As employed is volatilized, contributing to the formation of the stain. Yet this does not vitiate the value of the method, as the results based on color standards prepd. from known quantities of As are comparable, which is also confirmed by (a) and (b). When details are minutely observed, the method is extremely sensitive and reliable. A completely quant. evolution of  $\text{AsH}_3$  will still further increase its sensitiveness. Also in *Bull. soc. chim.* 53, 1548-63 (1933). S. Waldbott

Determination of small amounts of arsenic. G. A. Qunicke and M. Schmetka. *Z. Unters. Lebensm.* 66, 581-5 (1933).—A procedure is described for producing  $\text{AsH}_3$  electrolytically and causing it to react with paper impregnated with  $\text{HgCl}_2$ . F. L. Dunlap

Detection of bismuth by means of organic reagents containing sulfur. I. Detection with dimercaptothioazole. J. V. Dubsý and A. Okáč. *Z. anal. Chem.* 96, 267-70 (1934).—A suitable method for prepg

HS——SH is described. The reagent is prepd. by

dissolving 0.7 g. of  $\text{C}_2\text{H}_5\text{N}_3\text{S}_2$  in 35 cc. of 0.1 N KOH. A few drops of the reagent added to an acid soln. of Bi salt produces a red ppt. which is probably a mixt. of  $\text{Bi}(\text{C}_2\text{HN}_3\text{S}_2)_2$  and  $\text{Bi}(\text{C}_2\text{HN}_3\text{S}_2)_3\text{Cl}$ . The test is sensitive but not specific, since all the other members of the first 2 qual. groups give colored ppts. W. T. H.

A simple determination of chromium in steels containing vanadium and molybdenum. W. Erhard. *Mit. Forschungsanstalt. Gutehoffnungshütte-Konzern* 2, 268-70 (1934).—Dissolve the steel sample in  $\text{HNO}_3$ , oxidize with  $\text{KClO}_3$  and buffer the free  $\text{HNO}_3$  with  $\text{NaOAc}$ . To the cold soln. thus obtained add  $\text{Pb(OAc)}_2$  which ppt.  $\text{PbCrO}_4$  and  $\text{PbMoO}_4$  while  $\text{HVO}_3$  remains in soln. when not more than 4.3% V is in the steel. Cr can then be detd. iodometrically from the  $\text{PbCrO}_4$ . M. II.

New method for the volumetric determination of cobalt. G. Spacu and M. Kuraš. *Bul. soc. stiint. Cluj* 7, 377-83 (1934) (in French).—If a  $\text{Co}^{++}$  soln. is treated with pyridine and  $\text{NH}_4\text{CNS}$ , a pink ppt. of  $\text{Co(C}_6\text{H}_5\text{N)}_4(\text{CNS})_2$  is formed. A soln. contg. 0.02-0.05 g. Co in 50-60 cc. of water can be analyzed by heating on the water bath, adding 1 cc. of pyridine and a measured vol. of 0.1 N  $\text{AgNO}_3$ , filtering and titrating the excess Ag with thiocyanate with ferric alum as indicator. W. T. H.

Determination of nickel in steel. André Guédras. *Aciers spéciaux* 8, 373-4 (1933). Detn. with dimethylglyoxime and titration with KCN are described.

G. T. Motok  
Electroanalysis and macroelectroanalysis of nickel, with iron cathodes. J. Guzmán and G. García. *Anales soc. españ. fis. quim.* 32, 72-86 (1934).—Comparisons are made between Cu and Fe cathodes in Ni electrodetn. Cf. Guzmán, *ibid.* A. 26, 4550. The min. quantity of Ni necessary to deposit for quant. results with a new Fe cathode is 1.2 g. per 162 sq. cm. of cathode area. The best Ni deposits were obtained with an electrolyte contg. 5 g.  $(\text{NH}_4)_2\text{SO}_4$ , 3 g.  $\text{Na}_2\text{SO}_4$ , and 15 cc. of concd.  $\text{NH}_4\text{OH}$ , at 3 v. for 45 min. Poorer deposits were obtained with electrolytes contg.  $(\text{NH}_4)_2\text{C}_2\text{O}_4$ - $\text{NH}_4\text{OH}$ ,  $\text{HCO}_2\text{H}$ - $\text{NH}_4\text{OH}$ ,  $\text{Na}_2\text{HPO}_4$ - $\text{NH}_4\text{OH}$  in this order, and the worst with tartaric acid- $\text{NH}_4\text{OH}$ . E. M. Symmes

Potentiometric study of the quinhydrone electrode in the estimation of nickel. B. K. Chatterjee and J. B. Jha. *J. Indian Chem. Soc.* 10, 727-33 (1933). In a soln. contg. 0.34-0.09 g. of Ni in 25 cc. an end point is obtained at about  $\text{pH}$  7.5 in titrating with KCN which corresponds to the formation of  $\text{Ni(CN)}_4$ . W. T. H.

Indirect method for the potentiometric determination of nickel. G. Spacu and P. Spacu. *Z. anal. Chem.* 96, 270-7 (1934).—The method depends upon pptg. the Ni with  $\text{K}_2\text{CNS}$  and pyridine, whereby  $[\text{NiPy}_4(\text{SCN})_2]$  is formed, in which Py denotes pyridine. The excess of  $\text{K}_2\text{CNS}$  is then titrated with  $\text{AgNO}_3$  soln. To 10 cc. of Ni soln. in a 100-cc. measuring flask add 20 cc. of 0.1 N  $\text{K}_2\text{CNS}$  soln. and 0.6 cc. of pyridine. After the Ni ppt. has settled, fill with water to the mark, mix well and take 50 cc. of filtrate. Neutralize to methyl orange with  $\text{HNO}_3$ , add 30-40 cc. of water and titrate with  $\text{AgNO}_3$ . The results are within 0.5% of the truth. W. T. H.

Gravimetric determination of magnesium as magnesium ammonium arsenate. J. Dick and A. Rudnei. *Z. anal. Chem.* 96, 245-8 (1934).—The pptn. of  $\text{MgNH}_4\text{AsO}_4 \cdot 6\text{H}_2\text{O}$  is always preferable to that of  $\text{MgNH}_4\text{AsO}_4 \cdot 6\text{H}_2\text{O}$  except when it is desirable to remove the excess precipitant after the Mg ppt. has been removed. In that case there is danger of losing some As during the ignition of the filter. This danger of volatilizing As can be avoided, however, by weighing the ppt. on a Gooch-Neubauer or Munroe crucible. For pptg. 0.1 g. of Mg, the total vol. of soln. should not exceed 70 cc. To the concd. Mg soln. add 3-5 g. of  $\text{NH}_4\text{Cl}$  and 1 g. of Na or  $\text{NH}_4$  arsenate. Add concd. HCl dropwise until the ppt. dissolves, then make neutral to phenolphthalein and add concd.  $\text{NH}_3$  soln. equal to  $1/2$  of the total vol. After it has been in cold water 90 min., filter, wash with 2.5%  $\text{NH}_3$  soln., then with alc. and finally with ether. Weigh as  $\text{MgNH}_4\text{AsO}_4 \cdot 6\text{H}_2\text{O}$  after drying in a vacuum desiccator and wiping off the sides of the crucible with a linen cloth. The results of 10 expts. were all slightly high, but the greatest error was only a little more than 1% of the total Mg content of 0.03 g.  $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ . With a small crucible and a total vol. of 5 cc. fairly satisfactory results were obtained in the analysis of 3-11 mg. of Mg salt. W. T. H.

Semimicro, rapid, gravimetric determination of mag-

nesium as magnesium ammonium phosphate or as magnesium ammonium arsenate. L. W. Winkler. *Z. anal. Chem.* 96, 241-5 (1934).—To 20 cc. of boiling-hot aq. soln. contg. 0.15-0.9 g. of  $\text{Mg}^{++}$  add 0.5 g. of  $\text{NH}_4\text{Cl}$ , 1 cc. of 20%  $\text{NH}_3$  soln. and 2 cc. of 10%  $\text{Na}_2\text{HPO}_4$  soln. Shake a little, allow to cool 5 min. in the air and then for another 5 min. in cold water. Stopper the flask and shake vigorously for 5 min. Filter, wash with 10 cc. of 1%  $\text{NH}_3$  soln. and then with about 6 cc. of 96% alc. Draw dry air through the filter for 10 min. and weigh as  $\text{MgNH}_4\text{PO}_4 \cdot 6\text{H}_2\text{O}$ . The results are accurate within 0.3 mg. A similar procedure succeeds with  $(\text{NH}_4)_2\text{HAsO}_4$  except that the pptn. takes place in the cold and the flask is shaken once every 5 min. for 0.5 hr. The procedure succeeds also in a soln. from which the Ca has been pptd. as  $\text{CaC}_2\text{O}_4$  from 20 cc. of soln. contg. 0.5 g.  $\text{NH}_4\text{Cl}$ , 2 cc. of N  $\text{AcOH}$  and 4 cc. of 2.5%  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  (cf. *C. A.* 28, 12997). W. T. H.

A new test for potassium. Santiago A. Celis. *Anales. farm. bioquím.* (Buenos Aires) 4, 55-9 (1933). To 10 cc. of pure MeOH add 1 drop of a soln. contg. 7 g.  $\text{Co(NO}_3)_2$  dissolved in 50 cc. of 80% MeOH and 1 drop of a soln. contg. 10 g.  $\text{Na}_2\text{S}_2\text{O}_8$  in 50 cc. of water. When a violet color develops, add 1-4 drops of the soln. to be tested. A sky-blue ppt. is formed if  $\text{K}^+$  is present. The test is very sensitive. B. S. Levine

Methods for determining potassium. S. N. Rozanov. *Kabiz* (U. S. S. R.) 1933, No. 7, 17-34; cf. *C. A.* 27, 5025; 28, 1951<sup>6</sup>.—A review covering 218 papers. J. S.

Determination of sodium by the uranyl method. S. Z. Makarov and V. V. Bukina. *J. Gen. Chem.* (U. S. S. R.) 3, 581-91 (1933). The pptn. of  $\text{NaZn(UO}_2)_2\text{Ac}_2 \cdot 6\text{H}_2\text{O}$  gives excellent results even in the presence of salts of a large no. of other metals. The presence of K greatly interferes with the direct detn. of Na. When the ratio is  $\text{K/Na} > 20$ , a preliminary removal of K by the perchlorate method is necessary. W. P. Bricks

Detection of small quantities of tantalum and columbium. Walter R. Schoeller. *Z. anal. Chem.* 96, 252-7 (1934). The work of Rienacker and Schiff (*C. A.* 28, 68<sup>8</sup>) is criticized on the basis of prior work by S. (cf. *C. A.* 27, 2110). W. T. H.

Determination of tin. M. Frommes. *Z. anal. Chem.* 96, 280-9 (1934).—A review. W. T. H.

Volumetric determination of tin; use of potassium iodate. J. B. Ramsay and J. G. Blann. *J. Am. Chem. Soc.* 56, 815-18 (1934). To 50 cc. of soln. in 3 N HCl contg. about 0.15 g. of dissolved Sn in a 500-cc. Erlenmeyer flask add 1.5-2.0 g. of 20-mesh Zn. Cover with the lid of a porcelain crucible and incline the flask a little to one side. When the evolution of  $\text{H}_2$  stops, wash down the cover and sides with 10-15 cc. of water. Boil gently while passing a stream of  $\text{CO}_2$  through the flask for 10 min. Add 7-8 cc. of concd. HCl and 0.1 g. of  $\text{NiCl}_2$  or  $\text{CoCl}_2$ . Boil 5 min. to dissolve any pptd. metal, cool to room temp. in  $\text{CO}_2$ , add 100 cc. of 0.2 N  $\text{NaHCO}_3$ , make approx. 1 N in HCl and add  $\text{KIO}_3$  soln. until a slight yellow color due to free  $\text{I}_2$  is produced. Titrate this  $\text{I}_2$  with  $\text{Na}_2\text{S}_2\text{O}_3$ . The  $\text{SnCl}_2$  reduces the  $\text{IO}_3^-$  to  $\text{I}^-$  which reacts with excess  $\text{IO}_3^-$  to form  $\text{I}_2$ . The results are high if  $\text{Sh}^{+++}$  or  $\text{As}^{+++}$  is present. W. T. H.

Colorimetric estimation of uranium in low-grade ores. I. Chernichov and E. Guldina. *Z. anal. Chem.* 96, 257-63 (1934).—Digest 0.5 g. of the ore with 20 cc. of 7.5 N  $\text{H}_2\text{SO}_4$  and 5 cc. of 6 N HCl for 30 min. at the boiling temp. Dil. to 50 cc. and filter off the insol. residue. Ppt the sesquioxides by adding  $\text{NH}_3$  water (free from carbonate) together with 4-5 cc. of 3%  $\text{H}_2\text{O}_2$ . Filter and wash the ppt. with hot 3%  $(\text{NH}_4)_2\text{SO}_4$  soln. contg. a few drops of  $\text{NH}_4\text{OH}$ . Dissolve in a little hot 1% (by vol.)  $\text{H}_2\text{SO}_4$ . Electrolyze the soln. with a cathode of Hg at 4-5 amp. to remove Fe. In the electrolyzed soln. (not over 100 cc. in vol.) ppt. Al and U again with  $\text{NH}_4\text{OH}$  and  $\text{H}_2\text{O}_2$ . Dissolve the washed ppt. in 3%  $\text{H}_2\text{SO}_4$ . Add 6 N  $\text{NH}_4\text{OH}$  until a slight turbidity results, and dissolve this in as little  $\text{H}_2\text{SO}_4$  as possible. Dil. to 40 cc., add 5 cc. of 6 N  $\text{AcOH}$  and 15 cc. of 0.33 M  $\text{Na}_2\text{HPO}_4$  soln. Heat to boiling and add a little  $\text{Al}^{+++}$  if not

already present so that the uranyl phosphate ppt. will coagulate. After 10 min. filter, wash with  $N$   $NH_4NO_3$  soln., dissolve in hot 0.2%  $H_2SO_4$ , make up to 100 cc. and match the color produced on treating an aliquot part of the soln. with 10%  $K_4Fe(CN)_6$  soln. with that obtained similarly with known quantities of U.

W. T. H.

**Best conditions for the precipitation of zinc sulfide and aluminum hydroxide and a method for the gravimetric determination of zinc and aluminum.** C. Mayr. *Z. anal. Chem.* 96, 273-4(1934).—The assertion of Frers (*C. A.* 28, 431<sup>3</sup>) that the proper  $pH$  had not been detd. prior to his work is disputed.

W. T. H.

**Determination of zirconium.** M. Frommes. *Z. anal. Chem.* 96, 288-91(1934).—A review.

W. T. H.

**Detection and determination of small quantities of mercury.** F. Cucucl. *Mikrochemie* 13, 321-64(1933). A review of 180 papers, most of them recent.

W. T. H.

**Determination of nitrogen.** K. Fresenius. *Z. anal. Chem.* 96, 298-300(1934). A review.

W. T. H.

**Analysis of crude sulfur.** Salvatore Vinti. *Ann. chim. applicata* 23, 573-6(1933). The best results are obtained by dissolving S in  $CS_2$  (together with the bitumen), then detg. the bitumen by oxidation with  $H_2SO_4$  (concd.). The Fresenius and Beck method of distg. the S at 200-220° usually shows slightly higher values of S and lower for bitumen, because of some volatilization of the latter.

A. W. Contieri

**Sensitive test for the iodate ion.** G. Spacu and P. Spacu. *Bul. soc. stiinta Cluj* 7, 398-9(1934)(in French).—If a few drops of 0.1 molar  $Hg_2(NO_3)_2$  is added to a soln. of 0.03 mg. or more of iodate, a white ppt. of  $Hg_2(IO_3)_2$  is formed. An excess of the reagent must be avoided or the ppt. will dissolve.

W. T. H.

**The microchemical identification of some cations with the aid of  $\alpha$ -aminopyridine.** Adolfo Sá. *Anales. farm. biogéom.* (Buenos Aires) 4, 77-80(1933).  $\alpha$ -Aminopyridine and  $NH_4SCN$  form characteristic crystals with  $Co^{++}$ ,  $Cu^{++}$  and  $Zn^{++}$ . Four photomicrographs are shown.

B. S. L.

**Indirect determination of halogen hydride acids.** Th. I. Pirtea. *Z. anal. Chem.* 96, 263-6(1934).—To a soln. contg. KCl and KBr add an excess of  $AgNO_3$ , filter and weigh the  $AgCl + AgBr$ . Dissolve the weighed ppt. in a hot satd. soln. of KBr. Add a little  $HNO_3$ , dil. and filter off the  $AgBr$  and weigh. In case the soln. contained KCl and KI, proceed similarly but use a satd. soln. of KI to dissolve the ppt. The KI soln. dissolves the  $Ag$  halides more readily than does KBr soln. If all 3 halides are present, treat the weighed  $Ag$  ppt. with KBr soln. first to dissolve out  $AgCl$  and  $AgBr$  and then with KI to dissolve the  $AgI$ .

W. T. H.

**Determination of chlorogenic acid by the method of H. Jurany.** W. Plucker and W. Keilholz. *Z. anal. Chem.* 96, 249-52(1934); cf. Jurany, *C. A.* 28, 229<sup>2</sup>.—It is claimed that the conclusions drawn by J. are untenable.

W. T. H.

**Comparative clarification of sugar solutions. Copper reduction and iodine titration methods.** L. G. Saywell and E. P. Phillips. *Ind. Eng. Chem., Anal. Ed.* 6, 116-17(1934).—When neutral  $Pb(OAc)_2$  and  $Na_2C_2O_4$  were used for clarifying invert sugar solns., complete recovery was obtained by the iodometric method and 99.7% recovery by the Cu reduction method.

Amy Le Vesconte

**The estimation of plant poisons in Chili saltpeter.** E. S. Tomula and Katri Pelkonen. *Acta Chem. Fennica* 7B, 58(1934)(in German).—To det.  $Cl^-$  dissolve 10 g. of the sample in water and titrate with  $AgNO_3$  by the method of Volhard. To det.  $ClO_3^-$  treat a similar sample with 0.5 g. mossy Zn, 6 ml. of 2  $N$   $H_2SO_4$  and 1-2 drops of 10%  $CuSO_4$  soln., heating 0.75 hr. on the water bath to reduce  $ClO_3^-$  to  $Cl^-$ . Titrate with  $AgNO_3$  as before, allowing for the  $Cl^-$  originally present. To det.  $ClO_4^-$  dissolve 10 g. of the salt in water and add 3-5 ml. of 40% formalin, 1 ml. of 0.5  $N$   $FeCl_3$  and 2 ml. of 6  $N$   $HNO_3$ . Heat 0.5 hr. on the steam bath, add 20 cc. of concd.

<sup>1</sup>  $HCl$  and evap. to dryness. Take up in a little water and repeat the evapn. with concd.  $HCl$ . After 4 evapns. with  $HCl$  treat the residue with 60 ml. of concd.  $HCl$  and filter off  $NaCl$  through a Jena filter. Evap. the filtrate to dryness and weigh the residue. Analyze an aliquot for  $Cl^-$  by the  $AgNO_3$  titration. To the remainder add the exact vol. of  $Ag_2SO_4$  required to combine with all  $Cl^-$ , filter and in the dild. filtrate reduce the  $ClO_4^-$  to  $Cl^-$  with  $Ti^{++}$  and  $Fe^{++}$  and titrate with  $AgNO_3$ .

S. A. Karjala

**Physiological identification of strychnine in forensic toxicology.** A. Seria Negrão. *Arch. med. legal* 5, 45-50(1932).—White mice 14-16 days old are preferable to frogs for identification of strychnine. Injection of a min. of 0.001 mg. of the nitrate or sulfate induces tetany accompanied by a characteristic tremor in the tail.

B. C. A.

<sup>3</sup> **Detection of hydrocyanic acid in cadavers in cases of poisoning.** Otto Schmidt. *Deut. Z. ges. gericht. Med.* 21, 334-6(1933).—To 2 cc. of 10%  $KOH$  add water and about 10 drops of yellow  $(NH_4)_2S_2$  soln. Moisten a strip of filter paper with this soln. and hang in a closed vessel, as in the Schonbein-Färgenstein guaiac-Cu sulfate test, before using for the cadaver material. The addn. of dil.  $H_2SO_4$  liberates  $HCN$ . If  $Hg(CN)_2$  poisoning is suspected, it is necessary to add  $NaCl$ . The  $KCN$  formed on the paper strips is converted to  $KCNS$  by carefully heating in a test tube. Cool and add a slightly acid soln. of  $FeCl_3$ ; if 0.1 mg. of  $HCN$  per l. is present, red  $Fe(CNS)_2$  is formed.

Frances Krasnow

**The determination of blood alcohol by the method of D. Widmark, and its forensic importance.** Josef Koller. *Deut. Z. ges. gericht. Med.* 21, 269-74(1933); cf. *C. A.* 27, 1651.—It is important to do blanks on all solns. and also analyze a known alc. mixt.

Frances Krasnow

<sup>5</sup> **The incineration of small laboratory animals for the determination of bismuth.** C. Mesgrez, M. Glaume and R. Wolff. *Bull. soc. chim. biol.* 15, 1527-34(1933). In the destruction of org. matter of animal tissues by  $HCl$  and  $KClO_3$  some loss of Bi occurs. Rapid incineration at red heat also causes a loss. A satisfactory method is to cut up the tissues or the whole rat or guinea pig in a porcelain dish, dry at 100-120° 2-3 days, heat in a muffle below dull red heat until gassing ceases, grind the residue and ignite to a gray ash over a Bunsen burner with occasional stirring. The ash is treated with  $HCl$  and the Bi pptd. as  $Bi_2S_3$ , then converted into the yellow  $K$  iodobismuthate and detd. colorimetrically. A few mg. of Bi in a guinea-pig carcass can be detd. with a possible error of 2%.

J. E. Gilson

<sup>7</sup> **Can the kind of powder be determined microscopically from the traces of powder after a shot?** W. Karhan. *Deut. Z. ges. gericht. Med.* 21, 451-6(1933). Microscopic examn. detcs. only whether nitro or black powder was used.

Frances Krasnow

**The retention on clothing of traces of nitro and black powder from nearby shots.** Walter Karhan. *Deut. Z. ges. gericht. Med.* 21, 202-25(1933).

F. K.

<sup>8</sup> **Catalytic microhydrogenation of organic compounds.** Richard Kuhn and Ernst F. Möller. *Angew. Chem.* 47, 145-9(1934). An app. based upon the principle of the differential manometer is described. From 1 to 5 mg. of substance is dissolved in a suitable solvent and treated with  $H_2$ , and the course of the pressure is observed for the unknown and for a comparative standard. The accuracy of the method is  $\pm 0.5\%$ . The equations for the calcn. of the no. of double bonds are derived. Exptl. data are presented for 26 compds., which include hydrocarbons, xanthophylls, polycyclohexenoic acids, carbonylpolycyclohexenes, vitamins. Sorbic acid was used as a comparative standard. The use of solvent mixts. frequently exerted a favorable influence on the velocity of hydrogenation, e. g., for carotenoids mixts. of decalin and glacial  $AcOH$  (1:2 to 2:1).  $PtO_2$ ,  $PdO_2$  and  $SiO_2-Pt$  were used as catalysts.

Karl Kammermeyer

<sup>9</sup> **New method for determination of diolefin hydrocarbons in gas.** A. A. Korotkov. *Sintet. Kauchuk* 1933, No. 4, 23-31.—The app. is described in detail. It has a gradu

ated buret for holding the gas and a "reactor" [U-shaped tube contg. malic anhydride reacting with the butadiene of the gas], which is immersed in boiling water to keep the reagent in a molten state. The upper parts of the U-shaped tube and the buret are water-jacketed to cool the gas leaving the reactor and maintain a const. temp. in the app. outside the reaction zone. The procedure for carrying out the analysis and the advantages of the app. are discussed.

**Determination of butadiene in gases.** Hans Tropsch and W. J. Mattox. *Ind. Eng. Chem., Anal. Ed.* 6, 104-6 (1934).—The method is the same as that of the preceding abstr.

**Determination of acetylene.** A. Krauss. *Azetylen Wiss. Ind.* 35, 73 5 (1932). An app. for detg.  $C_2H_2$  in welding gases is described.

**Determination of the air content of high-percentage acetylene.** M. Korschak. *Azetylen Wiss. Ind.* 35, 118-22 (1932).

**Determination of air in high-percentage acetylene.** C. Assmann. *Azetylen Wiss. Ind.* 35, 184 6 (1932).—Korschak's method (preceding abstr.) is troublesome, but gives accurate results.

**The detection of alcohol denatured with pyridine bases in incendiarism.** Oskar Schmidt. *Angew. Chem.* 47, 151-2 (1934).—The reaction of pyridine with  $CNBr$  and aniline gives a yellow to red color which is definite proof of the presence of pyridine. Aniline can be replaced by  $p$ -phenylenediamine or  $\beta$ -naphthylamine. Charred wood which has not been treated before charring with denatured alc. gives distillates which do not react with the amines and  $CNBr$ . Therefore these color reactions, if pos., can be used as proof of the presence of alc. denatured with pyridine bases in charred wood or the like.

**Determination of the composition of recovered alcohol-benzene mixture.** Franz Khyut and R. L. Grodzinskaya. *Bumazhaya Prom.* 12, No. 11, 37 9 (1933). The detn. is based on the oxidation of  $EtOH$  to  $AcOH$  with  $K_2Cr_2O_7$ .

**Determination of alkyl alcohol sulfonates in dilute solution.** W. Kling and F. Puschel. *Melliand Textilber.* 15, 21 3 (1934). The alkyl alc. sulfonate is pptd. with benzidine-HCl, filtered, dissolved in hot alc. to sep. it from inorg. sulfate and the benzidine alkyl sulfate is titrated with  $NaOH$ . Results with a soln. contg. 0.1 0.2 g./l. were within  $\pm 5\%$ .

**Acidimetric determination of formaldehyde and sulfites.** Malaprade. *Compt. rend.* 198, 1037-9 (1934). The soln. of  $HCHO$  under examn. is neutralized, an excess of neutral aq.  $Na_2SO_3$  is added, and the resultant  $NaOH$  is titrated:  $HCHO + Na_2SO_3 + H_2O = HCHO(NaHSO_3) + NaOH$ . Conversely, to det. sulfite an excess of neutral  $HCHO$  is added to the sample which must have been neutralized in absence of air, and the resultant  $NaOH$  titrated with phenolphthalein; all other neutralizations should be with thymolphthalein as indicator.

**A volumetric method for determining furfural in pentoses and pentosans.** V. S. Sadikov and K. S. Belkova. *Schriften Zentral. biochem. Forschungsinst. Nahr.-Genuss-mittelind.* (U. S. S. R.) 3, 209 307 (1933).—The Kullgren-Tveden volumetric method for furfural and xylose, e. g., in pentosans, with  $NaCl$  for distg. furfural, is equal to the Tollens' gravimetric method in accuracy and superior in convenience and in temp. uniformity during distn. of  $HCl$ . The Tolman colorimetric method is not sufficiently accurate.

**Determination of organic acids.** R. I. Sotnikov. *Compt. rend. acad. sci. U. R. S. S.* 1933A, No. 6, 83-7.—To det. oxalic and citric acids formed in plant tissue as a result of metabolism, take 10-20 cc. of soln. to be analyzed, add 10 cc. of 15-20%  $AcOH$  and 20-30 cc. of water. Heat to boiling, add 10 cc. of 10%  $CuCl_2$  and continue boiling for 3 min. After it has stood 12-16 hrs. at room temp., filter off the  $CaC_2O_4$  ppt., wash and dissolve in 80-100 cc. of boiling 5%  $H_2SO_4$  and titrate hot with 0.1  $N$   $KMnO_4$ . To the filtrate from the  $CaC_2O_4$

ppt. add 1-2 drops of phenolphthalein soln. and  $NH_4OH$  to alk. reaction. Boil to expel almost all excess  $NH_4OH$ . Without cooling, filter off the ppt. of  $Ca$  citrate and wash with hot water until free from chloride. Dissolve the ppt. in 10-20 cc. of 0.1  $N$   $HCl$ , neutralize with 10-20 cc. of 0.1  $N$   $NaOH$  and add 10 cc. of 10-15%  $AcOH$ . Heat to boiling and ppt. the  $Ca$  equivalent to the citric acid with 10-25 cc. of boiling 2% oxalic acid. Filter, wash and titrate this  $CaC_2O_4$  ppt. as above.

**Identification of  $p$ -chlorobenzoic acid in the presence of benzoic acid.** F. Weiss. *Z. Untersuch. Lebensm.* 67, 84-6 (1934).—The Grossfeld modification of the Mohler reaction is carried out as a ring reaction, in that a soln. of hydroxylamine is poured as a layer over the reaction liquid. The nitration product of  $p$ -chlorobenzoic acid gives a green coloration, that of benzoic acid an orange-red one. In the identification of benzoic acid by the Mohler reaction as carried out by Grossfeld, consideration should be given to the fact that  $p$ -chlorobenzoic acid likewise gives a red coloration. An approx. quant. sepn. of  $p$ -chlorobenzoic acid and benzoic acid may be brought about by the difficult soly. of the former in  $H_2O$ .

**The microscopic determination of barbital and of dial by means of ammoniacal silver nitrate, with a crystallographic study.** C. Strzyzowski and L. Déverin. *Helv. Chim. Acta* 16, 1288-91 (1933).—The treatment of small quantities of barbital with warm ammoniacal  $AgNO_3$  gave octahedral crystals while the similar treatment of diallyl-barbituric acid gave needle clusters. The 2 crystal forms are discussed.

**Detection of sucrose in lactose.** M. Wagenaar. *Pharm. Weekblad* 71, 281-4 (1934). The method is based on the fact that ketoses (fructose) give a violet color with  $\alpha$ -naphthol and  $H_2SO_4$  while aldoses remain colorless. A 5-mg. sample of the lactose is suspended in a drop of a glycerol soln. of  $\alpha$ -naphthol, and a drop of concd.  $H_2SO_4$  stirred in with a Pt wire. If sucrose is present, a blue-violet color develops within 10 min. The reaction may be rendered more sensitive by warming the mixt. 0.5 min. on a steam bath and comparing the color with that of a control test with pure lactose. One % of sucrose can readily be detected.

**Determination of hydroquinone with particular reference to its determination in salt herrings.** W. Preiss. *Z. Untersuch. Lebensm.* 67, 144-60 (1934). It is shown by expt. that in the iodometric detn. of hydroquinone (in small amts.) the use of  $KHCO_3$  for neutralization leads to incorrect results. If  $CO_2$  is used to full satn. before introducing the  $KHCO_3$ , the method is usable. The use of either  $Na_2HPO_4$  or  $AcONa$  is preferable. Statements in the literature to the contrary, quinone can be distd. with water vapor without decompn. if one maintains a suitable  $pH$ . On the basis of this fact, a distn. method was worked out which seps. the hydroquinone and quinone in a simple fashion from other substances and they are then detd. The qual. methods for detecting hydroquinone and quinone are discussed and a new sensitive method is given for identifying them in salt-hydroquinone mixts. Convenient methods are given for the identification of hydroquinone and quinone in herring brine and in salt herring, as well as for their detn. in salt mixts. and of hydroquinone in herring brine and in salt herring. Hydroquinone undergoes changes through the action of other substances in herrings, whereby the hydroquinone content decreases on letting the herrings stand. Expts. indicate that this reduction in the amt. of hydroquinone is due to reactions of quinone produced by the oxidation of the hydroquinone. Twenty-two references.

**Methods for determining nicotine.** P. Koenig and W. Dörr. *Z. Untersuch. Lebensm.* 67, 413-44 (1934).—The physiol., colorimetric and nephelometric procedures for the detn. of nicotine are not satisfactory. The titrimetric detn. of nicotine by the methods of Toth, Rundshagen, Keller, Bodnar and some others detn. some of the  $NH_3$  and other bases. To a great degree, these methods depend on the alkyl, fineness of the material

and the method of extn. Because of the significant errors that arise, these methods should be abandoned. Only the Küssing method with modifications can lay claim to accuracy. The gravimetric detn. of nicotine according to Javillier, Rassmussen and Mach, as modified by Peter, is suitable for the exact detn. of nicotine if the cryst. ppt. is further worked up according to the proposals of the authors. The maintenance of a controlled HCl concn. is of great importance. The selective pptn. methods of Pfyl and Schmitt fulfil in all cases the basic requirements for a method of that character. A no. of modifications suggested by the authors do not in the least alter the basic principles of the method, but make the carrying out of the analysis much easier. For analysts who make only single detns., the authors recommend the silicotungstic acid pptn. method in its modified form. For more extended investigations, especially where a series of detns. must be made, the picric acid method possesses the merit of ease of operation and an accuracy which satisfies all demands, this limit being 0.5 mg. Almost 100 references. F. L. Dunlap

Gravimetric and volumetric determination of antipyrine in the presence of amidopyrine. I. M. Kolthoff. *J. Am. Pharm. Assoc.* 22, 947-50 (1933).—The iodometric method for the detn. of antipyrine is not applicable in the presence of amidopyrine. However, in acid media antipyrine yields with  $K_4Fe(CN)_6$  a cryst. ppt. of  $(C_{11}H_{13}N_3O)_2H_2Fe(CN)_6$ , whereas amidopyrine does not react. From 0.2 to 0.3 g. of antipyrine is dissolved in 30 cc. of 0.8 N HCl and 20 cc. of 0.5 M  $K_4Fe(CN)_6$  added with stirring. After standing for 30 min. the ppt. is collected in a weighed Gooch crucible, by using the filtrate for transferring. The ppt. is washed with  $H_2O$  freshly satd.

with the ppt., the residue dried at  $105-10^\circ$  and weighed. A correction of 0.005 g. is added for soly. The ppt. contains 63.53% of antipyrine. For the volumetric detn. the undried ppt. is suspended in  $H_2O$  and dissolved with stirring in a measured excess of 0.05 N or 0.1 N NaOH in the presence of phenolphthalein. The ppt. dissolves slowly and the alkali is added until the pink color persists for 2-3 min. A blank should be run with  $H_2O$ . A correction of 0.34 cc. of 0.1 N NaOH is added for the soly. of the ppt. 1 cc. of 0.1 N NaOH = 0.0094 g. of antipyrine. The method is not recommended for quantities less than 0.1 g. L. E. Warren

Effect of the surface of the oxidizing agent on the rate of oxidation of CO [detn. of small concns. of CO] (Astapenya, *et al.*) 2

Gas analysis. Svenska Aktieförlaget Mopra and Olof Rodhe. Brit. 403,324, Dec. 21, 1933. In a method of gas analysis involving alternate dissimilar detns., e. g., of  $CO_2$  alone and  $CO + CO_2$ , resp., a difference between successive detns. is used to operate a signaling or controlling device. App. is described.

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

RODGER L. WHERRY AND J. F. SCHAIERER

The dependence of the luminescence in minerals on their occurrence and their formation. St. Kreutz. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1933A, No. 4 8, 215-25. —Fluorite, apatite, topaz and calcite were illuminated by light with  $\lambda$  3890. The color, intensity and wave-length limits of the fluorescent light are recorded. A. B. F. Duncan

Frequent presence of pyrite crystals in the diatoms of lacustrine chalk: their probable bacterial origin. E. Joukowsky. *Compt. rend. soc. phys. hist. nat. Genève* 50, 182-5 (1933) (*Arch. sci. phys. nat.* 15, July-Aug.).—Descriptions are given. B. C. A.

Mineralogy of cassiterite and other pegmatitic and pneumatolytic minerals. B. N. Artem'ev. *Bull. acad. sci. U. R. S. S. Classe sci. math. nat.* No. 8, 1125-44 (1933).—A discussion of the physicochem. properties of cassiterite, beryl, columbite, tantalite and monazite with regard to the place and time of their crystn.

V. D. Karpenko

The chemical composition of pegmatitic and magmatic alkali feldspars. B. Zamewska-Chlipalska. *Centr. Mineral. Geol.* 1934A, No. 3, 91-3; cf. C. A. 27, 2052; Chudoba, C. A. 27, 5033. Reply. Karl Chudoba. *Ibid.* 93.—Polemic. Michael Fleischer

Anapaite, enigmatite and eudidyimite. C. Palache. *Z. Krist.* 86, 280-91 (1933).—Anapaite,  $Ca_2Fe(PO_4)_2 \cdot 12H_2O$ , is triclinic,  $a:b:c = 0.8575:1:0.9401$ ,  $\alpha = 108^\circ 56' 40''$ ,  $\beta = 104^\circ 5' 40''$ ,  $\gamma = 78^\circ 25' 24''$ . Enigmatite (or cosvyrite) (cf. Gossner and Musgrug, C. A. 24, 2403) is triclinic,  $a:b:c = 1.0014:1:0.5853$ ,  $\alpha = 97^\circ 2' 5''$ ,  $\beta = 96^\circ 49' 5''$ ,  $\gamma = 112^\circ 26' 5''$ . Eudidyimite is monoclinic,  $a:b:c = 1.7103:1:1.8951$ ,  $\beta = 76^\circ 42'$ . Previous results are discussed. B. C. A.

The wöhlerite and mosandrite groups. B. Gossner and O. Kraus. *Centr. Mineral. Geol.* 1934A, 72 9; cf. C. A. 27, 5684; 28, 9937.—Rotation spectrograms and goniometric measurements gave: wöhlerite (I)  $a = 10.80$ ,  $b = 10.20$ ,  $c = 7.26$  A.,  $\beta = 108^\circ 57'$ ; *lavenite* (II)  $a = 10.93$ ,  $b = 9.99$ ,  $c = 7.18$  A.,  $\beta = 110^\circ 18'$ ; *hioridahlite*

(III)  $a = 10.91$ ,  $b = 10.29$ ,  $c = 7.32$  A.,  $\alpha = 90^\circ 29'$ ,  $\beta = 108^\circ 50'$ ,  $\gamma = 90^\circ 8'$ . Though III is triclinic, its close agreement in chem. compn. places it in this group. The general formula for the group is  $(SiO_4)_2(ZrF)Ca_2Na$ . In I about 40% of (ZrF) is replaced by (CbO), in II, 20% of  $Ca_2$  by  $Zr_1$ , in III about 25% of (ZrF)Na by  $Ca$ . For mosandrite  $a = 18.47$ ,  $b = 5.67$ ,  $c = 7.46$  A.,  $\beta = 91^\circ 13'$ ; *rinkite*  $a = 18.37$ ,  $b = 5.63$ ,  $c = 7.42$  A. The general formula for the group is  $(SiO_4)_2[(Ti,Ce)F]Ca_2Na$ . In *johnstrupite*, (TiF)Na is partly replaced by  $Ca_2$ , while in mosandrite, there is apparently an open structure with II replacing Na and OH replacing F. M. F.

A geophysical exploration in Chile. N. Gella and M. Bertram Bateman. *Mining Mag.* 50, 84 5 (1934). Gold ore occurs at the Chivato mine, 15 km. south of Talca, as a mineralized zone in a granodiorite. With the typical pyrite, chalcopyrite, galena and cinnabar have also been deposited. Decompn. has produced limonite, resulting in a certain recon. of the Au at a lower horizon in faults and fissures. A new zone has been opened up through this geophys. exploration. A. W. Furbank

The Climax molybdenum deposit, Colorado. B. S. Butler, J. W. Vanderwilt and Charles W. Henderson. *U. S. Geol. Survey Bull.* 846-C, 195-237 (1933). E. H.

Ore deposits in the Tertiary of Sardinia. Giovanni Pavan. *Riscontri assoc. mineraria sarda* 38, No. 7, 9-23 (1933).—Pb and Zn sulfides in these deposits are scarce, of greater importance are the Cu and Cu-Fe sulfides and Mn minerals (contg. Mn 15-38,  $SiO_2$  15-25, Fe 1-5%). The most important minerals are kaolin and lignite. Kaolin is practically free from  $MgO$  and contains a max. of 1.8%  $Fe_2O_3$ , 50-60%  $SiO_2$  and 30-40%  $Al_2O_3$ ; it is a good material for the manuf. of refractory and porcelain ware. The lignite contains great quantities of S, and has 5500-6000 cal.; by distn. at low temp. it gives (for 100 pts. of lignite): 3 pts. benzine, 1 pt. petroleum, 2 pts. gas oil, 0.75 pt. phenols, 2 pts. S, 6 pts. gas (at 6500 cal.) and 65 pts. of semicoke. G. A. Bravo

The talc and steatite deposits of Orani (Sardinia).

Luigi Gerbella and Giuseppe Alfano. *Riscontri ass. mineraria sarda* 39, No. 1, 14-17 (1934).—The eruptive granite rocks were transformed into tremolite, which, in the Tertiary, was transformed into talc. Several uses of these minerals are suggested.

G. A. Bravo. The deposits in the southern part of Baichunas, Ural-Emba district. Geological structure and crude oil deposits. Kh. V. Buskin. *Neftyanoe Khosyaistvo* 26, No. 1, 12-19 (1934).—B. discusses geography, stratigraphy, prospecting work, capacity of the oil-bearing strata, phys. and chem. properties of the crude oils, and compn. of waters. The characteristics of the crude oils, depending upon the depth of the deposit were: sp. gr. 0.8751-0.8930,  $E_v$  viscosity 2.32-5.14, resins 3.6-4.7, gasoline 0.3-0.6, heavy naphtha 0.5-0.87, kerosene 8.3-17.25, gas oil 1.13-11.2 and bottoms 68.55-79.7%. The borehole water had the av. compn.: alkyl. 0-5.4, sp. gr. 1.1427-1.1490, dry residue 187.4-250.4,  $Ca^{++}$  0.942 g per l.,  $Mg^{++}$  0-6.895,  $Na + K^{+}$  49.804-78.662 g./l.,  $SO_4^{--}$  0-1.363 g./l.,  $Cl^{-}$  97.44-137.088 g./l.,  $HCO_3^{-}$  0.043-0.433 g./l. The analytical procedure is described.

A. A. Boethlingk. Survey of gas deposits in the Melnikov gas fields, lower Volga river. V. A. Sokolov and Yu. K. Yur'ev. *Neftyanoe Khosyaistvo* 26, No. 1, 20-2 (1934). The compn. of gases obtained through drilling up to a depth of 100 m. and suction exercised by the difference in the water level in bottles placed on the ground was  $CO_2$  1.5-3,  $O_2$  16.8-20.2, and hydrocarbon gases about 0.01%. The radioactivity of the gases was 0.62-1.88 divisions of the electroscope per min.

A. A. Boethlingk. Aegirine-augite hyalo-rhyolite from Tokachi, Hokkaido. Tadahiyo Nemoto. *Proc. Imp. Acad. (Tokyo)* 10, 21-4 (1934).—The microscopical character and chem. compn. are given.

E. R. Rushton. Genesis of a lithium pegmatite on the Bear mineral claim, southeast Manitoba. C. H. Stockwell. *Trans. Roy. Soc. Can. IV* 27, 27-36 (1933).—The materials of the pegmatite body crystallized chiefly from the magma of the dike beginning at the surface of contact with the walls and progressing inward into the magma. Replacements took place between the solidifying magma and the crystal structures formed, eventually leading to the distribution of minerals as found.

J. W. Shipley. Genesis of pegmatites of southeast Manitoba. C. H. Stockwell. *Trans. Roy. Soc. Can. IV* 27, 37-51 (1933).—The pegmatites of southeast Manitoba (dominantly of microcline and quartz) formed chiefly by crystallization from the magma, while those with biotite and magnetite were formed entirely by this process. Replacements took place from residual and interstitial solns.

J. W. Shipley. Composition of basic rocks, intrusive and metamorphic,

of the Kasai, Belgian Congo. M. E. Denayer. *Compt. rend.* 198, 956-8 (1934).—These include hypersthene-gabbros, dolerites passing into basalts, with spessartite and aegirites, all apparently derived from the same magma; associated with them are amphibolites, with much diopside and plagioclase, and also an orthoamphibolite contg. zoisite. Magmatic parameters are given for 11 varieties. Mt. Musungu, near Satsbigioia, consists of a dark red rock made up of red garnet, magnetite and hypersthene with vein quartz.

C. A. Silberrad. Nature of alteration of feldspars in granite sands of the Vosges. A. S. Mihara. *Compt. rend.* 198, 955-6 (1934).

The white altered feldspars of the sands, etc., formed from the granite of Hohwald (Vosges) contain 55% plagioclase, 36% phyllites (28 sericite and 8 kaolinite) and 9% free  $SiO_2$ . Analyses of altered (*i. e.*, with sericitized feldspar), but not yet disintegrated granite compared with one of the granite-sand shows insufficient  $Al_2O_3$  in the former for kaolinite to be present there as such; this must, therefore, result from sub-aerial action accompanying disintegration.

C. A. S. The volcanic region of Vesuvius: a chemical and geographical study. I. The high zone. O. Bottini. *Ann. sper. agrar. (Rome)* 12, 7-56 (1933). II. The plains zone. *Ibid.* 57-81. The chem. analyses of the soils near Vesuvius (51 samples from the high zone and 47 from the plains) are given. The soils are very rich in fertilizing elements. The  $H_2O$  content is 4-5.5,  $P_2O_5$  0.3-0.5, humus 1-3, N 0.1-0.2%. The Ca content is variable. The reaction of the soils is generally acid, although the rocks from which they are formed are basic; this is due to the presence of org. matter.

G. A. Bravo. Analysis of gas extracted from monazite and ilmenite. Piero De Cori. *Atti IV Congr. naz. chim. pura applicata* 1933, 714-20.—Ilmenite from Travancore (India), heated to 1100° in *vacuo* produced 52.04 cc. of gas per 100-g. sample, the gas contg.  $CO_2$  86.10,  $CO$  5.43,  $N_2$ ,  $H_2$ , rare gases 8.47%. Helium recovered was 0.380 cc. per 100 g. of sample. A monazite sand from Polynesia, heated to 1100°, produced a gas contg.  $CO_2$  24.3,  $CO$  9.1,  $H_2$  30.3,  $He$  34.5, hydrocarbons 1.7%. Helium recovered was 63 cc. at 800°, 68 cc. at 900°, 50.23 cc. at 1100°. Radioactivity of the sample, compared to  $U_3O_8$ , was about 5 times less than would correspond to the He content.

Deutsches Bergbau-Jahrbuch. Jahrbuch der deutschen Braunkohlen-, Steinkohlen-, Kali- und Erzindustrie, der Salinen, des Erdöl- und Asphaltbergbau. Jg. XXV. Edited by Heinrich Hirt and Wilhelm Pothmann. Halle: W. Knapp. 52 pp. M. 14.50.

## 9 METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, OSCAR E. HARDER AND RICHARD RIMBACH

Experimental work in the field of flotation reagents. D. A. Shvedov. *Results and Achievements Field of Ore Dressing, U. S. S. R.* 1932, 49-73. —A description of the work done at the Inst. of Mekhanobr. S. L. Madorsky.

Electrokinetics of flotation. J. Proszki and L. Ūrmosi. *Mitt. berg-huittenmann. Abt. ungar. Hochschule Berg-Forstw. Sopron* 5, 22-37 (1933).—Examn. of 3 essentially different coarsely disperse systems (galenite, quartz suspensions and a paraffin oil emulsion) showed quite different behavior and sensitivity toward the same electrolyte. Measurements of the velocity of settling of these systems by means of a special app. proved that the degree of coagulation of such systems like that of colloidal dispersions reaches its max. at the isoelec. point. The elec. condition of ore pulps may be specifically influenced to obtain selective flotation.

S. S. de Pinily. Effect of particle size on flotation of sphalerite. R. L. Kidd and W. A. Wall. *Mining Met.* 14, 421-2 (1933).—The finer sizes of sphalerite require less cresylic acid to give the best froth character than do the larger sizes.

With cresylic acid alone, much better recoveries are obtained with the finer than the coarser sizes. In general, recoveries increase with increase in amt. of frother used but more gang is carried over. In fine sizes, better recoveries are obtained with cresylic acid alone than when  $CuSO_4$  or  $CuSO_4$  and K Et xanthate are present. The reverse is true in larger sizes. The recovery of fine sizes can be improved by increasing the length of the collecting period, such as by using more flotation cells. A. H. E.

Why do minerals float? S. Frederick Ravitz. *Mining Met.* 15, 506-7 (1933).—A review.

Alden H. Emery. Review of fine grinding in ore concentrators. Alexander M. Gow, Morris Guggenheim and Will H. Coghill. *Bur. Mines, Information Circ.* 6757, 29 pp. (1934).—The fine-grinding practice in 49 concentrators in the U. S., Alaska, Canada, Mexico and Cuba is reviewed. The methods of operation, grinding capacities and milling costs for 470 ball, rod and pebble mills are tabulated.

- Metal losses in the smelter and their avoidance. V. Tafel and H. Porzig. Metall u. Erz 31, 49 59(1934).**—Losses due to atomizing, vaporization and in the marketing of com. products are discussed. Vaporization loss of Ag was detd. in various gases at 1100° for 2 hr. and was found to be about 17% in CO, 23% in CO<sub>2</sub>, 30% in N<sub>2</sub>, 42% in air and 46% in O<sub>2</sub>. Vaporization losses were also detd. for Ag<sub>2</sub>O, Ag<sub>2</sub>SO<sub>4</sub> and Ag<sub>2</sub>S in air and N<sub>2</sub> and found to be even greater than those for pure Ag, Ag<sub>2</sub>S losing almost 62% in air. Finally the vaporization of Ag in mixts. with PbO, CaO and SiO<sub>2</sub> was detd. in air and N<sub>2</sub>. PbO hinders vaporization; CaO is practically without effect and SiO<sub>2</sub> greatly increases it. H. Stoertz.
- Smelting copper concentrates in a converter. Geo. E. Beavers. Trans. Am. Inst. Mining Met. Engrs. 106, 149-50(1933).**—Operating data for a Pierce-Smith converter over 1 yr. of operation are given. A. H. E.
- Development of copper converting at Butte and Anaconda. Wm. Kelly and Frederick Laist. Trans. Am. Inst. Mining Met. Engrs. 106, 122 31(1933).** A. H. E.
- Developments in converting lead and copper mat at Tooele. B. L. Sackett. Trans. Am. Inst. Mining Met. Engrs. 106, 132 9(1933).**—From 1914 to 1927 Pb mat

was blown until Pb and Zn were largely eliminated by volatilization. The remaining charge, high in Fe and Cu, was transferred to another converter contg. Cu mat, where it was blown with addn. of siliceous ore, to blister Cu. In 1927, siliceous ore was added to mat in the Pb converter, the slag skimmed, and the charge blown to white metal; later this was combined with that made from Cu mat to finish to blister Cu. Ay. slag contained 17% SiO<sub>2</sub>. To protect lags, lime is added to gases. The change decreased the time of blowing, amt. of magnetite and Cu in slag, and reduced the proportion of shell to granulated converter slag. In 1930, still more siliceous ore was added at no addnl. converting cost.

Alden H. Emery

**The Messina stationary basic copper converter.** R. G. Knickerbocker. *Trans. Am. Inst. Mining Met. Engrs.* 106, 140-8 (1933).—High-grade Cu can be converted economically to blister Cu in a stationary converter with the intermittent use of addnl. heat and without the use of machinery in the usual standard converting practice. Refined Cu meeting A. S. T. M. specifications can be produced from molten Messina blister Cu without allowing it to solidify before charging to the refining furnace. Messina practice is good for small or medium-sized Cu producers. Operating practice and costs are described.

Alden H. Emery

**Conditions inside a blast furnace.** R. C. Tucker. *Iron & Steel Ind.* 7, 165-71 (1934).—Combustion, temp., formation of cyanides and thermal balance are reviewed.

Curtis L. Wilson

**Volume and production of blast furnaces.** The importance of the preliminary treatment of the charge. Paul Roubine. *Rev. mét.* 30, 63-9 (1933).—Speculation made on the useful vol. of blast furnaces and the effects which the grading of the charge might have on the production.

J. D. Gat

**The formation of cyanides in the blast-furnace process.** L. Adamovich and Ya. Avrasin. *Stal* 3, No. 9, 62-73 (1933).—The cyanogen content in the out-going gases is increased by increasing the coke ratio, temp. and pressure, by decreasing the O<sub>2</sub> content, and by maintaining a basic slag. The presence of Cl decreases cyanide formation.

H. W. Rathmann

**Electrolytic zinc from fume produced from Trail lead blast-furnace slags.** H. W. Hannay and James Bryden. *Trans. Can. Inst. Mining Met.* 1934 (in *Can. Mining Met. Bull.* No. 263), 141-64.—ZnO fume analyzed: Ag 1.2 oz. per ton, Zn 61.0%, Pb 15.6, Cd 0.04, Sb 0.230, As 0.037, Sn 0.05, Ge 0.02, Cl 0.005, S (as sulfate) 1.3, SO<sub>2</sub> 0.35%, Cu trace and Co trace. Amts. of impurities present alone in ZnSO<sub>4</sub> solns. necessary to cause loss of current efficiency are, in mg. per l.: Sb 0.15, Ge 0.15, Fe 0.5, Se < 1.0, Sn 3.0, As 5.0, Co 10.0, Ni 12.0, Bi 20.0, Cu 30.0, Pb 70.0, In harmless up to 50.0, and F no effect. Amts. below crit. concn. may be beneficial. In purification, Fe(OH)<sub>3</sub> is pptd. and removes As, Sb, etc. Treatment with Zn dust and small amts. of CuSO<sub>4</sub> at elevated temps. removed other toxic elements. F in the solns. caused excessive corrosion of the Al cathodes, and methods for its removal are discussed. The oxide leaching plant is described.

Alden H. Emery

**Comparison of hot blast stoves with single and multiple zone brick work.** Franz Koller and Josef W. Gilles. *Stahl u. Eisen* 53, 393-7 (1933).

J. A. Szilard

**Oxygen-enriched air in open-hearth practice.** M. Hoguechev. *Stal* 3, No. 9, 34-7 (1933).—The use of air contg. 30-5% O<sub>2</sub> permits operating without regenerators when using high-grade gas, regulating the temp. by varying the O<sub>2</sub> content, raising the capacity of old furnaces, and reaching higher temp.

H. W. Rathmann

**The metallurgical reactions during the open-hearth process.** Peter Bardenheuer. *Stahl u. Eisen* 53, 488-96 (1933).—Changes in the concn. of the molten bath and the slag during the basic open-hearth process were followed. The more FeO there is in the slag, the more O is available for the reaction  $\text{FeO} + \text{C} \rightarrow \text{CO} + \text{Fe}$ . The formation of CO is facilitated by increased temp. causing a more violent boiling up of the bath. Mn regulates the

amt. of FeO by the reaction  $\text{FeO} + \text{Mn} \rightarrow \text{Fe} + \text{MnO}$ . A min. amt. of Mn is necessary for the manuf. of a steel easily cast and free of hot-shortness. The concns. of P and S during the melt are also followed. Examples are given for the melt process under varying conditions.

J. A. Szilard

**Development of gun-feed reverberatory furnaces at Garfield Plant of American Smelting and Refining Co.** R. A. Wagstaff. *Trans. Am. Inst. Mining Met. Engrs.* 106, 90-103 (1933).—A method for feeding fine charge under the moving gas stream of the combustion zone and spread uniformly over the mat is described. Dust losses and Cu content of dust are reduced. Furnace life is doubled. A deep bath furnace is desirable, because it gives lower metal losses, better fuel ratios and easier manipulation of operations. Repair costs are increased, but gun feeding offsets these.

Alden H. Emery

**Repairs to steel furnaces.** Walter Lister. *Metallurgia* 9, 145-7 (1934).—Directions are given for making the bottoms in basic and acid open-hearth furnaces. J. L. G.

**Aluminum bearing shells for heat dissipation.** B. C. McPadden. *Iron Steel Eng.* 11, 95-6 (1934).—Al is very desirable for use in bearing shells because of its high heat cond. The best possible bond is obtained by timing the Al shell before pouring the babbit.

W. H. Hoynton

**The small coke-oven gas consumers in the iron industry.** Albert Herberholz. *Stahl u. Eisen* 53, 417-22 (1933).—The use of coke-oven gas for the heating of rooms, molds, troughs, for the drying of converter bottoms and linings and for miscellaneous other purposes is described. The design of the stoves used is given.

J. A. Szilard

**Flash roasting of iron concentrate.** Geo. E. Beavers. *Am. Inst. Mining Met. Engrs.*, Contribution No. 65, 5 pp. (1931).—The material roasted is pyrrhotite and pyrite (5:1). The SO<sub>2</sub> content of the roaster exit gas can be varied between wide limits (8% is common; 13% SO<sub>2</sub> is possible). Temps. of exit gases are high (2000°F. when roasting 60 tons of Fe concentrate per 24 hrs. in a modified Wedge roaster). Heat of combustion of dry Fe concentrate is 5,150,000 B. t. u. per ton.

A. H. E.

**Low total-carbon cast irons and their service to foundrymen.** W. West. *Proc. Inst. Brit. Foundrymen* 25, 408-40 (1931-32); cf. *C. A.* 26, 947.

Curtis L. Wilson

**The basis of desulfurization of pig iron and steel.** P. Bardenheuer and W. Geller. *Mitt. Kaiser-Wilhelm-Inst. Eisenforschung Düsseldorf* 16, No. 7, 77-91 (1934).—Methods and processes used for desulfurization and their theoretical principles are discussed in general and practical experiences compared. Lime is superior to Mn for desulfurization with basic slags. Desulfurization with 7 alumina is not possible. Forty-two references. M. H.

**Résumé of the work of the Malleable Iron Subcommittee of the Technical Committee.** Anon. *Proc. Inst. Brit. Foundrymen* 25, 254-306 (1931-32).

C. L. W.

**Influence of vanadium and cobalt additions to cast iron.** J. B. Huust. *Iron & Steel Ind.* 7, 67-70 (1933), 177-9 (1934).—About 0.15% V is recommended for cast Fe. Ti prevents loss of V. Small addns. of Co are without influence on graphitization and mech. properties.

Curtis L. Wilson

**The precipitation of phosphorus, sulfur and oxygen during the manufacture of high-quality steel in open-hearth furnace.** Fritz Better. *Stahl u. Eisen* 53, 369-75, 398-404 (1933).—The effect of the pptn. of P, S and O on the irregularities of cast steel blocks was investigated as a function of the type of steel, slag, ore and the melting method used. The O contents of both basic and acid slag were detd. and based on the velocity of the burning up of C in the melt; curves were developed to show the course of the reactions in the open-hearth furnace.

J. A. Szilard

**The manufacture, casting and treating of Thomas-steel ingots for rails.** Karl Eichel. *Stahl u. Eisen* 53, 521-32 (1933).—The quality requirements of the raw materials and the entire mfg. process required to obtain high-quality ingots are reviewed.

J. A. Szilard

**Treatment and preparation of green foundry sands.** G. Itam. *Rev. fonderie moderne* 28, 31-5(1934).—Good castings in green sand require that the different parts of the mold can be repaired without breaking under the tool, the sand render all lines of the pattern in true shape, patterns can be taken out without damage to the mold, cores have sufficient rigidity, that the sand is not eroded under the action of the live metal and that the gas can escape freely. In order to prevent the sand from adhering to the casting and from vitrifying a suitable powder such as graphite, etc., is applied. The prepn. and treatment of sands from these points of view are discussed.

M. Hartenhein

**Porosity in nonferrous metal castings.** G. L. Bailey. *Foundry Trade J.* 50, 175-8(1934).—A review in general terms of the 3 main causes of porosity in castings: (1) shrinkage; (2) the evolution of dissolved gases and (3) the entrapping of gases.

Downs Schaal

**Magnesium contg. silumin, capable of temper hardening.** O. Bauer, B. Blumenthal and M. Hansen. *Mitt. deut. Materialprüfungsanstalt*, Special Issue No. 23, 60-5 (1934).—Hardness, tensile strength and elastic limit of Mg contg. silumin can be considerably increased by tempering the cast material or by tempering after annealing and quenching. The hardness of an alloy contg. 0.3% Mg, after 50-60 hrs. of tempering, is increased by 30-35%. An alloy contg. 0.34% Mg, after 96 hrs. of tempering at 150°, shows approx. 25% increase in tensile strength, and approx. 65% increase of the elastic limit. The ductility shows corresponding decreases. Diagrams and photomicrographs are given.

Leopold Pessel

**Method for testing individually the even distribution of hardness on specimens.** C. Benedicks and C. F. Mets. *Arkiv Mat., Astron. Fysik* 24A, No. 15, 14 pp.; *Jernkontorets Ann.* 118, 1 22(1934).—A fine grating is produced automatically by parallel scratches with a diamond point. Microscopic examn. of the scratches reveals local discrepancies of hardness, especially those caused by local work-hardening which cannot be detected by other methods.

Leopold Pessel

**The conditions of formation of Widmanstätten structure.** I. Dolgopolskiĭ and E. Shumovskii. *Stal* 3, 28 40, 51 61(1933).—Three types of steel were heat-treated by various methods and micrographically examd. The formation of Widmanstätten structure is favored by holding the steel a long time at a high temp., by slowly cooling through the crit. range, and by chem. and phys. heterogeneity of the austenite grains. In general, Widmanstätten structure increases the tensile strength and decreases elongation.

H. W. Rathmann

**Manufacture, wear and fracture of rails. Protection against wear and oxidizing agents.** Carlo De Benedetti. *Riv. tec. ferrovie ital.* 43, 125-35(1933).—Mn steels with a max. of 0.5% C, rolled at low temp., are useful to obtain rails of high resistance to wear. For rails in tunnels, steels with 0.6% Cu are suggested.

G. A. Bravo

**Test method for determining the reactivity of aluminum and aluminum alloys.** H. Rohrig. *Korrosion u. Metallschutz* 10, 38-9(1934).—After pickling for 1 min. in 30% NaOH at 90°, and for 1 min. in concd. HNO<sub>3</sub>, the specimens are weighed and exposed for 1 hr. to a mixt. of 4 parts concd. HNO<sub>3</sub>, 1 part concd. HCl and 4 parts water, held at 20°. After rinsing and drying, the loss of wt. in g. per sq. m. is detd. Many specimens may be treated simultaneously in the same soln. The method offers a sensitive test for detg. the thermal history of the material.

Leopold Pessel

**Utilization of cadmium.** A. F. Burstall. *Giesserei u. Maschinenbau Ztg.* 5, 7-8(Jan., 1932); *Met. Abstracts* (in *Metals & Alloys*) 4, 257. —Cd exerts favorable influences on soft solders. American solders contain about Cd 25, Sn 50, Pb 25%, while a standard German alloy runs as follows: Cd 10, Sn 10, Pb 80%. Cd-bearing solders sometimes darken when exposed to atm. influences, but this is only under unfavorable circumstances. The tendency of Cd solders toward oxidation can be largely checked by addns. of 1.5-3% Zn. Zn, furthermore, enlarges solidification range, lowers solidification point and

1 results in a gain of strength. The best flux is ZnCl<sub>2</sub>.

G. G.

**Simultaneous effect of the degree of cold work and of the temperature on the mechanical properties of mild steel, copper and nickel.** A. Ancelle. *Revi. mét.* 30, 266-74, 309 18(1933).

E. H.

**Cementite.** Pierre Pingault. *Ann. chim.* 20, 371-438 (1933).—Fe (C 0.03, Si 0.005, Mn trace, S 0.002 and P 0.000%) was crushed, and the portion between 30 and 200 mesh used in 50-g. quantities for making cementite, Fe<sub>3</sub>C. The NaCN used was 98-99% pure. After carburization, the cyanide was removed with H<sub>2</sub>O, the residue washed with alc. and ether and dried in a vacuum. The Fe<sub>3</sub>C was sepd. mechanically and contained 6.65-6.70, ± 0.03% C (theoretical for Fe<sub>3</sub>C = 0.68%). It contained 0.05% or less graphitic C. The grains were grayish white, dull metallic and very brittle. The NaCN was easily oxidized at 650° and after heating 24 hrs. only 5% was left; hence fresh cyanide was added. At 650°, 48 hrs. was required for complete carburization, at 600°, 80 hrs., and at 800°, 30 hrs. Fe contg. 0.12% C was heated in N with 76% NaCN; the resulting Fe contained about 0.1% C, the NaCN remained 76%, and no Na was liberated, indications that there was no carburization in the absence of O. On electrolysis of fused NaCN the (Fe) cathode surface remained unchanged, but the Fe anode surface was hardened by C<sub>2</sub>N<sub>2</sub>. H under atm. pressure at 450° was without action on Fe<sub>3</sub>C. Pieces of Fe carburized at 650° became quite hard and on prolonged carburization regions on the surface became raised and brittle, and almost pulverulent. Small blocks of Fe were completely carburized after 500 hrs., and contained 6.65% C with no graphite. The presence of Ni or Cr did not affect the carburization of steel. Gray cast iron was not uniformly carburized even after heating 24 hrs. at 650° with 76% NaCN. Two-mm. soft steel wire was case-hardened at 900-920° in NaCN in 1.5 hrs. By prolonged heating Fe<sub>3</sub>C was formed. Purified illuminating gas case-hardened a soft steel wire (C = 0.09%) in 1.5 hrs. while 8 hrs. was required for complete cementation. A 6-mm. soft steel rod showed the same phenomenon. CH<sub>4</sub> functioned as a carburizer similarly to the illuminating gas. Steel could be carburized by CO. An equil. was established between the carburizing action of CO and the decarburizing action of CO<sub>2</sub>. CCl<sub>4</sub> was used as the reference liquid for detn. of Fe<sub>3</sub>C, the values being 7.39-7.46. Fe<sub>3</sub>C reduced by H gave 7.30 at 0°. Fe<sub>3</sub>C was thermodynamically unstable at ordinary temps. When heated for 1 hr. at 1225° globules resembling cast iron rich in C resulted, while a powder contg. much graphite was formed. Near the m. p. of cast iron Fe<sub>3</sub>C decompd. rapidly. After slow heating at 1000°, a break in the cooling curve of Fe<sub>3</sub>C occurred at 740-700°. A soft steel wire (0.6 mm. in diam.) contg. C 0.09, Si 0.02, Mn 0.25, S and P 0.02%, and a piano wire contg. C 0.85, Si 0.15, Mn 0.45, S 0.01 and P 0.02% were used for equil. studies. At 790° the CO<sub>2</sub> content increased to 6.8% in 120 hrs., and by decarburization, beginning with 15% CO<sub>2</sub>, 12% was reached only after some time. Heating 500 hrs. failed to result in equil. at temps. below 800°. Decarburization reached equil. in 7 hrs. at 950° and maintained this equil. at 2.1% CO<sub>2</sub> for 30 hrs. CO<sub>2</sub> content against temp. was plotted for the two reactions (1) 2CO = CO<sub>2</sub> + C, and (2) 2CO + 3Fe = CO<sub>2</sub> + Fe<sub>3</sub>C. These curves intersected at 820°. Attempts were made to carburize Cr with NaCN at 650° during 100-hr. periods. By combustion the Cr yielded only 0.68% C, while it originally contained 0.4%. It was then assumed that a protective layer of Cr carbide formed rapidly on the surface and prevented further carburization. Powd. Cr when carburized yielded 0.8% C. Mn could not be carburized by NaCN or else the carbide was decompd. during the washing process. In an attempt to carburize Mn by CH<sub>4</sub> at 950-975° for 24 hrs., C was deposited in the app. and on the Mn. One sample yielded free C 3.55, combined C 4%. After 48 hrs. the combined C increased to about 5%.

H. E. Messmore

The effect of aluminum and cobalt on the miscibility

gap of iron and copper in the solid state. F. Roll. Z. *anorg. allgem. Chem.* 216, 133-7(1933).—Ni and Mn increase the soly. of Cu in Fe considerably, Co only moderately. In general, investigation of the soly. of different elements in the system Fe-Cu shows that all those elements which can form series of solid solns. in the binary systems Fe-X and Cu-X are particularly apt to reduce the miscibility gap in the system Fe-Cu-X. Since a wide gap in the solid solns. of the binary system Cu-Co exists, it reduces the miscibility gap in the Cu-Fe alloys less than Ni or Mn. Al, Sn, Sb and P have only a small influence on the reduction of the Cu-Fe gap.

M. Hartenhein

X-ray testing of iron and steel. Franz Wever. *Stahl u. Eisen* 53, 497-505(1933).—Review with numerous references.

J. A. Szilard

Possible uses of nonrusting steels and cast-iron alloys in the chemical industry. Ernst Blau. *Chem. Ztg.* 57, 999 1000(1933).—A general discussion of the properties of Ni-steel, Cr-Ni-steel and other Cr-Fe alloys, and high-Si cast iron ("Thermisilid") of interest to the chem. industry.

O. W. Willeox

Steels in marine engineering service. T. H. Burnham. *Trans. Inst. Marine Engrs.* 46, 1-41(1934).—A discussion, with recommended analyses, of the steels used in the various parts of boiler furnaces and oil engines. Above a steam temp. of 800° F. the use of alloy steel is necessary. For long exposure to heat Mo steel should have over 0.5% Mo.

Ann Nicholson Hind

New theory proposed for the formation of annealed steels. J. Seigle. *Génie civil* 103, 369-73; 400 2(1933).—On cooling through  $A_1$  it is  $Fe_3C$  rather than ferrite which is in excess of its soly. in the solid soln. of  $\alpha$ -Fe, and which seps., carrying with it some  $\gamma$  soln. The transformation  $\alpha \rightleftharpoons \gamma$  is progressive and acts upon both the free ferrite and that in pearlite. The proportion of  $\alpha$ -Fe necessary to transform pearlite into solid soln. depends upon the C content. The C content of pearlite may be as low as 0.58%, at least locally, in 0.58% C steels. It is not necessary to consider a special iron  $\beta$  between  $A_1$  and  $A_2$ . This is merely a solid soln. mixt.  $\alpha\gamma$ , the magnetic change at 770° being due to the Currie point of  $\alpha$ -Fe. Dilatometric changes are due to the  $\alpha \rightleftharpoons \gamma$  transformation.  $A_1$  can be taken as the point at which the curve leaves the tangent of the line of dilatation of a soln. of pure  $\alpha$ -Fe;  $A_2$  as the point where the curve leaves the tangent of the line of dilatation of pure  $\gamma$ -Fe. Dilatometric and magnetic curves are given showing the effect of temp. for various steels.

Ann Nicholson Hind

Fatigue and impact strength of steel at low temperatures. Otto Forsman. *Jernkontorets Ann.* 117, 519-30(1933).—Tests were made on C steel, Cr-Ni steel and ordinary rail steel, all of Swedish manuf. Tensile tests were at 20°, fatigue tests with one-sided load at 20° and -18°, and notched-bar impact tests at -40° to +40°. There is a slight rise in fatigue limit with increased temp. The impact figure falls rapidly in a crit. region between -20° and +20°, but may be markedly changed by heat treatment. The change from high to low impact figures is gradual for hard steels, but rapid for mild steels used for structural purposes.

H. C. Duus

Nickel steels. Leon Guillet. *Japan Nickel Rev.* 1, 134-67(1933); cf. C. A. 27, 3903. —Review of the properties and applications of the Ni steels.

Leopold Pessel

Low-nickel cast steels. F. Renaud. *Actiers spéciaux* 8, 350-62(1933).—The compps. of 7 cast steels of the pearlitic nickel class used in industries are given. Heat treatments of these steels consist in: annealing at 850-980°, so-called homogenization (annealing in order to relieve the internal stresses due to irregularities of parts of a casting); grain refining at 770-850°; hardening with water or oil quench or air cooling depending on the kind of steel used; drawing of the quenched steels at temps. below the  $A_1$  or in the range 550-700°. A simplified heat treatment for self-hardening steels consists in homogeneity treatment at high temp. followed by air cooling. Mech. properties are given for the 7 steels subjected to a complete heat treatment or a simplified normalizing treatment

and drawing. At temps. around 500° Ni-Cr-Mo steels maintain better mech. properties than any of the other steels. Ni-Cr-Mo steels are free from temper brittleness that usually occurs when Ni-Cr steels are heated at 400 600° and slowly cooled. Low-Ni cast steels are preferably made in open-hearth or elec. furnaces, in England and the U. S. by the acid process, in France by the basic process. Soft Ni steel is used for casting chains. The heat treatment of these chains consists in an annealing followed by water quench and drawing. Special uses for these steels are indicated.

G. T. Motok

High-strength sand-casting aluminum alloys. W. C. Devereux. *Proc. Inst. Brit. Foundrymen* 25, 517-59(1931 1932); cf. C. A. 26, 1556; 27, 1852. C. L. W.

X-ray study of aluminum-zinc alloys. E. A. Owen and John Ball. *Phil. Mag.* 17, 433 57(1934); cf. C. A. 27, 5227. X-ray powder photographs were taken of Al-Zn alloys over the entire concn. range at room temp. and at temps. in the range 200-450°. Only alloys below the eutectoid transformation temp. could be investigated by quenching from the desired temp. The transformation temp. is between 300° and 310°. The at. vol. of the  $\alpha$ -phase (close-packed hexagonal structure) changes from 15.109 A.<sup>3</sup> for pure Zn to 15.164 A.<sup>3</sup> for the alloy satd. with Al. The  $\beta$ -phase is a solid soln. with face-centered cubic structure. At 375° it extends from 19 to 45% Al with the corresponding parameters 4.016 A. and 4.058 A. The  $\gamma$ -phase consists of alloys with more than 80% Al. The parameter changes from 4.0406 A. for pure Al to 4.0345 A. for an alloy with 80% Al.

E. J. Rosenbaum

Equilibria in the iron-carbon system. Alfred Stansfield. *Trans. Roy. Soc. Can.* 111 27, 177 8(1934).—A simple and relatively rapid method is described for measuring the equilibria between a mixt. of CO, CO<sub>2</sub> and various alloys of Fe and C.

J. W. Shipley

Activity of carbon in iron-carbon-alloy melts and the equilibrium between carbon and oxygen. G. Phragmen. *Jernkontorets Ann.* 117, 563 71(1933).—From an examn. of the equil. diagram it is concluded that the activity of C in molten Fe-C alloys in equil. with oxide and CO at 1550° lies between 0.00025 and 0.0005 and the percentage C between 0.0004 and 0.0008. The soly. product of C and O lies between  $10^{-7}$  and  $2 \times 10^{-7}$ . Seven references.

H. C. Duus

Hot-working properties of binary and complex copper-zinc alloys. P. Röntgen and W. Donike. Z. *Ver. deut. Ing.* 78, 220-3(1934).—Brasses with  $\alpha + \beta$  crystals can be worked hot without the formation of cracks. Pb, P and O<sub>2</sub> were found harmful to the hot-working properties. Al, Fe, Mn, Ni and Sn up to 5% do not influence hot working. These elements with the exception of Fe form solid solns. Fe enters between the crystals but is plastic and does not destroy the cohesion of the crystals. The harmful elements are found between the crystals as liquid or solid brittle films and greatly influence the cohesion of crystals. Investigation was made on alloys prepd. from electrolytic Cu 99.96% and electrolytic Zn 99.98%. The following alloys were investigated: 63 brass which at hot-working temp. is in the  $\alpha + \beta$  condition; 67 brass which is on the border line between  $\alpha$  and  $\alpha + \beta$  at the working temp.; and 84 brass which is pure  $\alpha$ -brass at all temps. The carefully prepd. slabs were hot-rolled and hot-pressed; their working ability was judged by the extent of crack formation.

C. B. J.

X-ray investigations on zinc-nickel alloys. Vincenzo Caglioti. *Atti IV Congr. naz. chim. pura applicata* 1933, 431-41; *Chem. Zentr.* 1934, 1, 1283. —The system Ni-Zn contg. up to 53% Ni was tested by x-rays. At 5% Ni there was a poorly defined  $\epsilon$ -phase, at 15-22% Ni a better-defined  $\gamma$ -phase, at 40% Ni a  $\beta$ -phase, and with 53% Ni a cubical  $\alpha$ -phase. Soly. of Ni in the Zn lattice was not found. For the cubical  $\gamma$ -phase, Ni<sub>2</sub>Zn, is probable. This compd. forms solid solns. both with Ni and Zn. The eutectic of the  $\gamma$ - and  $\beta$ -phase is at about 40% Ni. The  $\beta$ -phase (NiZn), according to the Hull system, can be regarded as tetragonal, with  $c/a = 0.83$ , corresponding to the type of  $\gamma$ -Mn or Au-Cu with  $a_0 = 3.867$  A. and 4

atoms in the elementary cell ( $\text{Zn} = 0\ 0\ 0, \frac{1}{2}, \frac{1}{2}, 0, \text{Ni} = \frac{1}{2}, 0\ \frac{1}{2}, 0\ \frac{1}{2}, \frac{1}{2}$ ). E. M. Symmes

**Composition of crystalline amalgams of zinc, lead, tin and cadmium.** Henry H. Hosford. *J. Dental Research* 14, 33-7 (1934).—When Zn, Pb, Sn and Cd are immersed for many days in Hg, cryst. amalgams form contg., resp., Zn 41-45, Pb 63-65, Sn 78-79 and Cd 15-16%. Under these conditions Ag and Cu form almost no crystals. These results apparently confirm the existence of the compds.  $\text{HgPb}_2$  and either  $\text{Hg}_2\text{Cd}$  or  $\text{Hg}_3\text{Cd}$ . J. S. H.

**Gold as a corrosion resistant.** P. Stein and O. P. van Steewen. *Werkstoffe und Korrosion* 8, 37-9 (1933).—Gold in the form of plating has the advantages of being resistant to oxidation, acids and alkalis; it has low heat radiation coeffs., small crystal structure and other advantages which are discussed. M. C. Rogers

**Organic substances and the acid corrosion of iron.** Hanns Pirak and Wilhelm Wenzel. *Korrosion u. Metallschutz* 10, 29-38 (1934).—A detailed classification and listing of a large no. of inhibitors, with numerous references and a list of patents. A relation exists between the inhibiting action of org. substances and their chem. constitution. Active at. groups, mol. wt. and dimension, and the position of substitutes within the mol. are important factors. Leopold Pessel

**Corrosion in steam-generating stations and its correction.** Sheppard T. Powell. *Combustion* 5, No. 7, 14-18 (1934).—A general discussion of corrosion, deacration, scale, protective coatings, etc. Leslie B. Bragg

**Fusion welding of alloy steels and nonferrous metals.** Hugo Schroeder. *Werkstoffe und Korrosion* 9, 1-2, 5-6 (1934).—Methods of welding various alloys, compns., patent protection, app., etc., are given for Cr-Ni steels, Cu, Al, Ag, Ni, Pb, monel metal and others. M. C. R.

Ball milling (Gow, *et al*) 1. How gas fuel has been applied at the Toole smelter (Nealey) 21. Theory of alloys in the  $\gamma$ -phase (Jones) 3. Crystal structure and compn. of cubic Cr carbide (Westgren) 2. Primary crystn. of metals (Kuznetsov, Saratovkin) 2. Producing glass from blast-furnace slag (Basore) 19. Tempering plates or sheets of steel or other metals (Brit. pat. 403,438) 19.

**Stoughton, Bradley:** The Metallurgy of Iron and Steel. 4th ed. New York: McGraw-Hill Book Co., Inc. 559 pp.

Le fer. T. II. Paris: Soc. d'Edit. géogr. maritimes et coloniales. 436 pp. F. 36.

**Stainless Steels and Their Uses.** New York: Electro Metallurgical Co. 19 pp.

**Ore flotation.** Ira H. Derby and Orin D. Cunningham (to Peter C. Reilly). U. S. 1,949,956, March 6. In the flotation treatment of ores such as partially oxidized Cu sulfide ore, an org. nitrogenous base salt of a hydrocarbon compd. of an org. thiophosphoric acid, such as an aniline or pyridine compd. of naphthalene thiophosphoric acid-tar acid compd. is used as a flotation agent.

**Flotation agent.** Stuart A. Falconer and Ludwig J. Christmann (to The American Cyanamid Co.). Can. 339,815, Mar. 6, 1934. A promoter consisting of a mixt. of Na mercaptobenzothiazole and NaSH is added to the flotation circuit in the concn. of minerals, especially of oxide minerals.

**Flotation agent for ores.** Ludwig J. Christmann (to The American Cyanamid Co.). Can. 339,814, Mar. 6, 1934. Agents for use in flotation of sulfide ores are made by the reaction of  $\text{P}_2\text{S}_5$  with aliphatic alcs. contg. 3 or more C atoms, particularly isopropyl or *sec*-butyl alc. E. g., to isopropyl alc. in a closed vessel heated to 50-60°.  $\text{P}_2\text{S}_5$  is added in small portions. Since the reaction is exothermic, the vessel is cooled to prevent the temp. from rising above 85°; toward the end of the reaction it is necessary to heat the mixt. to complete the reaction. The product probably is  $(\text{iso-PrO})_2(\text{HS})\text{P:S}$ .

**Flotation apparatus.** Fried. Krupp Grusonwerk A.-G.

Ger. 593,185, Feb. 22, 1934 (Cl. 16, 6). Means is described for mixing the suspension with the aid of compressed air.

**Drum for washing ores.** Hardinge Co. Inc. Ger. 590,928, Jan. 15, 1934 (Cl. 1a, 12.01).

**Differential flotation of sulfuretted copper and zinc ores.** Edmond M. C. Barthelemy. U. S. 1,950,537, March 13. For sepg. Cu sulfide ores from zinc blende by differential flotation, the ore is converted into a pulp which is rendered alk., and before flotation there is added an alkali ferrocyanide which can produce a colloidal Cu ferrocyanide in the pulp, flotation of zinc blende then being effected in the presence of a collecting agent of the dithiophosphate type which broadly has no destructive chem. action on colloidal Cu ferrocyanide, and flotation of Cu sulfides is then being effected in the presence of a collecting agent of the xanthate type which broadly has a destructive chem. action on colloidal Cu ferrocyanide.

**Recovering metals from ores.** Carl Goetz. Ger. 593,153, Feb. 22, 1934 (Cl. 40a, 11.50). Finely divided sulfidic or arsenical ores are treated under pressure with a reducing gas in counterflow in a vertical-retort furnace at a temp. considerably below the m. p. of the ore. Ger. 593,154, Feb. 22, 1934 (Cl. 40a, 11.70). The process of Ger. 589,448 (Cl. 1, 28, 13157) is applied to the treatment of oxide ores.

**Treating argentiferous lead bullion containing impurities such as antimony, arsenic and tin.** Jesse O. Betterton, Robert A. Crites and Henry P. Wagner (to American Smelting and Refining Co.). U. S. 1,950,380, March 13. The bullion is charged into a lead softening furnace, melted and subjected to oxidizing conditions to effect concn. of impurities in a dross; the dross is treated *in situ* with a carbonaceous reducing agent in sufficient quantity to reduce Pb oxide in the dross in amounts adequate to carry and return the Ag in the dross to the bath proper without reducing substantial amounts of the impurities such as Sb, As and Sn to the metallic state (the reducing treatment being conducted at relatively low temps. whereby fuming of the impurities in the dross is prevented) and the resulting argentiferous lead is sepd. from the drossed impurities.

**Treating impure lead containing antimony.** Jesse O. Betterton, Robert A. Crites and Henry P. Wagner (to American Smelting and Refining Co.). U. S. 1,950,388, March 13. A charge of impure Pb contg. Sb is introduced into a furnace contg. a quantity of molten softened lead covered by an antimonial slag formed during the final oxidation stage of the preceding charge; the furnace is heated to form a molten bath, which is agitated and maintained at a temp. of about 760° so that impurities, including some Sb, are oxidized and collect on the surface of the bath; the oxidation is continued until the Sb content of the bath is 0.5-0.9%; oxidized impurities are removed from the surface of the bath, Pb oxide is added, and oxidation is continued so that remaining impurities are reduced to a desired low proportion; a desired quantity of softened lead is removed from the bath, and some of the softened lead covered by the final oxidized impurities is allowed to remain in the furnace for the succeeding charge.

**Treatment of sulfide ores containing lead.** Paul Gamichon. U. S. 1,950,000, March 6. The ore is wetted with an alkali metal chloride such as NaCl or CaCl<sub>2</sub> soln. and the wet, heated ore is treated with Cl gas in the presence of a mixt. of an acid such as HCl and FeCl<sub>3</sub> acting as a catalyst.

**Chloridizing tin ores, etc.** Louis A. Wood, Henry L. Sulman, Hugh F. K. Picard and British American Mines Ltd. Brit. 403,122, Dec. 15, 1933. In extg. Sn from ores or concentrates contg. addnl. metallic bases and free  $\text{SiO}_2$  by chloridization in the presence of carbonaceous material, the quantity of the latter is not substantially less than that theoretically necessary to reduce all the bases present, fritting during chloridization being thus prevented. Brit. 403,123, Dec. 15, 1933. See U. S. 1,931,944 (C. A. 28, 4529).

**Igneous concentration of zinc ores.** Robert G. Hall.

U. S. 1,949,905, March 6. In treating ZnS ore for the sepn. of Zn from other materials, a molten magma is formed contg. the ZnS of the ore in igneous soln., and, while so dissolved, the ZnS is subjected to the action of an oxidizing agent such as air, and the resulting ZnO is thereafter subjected to the action of a reducing agent while there is maintained in the magma material such as Fe, Cu, SiO<sub>2</sub>, and lime compds. capable of maintaining ZnO in igneous soln.; reduced Zn is volatilized from the magma and the residual magma is utilized in cyclic operation for further ore treatment. App. is described.

**Agglomerating finely divided gold, etc., by heating ores.** Georg Bürg, Martha Harbort née Wermke, Waldtraut Harbort, Erika Harbort, Lotte Harbort and Gertrud Harbort. Ger. 590,852, Jan. 11, 1934 (Cl. 1a. 36).

**Distilling readily volatilizable metals such as zinc and cadmium.** Friedrich Johannsen (to Fried. Krupp Grusonwerk A.-G.). U. S. 1,950,249, March 6. Various details are described of the construction and operation of a rotary retort.

**Treatment of bituminous copper shale.** Fried. Krupp Grusonwerk A.-G. Ger. 593,186, Feb. 23, 1934 (Cl. 1c. 10.01). The ore is worked up by flotation, and the middle portion of the suspension is sepd., treated with concd. H<sub>2</sub>SO<sub>4</sub>, neutralized if necessary, and again subjected to flotation.

**Metal founding.** Markus Sondheim. Ger. 590,085, Jan. 13, 1934 (Cl. 31c. 01). Cores or molds for foundry work are formed from a mixt. of molding sand and potato flakes or meal. Pitch, resin, naphthalene, etc., may also be added.

**Mold materials.** Pinspongs Metallverks Aktiebolag. Brit. 402,686, Dec. 7, 1933. A chill mold is lined with or made of an alloy contg. not more than 2% Al. When an Al-Cu alloy is used, it may contain Zn or Ni up to 45, Fe, Mn or Sn up to 8%, or a combination thereof.

**Slag formation and reduction in lead softening.** Jesse O. Betterton and Charles W. Hanson (to American Smelting & Refining Co.). U. S. 1,950,387, March 13. In the treatment of Pb bullion contg. a relatively high percentage of Sn, a molten bath of the bullion is subjected to oxidizing conditions in the presence of a caustic flux by which impurities including Sn are slagged and softened Pb is obtained; the slag is transferred to a reverberatory furnace and is reduced to form a Sn slag which is further processed for the recovery of Sn.

**Vertical retort construction and setting suitable for treating cinnabar ore, etc.** Donald D. Shelton. U. S. 1,950,066, March 6.

**Furnace for the metallurgy of zinc.** O. Dony. Belg. 398,839, Oct. 31, 1933. Structural features.

**Furnaces for heating metal, etc.** Ernest E. Lucas. Brit. 401,942, Nov. 23, 1933.

**Furnace and other apparatus for producing hot billets from metal pieces.** Stewarts & Lloyds Ltd. and Gavin S. McLay. Brit. 402,979, Dec. 14, 1933.

**Metal-heating furnaces with step-by-step conveyors for carrying work therethrough.** British Furnaces Ltd. and Percy Hopkinson. Brit. 401,857, Nov. 23, 1933.

**Rotary furnaces for working spongy iron into blooms.** Fried. Krupp Grusonwerk A.-G. Brit. 402,743, Nov. 21, 1933.

**Metal powders.** I. G. Farbenind. A.-G. Fr. 758,659, Jan. 22, 1934. Ductile metals such as Mg are powd. by dividing the compact metal by means of bands provided with steel needles and fixed on cylinders.

**Deoxidizing metals.** Soc. Metallchemische Fabrik A.-G. Fr. 759,155, Jan. 30, 1934. Metals are deoxidized by adding mixts. of powd. metals and amorphous P, or alloys having a high content of P (P-Fe, P-Zn, P-brass) or pure phosphides, in a finely disseminated state to the fused metal.

**Improving metal surfaces.** I. G. Farbenind. A.-G. Fr. 758,730, Jan. 22, 1934. Fe or its alloys is improved superficially by cementation with a Si powder to which about 2% of S or salts contg. combined S or halogen is added.

**Working metals.** Vereinigte deutsche Metallwerke

A.-G. Zweigniederlassung süddeutsche Metallindustrie. Fr. 757,750, Dec. 30, 1933. Alloys of Cu are heated to a temp. below the limit of recrystn., preferably 300-600°, and subjected to high pressure in a press.

**Etching metals.** M. E. Loginov, T. N. Kozlyarova and P. G. Smolyanskaya. Russ. 31,729, Oct. 31, 1933. To the H<sub>2</sub>SO<sub>4</sub> bath is added up to 1% of a soln. of carpenters glue or 2-2.5% sulfite liquor which has been evapd. to the concn. of a thick ext. and then dild. with 15 parts of H<sub>2</sub>O.

**Treating metal waste.** David R. Tullis and Percy Oakley. Brit. 403,179, Dec. 21, 1933. Small waste metal, e. g., turnings chips, is heated to about 300-400° in a reducing atm., e. g., CO, to which Cl or the vapor of a volatile halide, e. g., BCl<sub>3</sub>, may be added, to expel volatile matter and soften and anneal the metal without melting; the metal is then sifted, passed to a magnetic separator and briquetted. Expelled oil vapors may be condensed in original or cracked form and used for heating the furnace.

**Apparatus for treating metal strip, etc., by passage of current therethrough, the contact at the outgoing end comprising a mercury bath covered with liquid to cool the heated metal before it enters the mercury.** Wm. E. Burnand. Brit. 403,401, Dec. 11, 1933.

**Lead, antimony and bismuth.** "Berzelius" Metallhütten-G. m. b. H. Ger. 590,505, Jan. 8, 1934 (Cl. 40a. 18.01). Addn. to 589,738 (C. A. 28, 2313\*). The method of 589,738 for obtaining Pb, Sb or Bi by treating their O-compds. with their S-compds., is modified by blowing air onto the O-compds. in a tilting furnace heated by flue gases, before adding the S-compds.

**Magnesium.** The Dow Chemical Co. Brit. 402,311, Nov. 30, 1933. Molten Mg (alloy) is heated in a tilting crucible with a fluid flux of higher sp. gr. than Mg and of such surface tension that it does not materially spread over the surface of the metal and in the presence of a protective atm. The flux may be a mixt. of MgCl<sub>2</sub>, K, Na or Li chloride and an alkali or alk. earth fluoride or a mixt. of CaCl<sub>2</sub>, NaCl, BaCl<sub>2</sub> and such a fluoride. The atm. may be (a) S vapor made by dusting powd. S over the metal surface, (b) N and (or) CO, CO<sub>2</sub>, SO<sub>2</sub>, mixed with a small proportion of CS<sub>2</sub>, or (c) F or a F compd., e. g., NH<sub>4</sub>BF<sub>4</sub>, CCl<sub>2</sub>F<sub>2</sub>, with or without a diluent, e. g., air, N. App. is described.

**Zinc.** The New Jersey Zinc Co. Fr. 758,865, Jan. 24, 1934. Zn is volatilized in a retort contg. a series of trays one above the other, the molten Zn overflowing from one tray to one beneath it.

**Zinc and like metals.** Fried. Krupp Grusonwerk A.-G. Fr. 758,722, Jan. 22, 1934. The reduction and volatilization of Zn, Cd, etc., are carried out in a muffle made of Ni, Co or their alloys.

**Coloring zinc.** Heinz Tichauer. Fr. 758,593, Jan. 19, 1934. The Zn is dipped into a bath contg. an aq. soln. of a salt of a heavy metal, e. g., a sulfate, to which a polyhydrate, e. g., of NH<sub>4</sub>, is added.

**Electric motor rotor windings of special cast aluminum containing silicon.** Cyril S. Taylor (to Aluminum Co. of America). U. S. 1,950,197, March 6. Cast Al rotor windings are used contg. about 1-3% Si, which are of substantial structural uniformity and have an elec. resistivity not greater than about 4.0 microhms per cm. cube.

**Carbonizing ferrous metals.** John H. Kyte (to Swedish Iron & Steel Corp.). U. S. 1,950,118, March 6. Surface carbonization is effected by treating the surface with HNO<sub>3</sub> and subsequently exposing it to a carbonizing gas at a suitable carbonizing temp. The HNO<sub>3</sub> treatment serves to facilitate the carbonizing for increasing heat radiation.

**Cementation.** P. R. Mallory & Co., Inc. Brit. 402,894, Dec. 14, 1933. In mfg. make-and-break contacts of W or Mo for ignition systems of motor vehicles the material is treated to increase the size of the surface granules or to reduce the amt. of amorphous material between the granules by heating the W<sup>0</sup>, etc., with a Si compd., e. g., Na silicate, which is reduced to SiO<sub>2</sub> by the heat, and then mechanically working to form a body

having an interlocked grain structure. Details of a preferred process are given.

**Annealing.** Albert Schmitz (to Vereinigte Stahlwerke A.-G.). Brit. 403,170, Dec. 21, 1933. In the bright annealing of metals, *e. g.*, sheets, a protective gas, *e. g.*, coke-oven or producer gas, is introduced at various points in the annealing box only after the metal has cooled below the annealing temp. and preferably down to about 400°. The gas is purified before entry by passing it over a heated contact substance which removes the O therein. App. is described.

**Annealing steel and iron objects.** Akt.-Ges. für Industriegasverwertung (C. W. Paul Heylandt, inventor). Ger. 590,664, Jan. 12, 1934 (Cl. 18c. 8.50). A low-temp. process for annealing Fe and Fe-C objects is described.

**Apparatus for handling flat metal stock when annealing, etc.** Marshall S. Allen (to Morgan Construction Co.). U. S. 1,950,377, March 13. Structural and mech. features.

**Means for cooling annealed metal articles in a non-oxidizing atmosphere.** Siemens-Schuckertwerke A.-G. Ger. 593,112, Feb. 21, 1934 (Cl. 18c. 8.80).

**Bending and hardening leaf springs.** Collet & Engelhard Werkzeugmaschinenfabrik A.-G. Ger. 590,584, Jan. 5, 1934 (Cl. 18c. 2.21).

**Increasing the surface hardness of aluminum articles.** Aluminium Ltd. Brit. 402,609, Dec. 7, 1933; cf. Fr. 749,608 (C. A. 28, 456<sup>3</sup>). Hard wear-resisting surfaces are produced on Al pistons for internal-combustion engines.

**Cutting tools.** Jean H. L. DeBats. U. S. 1,950,355, March 6. Tools such as cutting tools or dies are formed in part of an abrasive alloy which may comprise W carbide 70-97% reacted with Ni, Co or Fe. U. S. 1,950,356 also relates to the manuf. of similar products.

**Apparatus for drawing rods, wire, etc.** Schumag Schumacher Metallwerke A.-G. für Präzisionsmechanik. Brit. 403,547, Dec. 28, 1933.

**Magnetic induction testing apparatus for determining the crystal structure of iron, the identity of alloy constituents, etc.** Sigfrid Specht (to The Ferrous Magnetic Corp.). Brit. 403,409, Dec. 18, 1933.

**Cast iron.** Soc. d'électrochimie, d'électrometallurgie et des aciéries électriques d'Ugine. Fr. 759,187, Jan. 30, 1934. In making addns. to cast Fe such as Cr, Mo, Ti, V or Co, the added metal is incorporated with a reducing substance combining readily with O (Si, Mg or Al) and forming, with the addn. metal, very fusible crystd. compds. and, with the oxide of the metal, slags of low m. p. rising easily to the surface. An example contains Cr 50, Si 12-20% and Fe and C the rest.

**Preparation of sheet iron for plating with heavy metals.** A. I. Rabiner and V. A. Avdyukin. Russ. 31,728, Oct. 31, 1933. The sheets are etched, passed through a washer charged with a soln. of ZnCl<sub>2</sub> or of ZnCl<sub>2</sub> and alkali and through a flux composed of lard to which is added a soln. of alkali (NaOH, KOH, NH<sub>4</sub>OH, Ca(OH)<sub>2</sub>, etc.) to a complete saponification and the formation of an emulsion. ZnCl<sub>2</sub> is then added and the whole is kept warm.

**Rustless iron or steel alloys.** Virginio Angelini. Brit. 402,430, Nov. 28, 1933. A molten Cr-Fe alloy is prepd. by melting a mixt. of chrome ore (48% Cr<sub>2</sub>O<sub>3</sub>) 65, CaSi<sub>2</sub> 23, Al 4, fluorspar 4, Fe-Si (80% Si) 2 and CaO 2% and incorporating with molten Fe, a fused mixt. of chrome ore 30, CaO 25, bauxite 20, fluorspar 15 and Fe oxide 10% being added as a protective layer. In a modification the molten Fe is added in portions to the molten alloy until the desired Cr alloy is produced, the slag mixt. being present in the molten alloy. Cf. C. A. 28, 89<sup>5</sup>.

**Hard steels.** Vereinigte Stahlwerke A.-G. Fr. 757,983, Jan. 3, 1934. The tendency to form fissures in hard steels, due to tensions produced by cooling, is reduced by the addn. of Mo 0.15-1, V 0.1-0.6 or Zr 0.1-0.6% or of more than one of these.

**Steels for use at high temperatures.** Soc. industrielle & commerciale des aciéries. Fr. 758,991, Jan. 26, 1934. Steels for use at above 400° contain C up to 0.5, Co 0.3-10 and Mo 0.3-3%. Up to 6% of Cr or a total up to

1.5% of Cu, Ti, V, Ni, Si, Mn and Al, separately or mixed, may be added.

**Nitriding steel articles such as toothed wheels, clutch couplings, bearings.** Adolf Fry and Roland Wasmuht (to Fried. Krupp A.-G.). U. S. 1,950,540, March 13. An article is shaped from a steel alloy contg. one or more elements such as Al, Cr, Mo or Mn adapted to accelerate nitridation and one or more elements such as Cu, Be, B or Ti adapted to cause pptn. hardening at nitriding temp., and the article is cooled from a temp. below the m. p. and above the nitriding temp., further shaped, and then subjected to a nitride-hardening and pptn.-hardening process.

**Working steel alloys.** Herman J. Van Royen. Brit. 402,972, Dec. 14, 1933. Addn. to 277,031. Articles adapted to resist wear, made from steel contg. double carbide formers, *e. g.*, Mn, Cr, W, Mo, V, in such amt. that the C content is less than 0.89% and their structure exclusively lamellar pearlitic, are shaped finally at below 850°. The steel may contain Si 0.35-0.8, Ni 1-7 and Cu 1.5%. Mn, if present, may be 0.6-0.8%. The initial shaping may be at the usual temp. of 950-1150°.

**Alloys.** Joseph Sunnen. Brit. 403,302, Dec. 21, 1933. The non-abrasive blocks of a cylinder grinding machine are formed of comparatively friable material such as a die cast alloy of compn. given in Brit. 395,271 (C. A. 28, 92<sup>3</sup>).

**Alloys.** Gustaf N. Kirschom and Calloy Ltd. Brit. 403,120, Dec. 11, 1933. A metal that does not readily alloy with Al, *e. g.*, Pb, is mixed with an Al alloy contg. an alk. earth metal (including Mg and Be) and the resulting layers of Al and alloy of Pb, etc., with alk. earth metal are sepd. Thus pieces, grains, etc., of an alk. earth metal compd. may be added to an Al bath and, after reduction of the compd., molten Pb added; alternatively the compd. may be added to a bath comprising Al and Pb. The pure alk. earth metals may be extd. from the alloys, *e. g.*, by volatilizing the complementary metals.

**Alloys; annealing.** Henry W. Brownson and Imperial Chemical Industries Ltd. Brit. 402,796, Dec. 4, 1933. Metal articles having a threaded portion and (or) distinct head and stem portion, *e. g.*, bolts, studs, nuts, screws, are formed from a soft Cu-Ni-Al alloy, the Al being 0.5-5% and the Ni 3-4 times the Al, and are hardened by heating to 300-600°. The alloy may be softened by heating to 800-900° and rapidly cooling and may contain up to 37% Zn and (or) 0.5-15% Mn.

**Alloys for pistons.** Elektronmetall G. m. b. H. Brit. 402,945, Dec. 14, 1933. In a light-metal piston having an Fe alloy insert for carrying piston rings the coeff. of expansion of the Fe alloy is less than, but not more than 10% less than, that of the light metal by reason of Ni (and Mo) in the Fe alloy and not more than 5% Si in the light metal. Suitable Fe alloys contain Ni 27 and Mo 5% or Ni 25 and W 5%. For examples of light-metal alloys see Fr. 42,833 (C. A. 28, 1324<sup>2</sup>).

**Alloys of hard metal carbides.** Ejner Schjøth. Fr. 758,891, Jan. 24, 1934. Colloidal suspensions of the constituents are made separately, emulsified together in the absence of air and the sediment is sepd. and dried under vacuum. The product obtained is fritted to give a homogeneous and resistant alloy.

**Oxide alloys.** Siemens & Halske A.-G. Fr. 759,029, Jan. 27, 1934. Articles are made by agglutinating, at above 1600°, Al<sub>2</sub>O<sub>3</sub> contg. less than 5% of an oxide of Fe, Mg, Zr or Th.

**Masses containing silicon.** I. G. Farbenind. A.-G. (Hans Häuber, inventor). Ger. 590,711, Jan. 9, 1934 (Cl. 12f. 3). Molded masses contg. Si are prepd. by mechanically working Si alloys or silicides at temps. below 1000°, raising the temp. to over 1000° after the working, and finally molding.

**Type metal.** Metallgesellschaft A.-G. (Kurt Paarman and Ernst Koch, inventors). Ger. 590,686, Jan. 8, 1934 (Cl. 40b. 11). Addn. to 589,679 (C. A. 28, 2317<sup>7</sup>). An alloy suitable for type metal consists of 20-30% Sb, 5-12% Sn, 0.5-2% Cu, 0.5-3% Cd, 0.1-0.5% As, 0.01-0.02%

Al, 0.01–0.8% alkali and (or) alk.-earth metal, including 1  
Mg, 0–2.99% Zn, and the rest Pb.

**Aluminum alloys.** J. Stone & Co. Ltd., Alfred J. Murphy and Stanley A. E. Wells. Brit. 403,700, Dec. 20, 1933. Al alloys, contg. Cu 0.5–5, Ni 0.5–3, Mg 0.1–2.5, Fe 0.2–4 and Si 0.2–2.5%, are improved by adding up to 1% Ce; Mn, Cr and (or) Ti may be present. The alloys may be aged at not over 300° and aging may be preceded by quenching from 480–570°. Cf. C. A. 28, 2668.

**Alloys of iron and chromium.** Electro Metallurgical Co. Fr. 759,006, Jan. 27, 1934. The alloy contains Cr 2–30, C not more than 0.5%, Cl at least 4 times the amt. of C and Fe the rest.

**Improving the magnetic properties of iron alloys.** Electrical Research Products Inc. Ger. 590,506, Jan. 11, 1934 (Cl. 407.1.65). A process is described for improving the magnetic properties of Fe–Co–Ni alloys, etc., by heating to 400–400° in a strong magnetic field.

**Palladium alloys.** The International Nickel Co., Inc. Ger. 593,406, Feb. 26, 1934 (Cl. 406.4) See Brit. 354,239 (C. A. 26, 2061).

**Devices for passing wire through degreasing, pickling, plating, etc., baths.** Max Schlötter. Brit. 403,136, Dec. 21, 1933.

**Centrifugal machine for scaling or cleaning metal plates, castings, etc., by throwing abrasive thereon.** Walter Scheinmann and Fritz Kottmann. Brit. 403,263, Dec. 21, 1933.

**Cleaning metals.** James H. Cravell. Brit. 403,373, Dec. 15, 1933. A dilutable compn. for cleaning metal surfaces, e. g., motor car bodies prior to painting, comprises a trihydric metal-etching mineral acid, e. g.,  $H_3PO_4$ ,  $H_2AsO_4$ , and a sulfonated hydrocarbon wetting agent compatible with aq. solns. of acids and alkalis, e. g., "Neomerpin" ("Nekal"). A solvent, increasing the soly. of the wetting agent, e. g., alcs., ketones, ethers, esters, may be added. In 403,374, Dec. 15, 1933, soldering fluxes are removed from metal surfaces by an aq. alk. soln. comprising an alkali, e. g., NaOH,  $Na_2CO_3$ , borax,  $Na_2PO_4$ , and an alkali salt of "Neomerpin" or other sulfonated aromatic hydrocarbon having an isopropyl radical attached to the nucleus. An indicator to show when the alkali is used up is preferably present.

**Metal cleaning and rust prevention.** Wm. K. Schweitz-

zer (to Grasselli Chemical Co.). U. S. 1,949,921, March 6. Metals are treated with aq.  $H_3PO_4$  together with isopropyl ether, and other similar ethers, alc., etc., also may be used.

**Apparatus for passing tinplates through a branning machine.** Harold D. Jones. Brit. 402,753, Nov. 30, 1933.

**Coating metal objects with molybdenum.** Patent-Trenhand Ges. für elektrische Glühlampen m. b. H. (to The General Electric Co. Ltd.). Brit. 402,010, Dec. 14, 1933. See Ger. 580,748 (C. A. 28, 1014).

**Soldering aluminum.** Edward Jones. Brit. 402,497, Dec. 7, 1933. Al (alloy) is prepd. for soldering to Al, brass, Cu, Fe, etc., by coating the surface thereof with Sn by means of a scraper fixed in the center of a Bunsen burner so that the flame completely surrounds the scraper. After tinning, the Al surfaces are soldered together by heating the parts and applying further Sn with the scraper. In soldering to other metals these are first tinned and any flux used is removed prior to the soldering operation.

**Soldering aluminum.** Émile N. Deleuze. Fr. 757,001, Jan. 8, 1934. A product for soldering Al contains borax 0.1–0.5, boric acid 0.1–0.4, resin 0.3–0.8, Sn 15–22, pure Al 20–28 and fused Al 50–65%.

**Solder for aluminum.** Arthur Steffen. Fr. 758,394, Jan. 15, 1934. The solder contains, e. g., Zn 8, Sn 1, Cu 0.5, Al 1 and Bi 0.025 kg.

**Silver solder.** Harold Turner and Johnson Matthey and Co. Ltd. Brit. 402,640, Dec. 7, 1933. A Ag solder contains at least 60% Ag, up to 9% Sn and Zn, Cd and (or) Sb, with or without a small percentage of Cu.

**Soldering articles such as cylinder covers of internal combustion engines, etc.** Kurt Bassler (to General Elec. Co.). U. S. 1,950,214, March 6. Articles sepd. from each other by a crevice which is narrow but somewhat wider than one into which molten Cu or brass solder could be drawn by capillary action are heated in a reducing atm. and bonded with an alloy which may be formed of Cu 64, Ni 25 and a readily fusible metal such as Zn 11 parts.

**Soldering flux.** Howard S. McQuaid (to Grasselli Chemical Co.). U. S. 1,949,916, March 6. The hydrochloride of an aliphatic amine such as that of an ethanolumine is used in soft soldering. Colophony and aniline-HCl, *o*-toluidine-HCl, etc., also may be used.

## 10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

A new laboratory method for the preparation of pure ethylene and propylene. P. K. Sakmin. Ber. 67B, 392–3 (1934). The Ipat'ev method for the prepn. of  $C_2H_4$  from EtOH has been greatly simplified. The app. is a Cu tube, the heated portion of which is filled with pieces (the size of a pea) of unglazed clay plate, held in position by a ring of asbestos at the lower end. The upper end is closed with a stopper connected with a dropping funnel and the lower end is connected with a 2-necked bottle (to catch the condensed EtOH vapors) and a gasometer. The advantages of this app. and catalyst are: (1) Instead of the 3 weeks' work required for the prepn. of c. p.  $Al_2O_3$ , only 1 hr. is needed to fill the tube with the pieces of clay plate; (2) by using a Cu tube all danger of damage on heating or changing the catalyst is avoided; (3) no special furnace with a porcelain tube is required, since the resistance wire is wound directly on the asbestos wrapping of the Cu tube; (4) no separate condenser is required for the unchanged alc. vapors; (5) the temp. can be measured with a simple Hg thermometer inserted in the well soldered to the tube. The catalyst is not only cheap but remains active for a long time. By keeping the outside temp. of the tube at about 400° by means of a rheostat and dropping in the alc. at the rate of 1–2 drops per sec. 1000 l. of 96–8%  $C_2H_4$  (20 l. per hr.) can be obtained without any decrease in the activity of the catalyst. Propylene can be simi-

larly obtained from PrOH if the temp. is kept at around 350°.

**Addition of hydrogen bromide to 1-pentene and 1-heptene.** Mary L. Sherrill, Katherine E. Mayer and Gertrude F. Walter. J. Am. Chem. Soc. 56, 926–30 (1934). 1-Pentene was prepd. from allyl bromide and EtMgBr and from  $PrCH(OEt)CH_2Br$  and Zn; 1-heptene was similarly prepd.; the phys. consts. agree with those reported. The addn. compd. formed by satg. the olefin in an org. solvent with dry HBr and allowing the reaction to take place under atm. pressure is exclusively the 1-Br deriv.; with aq. HBr the 2-Br deriv. is formed. The difference in the products formed by the 2 methods is believed to be due primarily to the difference in the solvents and not to the presence of any peroxide in the olefin. 1-Olefins do not readily form peroxides whereas those olefins with the double bond in the 2- or 3-position form peroxides easily; if peroxides were present in any of the reactions, it would be in the aq. HBr expts. for these were well mixed with air in the shaking process.

**Preparation of divinyl directly from alcohol.** I. S. V. Lebedev. J. Gen. Chem. (U. S. S. R.) 3, 698–717 (1933); cf. Brit. pat. 331,482 (C. A. 25, 115); U. S. S. R. pat. 24,393 (1931).

**The vapor phase catalytic hydrolysis of alkyl halides II. The preparation of methanol, formaldehyde and**

benzoyl chloride from methyl chloride, dichloromethane and benzotrichloride. A. Abkin and S. Medvedev. *J. Chem. Ind. (Moscow)* 1934, No. 1, 30-4; cf. *J. Phys. Chem. (U. S. S. R.)* 4, 731 (1933).—MeCl and  $\text{CH}_2\text{Cl}_2$  may be hydrolyzed by passing them with steam over Sn phosphate deposited on pumice.  $\text{TiO}_2$  and mixts. of Sn and Fe phosphates are unsatisfactory. When hydrolyzed at  $460^\circ$ , MeCl gives 16% MeOH and 18.6%  $\text{CH}_3\text{O}$ .  $\text{CH}_2\text{Cl}_2$  gives 75.5%  $\text{CH}_3\text{O}$ . If mixts. of MeCl and  $\text{CH}_2\text{Cl}_2$  are run at  $460^\circ$ ,  $\text{CH}_2\text{Cl}_2$  gives 90%  $\text{CH}_3\text{O}$  and the MeCl is 30% hydrolyzed. The residual MeCl may be recirculated, in which case 3-4 cycles are required for its complete hydrolysis, or it may be further chlorinated to  $\text{CH}_2\text{Cl}_2$ . The ratio of chlorides to  $\text{H}_2\text{O}$  for hydrolysis should be 1:10.  $\text{PhCCl}_3$  and  $\text{H}_2\text{O}$  in the ratio 1:1 at  $240^\circ$  give 96%  $\text{H}_2\text{Cl}$ . H. M. Leicester

Halogen derivatives of vinyl sulfides. S. M. Klier. *J. Gen. Chem. (U. S. S. R.)* 3, 904 8 (1933); cf. *C. A.* 27, 952. The subject of the study was the reduction of  $(\text{ClCH}_2\text{CHCl})_2\text{SO}_2$  (I) to  $(\text{ClCH}_2\text{CHCl})_2\text{S}$  (II) and conversion of II to  $(\text{ClCH}:\text{CH})_2\text{S}$  (III). Contrary to Muller and Metzger (*C. A.* 21, 52), II decomposes by distn. *in vacuo*, producing III after repeated fractionation. Similarly  $(\text{BrCH}_2\text{CHBr})_2\text{SO}_2$  (IV) is converted to  $(\text{BrCH}_2\text{CHBr})_2\text{S}$  (V) and this to  $(\text{BrCH}:\text{CH})_2\text{S}$  (VI). The results of the interaction of I and  $\text{PCl}_5$  demonstrated that the intermediate compd.  $(\text{ClCH}_2\text{CHCl})_2\text{SCl}_2$  (VII) splits off HCl with the formation of  $\text{ClCH}_2\text{CHClSCHClCHCl}_2$  (VIII) (Michaelis and Gaudehaus, *Ber.* 24, 763 (1891)) and not  $\text{Cl}_2$  with the formation of II as presumed by M. and M. (*loc. cit.*). A yield of 17 g. II,  $d_4^{20}$  1.634, was obtained by passing a current of  $\text{H}_2\text{S}$  into 25 g. I in 200 g. 100% AcOH while adding slowly 60 g. of satd. soln. of HBr in 100% AcOH; the reaction mixt. was dild. with  $\text{H}_2\text{O}$  and the oil dried by repeated filtration through dry filters until entirely clear. III,  $b_p$  71-2°,  $d_4^{20}$  1.365, resulted by successive fractionations (4) of II *in vacuo*. From 20 g. IV was prepd. 10 g. V as described above. V twice distd. *in vacuo* gave VI,  $b_p$  94-8°. An almost theoretical yield of VII,  $d_4^{20}$  1.557, resulted from I and  $\text{PCl}_5$  by cooling the exothermic reaction with ice. VIII,  $b_p$  95-7°, resulted from VII by repeated vacuum fractionation. All products give with  $\text{HgCl}_2$  in alc. white, amorphous ppts. insol. in common org. solvents. C. B.

Bibliography of chloropierin. R. C. Roark. *U. S. Dept. Agr. Misc. Pub.* 176, 88 pp. (1934). A revision of Bur. Chem. Bibliography 1 (*C. A.* 20, 2079), contg. 533 references arranged alphabetically, with brief abstracts. R. C. Roark

Preparation of dibromoamine and its reaction with Grignard reagents. Geo. H. Coleman, Charles B. Yager and Harold Soroos. *J. Am. Chem. Soc.* 56, 965 6 (1934).— $\text{NIHBr}_2$  was prepd. by passing  $\text{NIH}_3$  into Br in  $\text{Et}_2\text{O}$  at  $-50^\circ$ ; the ratio of Br to N was usually 1.98 to 2.05. At  $0^\circ$   $\text{NIHBr}_2$  is less stable than  $\text{NH}_2\text{Br}$ ; both are relatively stable at  $72^\circ$ .  $\text{NIHBr}_2$  reacts with  $\text{RMgX}$  to give  $\text{RNH}_2$ ,  $\text{R}_2\text{NH}$ ,  $\text{NH}_3$  and  $\text{N}_2$ ; the yields of  $\text{RNH}_2$  are less than those obtained with  $\text{NIH}_2\text{Br}$ ; the yields of  $\text{R}_2\text{NH}$  are much less than those of  $\text{RNH}_2$ . With  $\text{BuMgCl}$ ,  $\text{BuMgBr}$  and  $\text{BuMgI}$  the yields of  $\text{RNH}_2$  and  $\text{R}_2\text{NH}$  were: 15 and 5, 5 and 1, 2 and 0.4%, resp.; with *tert*- $\text{BuMgX}$  the yields were 24 and 5, 16 and 5, 3 and 1, resp. C. J. West

Enolization as directed by acid and basic catalysts. II. Enolic mechanism of the haloform reaction. Paul D. Bartlett. *J. Am. Chem. Soc.* 56, 967 9 (1934); cf. *C. A.* 28, 756<sup>3</sup>.—The reaction of  $\text{Me}_2\text{CO}$  with strongly alk. soln. of HOBr and HOI involves enolization of the  $\text{Me}_2\text{CO}$  as a rate-controlling step. The reaction with HOCl is several hundred times slower than the rate of enolization at the concn. employed; the rate of this reaction is controlled by a 2nd order reaction between the enol and the OCl ion. An interpretation of the unsym. halogenation of  $\text{Me}_2\text{CO}$  is given in terms of the electronic theory. C. J. West

Preparation of pure eleostearic acid from Chinese wood oil. Arthur W. Thomas and James C. Thomson. *J. Am. Chem. Soc.* 56, 898 (1934).—Details are given for

the prepn. of  $\alpha$ -eleostearic acid from tung oil and of the  $\beta$ -isomer from "wood oil butter." C. J. West

Spectroscopic study of eleostearic acids from Chinese wood oil. Andrew Dingwall and James C. Thomson. *J. Am. Chem. Soc.* 56, 899-901 (1934).—The absorption characteristics of  $\alpha$ - and  $\beta$ -eleostearic acids (I and II) are very similar, yet sufficiently different to enable them to be identified easily by this means. Although it is well recognized that light may cause profound changes in the acids, yet the light sources used in characterizing the acids had, under the conditions specified, no apparent action. A much stronger source, however, did cause very decided changes in the structure of I. I (15% soln. in 95% EtOH), irradiated for 2 hrs. under certain standard conditions, was converted into an acid that had the same absorption spectrum, in the region 2500 to 2850 Å., as the acid obtained from the solid glyceride. It is possible to det. spectroscopically the percentage compn. of a mixt. of I and II. C. J. West

Conjugated systems. X. The electrolytic reduction of vinylacrylic acid. Irving E. Muskat and Barbara Harriet Knapp. *J. Am. Chem. Soc.* 56, 943-5 (1934); cf. *C. A.* 27, 5066.—Electrolytic reduction of vinylacrylic acid (I) until approx. 1 mol.  $\text{H}_2$  per mol. I was absorbed gives 25-30% of  $\Delta^3$ -pentenoic acid, showing that the H is first added in the 4,4-positions. This is in agreement with the reduction of I by Na-Hg but is in contrast with the catalytic reduction of I, whereby  $\text{H}_2$  is added in the 3,4-positions. No reduction (electrolytic or I occurred in a soln. which was 0.5 M in H<sup>+</sup> ion nor in alk. soln.; it was reduced most rapidly in a soln. which was neutral or faintly acid. C. J. West

A novel, nondestructive oxidation of bixin. F. Viehöck. *Ber.* 67B, 577-83 (1934).—Two of the 9 double bonds in bixin (I) are especially reactive, for when I suspended in AcOH is shaken with  $\text{Mn}(\text{OAc})_4$  2 atoms of O are rapidly taken up while the consumption of a 3rd atom requires several days. Norbixin (II) and methylbixin (III) behave in the same way, except that the oxidation of III is somewhat slower. In every case, on pouring the product into water there are obtained amorphous chrome-yellow ppts. contg. 2 HO and 2 AcO or 1 HO and 3 AcO groups. If the oxidation is effected in the presence of  $\text{Ac}_2\text{O}$  a triacetate is formed exclusively. The remaining HO group is probably tertiary, for it has thus far not been possible to acetylate it; more vigorous acetylating methods result in decomposition. Concordant analytical results are obtained only with III, as partial lactone or lactide formation leads to irregularities with I and II. One mol. AcOH can be split off from the yellow products with striking ease. The triacetate  $\text{C}_{22}\text{H}_{30}\text{O}_7$  (IV) from III, heated in AcOH, very quickly gives an intensely red soln. yielding a red substance  $\text{C}_{20}\text{H}_{28}\text{O}_6$ . Simple heating of IV at  $110^\circ$  in N does not split off AcOH but the triacetate (V) from I loses 1 mol.  $\text{H}_2\text{O}$ , forming a lactone or lactide, since the product is no longer an acid. The reaction on alk. sapon. must be similar to that on heating with AcOH, for there is obtained, instead of the expected tetrahydroxydicarboxylic acid, a dicarboxylic acid  $\text{C}_{22}\text{H}_{30}\text{O}_7$  with 2 HO groups and an O atom, probably as C:O; there is a marked deepening of color (dark red) and the product forms condensation products with  $\text{Ph-NHNH}_2$ . Hydrolysis of the oxidation products after hydrogenation likewise yields only dihydroxyketo acids. Attempted oxidation degradation of the hydrogenated products with  $\text{KMnO}_4$  had to be abandoned because of the difficulties encountered, but the Me ester (perhydrodihydroxyketomethylbixin,  $\text{C}_{22}\text{H}_{44}\text{O}_7$ ) of the hydrolysis product of hydrogenated V (prepd. with  $\text{CH}_3\text{N}_3$ ) gives with  $\text{Ph}(\text{OAc})_2$  according to Criegee a small amt. of an ester aldehyde  $\text{C}_{12}\text{H}_{24}\text{O}_3$  as a mobile oil of pleasant odor which takes up O from the air to form a peroxide; repeated distn. therefore gives a mixt. of the aldehyde with the ester acid. The latter is also obtained by oxidation with  $\text{CrO}_3$ . Besides the ester aldehyde, which results from an exact halving of the mol., there was obtained a small amt. of a higher-boiling product, but the other cleavage fragment corresponding to it, which is probably

smaller than half the original mol., could be detected only in vanishingly small amts. Nor has it been possible to isolate the fragments carrying the ketone O, which are probably lost in the large quantities of resinous non-distillable residu, which is not the unchanged starting material for its mol. wt. is only 0.5 as great. By oxidation in  $\text{CHCl}_3$  there has been obtained from III an orange-yellow product with 1 HO and 1 AcO group; I is oxidized with extraordinary rapidity and yields a red product; cleavage of these monooxidation products results again in halving of the mol. The work has been temporarily discontinued because of lack of material. C. A. R.

**Direct synthesis of acid fluorides from acids and the preparation of formyl fluoride.** A. N. Nesmeyanov and E. J. Kahn. *Ber.* 67B, 370-3(1934).—The readily available alkali fluorides are in general completely insol. in acid chlorides and can therefore not be used for the reaction  $\text{RCOCl} + \text{NaF} \rightarrow \text{RCOF} + \text{NaCl}$ . KF is sol. in  $\text{Ac}_2\text{O}$  and especially in AcOH, however, and in both of these solvents  $\text{AcCl}$  and KF give good yields of AcF. With higher acid chlorides, the product is always AcF, because the AcOH is converted into AcCl and then into AcF which, being more volatile than the fluoride of the higher acid, escapes from the reaction mixt. This difficulty can be overcome by treating the soln. of KI in the acid  $\text{RCO}_2\text{H}$  with  $\text{BzCl}$  or  $\text{PhCCl}_2$ , whereby there is formed  $\text{BzOI}$ ,  $\text{RCOF}$  and  $\text{KCl}$ . The hitherto unknown **formyl fluoride** (I) was prepd. in this way. The reaction is carried out under an upright condenser (cooled with water at  $10^\circ$  and  $<5^\circ$  in the prepn. of AcF and I, resp.) connected at its upper end with a receiver cooled with ice and salt (in prepg. I a 2nd receiver in  $\text{Et}_2\text{O}-\text{CO}$  is used). AcF, b.  $20.2^\circ$ , was obtained (1) in 76% yield from 15.7 g.  $\text{AcCl}$  gradually dropped into 15 g. KF and 50 cc. AcOH on the water bath, (2) in 60% yield from AcOH and KF slowly treated with  $\text{BzCl}$ , (3) in 64% yield from KF and  $\text{Ac}_2\text{O}$  with  $\text{BzCl}$ , and (4) in 70% yield from AcOH, KF and  $\text{PhCCl}_2$ . I is obtained in 16% yield, together with an amt. of CO corresponding to 30%  $\text{HCO}_2\text{H}$ , from 1 mol. each of  $\text{HCO}_2\text{H}$ , KF and  $\text{PhCCl}_2$ , heated 1 hr. on the water bath. I  $b_{760} -26^\circ$ , d. 1.195, 1.160, 1.090 at  $-30^\circ$ ,  $-26^\circ$  and  $0^\circ$  under its own vapor pressure, has an intense but not unpleasant odor, dissolves solid  $\text{CO}_2$  well, does not dissolve NaCl, NaF, KF,  $\text{C}_{10}\text{H}_8$  or sucrose, dissolves I very slightly with yellow color, is sol. in ether, acetone and  $\text{CHCl}_3$ , insol. in  $\text{CCl}_4$  and hydrocarbons, hydrolyzes in water but apparently not instantaneously, forms alkyl formates with alc., reacts readily with amines to give the formyl derivs., is stable at low temps. but at room temp. decomposes in the course of a few hrs. into CO and HF. Mixts. with air are difficultly inflammable. To insects, I is about 3 times more toxic than chloroform and AcF. C. A. R.

**Systematic study of the preparation of acyl chlorides.** R. H. Clark and Alan Bell. *Trans. Roy. Soc. Can.* III, 27, 97 107(1933).—The acyl chlorides of 25 acids were prepd. by the action of (1)  $\text{PCl}_5$ , (2)  $\text{PCl}_3$  and  $\text{ZnCl}_2$ , (3)  $\text{SOCl}_2$ , and a quant. comparison was made.  $\text{PCl}_5$  was found to be satisfactory only for the lower mono- and dibasic acids.  $\text{PCl}_3$  gave better yields with  $\text{ZnCl}_2$ . This did not hold for  $\text{PCl}_5$ . With  $\text{SOCl}_2$  the yield from the aliphatic acids increased with the mol. wt. of the acid and a ratio of 1 mol. acid:1.5 mols.  $\text{SOCl}_2$  gave the best results. The  $\text{SOCl}_2$  method is recommended. Tables are given.

R. B. Sandin

**The use of methoxyacetic anhydride for the determination of hydroxyl groups.** Douglas W. Hill. *J. Am. Chem. Soc.* 56, 993-4(1934).— $(\text{MeOCH}_2\text{CO})_2\text{O}$  is suggested as a substitute for  $\text{Ac}_2\text{O}$  in the detn. of HO groups, since the micro-MeO detn. is more satisfactory than the micro-Ac detn. *Bis(methoxyacetyl)hydroquinone*, m.  $89.5-90^\circ$ ; *p-methoxyacetoxycinnamic acid*, m.  $164.5^\circ$ ; *methoxyacetoxycinnaldehyde*, pale yellow, m.  $93^\circ$ ; *p-methoxyacetoxycinnophenone*, m.  $58-7^\circ$ ; *pentamethoxyacetoxycinnol*, m.  $97.8^\circ$ .

C. J. West

**2,3-Butanediol and its derivatives. I. Halohydrins of pseudobutylene.** M. V. Likhoshestov and S. V. Alekseev. *J. Gen. Chem.* (U. S. S. R.) 3, 927-32(1933).—

$\text{MeCHClCH(OH)Me}$  (I) was obtained from 2-butene (II) and  $\text{NH}_2\text{CONHCl}$  (III) with  $\text{CuCl}_2$  catalyst in weak acid solns. The reaction is based on the hydrolysis of aq. III into  $\text{HClO}$  and  $\text{CO(NH}_2)_2$ . III was prepd. by chlorinating  $\text{CO(NH}_2)_2$  in the presence of  $\text{Cu(OAc)}_2$ , the formed  $\text{CuCl}_2$  acting as a catalyst in the formation of chlorohydrins (cf. Frahm, *C. A.* 25, 2690; U. S. pats. 1,315,228, 1,496,675, *C. A.* 18, 2345). III was used in concns. capable of producing not less than 20%  $\text{HClO}$ , and the recovered  $\text{CO(NH}_2)_2$  was used again in the process. With gaseous II the conversion to I takes place in 30-40 min. and with liquid II in 15-20 min.; the latter reaction is exothermic and must be kept at  $15-17^\circ$  by outside cooling. The reaction results in a mixt. of I and  $\text{MeCHClCHClMe}$  (IV), which can be sep'd. by distn. The content of I and IV in the mixt. depends on the acid used in the reaction: 5%  $\text{HCl}$  gave 38.8% I and 61.2% IV, 5%  $\text{H}_2\text{SO}_4$  52.98 and 47.02, 0.4%  $\text{H}_2\text{SO}_4$  75.05 and 24.95, and 5%  $\text{AcOH}$  79.92 and 20.08. The formation of IV is thus explained:  $\text{III} + \text{HCl} = \text{CO(NH}_2)_2 + \text{Cl}_2$ . The quant. sep'n. of I and IV was effected by converting I to  $\text{MeCHClCH(OAc)Me}$ , b.  $152.6^\circ$  (uncor.),  $d_{15} 1.0890$ ,  $n_D^{20} 1.4224$ , and  $\text{MeCHClCH(OBz)Me}$ , b.  $203.5.5^\circ$  (uncor.), which are new compds.  $\text{MeCHBrCH(OH)Me}$  (V), b.  $152.4^\circ$ ,  $d_{15} 1.4797$ ,  $n_D^{20} 1.4740$ , was obtained from 2-butene oxide (VI) with concd.  $\text{HBr}$  at  $0-10^\circ$  (Read and Hook, *C. A.* 15, 57). VI, b.  $56.8^\circ$ , was prepd. by the method of Etekov (*J. Russ. Phys. Chem. Soc.* 14, 371). Better yields of V were obtained by the action of  $\text{AcNHBr}$  on II in an acid medium.  $\text{AcNHBr}$  was prepd. from  $\text{AcNH}_2$  in  $\text{H}_2\text{O}$  and  $\text{Br}$  at  $0-3^\circ$  in the presence of  $\text{ZnO}$  or  $\text{CaCO}_3$ . The exothermic reaction of II and  $\text{AcNHBr}$  is completed in 5-6 min., the content of V and  $\text{MeCHBrCHBrMe}$  (VII), b.  $156.9^\circ$ , in the reaction mixt. depending on the acid used. Five%  $\text{HCl}$  gave 20.2% V and 78.80% VII, 5%  $\text{H}_2\text{SO}_4$  55 and 45, 0.4%  $\text{H}_2\text{SO}_4$  70 and 30, and 3%  $\text{AcOH}$  75.80 and 20.5%.  $\text{MeCHBrCH(OAc)Me}$ , b.  $165.7^\circ$  (uncor.),  $d_{15} 1.6121$ ,  $n_D^{20} 1.4800$ .  $\text{MeCHClCH(OH)Me}$  (VIII), prepd. from VI and III, is decompt. at  $65.7^\circ$  at atm. pressure and by distn. *in vacuo*. V and its Ac deriv. and VIII are new compds. Eighteen references. Chas. Blanc

**Preparation of anhydrous ethylenediamine.** John C. Bailar, Jr. *J. Am. Chem. Soc.* 56, 955(1934).  $\text{C}_2\text{H}_4(\text{NH}_2)_2$  and  $\text{ZnCl}_2$  in  $\text{H}_2\text{O}$  give the salt  $[\text{ZnCl}_2(\text{NH}_2)_2] \cdot \text{C}_2\text{H}_4$ ; the dry salt, heated *in vacuo* at  $200^\circ$ , gives nearly quant. anhyd.  $\text{C}_2\text{H}_4(\text{NH}_2)_2$ , b.  $116.7^\circ$ ,  $d_4^{20} 0.907$ .

C. J. West

**Absorption of oxygen by linseed oil in the presence of catalysts of different oxidation-reduction potentials.** Bacon F. Chow. *J. Am. Chem. Soc.* 56, 894 8(1934).—An empirical equation relating the rate of O absorption of linseed oil to the potential of the catalysts is given. The effect of H-ion concn., concn. of catalyst and the ratio of ferrieyanide to ferrocyanide is shown in tables. Acetoxime is a fairly powerful inhibitor,  $5 \times 10^{-4}$  mol. cutting the rate to one-half; all the amino acids show definite inhibition, though there is no relation between their structures and power of inhibition; ethanolamine is not a very powerful inhibitor; cinnamic acid reduces the rate considerably.  $\text{PhNMe}_2$  is a catalyst for the  $\text{O}_2$  absorption. A "secondary"  $\text{O}_2$  absorption has been found when molybdcyanide or tungsticyanide was used as catalysts in  $pH$  9 or greater.

C. J. West

**Optically active thiodilactylic acid.** Arne Fredga. *Svensk Kem. Tids.* 46, 10 15(1934)(in German); cf. Lovén, *Ber.* 29, 1134(1896).—Inactive thiodilactylic acid (m.  $125^\circ$ ) was changed to the quinine salts (98 g.) and fractionated by crystn. from MeOH, giving 2 active products, 17 g.,  $[\alpha] 197^\circ$ , and 25 g.,  $[\alpha] -198^\circ$ . Both acids m.  $117^\circ$  separately and  $127^\circ$  when mixed,  $[\alpha] 200.5^\circ$ , and  $-200.9^\circ$ .

A. R. Rose

**Ricinoleic acid condensations.** As. Zlatarov and V. Brelavski. *Ann. univ. Sofia, Faculté phys.-math.* 28, No. 2, 21 38(in German 39-44)(1932).—The isolation of diricinoleic acid, i. e., the condensation product of OH group of 1 mol. with the  $\text{CO}_2\text{H}$  group of another mol. of ricinoleic acid, has been undertaken. The following

condensations have been studied: Promoted by light, ultra-violet light, heating at 90° for 36 hrs. and at 103° for 48 hrs., heating with various catalysts such as boric acid,  $\text{SnCl}_4$ ,  $\text{H}_2\text{SO}_4$ , and piperidine. The diricinoleic acid, extd. with alc. at -10° from the condensation products in 5-10% yields, had Ac no. 84.4 and I no. 88.8. It is a thick yellowish oil, sol. in alc., ether,  $\text{CHCl}_3$ ,  $\text{AcOH}$ , acetone and  $\text{C}_6\text{H}_6$ . Cu and Ni hydroxides give Cu diricinoleate, m. 109°, and Ni diricinoleate,  $n_D^{20}$  1.4773. These salts are insol. in alc., but sol. in  $\text{C}_6\text{H}_6$  and  $\text{CHCl}_3$ . Diricinoleic acid and  $\text{H}_2\text{SO}_4$  react to produce a sulfuric acid ester of unsatd. character. A possible mechanism for the structure and formation of Turkey-red oil from castor oil has been suggested.

G. S. Stamatoff

Proteins in liquid ammonia. II. Reaction of sodium in liquid ammonia with amino acids and related substances. C. O. Miller and R. G. Roberts. *J. Am. Chem. Soc.* 56, 935-7 (1934); cf. *C. A.* 25, 5800.—In liquid  $\text{NH}_3$  glycine and alanine react with Na as monobasic acids; the phenol group of tyrosine is slightly acidic; leucine liberates more  $\text{H}_2$  than does a monoaminomono-carboxylic acid; cystine is reduced, in part, by the Na acting directly upon the disulfide bond. The peptide linkage in dipeptides is not acidic in liquid  $\text{NH}_3$ . Diketopiperazine is reduced by Na. Mixts. of amino acids and of amino acids with diketopiperazine do not liberate  $\text{H}_2$  additively, as is to be expected. Thus glycine and tyrosine liberate 67% of the  $\text{H}_2$  that they would liberate if taken separately; other examples are given. C. J. West

Iron compound of gluconic acid. A. Proskuriakoff and R. J. Titherington. *J. Am. Chem. Soc.* 56, 996-7 (1934).—Ca gluconate (3 mols.) and  $\text{Fe}_2(\text{SO}_4)_3$  (1 mol.) in hot  $\text{H}_2\text{O}$  give a light yellow amorphous ppt.,  $\text{C}_6\text{H}_{12}\text{O}_6\text{Fe}$ , which is probably a basic ferrigluconic acid; it is acid to litmus and the soln. can be made distinctly alk. to litmus without pptg.  $\text{Fe}$ . The compd. is of value in the treatment of secondary anemia.

C. J. West

Preparation of lactones from the phenylhydrazides of the acids of the sugar group. Raymond M. Hann and C. S. Hudson. *J. Am. Chem. Soc.* 56, 957-8 (1934).  $\alpha$ -Galaleptonic phenylhydrazide (50 g.) and 40 g.  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$  in 500 cc.  $\text{H}_2\text{O}$ , refluxed 5 hrs., cooled and treated with  $\text{H}_2\text{S}$  to ppt. the Cu and with  $\text{Ba}(\text{OH})_2$  to ppt. the  $\text{H}_2\text{SO}_4$ , give 85% of  $\alpha$ -galaleptonic lactone; in the same way 90% of mannonic lactone is prepd. from the phenylhydrazide.  $\beta$ -Galaleptonic acid is obtained in 65 g. yield from 100 g. of the phenylhydrazide (theory, 71.5 g.). The  $\text{PhNHNH}_2$  is oxidized to  $\text{C}_6\text{H}_6$  and N. The hydrolysis with  $\text{Ba}(\text{OH})_2$  is often very slow or incomplete.

C. J. West

Certain derivatives of alkyl  $\gamma$ -oxalylcrotonates. Albert B. Boese, Jr. and Randolph T. Majer. *J. Am. Chem. Soc.* 56, 949-52 (1934).—In the attempt to synthesize  $\text{CH}_2\text{:CHCH}(\text{COCO}_2\text{Et})\text{CO}_2\text{Et}$  by the condensation of  $\text{CH}_2\text{:CHCH}_2\text{CO}_2\text{Et}$  (I) with  $(\text{CO}_2\text{Et})_2$  in presence of Na the resulting product is Et  $\gamma$ -oxalylcrotonate (II), m. 79-80°; apparently I rearranges to  $\text{MeCH:CHCO}_2\text{Et}$ , which then reacts normally with  $(\text{CO}_2\text{Et})_2$ . With  $(\text{CO}_2\text{Me})_2$  there results the Me ester, m. 124.6°. The Na deriv. of II and cold 30% NaOH give  $\gamma$ -oxalylcrotonic acid, m. 212°; oxidation of the acid gives glutamic acid. The Na deriv. of II and  $\text{ClCO}_2\text{Et}$  in  $\text{Et}_2\text{O}$  give 71% of Et O-carbethoxy- $\gamma$ -oxalylcrotonate,  $b_p$  160-3°; catalytic reduction gives di-Et adipate; the corresponding Me O-carbomethoxy deriv.  $b_p$  158-60° (88% yield) and gives di-Me adipate on reduction. The Na deriv. of Et oxalylacetate and  $\text{ClCO}_2\text{Et}$  give Et O-carbethoxyoxalylacetate,  $b_p$  143.6° (65% yield); reduction gives di-Et succinate. Reduction of Et O-acetyloxalylcrotonate gives di-Et adipate. Di-Et  $\alpha$ -acetoxyadipate could not be catalytically reduced. The mechanism of these reductions is discussed.

C. J. West

Tautomerism of cyanourea with guanyl isocyanate. J. S. Blair and G. R. P. Smith, Jr. *J. Am. Chem. Soc.* 56, 907-10 (1934).—It has been known since 1875 that the compd. called cyanourea (I) or amidodicyanic acid reacts with  $\text{H}_2\text{O}$  in the presence of acid to yield biuret; it is now found that guanidine is simultaneously formed

under these conditions. From this and other considerations it appears that the chemistry of I is best explained by the assumption of tautomerism between a 4-membered ring and 2 different chain structures for the substance. All 3 of the H atoms of I are dissociable, as attested by the fact that I behaves as a tribasic acid in liquid  $\text{NH}_3$ ; K, di-K and tri-K salts were prepd. The labile structure and acid character of I are in accord with the point of view that I should be regarded as a mixed aquo ammonio pyrocarbonic acid. The validity of a ring structure for I is attested by the results of work with Hoffmann's diphenyl diisocyanate; mol.-wt. detns. show that it is a dimer, and it probably has the ring structure assigned by H. C. J. West

Monophenyl nitrogen esters of biuret. J. S. Blair. *J. Am. Chem. Soc.* 56, 904-7 (1934).—Three monophenylbiurets, in which the Ph group is attached to N, are described, m. 156-65° (I), 190° and 197° (II); according to the accepted theory of structure only 2 should exist. The wide variation in the reported m. p. of I is due to the fact that it decomposes on melting but without charring, rapid evolution of gas or other obvious evidences of decomposition. II is a mol. compd. of 3 mols. I with 2 mols. of phenylisocyanuric acid (III); it forms a continuous series of solid solns. with each component. The soly. of I in abs.  $\text{EtOH}$  at 22-4° is 33.96 g. per l., of III, 4.75 g.; the compn. of II is not altered by leaching with a solvent (abs.  $\text{EtOH}$ ), in which 1 of its components is 7 times as sol. as the other, so that II is a definite compd. The "isomerization" of II into I by alkali is explained as follows: both I and III are acids but III is much the stronger acid and its soly. is much more increased by adding a base than is the soly. of I; under proper conditions I will crystallize out, though in small yield. The substance m. 190° is being studied.

C. J. West

Formation of hemiacetals and hydrates of carbonyl and carboxyl derivatives. W. Herold. *Z. Elektrochem.* 39, 568-71 (1933); cf. *C. A.* 26, 5257, 5290.—Abnormalities in the ultra-violet absorption spectra of alc. and aq. solns. of CO compds. are due to hemiacetal and hydrate formation, the extent of which can be estd. from absorption measurements. As the no. of groups surrounding either the CO group or the OH group of the alc. solvent increases, the extent and velocity of addn. compd. formation decrease. This compd. formation gives an insight into the mechanism of esterification and explains why Walden's inversion is never observed when an active alc. is esterified and then saponified. The more pos. the groups adjacent to the CO group, the greater is the additive tendency and the deeper the color of the solid. The aq. and alc. solns., however, are usually colorless because of compd. formation. On the other hand, no examples have been found of CO derivs., negatively substituted in the  $\alpha$ -position, in which the CO group is responsible for color or hydrate formation. It is shown that  $\alpha$ -HO ketones form dimers (cyclic hemiacetals) and that the structure of alloxanic acid, which is colorless, is  $\text{CO NH.CO NH C(OH)CO}_2\text{H}$

and not  $\text{NH}_2\text{CONHCOCOCO}_2\text{H}$ . The spectroscopic data upon which the conclusions of this paper are based are not presented.

Arnold M. Collins

N-Methyluridine and its bearing on the structure of uridine. P. A. Levene and R. Stuart Tipson. *J. Biol. Chem.* 104, 385-93 (1934); cf. *C. A.* 27, 4528.—In order to prove that uridine has the ribose residu in position 3, monotriyluridine (I) was prepd., and the 2 remaining OH groups were protected by acetylation. Treatment of the resulting diacetyltriyluridine (II) with  $\text{CHI}_3/\text{N}_2$  gave diacetyltriyl-N-methyluridine (III), which on complete hydrolysis yielded 1-methyluracil. Hence position 3 must have been occupied by the ribose. The properties of I are different from those given by Bredreck (*C. A.* 27, 2156); it is cryst., m. 200° without foaming, is not hygroscopic,  $[\alpha]_D^{25}$  9.5° ( $\text{Me}_2\text{CO}$ ). Compds. II and III were glasses,  $[\alpha]_D^{25}$  50.9° ( $\text{MeOH}$ ), and  $[\alpha]_D^{25}$  55.3° ( $\text{MeOH}$ ), resp. Partial hydrolysis of III with 1%  $\text{HCl}$  in  $\text{MeOH}$  yielded N-methyluridine, m. 108-10°,  $[\alpha]_D^{25}$  16.5°. The properties of the 1-methyluracil obtained

here were identical with those of the synthetic prepn. of Johnson and Heyl (G. A. 1, 2373). K. V. T.

**Crystalline lead and strontium salts of *d*-xyloic acid and a crystalline triacetate of *d*-threose.** Robert C. Hockett. *J. Am. Chem. Soc.* 56, 994-5 (1934).—Hasenfratz (C. A. 27, 1880) has reported a Pb salt of *d*-xyloic acid; this was first isolated by H. in 1932; the salt seps. with 5 mols.  $H_2O$ , m. 58-9° and has  $[\alpha]_D^{25} = -6.8^\circ$  (0.7571 g. in 25 cc.  $H_2O$ ). The Sr salt also forms a pentahydrate, the  $H_2O$  being lost in 24 hrs. at 55°;  $[\alpha]_D^{25} 18.2^\circ$  (0.4206 g. in 25 cc.  $H_2O$ ); this salt is obtained in 96% yield from xylose by the electrolytic method; it should be useful in identifying and purifying xyloic acid because of its sparing soly. in cold  $H_2O$ . *d*-Threose triacetate, m. 113-14°,  $[\alpha]_D^{25} 35.5^\circ$  ( $CHCl_3$ ). C. J. West

**Action of triphenylmethyl chloride on  $\alpha$ -methyl *l*-fucoside.** R. C. Hockett and C. S. Hudson. *J. Am. Chem. Soc.* 56, 945-6 (1934).— $\alpha$ -Me *l*-fucoside (13 g.) in 100 cc. dry  $C_6H_5N$  and 30 g.  $Ph_3CCl$ , allowed to stand 5 days at room temp. and then heated 1 hr. on the water bath, give 25 g. *monotriphenyl deriv.*, crystg. with 1 mol.  $EtOH$ ,  $[\alpha]_D^{25} -51.4^\circ$  (0.5906 g. in 25 cc.  $CHCl_3$ , m. 123-6° (cor.); drying *in vacuo* at 75° gives the anhyd. compd., m. 126-8° (cor.),  $[\alpha]_D^{25} -59.5^\circ$  (0.5437 g. in 25 cc.  $CHCl_3$ ). The sugar decomposes on drying at 80°, giving  $Ph_3COH$  and  $\alpha$ -Me fucoside. This reaction disproves the hypothesis that  $Ph_3CCl$  is completely sp. in action toward primary HO groups, although a preferential action is known to take place in many individual cases. C. J. West

**Free aldehyde form of fucose tetraacetate.** M. L. Wolfson and J. A. Orsino. *J. Am. Chem. Soc.* 56, 985-7 (1934).—*l*-Fucose Et mercaptal in  $C_6H_5N$  and  $Ac_2O$  at 0° for 1 hr. and at room temp. for 18 hrs. gives 87% of the *tetraacetate*, m. 99-100°,  $[\alpha]_D^{25} 5^\circ$  ( $CHCl_3$ , c 3.8 g. in 100 cc.); treatment with  $CdCO_3$  and  $HgCl_2$  in  $Me_2CO$  gives *aldehyde-*l*-fucose tetraacetate* (I), m. 166-7°,  $[\alpha]_D^{25} 40^\circ$  ( $C_6H_5Cl_2$ , c 1.0); it shows mutarotation in  $MeOH$  (from 22.49° in 4 days at room temp.); it gives a pos. Schiff test in 2 min. and reacts with Fehling soln. immediately on heating; the *Et hemiacetal*, m. 120-1°,  $[\alpha]_D^{25} -3.4^\circ$  (c 1.7 in  $EtOH$ ), changing to 3.4° in 70 hrs.; in  $EtOH$ -free  $CHCl_3$  (c 1.5), -32° changing to 27.8° in hrs.; boiling  $H_2O$  gives the *aldehydrol*, m. 160-1°; the *semicarbazone* of I, m. 215° (decompon.). *l*-Fucose in  $C_6H_5N$  and  $Ac_2O$  gives  $\alpha$ -*l*-fucose *tetraacetate*, m. 92°,  $[\alpha]_D^{25} -120^\circ$  ( $CHCl_3$ , c 1.8). C. J. West

**Crystalline compounds of *d*-xylose and of *l*-arabinose with calcium chloride.** J. K. Dale. *J. Am. Chem. Soc.* 56, 932-4 (1934).—Xylose and  $CaCl_2 \cdot 2H_2O$  in  $H_2O$  give  $\alpha$ -*d*-xylose- $CaCl_2 \cdot 3H_2O$ , m. 126°; the initial and final sp. rotations in  $H_2O$  obtained from a mutarotation curve were 46.8° and 9.33°, resp. *l*-Arabinose gives  $\beta$ -*l*-arabinose- $CaCl_2 \cdot H_2O$ , decompos. 213°, initial and final sp. rotations 99.59° and 56.6°; the mother liquor yields the compd. ( $\beta$ -*l*-arabinose) $_2 \cdot CaCl_2 \cdot 2H_2O$ , which has no p., initial and final sp. rotations 124.6° and 69.94°, resp. The mutarotation curves of these compds. are similar to those of their sugar components. The initial sp. rotations calcd. for the xylose and arabinose components are higher than have been found previously. C. J. West

**New crystalline compound of  $\alpha$ -*l*-arabinose with calcium chloride and water.** W. C. Austin and J. P. Walsh. *J. Am. Chem. Soc.* 56, 934-5 (1934).—*l*-Arabinose (I) (16.7 g.), 32 g.  $CaCl_2 \cdot 2H_2O$  and 28 cc.  $H_2O$ , heated on a steam bath until crystals begin to appear, give 37% (16.7 g.) of the compd.  $\alpha$ -*l*- $CaCl_2 \cdot 4H_2O$ , which slowly liquefies at 112-15° and decomposes 214-15°; a 4% soln. in  $H_2O$  shows  $[\alpha]_D^{25} 36.41^\circ$  (3 min. after soln.), 40.44° (9.6 min.), 44.48° (22.2 min.) and 47.65° (18 hrs.). From these values there is calcd.  $[\alpha]_D^{25} 75.18^\circ$  for  $\alpha$ -I. C. J. West

**Crystalline triphenylmethyl derivatives of  $\beta$ -methyl *d*-xyloside.** E. L. Jackson, R. C. Hockett and C. S. Hudson. *J. Am. Chem. Soc.* 56, 947-9 (1934); cf. C. A. 26, 423.— $\beta$ -Me *d*-xyloside and  $Ph_3CCl$  in  $C_6H_5N$  at 20° yield a mixt. of *bistriphenylmethyl deriv.*, sepd. by

crystn. from  $EtOH$ ; the 1st m. 238-40° (all m. ps. cor.),  $[\alpha]_D^{25} -55.5^\circ$  ( $C_6H_5N$ , 0.2386 g. in 25 cc.); the 2nd m. 102.5-3°,  $[\alpha]_D^{25} -22.5^\circ$  ( $C_6H_5N$ , 0.2772 g. in 25 cc.); in addn. there is formed a sirup which on acetylation yields 2 isomeric *diacetylmonotriphenylmethyl- $\beta$ -methyl-*d*-xylosides*, m. 169-70°,  $[\alpha]_D^{25} -15.7^\circ$  ( $CHCl_3$ , 0.6130 g. in 25 cc.), and m. 125-7°,  $[\alpha]_D^{25} -49.1^\circ$  ( $CHCl_3$ , 0.4808 g. in 25 cc.). These results show that  $Ph_3CCl$  reacts with the sec. HO groups in this xyloside. The reaction at 100° gives the 2 bis- $Ph_3C$  derivs. C. J. West

**The synthesis of ribose-5-phosphoric acid.** P. A. Levene and Eric T. Stiller. *J. Biol. Chem.* 104, 299-300 (1934).—In order finally to confirm the fact that the ribosephosphate of muscle adenylic acid (I) is ribose-5-phosphoric acid, synthesis was carried out. From 2 g. *d*-ribose in 380 cc.  $Me_2CO$  and 20 cc.  $MeOH$  contg. 0.2%  $H_2SO_4$ , by shaking with anhyd.  $CuSO_4$  and fractional distn., was obtained 14 g. *monoacetone-methylribose* (II), b.p. 83-6°. That II is a furanose was shown by methylation and hydrolysis; the *p*-bromophenylosazone, m. 175°,  $[\alpha]_D^{25} -55.2^\circ$  ( $EtOH$ :pyridine, 3:2), from the resulting *monomethylribose* (III), was identical with that prepd. from 5-methylribofuranose (cf. Levene and Stiller, C. A. 28, 1049). Hence III is the furanose and therefore II a furanose. Phosphorylation of 8.5 g. II by  $POCl_3$  in pyridine, followed by hydrolysis of the acetone and Me groups, led to a Ba ribosephosphate, which was therefore the 5-phosphate,  $[\alpha]_D^{25} 5.99^\circ$  ( $H_2O$ ). The free acid (IV) had  $[\alpha]_D^{25} 16.54^\circ$  (1 N HCl), while the natural product, prepd. from the inosinic acid of fish muscle, had  $[\alpha]_D^{25} 16.09^\circ$  (1 N HCl). The rates of hydrolysis of the Ba salts of ribose-3- and -5-phosphoric acids are also very different. It follows that I and IV are identical. K. V. Thimann

**Methylated sugars. I. Preparation of tetramethylglucose.** Edward S. West and Raymond F. Holden. *J. Am. Chem. Soc.* 56, 930-2 (1934).—Details are given for the prepn. of  $\alpha$ , $\beta$ -tetramethylmethylglucoside from glucose by treatment with  $Me_2SO_4$  in  $CCl_4$  and 60%  $NaOH$ ; the yield is equal to the glucose used and the rotation corresponds to 83-5% of the  $\beta$ -form; hydrolysis is carried out with 2 N HCl, steam being passed through for 1 hr.; the entire operation to obtain cryst. tetramethylglucose (I) is 8-10 hr. I has  $[\alpha]_D^{25} 81.3^\circ$  ( $H_2O$ ), 2° lower than reported values. The methylation of  $\alpha$ -Me glucoside is also described. The equation  $[\alpha]_D = 85 - 0.1846t$  expresses the relation between  $\alpha$ . rotation and *t* between 5° and 37°. I in  $C_6H_6$  has  $[\alpha]_D^{25} 86.57^\circ$  (c 4.86);  $EtOH$ , 81.3° (c 4.35);  $CHCl_3$ , 85.42° (c 3.98); in  $MeOH$   $[\alpha]_D^{25} 82.91^\circ$  (c 4.87). C. J. West

**Anhydro- $\beta$ -methylhexoside from triacetyl-4-toluenesulfonyl- $\beta$ -methylglucoside.** Alexander Müller. *Ber.* 67B, 421-4 (1934); cf. C. A. 25, 685.—The study of the anhydro- $\beta$ -methylhexoside (I) obtained from triacetyl-4-*p*-toluenesulfonyl- $\beta$ -methylglucoside with  $NaORt$  has not yet led to a decision as to the position of the newly-formed O bridge and as to what is the parent sugar (rendered doubtful by a possible Walden inversion) but has given some interesting results. The 2 HO groups in I are readily methylated and by interrupting the reaction there can be obtained a homogeneous *mono-Me deriv.* (II), an indication that 1 of the HO groups occupies a preferred position. This is confirmed by the pos. trityl reaction, showing the presence of a primary HO group and excluding the possibility of a 4,6-bridge. Hydrolysis of the *di-Me deriv.* (III) and the subsequent osazone reaction give no information, however, as to the length of the ring, for the products cannot be purified and contain only traces of  $MeO$ . With dil. HCl, I readily adds 1 mol. HCl to form a *chloro- $\beta$ -hexose*, isolated as the *tetraacetate* (IV). III behaves in the same way. The ease with which the HCl is added points to the presence of a highly strained ring (possibly 3,4). III, obtained almost quantitatively from I, with  $MeI$  and  $Ag_2O$  in boiling acetone, m. 83-4°,  $[\alpha]_D^{25} -148.2^\circ$  ( $CHCl_3$ ), II, m. 121°,  $[\alpha]_D^{25} -141.6^\circ$  (water). 6-Trityl-acetyl-anhydro- $\beta$ -methylhexoside, from I allowed to stand 20 hrs. with  $Ph_3CCl$  in pyridine at 15-20°, then 20 hrs.

with  $\text{Ac}_2\text{O}$ , m. 180.5–1.5°, seps. with 0.5 mol.  $\text{EtOH}$ ,  $[\alpha]_D^{25}$  –91.8° ( $\text{CHCl}_3$ ). IV (yield 41%), m. 128°,  $[\alpha]_D^{25}$  –21.17° ( $\text{CHCl}_3$ ), reduces hot Fehling soln. *Di-methylchloro- $\alpha$ -hexose*, m. 135–7°,  $[\alpha]_D^{25}$  in water –53.7° shortly after soln., –67.6° (equil.) after 70 hrs.

C. A. R.

**Improvements in the preparation of crystalline *d*-mannose.** C. S. Hudson and E. L. Jackson. *J. Am. Chem. Soc.* 56, 958 9(1934).—Me *d*-mannoside can be obtained in 45% yield from vegetable ivory. Hydrolysis with 2%  $\text{HCl}$  by refluxing gently for 4 hrs. gives 70% of *d*-mannose, a yield of about 30% of the sugar from the vegetable ivory used.

C. J. West

**Halogenoacetates of the  $\beta$ -series and their use for syntheses.** VIII. Crystalline  $\beta$ -*h*-ethyl galactoside (galactofuranoside). Hans H. Schlubach and Klaus Meisenheimer. *Ber.* 67B, 429–30(1934); cf. *C. A.* 27, 493. —A new way of prep. pure  $\beta$ -*h*-Et galactoside (I) has been discovered. The now readily available  $\beta$ -pentaacetyl-*h*-galactose is converted by 24 hrs. treatment with anhyd.  $\text{HCl}$  into  $\beta$ -acetochloro-*h*-galactose, which, without preliminary isolation, gives with  $\text{Ag}_2\text{CO}_3$  in moist acetone 40% of  $\beta$ -2,3,5,6-tetraacetylgalactose, and the latter, refluxed 6 hrs. with  $\text{Ag}_2\text{O}$  in EtI, yields 57% of the 2,3,5,6-tetraacetate, m. 50° (cor.),  $[\alpha]_D^{25}$  –50.5° ( $\text{CHCl}_3$ ,  $c$  0.96), of I, hydrolyzed by  $N/3$   $\text{Ba}(\text{OH})_2$  at 60° to I (71% yield), m. 86° (cor.),  $[\alpha]_D^{25}$  –97.2° (water,  $c$  0.98).

C. A. R.

**Keto-fructose pentaacetate.** M. L. Wolfrom and Alva Thompson. *J. Am. Chem. Soc.* 56, 880 2(1934). —In the prepn. of  $\beta$ -fructose pentaacetate (I) by the acetylation of  $\beta$ -fructose tetraacetate with  $\text{ZnCl}_2$  the 1st crystals are nearly pure " $\alpha$ "-form (II), but the mother liquor gives the  $\beta$ -form, m. 108°; in 1 expt., in which the quantity of  $\text{Ac}_2\text{O}$  was greatly decreased, I was the only form which crystd. I undoubtedly has a ring structure, which then must open on further acetylation in the presence of  $\text{ZnCl}_2$ . II and  $\text{Na}_2\text{SO}_4$ , added to  $\text{ZnCl}_2$  in EtSH and kept at 0° for 3–4 hrs., give *d*-fructose Et thioacetal pentaacetate (III), m. 83°,  $[\alpha]_D^{25}$  20° ( $\text{CHCl}_3$ ,  $c$  3.7 g. in 100 cc. soln.);  $\text{NH}_3$  in MeOH gives *d*-fructose Et thioacetal (IV), m. 65–7°,  $[\alpha]_D^{25}$  35.8° (MeOH,  $c$  4); it is sensitive to acid and decomposes over an acid drying agent. Reacetylation of IV gives III. III with  $\text{CdCO}_3$  and  $\text{HgCl}_2$  in MeCO gives II; this shows no mutarotation and does not react with  $\text{Ni}(\text{OH})_2$ ,  $\text{H}_2\text{NNHCONH}_2$  or  $\text{H}_2\text{NNHCSNH}_2$ ; the reaction products with  $\text{PhNHNH}_2$  and substituted hydrazines are sirups, which decompose readily. Aldehyde-glucose or -galactose pentaacetate with EtSH,  $\text{ZnCl}_2$  and  $\text{Na}_2\text{SO}_4$  readily yields the Et thioacetal pentaacetates. I and EtSH with  $\text{ZnCl}_2$  give  $\beta$ -Et thiofructoside tetraacetate, m. 96–8°,  $[\alpha]_D^{25}$  –151.9° ( $\text{CHCl}_3$ ,  $c$  3.7); MeOH- $\text{NH}_3$  gives  $\beta$ -Et thiofructoside, m. 140°,  $[\alpha]_D^{25}$  –232.9° (MeOH,  $c$  3.6) without mutarotation; it reduces Fehling soln. only after hydrolysis. Thioacetal formation can be used as a proof of open-chain structure in an acetate when a product contg. 2 EtS groups is obtained without loss of Ac groups. C. J. W.

**Reactions relating to carbohydrates and polysaccharides.** XLVI. Structure of the cellulose synthesized by the action of *Acetobacter xylinus* on fructose and glycerol. J. Barsha and H. Hilbert. *Can. J. Research* 10, 170–9 (1934); cf. *C. A.* 25, 3960. —Membranes synthesized by *Acetobacter xylinus* on fructose and on glycerol have been shown by the recognized methods of methylation, acetylation, acetolysis and hydrolysis to be chemically identical with cotton cellulose. This is confirmed by x-ray analysis. The x-ray investigation by Sisson and Clark (cf. *C. A.* 27, 5963) indicates the identity of the cellulose membranes from glucose, fructose, glycerol, sucrose, galactose and mannitol by the action of *A. xylinus* and thus supports the view that the same polysaccharide is synthesized by the organism whenever cell-wall formation (growth) occurs and that this polysaccharide is chemically identical with cotton cellulose.

R. B. Sandin

**Highly polymerized compounds.** LXXXIX. The polyoxymethylenes as a model of cellulose (remarks on the

work of K. Hess and co-workers). H. Staudinger. *Ber.* 67B, 475–9(1934); cf. *C. A.* 28, 2521<sup>4</sup>; Wadano, Trogus and Hess, *C. A.* 28, 2600<sup>5</sup>. —Polymers. XC (also Cellulose. XII). Cellopentaose acetate and the constitution of cellulose. H. Staudinger and E. O. Leupold. *Ibid.* 479–80; cf. *C. A.* 28, 1589<sup>6</sup>. —Mol.-wt. detns. by the viscosity method used by S. and Freudenberg (C. A. 27, 3071) indicate that Zechmeister and Tot's cellohexaose acetate (C. A. 25, 4119) is really cellopentaose acetate. To test further the validity of the viscosity laws on which the method is based, measurements were made on *heptaacetylcellobiose nonylate*, m. 116–18°, and the *stearate*, m. 130 2°, prepd. from acetobromocellobiose and the Ag salts of the acids; for the stearate the  $\eta_{sp.}$  (1.4%) value for a glucose residue agrees with that for a glucose residue in the pentaose acetate and the highly polymerized cellobiose acetates; the value found for the nonylate is somewhat higher than the calcd. value. That the Z. and T. cellohexaose acetate is really the pentaose compd. was further confirmed by mol.-wt. detns. (Rast) in camphor by the Pregl micro method, which was found to give the cor. values with  $\beta$ -glucose pentaacetate, cellobiose octaacetate, cellotriose acetate and cellotetraose acetate.

C. A. R.

**Mechanism of macropolymerization reactions.** Wm. Chalmers. *J. Am. Chem. Soc.* 56, 912 22(1934). —An investigation has been made of the "stepwise" mechanism of macropolymerization supported by several writers. On the fundamental assumption that the rates of the consecutive reactions are not greater than that of the dimerization, it has been shown that the dimer and other low polymers would be formed in largest proportion. On the basis, 1st, of the compn. and complexity of the polymer, and, 2nd, of the reaction course of the monomer, the stepwise scheme has been rejected, and a "polymerization-chain" mechanism adopted. The polymerization chain is made up of a primary activation of the monomer and a subsequent process of concatenation which is rendered possible by the presence of free terminal bonds on all intermediate stages. The linking of the monomeric units proceeds initially at a rate which is almost instantaneous compared with that of activation but for very great chain lengths becomes increasingly slow. The start and propagation of the chain have been studied from the viewpoint of energetics and of the phenomenon of neg. catalysis. It is suggested that in catalytic processes the "trigger" mol. is formed by union of the catalyst with only 1 unsatd. atom of the monomer, giving a half-addn. product with a free bond. C. J. W.

**Starch.** VI (preliminary communication). A ditosyl-acetyliodomethylglucoside from tritosylstarch. Kurt Hess and Otto Littmann. *Ber.* 67B, 465–6(1934); cf. *C. A.* 28, 1147<sup>7</sup>. —Cleavage of ditosylodostarch with HBr gives a product (I) which was provisionally assigned the structure of a 1- $\alpha$ -bromo-2,3-ditosyl-4-acetyl-6-iodoglucose, and tritosylstarch gives 1- $\alpha$ -bromo-2,3,6-tritosyl-4-acetylglucose (?) (II). By analogy and from the known structure of starch it was to be expected that the 2,3,6-tritosyl-4-acetyl- $\beta$ -methylglucoside (?) obtained from II would give with NaI a 2,3-ditosyl-4-acetyl-6-iodo- $\beta$ -methylglucoside (?) (III) identical with the  $\beta$ -Me hexoside (IV) obtained from I. As a matter of fact, III m. 129–30° and shows  $[\alpha]_D^{25}$  13.16° ( $\text{CHCl}_3$ ), –8.59° (acetone), –16.18° (benzene), while the corresponding consts. for IV are 162–3°, 10.62°, 4.81°, –17.74°. The nature of the isomerism between III and IV remains unexplained as yet.

C. A. R.

**Cyclopentadiene in products of pyrolysis of kerosene.** I. A. Volzhinskii and A. P. Shecheglova. *Sigret. Kauchuk* 1933, No. 4, 31–5. —A preliminary report on the investigation made to det. the diene hydrocarbon content of the high-boiling fraction obtained in the process of rectification of bivinyll; bivinyll was produced by pyrolysis of kerosene *in vacuo*. It was found that cyclopentadiene formed the greater part of the diene content of the 28–50° fraction; the total diene content of this fraction was 30–35% as detd. by  $\text{SO}_2$ . James Sorrel

**Jasmine perfumes. I. The constitution of jasmone.** L. Ruzicka and M. Pfeiffer. *Helv. Chim. Acta* 16, 1208-14 (1933).—The structure of *jasmone* (I) is concluded to be  $\text{EtCH:CHCH}_2\text{C:CMc}_2\text{CH}_2\text{CH}_2\text{CO}$ . I

was isolated from that portion of jasmine oils  $b_{12} > 100^\circ$  as its *semicarbazone*, m.  $209.5-10^\circ$  (from alc.), which, when treated in water suspension with phthalic anhydride, gave I,  $b_{12}$   $134-5^\circ$ ,  $[\alpha]_D^{20}$   $0^\circ$ ,  $d_4^{20}$   $0.9437$ ,  $n_D^{20}$   $1.4979$ . I with  $\text{O}_3$  in cold  $\text{CCl}_4$  gave an amorphous *osonide* which when decompd. at  $100^\circ$  gave products among which  $\text{EtCHO}$ ,  $\text{EtCO}_2\text{H}$ ,  $\text{AcOH}$ , malonic and levulinic acids were detected. Among the oxidation products obtained from treating an aq. suspension of I with  $\text{KMnO}_4$  were propionic, levulinic, malonic and succinic acids. I was not reduced by  $\text{Zr}$  and alc.  $\text{NaOH}$ , but was reduced catalytically to *dihydrojasmone* (3-methyl-2-pentylcyclopenten-1-one),  $b_{12}$   $120^\circ$ ; *semicarbazone*,  $175-6^\circ$ ; *p-nitrophenylhydrazone*, m.  $111^\circ$  (from dil.  $\text{MeOH}$ ). The reduction of I with Adams Pt oxide catalyst gave *tetrahydrojasmone*; *semicarbazone*, m.  $156-7^\circ$ . T. H. Ryder

**The stereoisomers of 1-methyl-2-propylcyclopentane.** Gregoire Chierdoglu. *Bull. Soc. chim. Belg.* 43, 35-48 (1934).—Na and di-Et adipate give the Na deriv. of Et cyclopentanecarboxylate which with  $\text{PrI}$  gives 85% of Et  $\alpha$ -propylcyclopentanecarboxylate, m.  $-37.6^\circ$ ,  $b_{12}$   $126.0-6.2^\circ$ ,  $b_{14}$   $127.5-7.7^\circ$ ,  $d_4^{20}$   $1.0309$ ,  $d_4^{25}$   $1.0136$ ,  $n_D^{20}$   $1.4482$ ,  $n_D^{25}$   $1.4500$ ,  $n_{\text{He}}$  yellow  $1.4507$ ,  $n_{\text{He}}$   $1.4564$ ,  $n_D^{20}$   $1.4611$ , at  $20^\circ$  *semicarbazone*, m.  $160.2^\circ$ . Its hydrolysis yields 85% of  $\alpha$ -propylcyclopentanone, m.  $68.25^\circ$ ,  $b_{12}$   $183.10-3.20^\circ$ ,  $b_{14}$   $59.4^\circ$ ,  $b_{16}$   $62.8^\circ$ ,  $b_{18}$   $70.2^\circ$ ,  $d_4^{20}$   $0.9183$ ,  $d_4^{25}$   $0.9127$ ,  $d_4^{30}$   $0.9017$ ,  $n_D^{20}$   $1.4406$ ,  $n_D^{25}$   $1.4429$ ,  $n_{\text{He}}$  yellow  $1.4430$ ,  $n_{\text{He}}$   $1.4487$ ,  $n_D^{20}$   $1.4532$  at  $20^\circ$ . This ketone and  $\text{MeMgI}$  give 90% of 1-methyl-2-propyl-1-cyclopentanol, which can be sep'd. into a *trans*-isomer,  $b_{12}$   $84.5-5.0^\circ$ ,  $d_4^{20}$   $0.9141$ ,  $d_4^{25}$   $0.8976$ ,  $n_D^{20}$   $1.4530$ ,  $n_D^{25}$   $1.4553$ ,  $n_{\text{He}}$  yellow  $1.4554$ ,  $n_{\text{He}}$   $1.4610$ ,  $n_D^{20}$   $1.4656$  at  $20^\circ$ , viscosities  $\eta$   $0.15126$  at  $15^\circ$  and  $0.06449$  at  $30^\circ$ , and a *cis*-isomer,  $b_{12}$   $91.5-2.0^\circ$ ,  $d_4^{20}$   $0.9161$ ,  $d_4^{25}$   $0.9010$ ,  $n_D^{20}$   $1.4549$ ,  $n_D^{25}$   $1.4572$ ,  $n_{\text{He}}$  yellow  $1.4573$ ,  $n_{\text{He}}$   $1.4628$ ,  $n_D^{20}$   $1.4673$ , viscosities  $\eta$   $0.20509$  at  $15^\circ$  and  $0.09504$  at  $30^\circ$ . Dehydration of either alc. yields (90%) the same 1-methyl-2-propylcyclopentene, m.  $130^\circ$  (approx.),  $b_{12}$   $150.15$   $0.25^\circ$ ,  $d_4^{20}$   $0.8223$ ,  $d_4^{25}$   $0.8059$ ,  $n_D^{20}$   $1.4408$ ,  $n_D^{25}$   $1.4497$ ,  $n_{\text{He}}$  yellow  $1.4498$ ,  $n_{\text{He}}$   $1.4566$ ,  $n_D^{20}$   $1.4623$  at  $20^\circ$ . Hydrogenation over Pt black gave quantitatively 1-methyl-2-propylcyclopentane, which is sep'd. by fractional distn. into 2 *stereoisomers*, A, becoming a glass at about  $-123^\circ$ ,  $b_{12}$   $116.37-6.38^\circ$ ,  $d_4^{20}$   $0.79328$ ,  $d_4^{25}$   $0.77743$ ,  $n_D^{20}$  at  $20^\circ$ , for the lines  $6678$ ,  $6563$ ,  $5893$ ,  $5876$ ,  $461$ ,  $5016$ ,  $4861$ ,  $4358$  and  $4341$  A.  $1.42496$ ,  $1.42526$ ,  $1.42740$ ,  $1.42750$ ,  $1.42927$ ,  $1.43173$ ,  $1.43279$ ,  $1.43682$  and  $1.43705$ , resp., viscosities  $\eta = 0.0075$  at  $15^\circ$  and  $0.00622$  at  $30^\circ$ , crit. soln. temp. in aniline  $58.0^\circ$ ; and B, m.  $104.9^\circ$ ,  $b_{12}$   $152.58^\circ$ ,  $d_4^{20}$   $0.80783$ ,  $d_4^{25}$   $0.79212$ ,  $n_D^{20}$  at  $20^\circ$  for the above mentioned lines  $1.42471$ ,  $1.43211$ ,  $1.43432$ ,  $1.43442$ ,  $1.43616$ ,  $1.43858$ ,  $1.43962$ ,  $1.44377$ , and  $1.44395$ , resp., viscosities  $\eta$   $0.00941$  and  $0.00753$  at  $15^\circ$  and  $30^\circ$ ,  $n_D^{20}$ , crit. soln. temp. in aniline  $52.5^\circ$ . A. L. Henne

**Constitution of the polymers of cyclopentadiene.** Remarks on the communication under the same title by J. Pirsich. —Kurt Alder and Gerhard Stein. *Ber.* 67B, 115 (1934); cf. Pirsich, *C. A.* 28, 2335.—Detns. of the mol. m.-p. depression do not suffice for the soln. of problems of structure and configuration in the series of polymeric homologs of cyclopentadiene. C. A. R.

**Physical-chemical properties of styrene.** A. P. Aleksandrov. *J. Tech. Phys.* (U. S. S. R.) 3, 823-30 (1933). The cond. of styrene as a function of temp. was found to be  $\sigma = \gamma e^{-b/T}$ , for which  $b = 27,000$  in the temp. interval of  $74^\circ$ , and the viscosity  $\eta = \eta_0 e^{b_1/T}$ . Coeff.  $b$  is greater than  $b_1$ . Impurities do not alter the shape of the curve but merely move its position. At temps. where polymerization begins to bear an influence, the former equations do not hold and the viscosity increases while the cond. decreases. The cond. at  $35^\circ$  was  $2.5 \times 10^{-10}$  ohm/cm. In polystyrene a marked polarization is observed.

Riio Hanninen

**The synthesis of glycols and certain of their derivatives. Synthesis of divinylbenzenes, dipropenylbenzenes and diethynylbenzenes.** René Deluchat. *Ann. chim.* [11], 1, 181 255 (1934).—A résumé of previous work done by D. and others on the glycols and their derivs. is given. Some new compds. are also reported. 1,2-[ $\text{PhCH}(\text{OH})_2$ ] $_2\text{C}_6\text{H}_4$ , treated with  $\text{H}_2\text{SO}_4$ , yielded diphenylphthalane, m.  $93^\circ$ , contrary to Nelken and Simonis' report of this substance (cf. *C. A.* 2, 1960) as a heavy oil  $b_{12}$   $240^\circ$ . The following dibromohydrins were prep'd. by the method given in *C. A.* 25, 4532-3: 1,2-( $\text{EtCHBr}$ ) $_2\text{C}_6\text{H}_4$  (I) m.  $40^\circ$ ; 1,3-( $\text{MeCHBr}$ ) $_2\text{C}_6\text{H}_4$  (II),  $b_{12}$   $131^\circ$ ,  $d_4^{20}$   $1.567$ ,  $n_D^{20}$   $1.5914$ ; 1,4-( $\text{EtCHBr}$ ) $_2\text{C}_6\text{H}_4$ , m.  $70^\circ$ . Distn. of I under 5 mm. gave *o*-divinylbenzene and 1- $\alpha$ -bromoethyl-2-vinylbenzene,  $b_{12}$   $87.5^\circ$ ,  $b_{14}$   $115^\circ$ ,  $d_4^{20}$   $1.312$ ,  $n_D^{20}$   $1.5872$ , M. R. 54.05 (theory 52.32). II treated as I and fractionated yielded 2 fractions: the 1st,  $b_{12}$   $52^\circ$ , was *m*-divinylbenzene and the 2nd was 1- $\alpha$ -bromoethyl-3-vinylbenzene,  $b_{12}$   $86.5^\circ$ ,  $d_4^{20}$   $1.319$ ,  $n_D^{20}$   $1.5905$ , M. R. 54.02 (theory 52.32). When 1,2-[ $\text{EtCH}(\text{OH})_2$ ] $_2\text{C}_6\text{H}_4$  (III) was dist'd. with a large excess of quinoline as in *C. A.* 25, 4532, it yielded 2 fractions: the 1st  $b_{12}$   $108.0-8.5^\circ$ ,  $d_4^{20}$   $0.9185$ ,  $n_D^{20}$   $1.5760$ , M. R. 56.93; the 2nd  $b_{12}$   $108.5$   $9.0^\circ$ ,  $d_4^{20}$   $0.9263$ ,  $n_D^{20}$   $1.5732$ , M. R. 56.42 (theory 53.08). The 2 fractions m.  $-26^\circ$  and were apparently both *o*-dipropenylbenzene (IV). The *tetra-Br* deriv. of IV m.  $80^\circ$ . IV, on being exposed to the air for 1 month, gave the aldehyde. Its *semicarbazone* m.  $205^\circ$ . 1,3-[ $\text{EtCH}(\text{OH})_2$ ] $_2\text{C}_6\text{H}_4$  treated as III gave *m*-dipropenylbenzene (V),  $b_{12}$   $117$   $20^\circ$ ,  $d_4^{20}$   $0.9231$ ,  $n_D^{20}$   $1.5780$ , M. R. 56.80 (theory 53.08). The *tetra-Br* deriv. m.  $98$   $9^\circ$ . The *tetra-Br* deriv. of 1,4-( $\text{MeCH:CH}$ ) $_2\text{C}_6\text{H}_4$  m.  $187^\circ$ , contrary to Quelet's value of  $168$   $9^\circ$  (cf. *C. A.* 23, 3908). V, on exposure to air, gave the aldehyde  $b_{12}$   $97^\circ$ . W. A. M.

**Addition of methyl hypochlorite to phenylacetylene.** Ernest L. Jackson. *J. Am. Chem. Soc.* 56, 977-8 (1934).— $\text{PhC}\equiv\text{CH}$  and  $\text{Cl}$  in  $\text{MeOH}$  at room temp. give 70% of 1-phenyl-1,1-dimethoxy-2,2-dichloroethane (I), m.  $66$   $6.5^\circ$ ; this is evidently formed by the addn. of 2 mols.  $\text{MeOCl}$  to the triple bond. Its structure was established by hydrolysis with hot  $0.4$   $N$   $\text{HCl}$  to  $\omega,\omega$ -dichloroacetophenone,  $b_{12}$   $131-2^\circ$ . I is stable to  $\text{KOH}$  in  $\text{MeOH}$ . C. J. West

**Acetyl derivatives of diphenylthiosemicarbazide.** M. Busch and W. Renner. *Ber.* 67B, 384-7 (1934).—Some of the results reported by McKee (*C. A.* 9, 3223) do not agree with those given by Busch and Schneider in a paper (*J. prakt. Chem.* [2], 67, 201) of which McK. was apparently unaware, and the work has accordingly been repeated. His compd.  $\text{PhNHCSNHNHPh}$ , obtained from  $\text{PhNHCSNHNHPh}$  and  $\text{AcCl}$ , is undoubtedly identical with the product obtained in the same way by B. and S. and which has the structure  $\text{PhN.CMeCl.S.C}(\text{NHPh})_2$  (I). In the hydrolysis

of I there is formed, in addn. to McK.'s  $\text{PhNHCSNHNHPhAc}$  (II), m.  $160^\circ$ , depending on the concn. of the aq. soln. and the length of heating, an isomer (believed to be the carbinol base corresponding to I) which m.  $173^\circ$  (foaming) and is converted into II by repeated crystn. from boiling alc. or by boiling for some time in dil. alc. soln.; with  $\text{HCl}$  in alc. it gives I. II likewise gives I with alc.  $\text{HCl}$ . McK.'s "anhydride" of II, m.  $233-4^\circ$ , resolidifies and m. again  $265^\circ$ , is B. and S.'s 5-methyl-1,4-diphenyl-3,5-endothiotriazole (III); they had reported it as m.  $253^\circ$  but it has now been found that when freshly prep'd. it m. transiently  $233^\circ$ , then  $255-6^\circ$ . The lower m. p. is due to a labile form which is reformed when the higher-melting form is repeatedly recrystd. from or boiled  $0.5$  hr. in  $\text{MeOH}$ . In the acetylation of  $\text{PhNHCSNHNHPh}$  to  $\text{PhNHCSNHNHAc}$  (IV), m.  $133^\circ$ , with  $\text{Ac}_2\text{O}$  there is also formed  $\text{PhNHCSNHNHPh}$  (by rearrangement of the  $\text{PhNHCSNHNHPh}$ ) and finally III; that IV is formed from I with boiling alc.  $\text{KOH}$  could not be confirmed. McK.'s 2nd  $\text{Ac}$  deriv.,  $\text{PhNAcCSNHNHPh}$  (V), m.  $161-2^\circ$ , obtained from  $\text{PhNHCSNHNHPh}$ , has really the compn.  $\text{C}_{16}\text{H}_{12}\text{N}_4\text{S}$  and is the anhydride,  $\text{PhN:C.NPh.N:CMe}_2$ , of IV.

C. A. R.

**Diarylsulfonylhydrazine series. III.** The oxidation of acetylhydrazobenzene. Frank O. Ritter. *J. Am. Chem. Soc.* 56, 975-6 (1934); cf. *C. A.* 25, 1227.—The oxidation of acetylhydrazobenzene with  $\text{Na}_2\text{Cr}_2\text{O}_7$  in AcOH gives *p*-benzenesulfonyl diphenylhydrazine (I), dark red with bronze luster, m. 163° (cor.). Reduction of I with EtOH-KOH gives 65% of *p*-PhNHC<sub>6</sub>H<sub>4</sub>N:Ph; reduction with Zn and AcOH gives *p*-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>NHPh, *p*-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>OH and PhNH<sub>2</sub>; titration with SnCl<sub>4</sub> requires 8 equivs. of H<sub>2</sub>. Reduction of Ph<sub>2</sub>NNH<sub>2</sub> with EtOH-KOH gives Ph<sub>2</sub>NH and NH<sub>3</sub>. It is suggested that an analogous bimol. compd. may be an intermediate in the semidine rearrangement of hydrazo compds. C. J. West

**Dissociation constants of the chlorophenyl- and phenetylboric acids.** G. E. K. Branch, David L. Yabroff and Bernard Bettman. *J. Am. Chem. Soc.* 56, 937-41 (1934).—The following values are reported for the mean  $K_a \times 10^{10}$  in 25% EtOH (except for the 1st 2, which are in H<sub>2</sub>O): boric 6.53, Ph deriv. 13.7; boric 1.34, Ph deriv. 1.97; *o*-chlorophenyl deriv. 14, *m*-isomer 14.5, *p*-isomer 6.23; *m*-phenetyl deriv., m. 130° (cor.), 3.05 (the anhydride m. 152-3° (cor.)), *o*-isomer 0.910, *p*-isomer 0.608; *o*-ClC<sub>6</sub>H<sub>4</sub>OII 7.97, *m*-isomer 3.30, *p*-isomer 1.46. These results are compared and discussed on the basis of the negativities and resonances of the groups involved. The relative importance of the alkoxyl type of resonance to the negativity factor is greater with alkoxyl than with Cl compds. and is greater in phenylboric acid derivs. than in phenols. A simplified *B* analysis is given. C. J. West

**Catalytic reduction of arylsulfonyl chlorides with palladium.** P. de Smet. *Natuurw. Tijdschrift* 15, 215-26 (1933).—A horizontal tubular glass reaction vessel, 25 × 4 cm., was used with a vertical side tube 10 cm. high provided with ground-glass connection to the gasometer and a magnetic trap to introduce the reagent. The vessel contained 50 cc. Me<sub>2</sub>CO (10% H<sub>2</sub>O) + 0.1 g. Pd (2.5 cc. PdCl<sub>2</sub> soln. + traces of ignited Pd); 2-2.5 g. of the sulfonyl chloride was added after closing, evacuation, H<sub>2</sub> filling of the app. and reduction of the PdCl<sub>2</sub>. The app. was shaken continuously. The course of the rapid reaction was followed by the vol. contraction; from the 2nd min. on the H<sub>2</sub> consumption was const. until 1 mol. H<sub>2</sub> had been absorbed, during this period the reaction rate is of zero order. The reaction product, sulfinic acid, was protected by immediate neutralization with 5% Na<sub>2</sub>CO<sub>3</sub> soln., evapn. and extn. with EtOH. After the initial rapid reaction a continued slow absorption of H<sub>2</sub> was observed for several days up to 1.5 to 1.8 mols. H<sub>2</sub> per mole chloride; the resulting substance pptd. from Me<sub>2</sub>CO by H<sub>2</sub>O addn. is diaryl disulfide; max. yield 50%. Even at 50 atm. pressure the final reduction product, mercaptan, could not be obtained from *p*-BrC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>Cl. Individual characteristics: for *p*-BrC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>Cl, H<sub>2</sub> consumption 12 cc. per min., sulfinic acid m. 130°, variable, and after 10 days (p-BrC<sub>6</sub>H<sub>4</sub>S)<sub>2</sub> (m. 93.5-94°). For *p*-ClC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>Cl, 10-11 cc. H<sub>2</sub> per min., sulfinic acid m. 97-8° (after 1 hr. in air 95°), after 14 days with 1.8 mols. H<sub>2</sub> used, *p,p'*-disulfide, m. 71-1.5°. For PhSO<sub>2</sub>Cl, 8 cc. H<sub>2</sub> per min., sulfinic acid m. 83°, after 10 days 1.7 mols. H<sub>2</sub> absorbed, disulfide m. 60-12°. For C<sub>6</sub>H<sub>5</sub>SO<sub>2</sub>Cl, 16 cc. H<sub>2</sub> per min., sulfinic acid m. p. variable, max. 105.5-6°, after 10 days 1.5 mols. H<sub>2</sub> used, *β,β'*-disulfide, m. 139°. For *m*-C<sub>6</sub>H<sub>4</sub>(SO<sub>2</sub>Cl)<sub>2</sub>, the H<sub>2</sub> absorption is somewhat faster than for PhSO<sub>2</sub>Cl, total amt. 10% below theory; the free disulfinic acid could not be isolated. For 1,3,5-C<sub>6</sub>H<sub>3</sub>(SO<sub>2</sub>Cl)<sub>3</sub>, an irregular reduction is observed, 2/3 of the calcd. H<sub>2</sub> is used, sulfite seems to be formed. B. J. C. van der Hoeven

**Preparation of *N*-benzoyl-*o*-aminobenzenesulfonamide. Condensation to heterocyclic compounds.** E. Werthmann. *J. Am. Chem. Soc.* 56, 971-3 (1934).—*o*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>NH<sub>2</sub> and BzCl at 175-80° for 30 min. give *N*-benzoyl-*o*-nitrobenzenesulfonamide, m. 197.5-8°; reduction with FeSO<sub>4</sub> and NH<sub>4</sub>OH gives the *o*-NH<sub>2</sub> deriv. (I), m. 198-8.5°. I in EtOH, satd. with HCl and warmed until the ppt. dissolves, gives 3-phenyl-1,2,4-isobenzothiadiazine 1-dioxide (II), m. 302-3°; this also results by heating I at 210°. The diazo soln. from I added to HCl gives 3-phenyl-1,4,2-benzothioxazine 1-dioxide (III), m. 176-7°, when the light

yellow ppt. is heated in kerosene at 75-110°, in H<sub>2</sub>O or on allowing it to stand over H<sub>2</sub>SO<sub>4</sub> or H<sub>2</sub>O for some weeks; when I is diazotized in AcOH-AcCl with HCl and AmNO<sub>2</sub>, the diazonium chloride is pptd. as a white flocculent powder by Et<sub>2</sub>O; H<sub>2</sub>O gives the yellow cryst. compd. of the aq. diazotization; heating the AcOH soln. gives III. III dissolves almost completely in NaOH in about 40 hrs., acidification gives *o*-benzoxybenzenesulfonamide, m. 178-80°. Heating III in HCl gives BzOH.

C. J. West

**The Friedel-Crafts synthesis of *p*-iodoacetophenone, and *p*-iodo-*o*-bromoacetophenone.** Wasaburo Kinnura. *Ber.* 67B, 394-5 (1934).—In the prepn. of *p*-IC<sub>6</sub>H<sub>4</sub>COMe (I) according to Judefind and Reid (*C. A.* 14, 1832), who added AcCl slowly to a soln. of PhI and AlCl<sub>3</sub>, the yield is very small because of the abundant formation of a dark red oil; the more slowly the AcCl is added, the smaller is the yield of I. This is probably due to the splitting off of I as a result of secondary reactions between the excess of AlCl<sub>3</sub> and the I-contg. components of the reaction mixt. By mixing the 3 reagents beforehand in equimol. proportions in CS<sub>2</sub>, then cautiously heating to boiling and continuing the boiling until the evolution of HCl is still just barely perceptible (30-40 min.) the yield of I, m. 85° after crystn. from alc., is increased to 80-95%. The PhI is best prepd. (510 g., b.p. 75°) from I (381 g.) and benzene (400 g.) with HNO<sub>3</sub> (d. 1.50) at 60° (Dains and Brewster, *C. A.* 23, 2157). *p*-IC<sub>6</sub>H<sub>4</sub>COCH<sub>2</sub>Br, m. 118°, is obtained in 26 g. yield from I and Br in AcOH (J. and R.).

Q. A. R.

**Side-chain reactions of benzene derivatives.** W. S. Nathan and H. B. Watson. *Nature* 133, 379-80 (1934). The equation given for the energies of activation of *p*-substituted acetophenones (*C. A.* 28, 24<sup>a</sup>) is valid for *m*-substituted compds. except when the substituent is a halogen. Julius White

**Reactions of certain  $\gamma$ -ketonic acids. II. Hydroxyl derivatives.** E. P. Kohler and Louis Leers. *J. Am. Chem. Soc.* 56, 981-2 (1934); cf. *C. A.* 28, 2700<sup>a</sup>. PhCH:CHCOCH<sub>2</sub>CH<sub>2</sub>OMe with KCN in EtOH-AcOH gave 60% of PhCH(CN)CH<sub>2</sub>COCH<sub>2</sub>CH<sub>2</sub>OMe, m. 68°; the corresponding acid m. 141° (*Me* ester, m. 97°); PhCH(CO<sub>2</sub>H)CHBrCOCH<sub>2</sub>CH<sub>2</sub>OMe, m. 158°; PhCH(CO<sub>2</sub>H)(CH(OH)COCH<sub>2</sub>CH<sub>2</sub>OMe) (I), m. 159°. I in 1% aq. NaOH, allowed to stand 1 day, gives  $\alpha$ -phenyl- $\gamma$ -hydroxy- $\beta$ -keto- $\gamma$ -(*p*-methoxyphenyl)propane (II), m. 115°; this is obtained more easily by dissolving the Br acid in 2 equivs. of cold dil. NaOH; it was also synthesized from the cyanohydrin of anisaldehyde and PhCH<sub>2</sub>MgCl. Heating 6 g. II in 30 cc. 2% NaOH on the steam bath gives  $\alpha$ -phenyl- $\beta$ -hydroxy- $\gamma$ -keto- $\gamma$ -(*p*-methoxyphenyl)propane, m. 62°; the oxime was sepd. into 2 isomers, m. 135° and 118°. *p*-MeOC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>MgCl and C<sub>6</sub>H<sub>5</sub>CH(OH)CN give  $\alpha$ -phenyl- $\alpha$ -hydroxy- $\beta$ -keto- $\gamma$ -(*p*-methoxyphenyl)propane, m. 126°, which is not affected by prolonged boiling with 2% aq. NaOH. The results establish the mechanism proposed in the earlier paper. C. J. West

**The isomeric oximes of ethylvanillin.** Raymond M. Hann. *J. Wash. Acad. Sci.* 24, 126-8 (1934).—Ethyl vanillin (I) and NH<sub>2</sub>OH in the presence of NaHCO<sub>3</sub> gave the anti-oxime, m. 102° (oxime acetate, m. 99°). This was dissolved in dry ether and the HCl salt pptd. by passage of HCl. On pouring into Na<sub>2</sub>CO<sub>3</sub> soln. the syn-oxime of I, m. 98°, was pptd., which, warmed with AcOH for 10 min., gave the nitrite, m. 102°. This on alk. hydrolysis gave 3-methoxy-4-ethoxybenzoic acid, m. 193-4.

R. C. Elderfield

**3,4-Dimethoxy-5-chlorobenzylidenediamides.** Raymond M. Hann. *J. Wash. Acad. Sci.* 24, 124-6 (1934). The aldehyde amide condensation reaction has been extended to include a solid aromatic aldehyde with various aliphatic amides. 5-Chlorovanillin and Me<sub>2</sub>SO<sub>2</sub> gave a quant. yield of 3,4-dimethoxy-5-chlorobenzaldehyde, m.

57°. This was condensed with amides by heating with 2 mols. of the amide and 1 cc. of AcOH at 140° for 15 hrs. *Diacetamide compd.*, m. 244–5°; *dipropionamide*, m. 235°; *diisobutyramide*, m. 204–5°; *diisopropionamide*, m. 172–3°; *di-n-butylamide*, m. 217°.

R. C. Elderfield  
Validity of Fremberg's displacement rule. Philip G. Stevens. *J. Am. Chem. Soc.* 56, 997–8 (1934); cf. Levene and Meyer, *C. A.* 28, 1661<sup>5</sup>.—Repetition of the work of L. and M. on *p*-nitrophenyl methylpropylpropionate gives a value of  $[M]_D^{25}$  —5.4°, thus proving that the shift in rotation, as evidenced by the change in sign on passing from the Et to the *p*-nitrophenyl ester, is in complete accord with the displacement rule. *l*-β-Methyl-β-propylpropionic acid,  $b_p$  109–9.5°,  $[M]_D^{25}$  2.19°,  $d_4^{25}$  0.9111,  $n_D^{25}$  1.4190; through the acid chloride this yields the *d*-*p*-nitrophenyl ester, purified by repeated distn.,  $b_p$  124–6°,  $d_4^{25}$  1.1121,  $n_D^{25}$  1.5113,  $[M]_D^{25}$  5.4°.

C. J. West  
Interaction of the acid chlorides of 2-benzoylbenzoic acid with phenols. I. Aryl esters and phenylaryloxyphthalides. F. F. Blicke and R. D. Swisher. *J. Am. Chem. Soc.* 56, 902–4 (1934).—The interaction of 2-BzC<sub>6</sub>H<sub>4</sub>COCl with the K derivs. of various phenols, with the phenols alone and with phenols in C<sub>6</sub>H<sub>5</sub>N gives, in general, 3 isomeric compds., 2 of which are presumably the aryl ester of BzC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H and the phenylaryloxyphthalide, resp., and the hydroxydiaryloxyphthalide. The first 2 cannot be differentiated by chem. means; when heated with AlCl<sub>3</sub> or mixed with concd. H<sub>2</sub>SO<sub>4</sub>, both yielded the 3rd compd. PhOH gives compds. m. 80–2° and 162–3°; 4-BrC<sub>6</sub>H<sub>4</sub>OH, m. 92–4° and 170–2°; PhSH, m. 112–3° and 117–8°; *o*-xenol, 103–5° and 195–7°; *p*-xenol, 117–9° and 163–5°; *α*-C<sub>10</sub>H<sub>7</sub>OH, 102–4°; β-C<sub>10</sub>H<sub>7</sub>OH, 103–5° and 198–9°. II. Diaryloxyphthalides. *Ibid.* 923–5.—2-BzC<sub>6</sub>H<sub>4</sub>COCl (I) reacts readily at room temp. with a variety of phenols and aryl Me ethers to yield diaryloxyphthalides; in a few instances it is necessary to add AlCl<sub>3</sub> to the reaction mixt. I and PhOH give 4'-hydroxydiphenylphthalide, m. 168–70°; PhOMe gives the 4'-MeO deriv., m. 110–5°; reduced by Zn and NaOH to 4'-methoxytriphenylmethane-2-carboxylic acid, m. 146–7°; 4-BrC<sub>6</sub>H<sub>4</sub>OH gives 2'-hydroxy-4'-bromodiphenylphthalide, m. 210–11°, reduced to 2'-hydroxytriphenylmethane-2-carboxylic acid, m. 194–6° (Me ether, m. 191–3°); 2,6-Br<sub>2</sub>C<sub>6</sub>H<sub>3</sub>OH gives 4'-hydroxy-3',5'-dibromodiphenylphthalide, m. 199–200°; *o*-xenol gives phenyl-*o*-hydroxyphenylphthalide, m. 178–80° (Me ether, m. 152–4°); *p*-HO isomer, m. 220–2° (Me ether, m. 179–80°); *α*-C<sub>10</sub>H<sub>7</sub>OH gives phenyl-*α*-hydroxyphenylphthalide, m. 231–3° (Me ether, m. 206–7°); *p*-HO isomer, m. 234–5° (Me ether, m. 210–12°); 2-(4-HOC<sub>6</sub>H<sub>4</sub>-CO)C<sub>6</sub>H<sub>4</sub>COCl and PhOH give 4',4'-dihydroxydiphenylphthalide, m. 253–6°, while PhOMe gives the 4'-Me ether, m. 139–42°; 2-(4-MeOC<sub>6</sub>H<sub>4</sub>-CO)C<sub>6</sub>H<sub>4</sub>COCl and PhOH give the same Me ether, while PhOMe gives 4',4'-dimethoxydiphenylphthalide, m. 97–9°. 2-(4'-Methoxybenzoyl)benzophenone, by oxidation of the methane with HNO<sub>3</sub>, m. 133–5°; N<sub>2</sub>H<sub>4</sub> in AcOH gives a diazine, C<sub>21</sub>H<sub>18</sub>O<sub>2</sub>, m. 157–9°.

C. J. West  
Ramalic acid. Georg Koller, Erich Krakauer and Karl Pöpl. *Monatsh.* 64, 3–5 (1934).—*Ramalina farinacea* gives a small yield of ramalic acid, C<sub>11</sub>H<sub>8</sub>O<sub>6</sub>; boiling with 10% NaOH 38 hrs. gives the EtO deriv., C<sub>20</sub>H<sub>14</sub>O<sub>6</sub>, which yields with Me<sub>2</sub>SO<sub>4</sub> the Me ester of the di-Me ether of cetraric acid, m. 151°. Ramalic acid is therefore identical with protocetraric acid.

C. J. West  
Capraric acid. Georg Koller and Karl Pöpl. *Monatsh.* 64, 1–2 (1934).—Methylation of the reaction product of capraric acid and EtOH gives the Me ester of the di-Me ether of cetraric acid, m. 151°. Capraric acid differs from cetraric acid only in that the hydroxylactone ring is intact.

C. J. West  
Lichen substances. XXXIII. Enzymic cleavage of lichen depsides and related compounds. Yasuhiko Asahina and Takeo Higuti. *Ber.* 66B, 1959–64 (1933); cf. *C. A.* 28, 1032<sup>2</sup>; Koller and Pfeiffer, *C. A.* 28, 3092<sup>2</sup>. The tannase from *Aspergillus niger* and the enzyme from *A. oryzae* break down most lichen depsides into phenol-

carboxylic acids. Especially well adapted for this purpose is a taka-diastase specially prepd. by Sakyo and Co., Tokyo. The  $pH$  of the aq. soln. of the alkali salt of the depside and the diastase is adjusted to 7.0–8.5 and the soln. is allowed to stand at 37°; when cleavage sets in, the soln. becomes turbid and the  $pH$  falls appreciably. The ppt. generally consists of the phenolcarboxylic acid split off and unchanged depside set free by the acid. The  $pH$  of the soln. is again adjusted to the original value, more diastase is added and the process is repeated until further addn. of the enzyme produces no appreciable change. Acidification and extn. with ether now yields a mixt. of acids and unchanged depside which can be sep'd. without special difficulty, since the depside is in general much more difficultly sol. than the phenolcarboxylic acids. The sepn. of the latter from each other is not so easy, however, but as their esters are much more difficultly hydrolyzed by the diastase than the depsides, the diastase can be allowed to react on the Me ester of the depside rather than on the depside itself; the product then consists of an acid and an ester, which can readily be sep'd. from each other. Lecanoric, gyrophoric, evernic, olivetoric, sekikic, divaricatic and squamatic acids, atranorin, salicylsalicylic acid and the tannin from Chinese gall nuts can readily be broken down in this way; difractic, benzoylsalicylic and *p*-(*p*-hydroxybenzoyl)benzoic acids and the Me esters of gallic and salicylic acids are hydrolyzed with somewhat greater difficulty. Apparently those depsides which contain a free HO group in the *o*- or *m*-position to the carboxyl group involved in the depside union are more easily broken down by taka-diastase. XXXIV. Constitution of alectoronic and  $\alpha$ -collatolic acid. Yasuhiko Asahina and Fukujiro Fujikawa. *Ibid.* 67B, 103–8 (1934).—In the fusion of alectoronic acid (I) with KOH there had been obtained, in addn. to 31% caproic acid, orcinol, *sym*-xylenol and *sym*-cresotic acid; and  $\alpha$ -collatolic acid (II), a Me ether of I, had been found to give olivetonic Me ether with KMnO<sub>4</sub>. On the basis of these results II had been formulated as a C<sub>12</sub>H<sub>12</sub> deriv. (*C. A.* 27, 3461). It has now been found, however, that the xylenol and cresotic acid are either produced from an impurity or result from a secondary reaction during the fusion and that the structure assigned to II must be discarded. On heating with concd. aq. KOH, the di-Me ether Me ester, m. 114°, of II splits off 2 mols. caproic acid and the CO<sub>2</sub>H group is also involved. To remove the latter completely, the product must also be boiled with HCO<sub>2</sub>H. There is thus obtained an ether of a trihydric phenol, *aleclol tri-Me ether*, C<sub>21</sub>H<sub>20</sub>O<sub>4</sub> (III), m. 96°, gives no color with FeCl<sub>3</sub> or bleaching powder, dissolves in hot concd. H<sub>2</sub>SO<sub>4</sub> with grass-green color and depresses the m. p. of desoxyhyposalazolin (m. 95°) to 75°, mol. wt. in camphor 296. *Di-Cl deriv.*, from III and PCl<sub>5</sub> in PhNO<sub>2</sub> at 160°, m. 125°. *Tri-Cl deriv.*, from III and PCl<sub>5</sub> in CHCl<sub>3</sub> at 100°, m. 185–8°. *Tri-Br deriv.*, from III and Br in a little AcOH at room temp., m. 179°. With HI (d. 1.7) and PhOH at 150°, III yields orcinol; on fusion with KOH (because of its insol. in fused KOH, the III must previously be partially demethylated with III) it gives  $\alpha$ -resorcylic acid and orcinol. Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>-AcOH or 50% HNO<sub>3</sub> in AcOH oxidizes III to 6-methoxy-2-methyl-1,4-benzoquinone, yellow, m. 151°, which was synthesized from orcinol mono-Me ether through the nitroso and amino derivs. (Henrich and Nachtigall, *Ber.* 36, 894 (1903)), and from orcinol di-Me ether with Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>-AcOH. As further degradation of III, which was apparently a Ph<sub>2</sub>O deriv., gave no results of value, synthesis was resorted to. *Bromo-orcinol di-Me ether*, 2,3,5-Br-(MeO)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>Me, m. 57°, prep'd. from bromo-orcinol with alk. Me<sub>2</sub>SO<sub>4</sub>, or by decarboxylation of bromo-*p*-orsellinic acid di-Me ether, couples with the K salt of orcinol mono-Me ether, when heated in the presence of Cu bronze to 210°, to yield III, which is thus shown to be a Ph<sub>2</sub>O deriv. Almost all the reactions of II can be explained on the basis

of the formula

$$\begin{array}{c} \text{CH:CR.C.CO.O.C.CH:COH} \\ | \quad | \quad | \quad | \quad | \\ \text{MeOC}_6\text{H}_4\text{---CH}_2\text{---C---O---C:CR:CCO}_2\text{H} \quad (\text{R =} \\ \text{CH}_2\text{COC}_6\text{H}_4\text{H}), \text{ or } \text{C}_6\text{H}_4\text{O}_2 \text{ instead of } \text{C}_6\text{H}_4\text{O} \end{array} \quad \text{XXXV.}$$

Identity of  $\alpha$ -collatolic acid with lecanorolic acid. *Ibid.* 189 70. — From a Japanese *Lecanora atra* Ach. has been isolated atranorin and an acid having all the properties of Zopf's lecanorolic acid (*Die Flechtenstoffe*, p. 284) and identical with  $\alpha$ -collatolic acid. XXXVI. **Fumarprotocetraric acid.** Yasuhiko Asahina and Yaitiro Tanase. *Ibid.* 411-16 (1934). On the basis of analyses (C 55.21-55.62, H 3.05-3.81%) Hesse (*J. prakt. Chem.* 70, 458 (1904)) assigned to fumarprotocetraric acid (I) from *Cetraria islandica* the formula  $C_{14}H_{16}O_{10}$ , while A. and T. obtain values (C 55.06-55.98, H 3.54-3.66%, mol. wt. (by titration as a dibasic acid) 466-78) agreeing better with the formula  $C_{12}H_{14}O_{10}$ . As protocetraric acid (II) has the compn.  $C_{13}H_{14}O_8$  (C. A. 27, 5318) and I gives with  $PhNH_2$  a *monoanil* (III) agreeing in compn. with the  $C_{22}$  formula, I seems to result from the condensation of 1 mol. each of fumaric acid and II, with elimination of 1 mol.  $H_2O$ . With  $Ac_2O$  and a few drops concd.  $H_2SO_4$  I yields a *tetra-Ac deriv.* (IV) (2 of the Ac groups in aldehyde diacetate form), and II gives a *penta-Ac deriv.* (V) (likewise with 2 Ac groups in the aldehyde diacetate form). Cetraric acid (VI) (Et ether of II) and the Me ether of II on similar treatment split off the alkyl group and give V. The mono-Ac deriv. (VII) of II with boiling alc. gives VI as easily as does I. On catalytic hydrogenation VII takes up 3 mols.  $H_2$  and yields hypocetraric acid (VIII),  $C_{13}H_{16}O_7$ , with loss of  $AcOH$ ; I takes up 4 mols.  $H_2$  and gives VIII + succinic acid, while V absorbs no  $H_2$  and remains unchanged, and IV absorbs 1 mol., the fumaryl group being reduced to succinyl with formation of a *compd.*  $C_{20}H_{22}O_{17}$  (IX). I is therefore assigned the same structure as VII, with  $OCOCH:CHCO_2H$  instead of  $OAc$  on the carbinol HO group. III, yellow-red amorphous powder, becomes discolored around 250° and gradually carbonizes, gives a red color with alc.  $FeCl_3$ . IV, needles with 3  $H_2O$ , m. 130-1° and (anhyd.) 155° (gas evolution), gives no color with alc.  $FeCl_3$ , dissolves in concd.  $H_2SO_4$  with deep yellow color soon changing to red, forms no anil. IX, needles with 2  $H_2O$ , m. 100 1° and (anhyd.) 107 8°, is easily sol. in  $NaHCO_3$  and gives no color with alc.  $FeCl_3$ . V, needles with 1  $H_2O$ , m. 112 13°, gradually decomposes when dried at 60°, dissolves in  $NaHCO_3$  without color at first but later becoming reddish, is sol. in concd.  $H_2SO_4$  with yellow color soon changing to red gives no color with alc.  $FeCl_3$ . XXXVII. **Constitution of spherophorin.** Yasuhiko Asahina and Akira Hashimoto. *Ibid.* 416 20. — Zopf's spherophorin (I) (*Ann.* 340, 278 (1905)), which A. and H. have obtained from *Spherophorus melanocarpus* DC (*S. compressus* Ach.), has the compn.  $C_{27}H_{34}O_{12}$ , not  $C_{26}H_{32}O_{12}$  (it escaped Z.'s observation that it readily loses  $CO_2$  on drying at elevated temps.). On hydrolysis with alc. KOH it gives evermic acid,  $CO_2$  and a phenol, *spherophorol*,  $C_{16}H_{20}O_2$  (II), shown by synthesis from Et caprylate and  $CO(CH_2CH_2)_4I$ , to be 1-heptyl-3,5-dihydroxybenzene. As I gives no color with bleaching powder and the occurrence of an *o*-depside in nature is excluded, I is assigned the structure  $2,6,4-C_6H_3(OH)[2,6,1-Me-(HO)(MeO)C_6H_3CO_2]C_6H_3CO_2H$ . Extn. of *S. globosus* Wain. f. *metophorus* A. Zahlbr., which is very closely related morphologically to the European *S. coralloides*, yielded isosquamatic acid (III), but it seems premature as yet to say that Zopf's spherophoric acid (m. 206 7°) is impure III (m. 227°), although the green  $H_2SO_4$  reaction described by Z. agrees with that of III. If, however, his observation that his product does not show green fluorescence when boiled with alkali and  $CHCl_3$  is correct, the identity of the 2 acids is entirely excluded. I (yield, 1% of the carefully selected thall), m. 140°; the alc. soln. reddens litmus paper, gives a violet color with a trace of  $FeCl_3$  but no color with bleaching powder; when stirred with concd.  $NaHCO_3$  or with  $Na_2CO_3$ , I becomes oily and dissolves completely only on diln. and the soln. foams strongly on shaking; KOH dissolves it at once and the soln. shows strong green fluorescence when boiled with a drop of  $CHCl_3$ . *Di-Ac deriv.*, m. 133 4°, is sol. in  $NaHCO_3$  and gives no color with alc.  $FeCl_3$ . *Tri-Me deriv.*, prepd. with  $CH_3N_3$ , m. 85-6°, gives no color with alc.  $FeCl_3$ . II, m. 57 8°; the aq. soln. foams considerably on

shaking and gives with bleaching powder a transient red, with  $FeCl_3$  no color; on boiling with KOH and  $CHCl_3$  it shows strong green fluorescence; over  $H_2SO_4$  it liquefies with loss of water but after long standing it resolidifies and then m. 51°; with  $KMnO_4$  in KOH it yields caprylic acid. C. A. R.

Organic compounds with high molar melting-point depressions. Josef Pirsch. *Ber.* 66B, 1694-7 (1933); cf. C. A. 27, 3381. — The following compds. gave values for  $E$ , the molar m.-p. depression, as listed: camphetillone 64.0, isocamphane 44.5, bornylene 33.5, tricyclene 35.9 and camphane 29.5. Louise Kelley

Action of carbon dioxide and sodium on 2,5-diketocamphane. Yasuhiko Asahina and Morizo Ishidate. *Ber.* 67B, 440 6 (1934). Unlike camphor, 2,5-diketocamphane (3-ketocamphor) (I) reacts very slowly with  $CO_2$  and Na in ether or benzene; the reaction takes place only in xylene at about 130°, yielding at least 3 carboxylic acids, while the original I is in part reduced to the di-HO compd. Recrystn. of the product from benzene yields first a 2,5-diketocamphanecarboxylic acid,  $C_{11}H_{14}O_4$  (II), which regenerates I by elimination of  $CO_2$ , gives a stable blue-violet color with aq. or alc.  $FeCl_3$  (hence the CO group adjacent to the  $CO_2H$  must be enolized) and gives with Br a *mono-Br deriv.* (III) which has no enolic properties and on elimination of  $CO_2$  yields the bromo-2,5-diketocamphane (IV) prepd. by Bredt and Pinten (C. A. 22, 2559) by direct bromination of I. By splitting off  $HBr$  from IV they obtained an unsatd. acid (V) which  $E$  and I. have converted into  $\alpha$ -ketoisocamphanonic acid with  $KMnO_4$ . Therefore V is the *ketocampholenic acid*  $Me_2C=CH-CO.CHCH_2CO_2H$ . As III gives no  $FeCl_3$  reaction, the

Br must occupy the position of the mobile H atom in II and the  $CO_2H$  group in II must likewise be in position 6. Along with II were obtained 2 acids  $C_{11}H_{14}O_4$ . One, provisionally designated *b-acid* (VI), is very unstable, immediately decolorizes  $KMnO_4$ , gives a wine-red color with alc.  $FeCl_3$  and its Na salt heated in water forms a neutral product which gives the same  $FeCl_3$  reaction as VI but quickly resinifies in the air. VI yields a more stable *Br deriv.*,  $C_{10}H_{12}O_2Br$  (VII) and with  $NH_4OH$  forms an oxime of the decarboxylated product. With Na-Hg VI gives 2 acids,  $C_{11}H_{14}O_4$ , m. 125 6° and 188-9°, and a neutral product  $C_{10}H_{12}O_2$  (VIII), which gives no color with  $FeCl_3$  and is stable toward  $KMnO_4$ . *c-Acid* (IX), obtained along with VI, is stable, yields neither an oxime nor a semicarbazone, does not reduce  $KMnO_4$  and gives no color with  $FeCl_3$ . II, m. 210 11° (loss of  $CO_2$ ,  $[\alpha]_D^{25}$  94.4° (abs. alc.)). III, m. 185 6° (decompn.). VI, m. 113 4° (decompn.), isolated as the *quinine salt*, m. 165 6° (decompn.); *Me ester*, m. 87°, VII, m. 91 2°, reacts neutral and gives a dirty blue color with alc.  $FeCl_3$ , corresponding *OAc deriv.*,  $C_{12}H_{16}O_5$ , m. 65 6°, is insol. in  $Na_2CO_3$ , stable toward  $KMnO_4$  and gives no color with  $FeCl_3$ ; *oxime*,  $C_{10}H_{12}O_2N$ , m. 165° (decompn.); *semicarbazone*, m. 215° (decompn.). VIII, m. 92 3°, is also obtained from the decarboxylation products of VI, together with a volatile product,  $C_{10}H_{14}O_2$ , m. 125° (*semicarbazone*, m. 225-6°). IX, m. 145.5°, is sol. in 50 parts water at 15°,  $[\alpha]_D^{25}$  -64.81° (abs. alc.); *quinine salt*, m. 133 4° (decompn.); *Me ester*, m. 98 9°, mol. wt. in PhOH 209.4. C. A. R.

The effect of halogens on the constitution and the color of nitroamines of the biphenyl series. I. The colored derivatives. Joseph B. Codolosa. *Anal. farm. bioquim.* (Buenos Aires) 4, 60 70 (1933). — Methods by which the following compds. were prepd. are described: *o*- $O_2NC_6H_4Cl$ , 3,4-( $O_2N$ ) $_2C_6H_3Cl$ , 4-chloro-4'-nitrobiphenyl, (*p*- $O_2NC_6H_4$ ) $_2$ , 4-nitro-4'-aminobiphenyl (by reduction from (*p*- $O_2NC_6H_4$ ) $_2$ , 4-chloro-4'-nitrobiphenyl (by diazotizing  $O_2NC_6H_4C_6H_4NH_2$ ), 4-chloro-4'-aminobiphenyl (by reduction from the 4-nitro compd. and by unilateral diazotizing of benzidine). The following condensations were then carried out: 4-chloro-4'-aminobiphenyl with *o*- $O_2NC_6H_4Cl$ ; 4-chloro-4'-aminobiphenyl with 2,4-( $O_2N$ ) $_2C_6H_3Cl$  giving ( $O_2N$ ) $_2C_6H_3NHC_6H_4Cl$ ; same by

fusion; 4-chloro-4'-aminobiphenyl with  $(\text{O}_2\text{N})_2\text{C}_6\text{H}_7\text{Cl}$ , giving  $(\text{O}_2\text{N})_2\text{C}_6\text{H}_4\text{NHC}_6\text{H}_4\text{C}_6\text{H}_4\text{Cl}$ ; same—by fusion. II. Bromine derivatives. *Ibid.* 86–91.—Prepus.: 4-bromo-4'-nitrobiphenyl from 4- $\text{O}_2\text{NC}_6\text{H}_4\text{Ph}$  by bromination in water; 4-bromo-4'-aminobiphenyl by reduction from the 4'-nitro compd. Condensations:  $\text{o-O}_2\text{NC}_6\text{H}_4\text{Cl}$  with 4-bromo-4'-aminobiphenyl; 4-bromo-4'-aminobiphenyl with  $(\text{O}_2\text{N})_2\text{C}_6\text{H}_7\text{Cl}$ , giving dinitro- $(\text{O}_2\text{N})_2\text{C}_6\text{H}_4\text{NHC}_6\text{H}_4\text{C}_6\text{H}_4\text{Br}$ ; same—by fusion; 4-bromo-4'-aminobiphenyl with  $(\text{O}_2\text{N})_2\text{C}_6\text{H}_7\text{Cl}$  giving  $(\text{O}_2\text{N})_2\text{C}_6\text{H}_4\text{NHC}_6\text{H}_4\text{C}_6\text{H}_4\text{Br}$ ; same—by fusion. From a study of the reactions C. concludes that the Ph radical in the *p*-position to the reactive amino group simulates the halogenated radicals  $\text{XC}_6\text{H}_4$  ( $\text{X} = \text{Cl}, \text{Br}, \text{I}$ ).

**Anhydrous-acetylbenzilic acid.** Victor K. La Mer and Joseph Greenspan. *J. Am. Chem. Soc.* 56, 956 (1934).—Acetylbenzilic acid, as ordinarily prep'd., contains 1 mol.  $\text{H}_2\text{O}$ ; the  $\text{H}_2\text{O}$  is lost over  $\text{H}_2\text{SO}_4$  in 18–25 days; the anhyd. acid m. 104.5–4.8°.

**Retene field. III. Some new nitroreteneols, nitrofluorenes and related compounds.** Marston T. Bogert and Torsten Hasselström. *J. Am. Chem. Soc.* 56, 983 (1934); cf. *C. A.* 26, 4326.—6-Acetoxyretene and  $\text{HNO}_3$  (d. 1.52) in  $\text{AcOH}$  give a *NO* deriv., pale yellow, m. 194.5–5.5° (all m. ps. cor.); reduction with  $\text{SnCl}_4$  in  $\text{EtOH}$  sat'd. with  $\text{HCl}$  gives the *NH* deriv., amorphous, m. 215.7° (*Ac deriv.*, m. 203.5–4.5°). Retene ketone (1-methyl-7-isopropylfluorenone) yields a *NO* deriv., bright yellow, m. 165.5°; the *NH* deriv. dark red, m. 146.8° (*Ac deriv.*, bright yellow, m. 197.5–8.5°, whose oxime, pale yellow, m. 254–5° (decompn.)). *Retene ketoxime* (1-methyl-7-isopropylfluorenone oxime), m. 174.5°; with  $\text{PCl}_5$  in  $\text{Et}_2\text{O}$  there results *methylisopropylphenanthrone*, m. 219.5–20.5°. 6-Acetoxyretenequinone, refluxed with 50%  $\text{KOH}$  for 4 hrs., gives a compd. apparently identical with 6-hydroxyretenequinone; reduction of the  $\text{HO}$  deriv. with  $\text{Na}_2\text{S}_2\text{O}_4$  gives a pale yellow vat, which dyes cotton a peach-red, fairly stable to laundering but fugitive to light.

**Tribenzylmethane.** G. Albert Hill, Mervyn H. Little, Stephen Wray, Jr., and Roger J. Trimby. *J. Am. Chem. Soc.* 56, 911 (1934).—The compd. obtained by Schmierda (*C. A.* 4, 308) and by Trotman (*C. A.* 19, 1138) and assumed to be  $\text{C}_6(\text{CH}_2\text{Ph})_3$  is really *tribenzylmethane*, m. 81.8–2.0°; this was prep'd. by reduction of  $(\text{PhCH}_2)_3\text{COH}$  with red P and  $\text{HI}$ , by refluxing  $(\text{PhCH}_2)_3\text{CBr}$  with  $\text{NaNH}_2$  in  $\text{C}_6\text{H}_5\text{Me}$  for 40 hrs. at 145–50° and by reducing  $(\text{PhCH}_2)_3\text{CBr}$  with red P and  $\text{HI}$ . The tri- $\text{NO}_2$  compd. m. 74°. Mol.-wt. detns. confirm the structure.

**Preparation and reactions of benzil disodium.** W. E. Bachmann. *J. Am. Chem. Soc.* 56, 963–5 (1934). *Benzil di-Na*,  $\text{PhC}(\text{ONa})_2\text{C}(\text{ONa})_2\text{Ph}$ , is formed in quant. yield by the action of 2%  $\text{Na-Hg}$  on benzil in  $\text{Et}_2\text{O-C}_6\text{H}_6$  at room temp.;  $\text{I}_2/\text{O}$  gives 97% of benzoin;  $\text{I}$  gives 98% benzil, while  $\text{S}$  or  $\text{Ph}_3\text{CCl}$  gives 90%;  $\text{BzCl}$  gives 80% of stilbene dibenzoate;  $\text{Ac}_2\text{O}$  gives 82% of the diacetate;  $p\text{-MeC}_6\text{H}_4\text{COCl}$  gives 50% of the di-*p*-toluate;  $\text{MeI}$  gives 45% of stilbene di-Me ether; allyl bromide gives 84% of the diallyl ether;  $\text{CO}_2$  gives the Na salt of stilbenedicarboxylic acid, which with  $\text{H}_2\text{O}$  gives benzoin;  $\text{O}$  gives  $\text{BzOH}$  and some benzilic acid;  $\text{BzH}$  gives a mixt. of benzoin and benzyl benzoate;  $(\text{ClC}_6\text{H}_4)_2\text{CO}_2$  gives di-*ft* stilbenedicarboxylate. Anil, 4,4'-diphenylbenzil and  $\alpha$ -naphthyl yield di-Na derivs. under similar conditions, hydrolysis of which yields the corresponding anisoin, 4,4'-diphenylbenzoin and  $\alpha$ -naphthoin. With excess of 40%  $\text{Na-Hg}$  only a di-Na compd. of benzil is formed.

**Ortho effects. II. Observations in the naphthalene series.** Harry Willstaedt and Gabriel Scheiber. *Ber.* 67B, 106 (1934); cf. *C. A.* 26, 1271. It was desired to prep. the 2- and 8-halo derivs. of  $\beta$ -(1-naphthyl)acrylic acid (I) in order to det. the effect of 2- and 8-substituents on the velocity of addn. of  $\text{Br}$  to I. No attempt was made to prep. the necessary 2-halo-1-naphthaldehydes from the corresponding 2-halo-1-methylnaphthalenes with  $\text{CrO}_2\text{Cl}_2$  because of the difficulty of obtaining these methylnaphthalenes in large amts. Nitration of 1- $\text{C}_{10}\text{H}_7\text{Me}$  with  $\text{EtNO}_3$

in the presence of  $\text{AlCl}_3$  gave exclusively the 4-nitro deriv.,  $b_{12}$  176°, m. 71–2°. In the attempted series of reactions  $1,2\text{-C}_{10}\text{H}_6(\text{NO}_2)_2\text{NH}_2 \rightarrow \text{C}_{10}\text{H}_6(\text{NO}_2)_2\text{X}$  ( $\text{X} = \text{halogen}$ )  $\rightarrow \text{C}_{10}\text{H}_6(\text{NH}_2)_2\text{X} \rightarrow \text{C}_{10}\text{H}_6(\text{CN})_2\text{X} \rightarrow \text{C}_{10}\text{H}_6(\text{CO}_2\text{H})_2\text{X}$ , the  $\text{C}_{10}\text{H}_6(\text{NO}_2)_2\text{X}$  ( $\text{X} = \text{F}$  or  $\text{I}$ ) were readily obtained but they could in no way be reduced to the  $\text{C}_{10}\text{H}_6(\text{NH}_2)_2\text{X}$  ( $\text{Sn}$  and  $\text{HCl}$ ,  $\text{SnCl}_2$  and  $\text{HCl}$  in water or alc.,  $\text{Fe}$  and  $\text{AcOH}$ ,  $\text{Fe}$  and  $\text{H}_2\text{SO}_4$ ,  $\text{TiCl}_4$  and  $\text{HCl}$ ,  $\text{Cu-Zn}$  in  $\text{HCO}_2\text{H}$ ); the nitro compd. was always recovered unchanged. This hindrance of the reaction is not due to steric influences, for it is equally pronounced with the *F* and the *I* compd., but is probably related to the neg. nature of the *o*-substituent (1,2- $\text{C}_{10}\text{H}_6(\text{NO}_2)_2\text{Me}$  is readily reduced by even  $\text{Fe}$  and  $\text{AcOH}$ ). It was next attempted to carry out the reactions  $1,2\text{-C}_{10}\text{H}_6(\text{N:NPh})_2\text{NH}_2 \rightarrow \text{C}_{10}\text{H}_6(\text{N}_2\text{Ph})_2\text{N}_2\text{Cl} \rightarrow \text{C}_{10}\text{H}_6(\text{N}_2\text{Ph})_2\text{N}_2\text{BF}_4 \rightarrow \text{C}_{10}\text{H}_6(\text{N}_2\text{Ph})_2\text{F} \rightarrow \text{C}_{10}\text{H}_6(\text{NH}_2)_2\text{F}$ , but although a well-crystd. diazonium borofluoride was obtained its thermal decompn. yielded only an oily product, and when, without attempting to isolate the pure azo compd., the red oil was treated directly with  $2\text{N-AcOH}$  or  $\text{Sn-HCl}$ , there were again obtained only products which were still colored bright red. 1- $\text{C}_{10}\text{H}_7\text{ClHO}$  is readily obtained from  $\text{C}_{10}\text{H}_7\text{MgBr}$  and  $\text{HC}(\text{OEt})_2$ , but 8,1- $\text{C}_{10}\text{H}_6\text{ClH}$  does not react with  $\text{Mg}$ . 8,1- $\text{C}_{10}\text{H}_6(\text{NO}_2)_2\text{NH}_2$  yielded a diazonium borofluoride which, however, was so explosive that, even when mixed with much sand, it could not be used for the prepn. of 8,1- $\text{C}_{10}\text{H}_6(\text{NO}_2)_2\text{F}$  by thermal decompn. In the course of this work the following compds. were prep'd.  $\alpha$ -Naphthalimide (II), from 1- $\text{C}_{10}\text{H}_7\text{ClHO}$  and malonic acid in  $\text{AcOH}$  on the water bath, m. 214–15°.  $\beta$ -Isomer, from 2- $\text{C}_{10}\text{H}_7\text{ClHO}$ , m. 193° (decompn., beginning 184°). I, from II heated until the evolution of  $\text{CO}_2$  ceases, m. 129–30°, adds  $\text{Br}$  in  $\text{CHCl}_3$  with about the same velocity as  $\alpha$ -1- $\text{C}_{10}\text{H}_7\text{CH}(\text{CH}_3)\text{CHCO}_2\text{H}$ , forming the  $\alpha,\beta$ -dibromopropionic acid, m. 189° (decompn.). 1-Nitro-2-fluoronaphthalene,  $b_{12}$  120–4°, m. 49–50°, is obtained in 33% yield (based on the  $\text{C}_{10}\text{H}_6(\text{NO}_2)_2\text{NH}_2$ ) through the diazonium borofluoride (88% yield), decompn. 181°. 2-1 analog, from diazotized  $\text{C}_{10}\text{H}_6(\text{NO}_2)_2\text{NH}_2$  and  $\text{KI}$ , very light yellowish prisms,  $b_{10}$  172–5°, m. 81°. 1-Benzeneazomaphthalene-2-diazonium borofluoride (yield, 31%), decomposes 258°. 8-Chloro-1-iodonaphthalene, from diazotized  $\text{C}_{10}\text{H}_6\text{ClNH}_2$ , m. 80–2°,  $b_{10}$  196–8°. 8-Nitronaphthalene-1-diazonium borofluoride, yellow, decomposes 124° (violent deflagration). 1-Fluoro-2-methylnaphthalene, b. 200–2°, solid at room temp., is obtained from  $\text{C}_{10}\text{H}_6(\text{NH}_2)_2\text{Me}$  through the diazonium borofluoride, decompn. 150°. 1-Chloro-2-naphtholnitrile, from  $\text{C}_{10}\text{H}_6\text{ClNH}_2$  by the Sandmeyer method,  $b_{11}$  183–4°, seps. from  $\text{MeOH}$  in needles. 1-Br analog,  $b_{10}$  178°, m. 93°. 1-Iodo-2-acetonaphthalide, from 2- $\text{C}_{10}\text{H}_7\text{NHAc}$  and  $\text{ICl}$  in  $\text{AcOH}$ , turns brown above 140°, decomposes 167° and is hydrolyzed by concd.  $\text{HCl}$  in boiling alc. to 1-iodo-2-naphthylamine, m. 108°.

**Synthesis of 1-methyl-2-ethyl and 1-ethyl-2-methylnaphthalene.** Otto Brunner and Franz Grof. *Monatsh.* 64, 76 (1934).  $\text{PhCH}_2\text{CH}_2\text{Br}$  and  $\text{EtCH}(\text{CO}_2\text{H})_2$  with  $\text{Na}$  in  $\text{PhMe}$  give di-*ft* ( $\beta$ -phenylethyl)ethylmalonate,  $b_{11}$  186–7°; hydrolysis and removal of  $\text{CO}_2$  gives  $\gamma$ -phenyl- $\alpha$ -ethylbutyric acid,  $b_{11}$  172–3°; concd.  $\text{H}_2\text{SO}_4$  gives 2-ethyl-1-keto-1,2,3,4-tetrahydronaphthalene,  $b_{11}$  140°.  $\text{MeMgI}$  gives 1-methyl-2-ethyl- $\Delta^1$ -dihydronaphthalene,  $b_{11}$  135–45°; heating with  $\text{S}$  at 260–90° for 1 hr. gives 1-methyl-2-ethylnaphthalene,  $b_{11}$  140–5° (picrate, orange, m. 97°; styphnate, yellow, m. 114°).  $\gamma$ -Phenyl- $\alpha$ -methylbutyric acid,  $b_{11}$  155–65°; concd.  $\text{H}_2\text{SO}_4$  gives 2-methyl-1-keto-1,2,3,4-tetrahydronaphthalene,  $b_{11}$  140–50°, which yields with  $\text{EtMgBr}$ , as above, 1-ethyl-2-methylnaphthalene,  $b_{11}$  135–15° (picrate, golden yellow, m. 110–1°; styphnate, yellow, m. 141°).

**Synthesis of 1-ethyl-6-methyl- and 1-ethyl-7-methylnaphthalene.** Otto Brunner and Franz Grof. *Monatsh.* 64, 28–34 (1934).— $p\text{-MeC}_6\text{H}_4\text{CCl}_3\text{CHCO}_2\text{H}$  (48 g.) on reduction with 144 g.  $\text{Na}$  gives 22 g. 3-(*p*-tolyl)pentan-1-ol,  $b_{11}$  134–6°; the bromide  $b_{12}$  133°; through the cyanide there results  $\gamma$ -(*p*-tolyl)caproic acid,  $b_{12}$  189° (chloride,  $b_{11}$  141°);  $\text{AlCl}_3$  gives 1-ethyl-6-methyl-4-keto-1,2,3,4-tetrahydronaphthalene,  $b_{11}$  159° (semicarbazone, m. 156°);

this also results from the ketone and 5 parts concd.  $\text{H}_2\text{SO}_4$ ; reduction gives 1-ethyl-6-methyl-1,2,3,4-tetrahydronaphthalene,  $b_{10}$  126°; S at 250–80° for 16 hrs. gives 1-ethyl-6-methylnaphthalene,  $b_{12}$  135 8° (picrate, golden yellow, m. 81.5°; styphnate, yellow, m. 90°). 7-Methyl-1-keto-1,2,3,4-tetrahydronaphthalene and  $\text{EtMgBr}$  give 1-ethyl-7-methyl- $\Delta^1$ -dihydronaphthalene,  $b_{10}$  135°. Heating with S 16 hrs. at 250–80° gives 1-ethyl-7-methylnaphthalene,  $b_{11}$  128° (picrate, golden yellow, m. 106°; styphnate, yellow, m. 142–3°). C. J. West

Synthesis of condensed polynuclear hydrocarbons by the cyclodehydration of aromatic alcohols. II. Synthesis of ionenes. Marston T. Bogert, David Davidson and P. Max Apfelbaum. *J. Am. Chem. Soc.* 56, 959–63 (1934); cf. C. A. 28, 1091°.—The recently suggested structure of ionene as 1,1,6-trimethyltetralin has been confirmed by its synthesis from *m*-xylene. Reduction of *l*t *m*-methylcinnamate with Na in  $\text{AmOH}$  gives 68% of 3-(*m*-tolyl)-1-propanol (*m*-tolylpropyl alc.),  $b_4$  108°,  $b_{20}$  147°,  $d_4^{20}$  0.9776,  $n_D^{20}$  1.52004 (phenylurethan, m. 52–3°); the bromide  $b_{20}$  140–5° (67% yield); the Grignard reagent with  $\text{Me}_2\text{CO}$  gives 46% of 2-methyl-5-(*m*-tolyl)pentan-2-ol,  $b_5$  128–32°,  $d_4^{25}$  0.9493,  $n_D^{25}$  1.50818 (phenylurethan, m. 97–8°); dehydration with concd.  $\text{H}_2\text{SO}_4$  gives ionene. The synthesis of 1,1-dimethyltetralin (I) was carried out as follows:  $\text{Ph}(\text{CH}_2)_3\text{MgBr}$  and  $\text{Me}_2\text{CO}$  give 51% of 2-methyl-5-phenylpentan-2-ol (II),  $b_{10}$  130°,  $d_4^{25}$  0.9556,  $n_D^{25}$  1.50681 (phenylurethan, m. 101.5–2.5°); dehydration of II by distn. with I gives 2-methyl-5-phenyl-2-pentene (III), a sample contg. 85% olefin  $b_{10}$  108–12°; the structure is established by the action of  $\text{O}_3$ .  $\text{Ph}(\text{CH}_2)_3\text{MgBr}$  and  $\text{Me}_2\text{CHCHO}$  give 59.5% of 2-methyl-5-phenylpentan-3-ol (IV),  $b_{10}$  130.5–1.5°,  $d_4^{25}$  0.9563,  $n_D^{25}$  1.50466. Dehydration of II or IV with  $\text{H}_2\text{SO}_4$  or the action of 90%  $\text{H}_2\text{SO}_4$  upon III gives I,  $b_{10}$  98°,  $b_{20}$  220–2°,  $d_4^{25}$  0.9474,  $n_D^{25}$  1.52736, the yields being 82.5, 74.5 and 90%, resp.; the *di*- $\text{NO}_2$  deriv. of I m. 64.5° (32% yield); the sulfonamide m. 148–9° (33% yield). I was not dehydrogenated by boiling with S or Se. C. J. West

$\beta$ -Phenyl- $\beta$ -anthronylpropionic acid. 3-Anthronylindan-1-one. L. Gravel. *Naturaliste can.* 57, 221–55 (1933). — $\beta$ -Phenyl- $\beta$ -anthronylpropionic acid (cf. Meierwein, C. A. 13, 1310) [chloride (I), m. 115–16°; Me ester, m. 111–12°; Et ester, m. 88–9°; amide, m. 181–2°; anilide, m. 168–9°; Ag salt] is dehydrated by concd.  $\text{H}_2\text{SO}_4$  at 103–10° to 3-anthronylindan-1-one (II), m. 161–2° [2-Br deriv. (III), m. 170–1°; hydrazone (+ $\text{H}_2\text{O}$ ), m. 176°; phenylhydrazones, m. 224–5° (+1PhMe); oxime (+1PhMe), m. 181–4°], identified by oxidation ( $\text{HNO}_3$ , d. 1.2) to anthraquinone and *o*- $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$ . I with  $\text{AlCl}_3$  in  $\text{C}_6\text{H}_6$  or (better)  $\text{CS}_2$  gives II and in addn. an isomer, m. 188°, which on account of its conversion into III with Br is regarded as the enolic form of II; in  $\text{C}_6\text{H}_6$  Ph  $\beta$ -phenyl- $\beta$ -anthronyl-ethyl ketone, m. 115–16° (*loc. cit.*), is also obtained. The following are also described:  $\text{Me}_2$ , m. 58–9°,  $b_2$  175°, and Et *o*-chlorobenzylidenemalonate, m. 30°,  $b_2$  182–3°;  $\text{Me}_2$ , m. 148–9°, and Et  $\beta$ -*o*-chlorophenyl- $\beta$ -anthronylsuccinate, m. 119–20°; Et  $\beta$ -phenyl- $\beta$ -anthronylsuccinate, m. 104–5°; and  $\beta$ -*o*-chlorophenyl- $\beta$ -anthronylpropionic acid, m. 159–61°. B. C. A.

Nitric acid oxidation of 2,5-diphenylfurans to cis unsaturated 1,4-diketones. Robert E. Lutz and Frank N. Wilder. *J. Am. Chem. Soc.* 56, 978–9 (1934).—Various 2,5-diphenylfurans are oxidized consistently to cis unsatd. 1,4-diketones, probably through a 1,4-addn. mechanism; the yields are about 80%. The method has been applied to 2,5-diphenylfuran (*cis*- $\text{BzCH:CHBz}$ ), its 3,4-di-Cl and -di-Br derivs., bis(bromophenyl)dichloro- and -dibromofurans and triphenylfuran. C. J. West

The preparation and production of furfural. N. M. Chetverikov and A. I. Lazarev. *J. Chem. Ind. (Moscow)* 1934, No. 1, 72–6.—For reasons of economy, the amt. of steam used in steam distn. of furfural from an autoclave should be reduced near the end of the distn. Sunflower husks may be treated with  $\text{H}_2\text{SO}_4$  and then steam-distd., without the use of an autoclave. This yields 12% furfural as well as  $\text{HOAc}$  and C. H. M. Leicester

Toxicarol. V. 7-Hydroxytoxicarol and related com-

pounds. E. P. Clark. *J. Am. Chem. Soc.* 56, 3796–3798 (1934); cf. C. A. 26, 3795.—Butenandt (C. A. 26, 3796; 28, 1479) has designated the compd. obtained by the action of  $\text{EtOH}$ -alkali on toxicarol (I) as the hydrate; this is 7-hydroxytoxicarol (II). II is obtained by the action of 50%  $\text{KOH}$  on I in  $\text{EtOH}-\text{C}_6\text{H}_6$ , the reaction being one of atm. oxidation, since the yield is increased by stirring the soln.; it also results by the action of  $\text{Na-Hg}$  with stirring; it further results by oxidizing I with  $\text{CrO}_3$  in  $\text{AcOH}$ . II m. 226–7°,  $\eta_a$  1.580,  $\eta_s$  1.650,  $\eta_r$  slightly greater than 1.737. II and  $\text{As}_2\text{O}_3$  give acetyldehydrotoxicarol;  $\text{EtOH-HCl}$  gives dehydrotoxicarol (III). Diacetyltoxicarol and  $\text{Na}_2\text{Cr}_2\text{O}_7$  in  $\text{AcOH}$  give 7-hydroxymonoacetyltoxicarol (IV), m. 184°,  $\eta_a$  1.555,  $\eta_r$  between 1.700 and 1.737; alk. hydrolysis gives II; alc.  $\text{HCl}$  gives III. Catalytic reduction of IV gives 7-hydroxymonoacetyldihydrotoxicarol (V), m. 194–5°,  $\eta_a$  1.550,  $\eta_r$  1.685, which also results by  $\text{KMnO}_4$  oxidation of diacetyldihydrotoxicarol. Dihydrotoxicarol with alkali or with  $\text{Na-Hg}$  gives 7-hydroxydihydrotoxicarol, m. 222–3°,  $\eta_a$  1.576,  $\eta_s$  1.630,  $\eta_r$  1.695, which also results by hydrolysis of V. C. J. West

Chemistry of quebracho tannin. K. Freudenberg and P. Maffland. *J. Intern. Soc. Leather Trades Chem.* 18, 156–9 (1934).—Quebracho tannin is believed to be a polymerization product of "quebracho-catechol" (I, R = 3,4-(HO) $_2$  $\text{C}_6\text{H}_3$ ), a reduction product of fisetin, contg. 1 less OH than ordinary catechol. This quebracho-catechol has not been isolated from the tree, but has been synthesized (catalytic reduction of fisetinidin chloride, isolation as the Ac deriv., liberation by shaking with  $\text{Ba}(\text{OH})_2$ ). It readily polymerizes to a tannin-like substance on boiling with dil. acid, and gives decomposition products identical with those of natural quebracho tannin. Polymerization occurs by condensation without elimination of  $\text{H}_2\text{O}$  through opening up of oxonium rings (II, R = 3,4-(HO) $_2$  $\text{C}_6\text{H}_3$ , R' = 2,4-(HO) $_2$  $\text{C}_6\text{H}_3$ ,  $\text{CH}_2\text{CH}(\text{OH})\text{CH}_2\text{R}$ )

H. B. Metcill

2-Methyl- and 2-ethyl-4-(*p*-halophenyl)thiazoles and some of their derivatives. J. P. Wetherill and Raymond M. Hann. *J. Am. Chem. Soc.* 56, 970–1 (1934).—The thiazoles were obtained by refluxing 0.05 M quantities of thioamides with the appropriate *p*-halophenacyl chloride in 95%  $\text{EtOH}$  for 15 min., the yields being 85–95%. 2-Methyl-4-*p*-chlorophenylthiazole, m. 122–3° (HBr salt, m. 186–7°; picrate, yellow, m. 163°; mercurichloride, m. 202–3°); 4-*p*-Br deriv., m. 134° (picrate, yellow, m. 160°); mercurichloride, m. 221°; 4-*p*-I deriv., pale yellow, m. 138° (picrate, yellow, m. 152°; mercurichloride, m. 233°); 2-ethyl-4-*p*-chlorophenyl deriv., m. 72° (picrate, yellow, m. 143–4°; mercurichloride, m. 164°); 4-*p*-Br deriv., m. 80° (picrate, yellow, m. 143°; mercurichloride, m. 177°); 4-*p*-I deriv., m. 99° (picrate, yellow, m. 148°; mercurichloride, m. 188°). All m. ps. are cor. These compounds are to be tested as larvicides. C. J. West

Oxidation-reduction relations and a color reaction for lactoflavin (vitamin  $\text{B}_2$ ). Richard Kuhn and Theodor Wagner-Jauregg. *Ber.* 67B, 361–3 (1934); cf. C. A. 28, 1613.—Reduction of lactoflavin in  $\text{AcOH}$ ; neutral or alk. soln. yields a colorless dihydro compd., leucolactoflavin. If reduction is conducted in a mineral acid soln. an intermediate monohydro compd. is formed having an intense red color, and showing an absorption band at 4900 Å. Shaken with air in the presence of  $\text{NaOAc}$ , it develops a yellow color and fluorescence with a max. absorption band at 4450 Å. The oxidation-reduction relations of lactoflavin resembled those with vitamin  $\text{B}_2$ . These properties are believed to be related to the sugar-like side chain  $-\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{OH}$ . J. C. Munch

Preparation of picolinic acid amide from  $\alpha$ -bromopyridine. Wallace R. Brode and Clarence Bremer. *J. Am. Chem. Soc.* 56, 993–4 (1934).—2-Bromopyridine (15 g.), 15 g.  $\text{KCN}$ , 2 g.  $\text{Cu}(\text{CN})_2$  and 20 cc.  $\text{H}_2\text{O}$ , heated

18 hrs. at 175°, give 25% of picolinic amide, m. 106.3–6.8° (cor.).

**C. J. West.** Comparison of the dimethylquinoline from aniline, isobutyraldehyde and methylal with 2,3-dimethylquinoline, and some new observations on the behavior of 2,3-dimethylquinoline toward benzil. G. Rohde. *Ber.* 67B, 431–4 (1934).—The 2 dimethylquinolines (I), v. Miller and Kinkelin, *Ber.* 20, 1934 (1887), and (II), Rohde, *Ber.* 22, 267 (1889) are identical. I, after crystn. from pure dry ether or ligroin (b. 75°), m. 68.8.5°; II m. 69.5°; mixed m. p. 68–8.5°. Both have the same crystallographic const.: short rhombic prisms,  $p[110], b[010], c[001], (110):(110) = 121^\circ 46', (110):(001) = 90^\circ 0'$ , plane of the optical axes parallel to  $\{001\}$ ,  $a:b:c = 0.5569:1:2$ . Picrates, m. 229–30°, 230–1°; mixed m. p., 229–30°. Chloroplatinates (spears, granules and hair-like crystals), blacken 225–50°, m. indistinctly 280–90° on rapid heating (the spears from I decompose 245°). Chloraurates, light golden yellow, m. 204–5°, 205–8°. The formation of the condensation product  $C_{22}H_{19}NO$  (III) from II and  $Bz_2$  (Rohde, *Diss. Erlangen*, 1888) is preceded by the formation of an addn. product  $C_{22}H_{19}NO_2$  (obtained from the components kept 20 hrs. at 100°), m. 145–6°, does not show in acids the intense yellow-green fluorescence of III, is converted into III by concd.  $H_2SO_4$ . Sulfate of III, light yellow leaflets, m. around 294°. III seps. from alc. in druses of hair-fine needles with a few yellowish prisms, the needles changing completely under the mother liquors in the course of several days into the prisms and the process repeating itself after every recrystn. from alc. Both forms m. 180–1°; if kept a few min. above their m. p., they solidify to the yellow isomer (also obtained from II and  $Bz_2$  at 160–70°), m. 246.7°. II and  $Bz_2$ , heated 15 hrs. in sealed tubes at 180° give the compd.  $C_{22}H_{19}N$  (possibly  $C_{22}H_{19}NMeCH_2CHPh_2$ ), m. 121–2°. Quinaldine likewise forms with  $Bz_2$  an addn. product, m. 134–5°, which loses water and yields a compd.  $C_{22}H_{17}NO$ , m. 189–9.5°, sol. in acids with intense yellow-green fluorescence. The latter does not undergo a transformation analogous to that of III, however, and quinaldine and  $Bz_2$  heated in a sealed tube at 180° form yellow prisms, m. 245–6°, having apparently the compn.  $(C_8H_5NCH: CPh_2)_2$ .

**C. A. R.** The hydroxyquinolines. Iodo derivatives of *o*-hydroxyquinoline. I. F. Pirrone and A. Cherubino. *Atti accad. Lincei* 18, 311–13 (1933).—By treating *o*-hydroxyquinoline (I) with  $I_2$  (both in  $EtOH$ ) at the boiling temp., 2 isomeric mono-I derivs. (cis, trans) have been prepd. The 1st isomer m. 124–6° (hydrated), or 114–16° (anhyd.), forms brilliant green needles, sol. in common org. solvents, and in 50%  $EtOH$ . The other isomer forms dark yellow needles, m. 174–5° (decompn.), is sol. in  $CHCl_3$ , less in  $EtOH$  or  $Et_2O$ . Both give a green-violet color with  $FeCl_3$ . Derivs. prepd.: a *N*-iodomethyl compd., m. 136–7°, brown needles with a metallic luster;  $HCl$  deriv., m. 206–8° (decompn.); picrate, m. 162.3°, golden yellow needles; sulfate, m. 208.9°, minute green crystals; a complex  $Cu$  salt as bright yellow plates; complex  $Ni$  salt, greenish yellow plates. The expl. part will appear in *Gazz. chim. ital.*

**A. W. Contieri.** Action of hydriodic acid on lupanine. Geo. R. Clemo and Richard Raper. *Ber.* 67B, 463–4 (1934).—Winterfeldt, Kneuer and Holschneider (*C. A.* 26, 465) still insist that 1 of the products of the action of fuming  $HI$  and red  $P$  on lupanine (I) at high temp. and pressure is  $\beta$ -lupanine (II). Clemo, Leitch and Raper in their work (*C. A.* 25, 1274) had used com.  $HI$  (d. 1.96); in the present work they used, in each of 4 pressure tubes, 0.65 g. purified *dl*-I, 0.9 g. red  $P$  and 3.5 cc.  $HI$  prepd. by freshly satg. the com. acid at  $-10^\circ$  to  $-15^\circ$ , and heated the mixts. 50 hrs. at 70–60°. On working up the product according to W., K. and H., they obtained less than 0.02 g. distillate  $b_m$  below 100°, from which they isolated a little II picrate, m. 163°. The higher-boiling fraction (0.85 g.  $b_m$  120–30°) had the properties of the 2nd cleavage product of W., K. and H. Lupanine (III) (0.65 g.), treated the same way, gave 0.1 g. II,  $b_m$  90–2°. Careful tests of the I used revealed that it contained traces of a base volatile with steam but

as yet no deriv. of III has been found of which traces could be detected in the I. Addn. of 10% III to I results in a considerably larger yield of II, but from a l m. 90° which had been very carefully purified (by converting it into the picrate or thiocyanate, liberating it from the salt, distg. it and recrystg. it twice from acetone) not a trace of II picrate could be isolated after treatment with  $HI$  and  $P$ . In parallel expts. in which 0.01 g. III was added to the I (0.65 g.) there were obtained traces of distillate  $b_m$  below 100° which had the characteristic odor of II and gave a picrate m. 162.3°. It is concluded that I free of III gives no II.

**C. A. R.** Catalytic dehydrogenation of cyclic bases. II. Maximilian Ehrenstein and Ilse Marggraff. *Ber.* 67B, 486–91 (1934); cf. *C. A.* 25, 3990.—From the behavior of piperidine and pyrrolidine rings, it might have been expected that in the bicyclic tropane (I) the piperidine ring would not be dehydrogenated, since it has a Me group on the N, while the pyrrolidine ring would, the only question being whether the resulting structure would be sufficiently strain-free; it was possible, therefore, that I would be unchanged by the catalyst. Expt. showed that I does not behave in either of these 2 ways; when its vapors are passed over  $Pd$ -asbestos at about 300° no II is split off but the distillate is not unchanged I. As the result of isomerization, the I, in part, at least, is changed into a secondary base,  $CH_2CH:CHCH_2CH_2CH_2CHNHMe$  or

which in the air at once changes into a white solid (presumably the carbonate), decolorizes  $KMnO_4$  in  $H_2SO_4$ , and yields a *Bz* deriv., m. 94.6.5°. Like cycloheptane, the N-analog, hexamethylenimine, shows no great tendency to lose H; when it is passed over  $Pt$ -asbestos, a considerable amt. is unchanged and there is regularly formed  $\alpha$ -picoline, together with pyrrole derivs. (detected by means of the pine splinter reaction). The dehydrogenation method is therefore not to be recommended for the detection of N-contg. 7-membered rings in alkaloids.

**C. A. R.** Strychnos alkaloids. LXXIX. Nature of the acid oxidation products from benzal- and 11-hydroxydihydrostrychnine. Hermann Leuchs and Hans Beyer. *Ber.* 67B, 459–63 (1934); cf. *C. A.* 28, 1707<sup>a</sup>. The acid  $C_{26}H_{22}O_8N_2$  which Kotake and Mitsuwa report having obtained by oxidation of benzaldihydrostrychnine (*C. A.* 27, 5334) has probably the compn.  $C_{27}H_{23}O_8N_2$  (I). The product obtained by pptn. from cold alk. soln. with  $CO_2$  seems to be a hydrate  $C_{26}H_{21}O_8N_2$ ; such preps. do not attain quite const. wt. at 100° and 15 mm. and lose 3.3–4.4% at 115–45°.  $[\alpha]_D^{25}$  of various preps. in 1 mol. 0.1 *N*  $NaOH$  ranges between 91° and 96.8°/d. *Perchlorate*, tablets and leaflets losing 8.0–8.1% at 20–95° under 15 mm. I dissolves clear in cold  $Ba(OH)_2$  and on heating 1 hr. at 95° yields at first broad prisms, giving a red-violet Otto reaction, which then disappear and are replaced by needles of  $Ba$  oxalate; the other cleavage product is isolated as a *perchlorate*,  $C_{26}H_{21}O_8N_2 \cdot 2HClO_4$ , prisms and leaflets losing 5.03–5.5% at 20–95° and 15 mm.,  $[\alpha]_D^{25} = -84.4^\circ/d.$ , gives no color with  $FeCl_3$  or with  $CrO_3$  in concd.  $H_2SO_4$  but does give a strong brown-red color in 2 *N* acid and with 14 *N*  $HNO_3$ . The following degradation may therefore be assumed to have occurred:  $N.CO.C:(CHPh).CH.O-CH_2 \rightarrow N.CO.CO.CH.O.CH_2 \rightarrow N.CO.CO_2H:CO.O-CH_2 \rightarrow NH(CO_2H).CO_2H(HO).CH_2$ . The bromination product of I is not  $C_{26}H_{22}(n)O_8N_2Br.AcOH$  but  $C_{26}H_{21}O_8N_2Br$ , obtained as prisms m. 237–0° (decompn.), losing 0.9% at 20° and 15 mm., then slowly 6.9–7.4% at 95–145° and increasing in wt. 6% in 6 days in the air,  $[\alpha]_D^{25}$  63.1–63.8°/d. in 1 mol.  $NaOH$ ; it is sol. in 2 *N*  $HCl$  and in  $NH_4OH$ , gives a strong blue color with  $CrO_3-H_2SO_4$  and is hydrolyzed by  $Ba(OH)_2$  to  $(CO_2H)_2$  and an acid isolated as the *perchlorate*,  $C_{26}H_{21}O_8N_2Br \cdot 2HClO_4$ , tables losing 4.25% at 100° in a high vacuum,  $[\alpha]_D^{25} = -103.5^\circ/d.$  L. and B. believe that the acid  $C_{27}H_{23}O_8N_2$ , m. 298°, obtained by Wieland and Kaziro (*C. A.* 28, 158<sup>a</sup>) by oxidation of 11-hydroxydihydrostrychnine (12-HO deriv. according to the

notation used by W. and K.), is identical with I.

C. A. R.

**Strophanthin. XXIX.** Dehydrogenation of strophanthin. Robert C. Elderfield and Walter A. Jacobs. *Science* 79, 279 80(1934); cf. *C. A.* 27, 5747.—Dehydrogenation of 180 g. strophanthin (I) with Se gave 72 g. oil b. up to 275°. Repeated fractionation gave a fraction b.p. 185–95°. Cryst. material from this was purified through the picrate and recrystn. with alc. A yield of 0.5 g. of a hydrocarbon  $C_{11}H_{14}$  was obtained which corresponded to that of Diels, Gädke and Körding obtained from cholesteryl chloride. These results confirm those of Tachesche and Knick obtained with dianhydrouzarigenin. The dimethylphenanthrene previously obtained from I was apparently the product of too rapid heating of the reaction mixt. Since the formation of  $C_{11}H_{14}$  appears to be a characteristic degradation product of the sterol skeleton and there is no evidence on hand to show that it is the result of extensive rearrangement, the ring system of the cardiac aglucones appears to be built on the same general plan as that of the sterols and bile acids. R. B.

**Constitution of the two solanines t and s.** Giuseppe Oddo and Gaetano Caronna. *Ber.* 67B, 448 58(1934); cf. *C. A.* 23, 2978; 27, 2957; Zemplén and Gerecs, *C. A.* 23, 1412. —Repetition of the work of Z. and G. has given results differing in almost all respects from theirs and showing beyond doubt that the 4 components of solanine t (I) (from *Solanum tuberosum*) are linked in the order solanidine t-d-glucose-d-galactose-d-rhamnose and that solanine s (II) (from *S. sodomum*) has the structure solanidine s-d-glucose-d-galactose-d-rhamnose solanidine s. The Ac deriv. (III), begins to decompose 190°, m. 204–5°, has the compn.  $C_{71}H_{108}O_{22}N$  (C 56.57, H 7.33%), not  $C_{70}H_{107}O_{21}N$ , and is the acetate of *tridecaacetylsolanine* t,  $C_{88}H_{140}O_{23}N$  (V), which has now been isolated in the free form, m. 120°. G. and Z. report that by the action of 70% HBr in AcOH on III they obtained an acetylated solanidine glucoside, m. 115–20° (decompn.), and rhamnosidogalactose and that oxidation of the latter with I and distn. with HCl gave a product which formed a ppt. with phloroglucinol, whence they concluded that the 2 cleavage products are united, in I, through the galactose residue. None of this could be confirmed by repetition of the process under the same conditions; the method of extn. was accordingly modified and there were obtained. (1) tetraacetylramnose, m. 90°, sol. in ether and reprecipitated by petroleum ether; (2) a monoacetylsolanidine t-glucose-galactose-HBr  $\cdot H_2O$  (C 56.34, H 7.09, Br 6.87%), m. 130°, sol. in benzene and reprecipitated by petroleum ether, in which, however, the HBr is not in ionizable form and which is converted by alc. KOH or NaOMe into the true solanidine t glucoside (VI) (C 70.02, H 9.31%), m. 170°; and (3) a pentaacetylsolanidine t-glucose-HBr  $\cdot H_2O$  (C 59.81, H 7.33, Br 7.75%), yellow amorphous powder, m. 115° (decompn.), insol. in ether and benzene, in which the HBr is present in ionizable form and which gives VI with alc. KOH. The results with II are entirely different. The Ac deriv. prepd. according to Z. and G. or by the method previously used by Oddo is decaacetylsolanine s,  $C_{70}H_{106}O_{21}N$  (C 59.51–59.52, H 7.10–7.15), m. 135–8°. Treatment with 70% HBr in AcOH gives: (1) the ether-sol. diacetylramnose, m. 75°; (2) an ether-insol., benzene-sol. heptaacetylsolanidine s-glucose-galactose  $\cdot H_2O$  (VII) (C 57.79–57.81, H 7.52–7.54%), faintly yellowish powder, begins to decompose 140°, m. 170°, hydrolyzed by alc. KOH to solanidine s glucoside (C 63.28–63.21, H 9.35–9.41%), m. 185°; and (3) an ether- and benzene-insol. bromoacetylsolanidine s,  $C_{12}H_{18}ONAcBr$  (VIII), begins to decompose when dried *in vacuo* and m. 135°. With 30% instead of 70% HBr in AcOH there were obtained: (1) an ether-sol. heptaacetylsolanidine s-glucose-galactose, mixed with a little diacetylramnose from which it was sepd. by treatment with 70% HBr in AcOH whereby the new glucoside lost 1 mol. water and was converted into the ether-insol. VII; (2) an ether-insol., benzene-sol. monoacetylated solanidine-rhamnose-HBr (IX) (C 55.50–55.52, H 7.73–7.78, Br 12.34–12.37%), yellow flocks, m. 132° (darkening), hydrolyzed by

1 70% HBr in AcOH to diacetylramnose and VIII; and (3) the ether- and benzene-insol. VIII. Oxidation of IX with I and distn. with HCl gave a distillate forming no ppt. with phloroglucinol. A further difference between I and II is that whereas I,  $C_{88}H_{140}O_{23}N$ , is formed by addn. of the 4 components with elimination of 3 mols.  $H_2O$ , II,  $C_{84}H_{134}O_{21}N$ , is formed by simple addn. of the 5 components + 1 mol.  $H_2O$  (which possibly adds to the N of 1 of the end solanidine residues).

C. A. R.

The flavanone glucoside in *Glycyrrhiza glabra* L. var. *glandulifera*, Regel et Herder. Junzo Shinoda, and Seichi Ueda. *Ber.* 67B, 434–40(1934).—Extn. of the powd. root with MeOH yields a glucoside, *liquiritin*,  $C_{21}H_{32}O_{10}$ , needles with 1  $H_2O$ , m. 212°, giving with Mg and HCl in alc. a violet-red color and hydrolyzed by aq. alc.  $H_2SO_4$  on the water bath to glucose and *liquiritigenin* (I),  $C_{15}H_{12}O_6$ , needles with 1  $H_2O$ , m. 207°, which likewise gives a violet-red color with Mg and HCl. Neither the glucoside nor I gives a color with alc.  $FeCl_3$ . I forms with  $Ac_2O$  and a drop of  $H_2SO_4$  a diacetate, m. 186°, and with  $NH_4OH.HCl.NaOAc$  in alc. an oxime, m. 118°; 50% KOH at 170–80° converts it into resacetophenone and  $p-HOC_6H_4CO_2H$ . I is therefore 4',7-dihydroxyflavanone. To det. the position of the sugar residue in the glucoside, the latter was decompd. with  $Ba(OH)_2$ , which yielded resacetophenone, but the part bound to the sugar residue could not be isolated. Alkylation of the glucoside in anhyd. acetone with  $K_2CO_3$  and MeI and treatment of the product with dil.  $H_2SO_4$  gave the Me deriv. of I only as a resin. Decompn. of the glucoside with 50% KOH yielded pemon (oxime, m. 131.5°) and  $p-HOC_6H_4CO_2H$ , whence the glucose residue must be on the 4'-HO group. Tamlor (*C. A.* 11, 1969) reports 4',7-dihydroxyflavanone as m. 182–3° and its diacetate as m. 175 6°. The flavanone was accordingly synthesized from  $p-EtO_2COC_6H_4CH_2CH_2CHCOCl$  and  $m-C_6H_4(OH)_2$  with  $AlCl_3$  in  $PhNO_2$  (Shinoda and Sato, *C. A.* 23, 836) and found to be identical with I.

C. A. R.

**Plant pigments. LV.** The occurrence of  $\alpha$ - and  $\beta$ -carotene in different natural products. P. Karrer and W. Schlienz. *Helv. Chem. Acta* 17, 7–8(1934).—In the ovary of the cow  $\beta$ -carotene is found with not more than 1% of  $\alpha$ -carotene. Carotene preps. from spinach, paprika and burning nettles were treated in a  $Ca(OH)_2$  chromatogram system and shown to consist essentially of  $\beta$ -carotene with very small, but detectable, amts. of  $\alpha$ -carotene. LVI. The autumnal coloration of leaves. P. Karrer and O. Walker. *Ibid.* 43 51. Dried green leaves of the horse-chestnut were extd. with petr. ether and with  $Et_2O$ . The exts. were treated with KOH, MeOH and with NaOMe. The dried petr. ether-sol. was passed through  $Ca(OH)_2$  and a 3-layer chromatogram resulted. The most abundant layer was treated with MeOH and this, on evapn., yielded an oil, which was dissolved in petr. ether and treated with  $I_2$ . The pptd. iodide was filtered, dissolved in  $Me_2CO$  and treated with  $Na_2S_2O_4$ . Petr. ether and  $H_2O$  were added. Some xanthophyll was pptd. and a new chromatogram made from the petr. ether soln. Isocarotene was obtained from one of the layers, proving that  $\beta$ -carotene was present in the original ext. Yellow horse-chestnut leaves, by similar treatment, yielded xanthophyll and isocarotene; oxidation products of carotene were also present. Yellow leaves of a maple, *Pseudoplatanus*, gave some material known as "autumn xanthophyll," probably carotenoid oxidation products. In green horse-chestnut leaves, gathered at a date later than those previously mentioned, xanthophyll seemed to be present, but none could be obtained crystalline. Yellow leaves of the ginkgo biloba were extd. with petr. ether. By the treatment of the unsaponif. ext., carotene oxidation products were obtained. Half of the ginkgo ext. was saponif. by KOH-MeOH. No isocarotene or xanthophyll-like products were observed, but some unknown material caused a shift of absorption bands toward the violet. The green leaves of *Ulmus campestris* were treated as indicated above. No isocarotene was obtained, carotene had disappeared and only xanthophyll-like substances could be detected. None was isolated. The dis

appearance of carotene and of phytozanthin as the leaves die is probably the result of oxidation. LVII. Caricaxanthin, kryptoxanthin, zeaxanthin monopalmitate. P. Karrer and W. Schlienz. *Ibid.* 55-7.—Caricaxanthin from the fruit of *Carica papaya* L. is identical with kryptoxanthin and hence should be represented by  $C_{45}H_{74}O$ , rather than by the formula previously assigned to it by Yamamoto and Tin. It is the 1st naturally occurring, O-contg. carotenoid to display a growth-producing action. The position of the OH in this  $\beta$ -carotene deriv. is not known. By the partial sapon. of physalinen, zeaxanthin monopalmitate, m. 148°, results, and by further sapon. it yields zeaxanthin. It is the 1st known representative of the partially esterified phytozanthins. G. A. H.

Carotene. VIII. Physical properties of carotenes from different plant sources. James H. C. Smith and Harold W. Milner. *J. Biol. Chem.* 104, 437-47 (1934); cf. C. A. 26, 3509; 27, 5747.—Pure  $\alpha$ -carotene (I) from carrot roots, m. 182.3-2.7°, had  $[\alpha]_D^{25} 297-311^\circ$ ,  $[\alpha]_D^{25} 352-4^\circ$  and  $[\alpha]_D^{25} 584-93^\circ$ . Leaf carotene, from spinach, sugar beet, alfalfa, chard, cauliflower or sunflower leaves, m. 180.5° and was always optically inactive. It is therefore pure  $\beta$ -carotene (II). Mixts. of I and II show depressed m. ps., the curve of m. p. against optical activity passing through a min. at m. p. 162°,  $[\alpha]_D^{25} 160^\circ$ , indicating a 2-component system in which solid solns., but not compds., are formed. Similarly mixts. of I and II are more sol. in heptane than either separately. The absorption spectra of such mixts. show a progressive shift toward the violet and intensification of the peak as the optical activity increases; from the spectra of pure I and II, spectra could be calcd. for mixts. on the basis of their optical activity, giving satisfactory agreement with the observations. All rotations are in benzene with isolated Hc lines. K. V. Thimann.

Chlorophyll. VI. Benzoyl compounds and oximes of methylpheophorbide *a* and pheophorbide *a*. Arthur Stoll and Erwin Wiedenmann. *Helv. Chim. Acta* 17, 163-82 (1934); cf. C. A. 28, 2361<sup>2</sup>.—(1) An improved method for the prepn. of the Bz deriv. ( $C_{55}H_{82}O_6N_4 - C_7H_5N$ ) from pheophorbide *a* is described. (2) Prepn. of the Bz deriv. from methylpheophorbide *a* is described. (3) The app. and method for the detn. of carboxyl groups in chlorophyll derivs. by absorption of  $NH_3$  are described. (4) Methylpheophorbide  $\alpha$ -oxime ( $C_{55}H_{80}O_6N_4$ ) is prepd. (5) Pheophorbide  $\alpha$ -oxime ( $C_{55}H_{78}O_6N_4$ ) is prepd. from the oxime in (4). (6) Phase-positive pheophorbide *a* prepd. from the oxime in (4) possesses properties similar to those of the natural product. H. M. Burlage.

Ring-system of sterols and bile acids. V. Constitution of ergosterol and its irradiation products. O. Rosenbaum and H. Kirs. *Chemistry and Industry* 1934, 190-200; cf. C. A. 28, 2302<sup>4</sup>. R. and K. give a review on the work done on the structure of ergosterol, placing the emphasis on the position of the nuclear double bonds and the HO group. A hypothesis is proposed for the formation of the different irradiation products of ergosterol. Absorption spectra curves are given for cholesterolene, hydroxycholesterolene and ergosterol. Julius White.

Dehydrogenation of estrin. J. W. Cook and A. Girard. *Nature* 133, 377-8 (1934); cf. C. A. 28, 145<sup>6</sup>.—The C:O group of ketohydroxyestrin was reduced to give the "deoxy" compd. (I) by the method of Kishner-Wolf. I gave the MeO compd. (II), m. 76-7°. II heated 24 hrs. with Se at 300-20° and distd. over Na in a high vacuum gave methoxycyclopentenophenanthrene (III), m. 134.5-6°, picrate, orange-yellow, m. 135-6.5°. Nitrobenzene complex, golden orange, m. 160-1°. III has been assigned the structure 7-methoxy-1,2-cyclopentenophenanthrene. Its synthesis is now in progress. Julius White.

Couper, Archibald S.: On a New Chemical Theory and Researches on Salicylic Acid. Alembic Club Reprints No. 21 (Originally published 1858). London: Gurney & Jackson. 45 pp. 2s. 6d. Reviewed in *J. Am. Chem. Soc.* 56, 486 (1934).

Lowy, Alexander, and Baldwin, Wilmer E.: Laboratory Book of Elementary Organic Chemistry. 2nd ed. New York: John Wiley & Sons, Inc. 182 pp. \$2.50.

Hydrocarbons. Jean Mercier. Ger. 593,061, Feb. 21, 1934 (Cl. 12o. 1.03). See Brit. 312,916 (C. A. 24, 860-1).

Hydrocarbons. I. G. Farbenind. A.-G. (Fritz Winkler and Hans Häuber, inventors). Ger. 593,248, Feb. 23, 1934 (Cl. 12o. 1.03). Liquid hydrocarbons are obtained by passing  $C_2H_4$  and its homologs or gases contg. them at 100-300° and atm. or raised pressure over metal surfaces coated or superficially alloyed with Sn, Zn, Al or Cr.

Hydrocarbons. I. G. Farbenind. A.-G. Fr. 758,889, Jan. 21, 1934. Hydrocarbons rich in C are obtained by preliminary heating of  $CH_4$  and its homologs, to such a degree that at least 5% thereof is converted to olefins and that an addnl. proportion is eventually converted to liquid hydrocarbons, particularly of an aromatic nature. Condensable fractions are removed and the resulting gas incompletely burned.

Thermal treatment of hydrocarbons. I. G. Farbenind. A.-G. (Fritz Winkler, Hans Häuber and Paul Feiler, inventors). Ger. 593,257, Feb. 26, 1934 (Cl. 12o. 1.03). In the thermal treatment of gaseous or vaporized hydrocarbons, all or some of the app. parts exposed to a temp. above 500° are made of or lined with a compn. contg. free Si which has been molded into tubes, plates or other suitable shapes by the usual ceramic processes, with addn. of binders if necessary. Examples are given and app. is described.

Apparatus for the thermal treatment of hydrocarbons. I. G. Farbenind. A.-G. (Paul Feiler, inventor). Ger. 590,874, Jan. 12, 1934 (Cl. 23b. 1.04). App. for the thermal treatment of hydrocarbons, etc., is coated with Sn, Pb, Mo, Cr, W, etc., by the decompn. of carbonyls or alkyls of these metals within the app.

Apparatus for the thermal treatment of hydrocarbons. I. G. Farbenind. A.-G. (Fritz Winkler and Hans Häuber, inventors). Ger. 590,875, Jan. 13, 1934 (Cl. 23b. 1.04). App. for distg., decomposing or polymerizing hydrocarbons is coated internally with a high-melting element of the 4th group, especially Si or Ti, by firing the latter in the app. in powd. form.

Stabilizing chloro hydrocarbons. Imperial Chemical Industries Ltd. Ger. 593,384, Feb. 26, 1934 (Cl. 12o. 2.01). See Brit. 391,150 (C. A. 27, 4892).

Hydrogenation of unsaturated compounds. Yoshio Tanaka and Ryunosuke Kobayashi. Japan. 100,403, Apr. 4, 1933. Addn. to 89,632 (C. A. 25, 4281). Unsaturated compds. are reduced with  $H_2$  at ordinary or elevated pressure with Japanese acid clay or the like and reduced metals or hydroxides of metals as catalysts.

**Bi- and multi-valent organic compounds.** Léon Lilienfeld. Fr. 758,359, Jan. 15, 1934. Valuable bi- and multi-valent compds. (which may contain or not one or more free OH groups) contg. at least one atom of S, Te or Se and at least one halogen atom, are obtained when bi- and multi-valent halogen deriva. (which may contain or not one or more free OH groups and one or more other groups, *e. g.*, atoms of N or groups contg. N or O) are treated with inorg. sulfides or hydrosulfides in amt. appreciably less than the stoichiometric proportion. Examples are given of compds. from  $\alpha$ - and  $\beta$ -dichlorohydrin and trichlorohydrin. Other compds. are mentioned.

**Reducing organic compounds.** Farb- und Gerbstoff-Werke Carl Flesch, Jr. Fr. 758,969, Jan. 26, 1934. Org. compds. are reduced by means of alkali metals and alcs. *in vacuo*.

**Mercapto compounds.** Imperial Chemical Industries Ltd. Fr. 758,246, Jan. 12, 1934. 2,5 (and 2,8)-Dimercapto derivs. of 1-aminoanthraquinone are prepd. by treating 1-aminoanthraquinone-5 (and 8)-sulfonic acid with a hot alc. alkali sulfide or by treating 1-chloro-5- (and 8)-nitroanthraquinone with a hot alc. alkali acid sulfide. The compds. are converted by treatment with haloacetic acids to thioglycolic acids of anthraquinone and these give lactams when treated with hot dild. acids.

**Diazo compounds.** I. G. Farbenind. A.-G. (Anton Ossenbeck and Ernst Tietze, inventors). Ger. 593,260, Feb. 23, 1934 (Cl. 12g. 10). Solns. of diazo compds. are treated with cyclic sulfonic acids contg. at least one acylamino group, *e. g.*, 1-acetylaminobenzene-4-sulfonic acid. Stable solid compds. are obtained. Examples are given.

**Friedel-Craft reactions.** Fritz Hofmann and Carl Wulff. Ger. 513,414, Nov. 27, 1933 (Cl. 12o. 1.01). See Brit. 307,802 (C. A. 24, 127).

**Primary alcohols.** P. Ya. Loshakov and D. A. Alvin-Gutzetz. Russ. 31,431, Oct. 31, 1933. Primary alcohols with the same number of C atoms as the acid of the corresponding ester are prepared by reducing esters in abs. alc. with activated Al in the presence of catalysts such as ZnCl<sub>2</sub>, CuCl<sub>2</sub> or Zn.

**Alcohols.** N. V. de Bataafsche Petroleum Maatschappij. Fr. 758,141, Jan. 11, 1934. Alcs. are made by causing H<sub>2</sub>SO<sub>4</sub> to act on olefins obtained, *e. g.*, by cracking mineral oils, and the polymers formed are extd. by solvents of low b. p., *e. g.*, C<sub>6</sub>H<sub>6</sub>, toluene, xylene, CCl<sub>4</sub>, C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub>, cyclohexane and isopropyl acetate, and the extn. agent is used as entrainer in the azeotropic distn. of the dild. alc. obtained by the distn. of the refined extn. product.

**Alcohols from olefins.** N. V. de Bataafsche Petroleum Maatschappij. Ger. 593,441, Feb. 28, 1934 (Cl. 12o. 5.02). In prepg. alcs. by absorbing olefins in H<sub>2</sub>SO<sub>4</sub> and hydrolyzing the sulfuric esters so obtained, impurities (polymerization products) are removed from the dild. sulfuric esters or from the aq. alcs. by extn. with an Edeleanu ext. of mineral oil. The esters may first be neutralized. Examples are given.

**Aliphatic alcohols; esters.** Henry Dreyfus. Brit. 402,060, Nov. 21, 1933. Aliphatic alcs. and (or) org. esters thereof are prepd. by subjecting hydrocarbons to thermal decompn. in the presence of the vapor of an org. acid, preferably a lower aliphatic acid, *e. g.*, AcOH, propionic acid. Suitable hydrocarbons are petroleum (fractions), C<sub>2</sub>H<sub>6</sub>, C<sub>3</sub>H<sub>8</sub>. In an example a mixt. of a vaporized petroleum fraction and AcOH vapor is passed through narrow tubes at 700° and atm. pressure and the products are passed at 400° and 400 atm. through tubes contg. H<sub>2</sub>PO<sub>4</sub> on pumice; the products include EtOAc.

**Aromatic amines.** Arthur W. Campbell (to B. F. Goodrich Co.). U. S. 1,950,079, March 6. When triphenylmethyl chloride is caused to react with diphenylamine in the presence of anhyd. AlCl<sub>3</sub>, the course of the reaction is modified and a considerable proportion of a new material is formed, which has the same empirical compn. as the *p*-phenylaminotetraphenylmethane already known, but which has a much higher m. p., namely, 350°. This new substance exhibits all the usual properties of a diarylamine, and is believed to be *p*-diphenylmethyl-*p'*-phenyl-

aminobiphenyl. Similar products may be obtained from other triarylmethyl halides such as tritolylmethyl chloride, trisbiphenylmethyl chloride, etc., when caused to react in the presence of AlCl<sub>3</sub> with diarylamines such as diphenylamine, phenyltolylamine, phenylanthrylamine, phenylbiphenylamine, etc., particularly when one of the aromatic rings in each component has a replaceable H in the *p*-position. However, the products of this new reaction are not necessarily para substituted compds., hence other positions of the constituent groups are not excluded. The reaction is not limited solely to diarylamines, for dimethyl-aniline, diethylaniline, and other aromatic amines and substituted aromatic amines undergo the same general reaction with triarylmethyl chlorides, with the formation of biaryl compds. having an amino group substituted on one of the aromatic rings and a diarylmethyl group on the other. The products may be used as dye intermediates, antioxidants, etc.

**Aromatic amines.** F. I. du Pont de Nemours & Co and Alexander J. Wuertz. Brit. 402,063, Nov. 13, 1933. Amines of the C<sub>6</sub>H<sub>5</sub> series are obtained by heating a halogenated C<sub>6</sub>H<sub>5</sub> with aq. NH<sub>3</sub> in the presence of an inorg. oxidant, *e. g.*, an alkali metal chlorate, perborate, perchlorate or dichromate. A metal (compd.), including and subsequent to Cu in the *t. m. f.* series, may be present as catalyst. In examples (1) PhNH<sub>2</sub> is obtained by heating PhCl with aq. NH<sub>3</sub> in presence of KClO<sub>3</sub>, NH<sub>4</sub>NO<sub>3</sub> and reduced Cu, and (2) *p*-phenylenediamine and *p*-nitroaniline are similarly obtained from *p*-dichlorobenzene and *p*-nitrochlorobenzene.

**Cyclic ketones.** I. G. Farbenind. A.-G. (Erwin Kramer, inventor). Ger. 590,579, Jan. 5, 1934 (Cl. 12o. 10). These are prepd. by heating carboxylic acid of the general formula *o*-HO<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>XPh, their substitution products or derivs. with a free *o*-position to the X in the Ph nucleus, with aroyl acid halides, X being used to denote R<sup>1</sup>CR<sup>2</sup> where R<sup>1</sup> and/or R<sup>2</sup> denote H, a hydrocarbon residue or the groups C=O, S=O, O, S or NH. The H of the latter group may be replaced by the group denoted by R<sup>1</sup>. In an example, benzoyl-*o*-benzoic acid is heated with BzCl in C<sub>6</sub>H<sub>5</sub>Cl<sub>2</sub> to give a 90% yield of anthraquinone. Other examples describe the prepn. of phthaloylpyrene, m. 249-50°, anthraquinone-2,1(N-1',2'(N)-benzeneacridone, anthraquinone-2,1(N)-1',2'(N)-6,5(N)-1',2'(N)-dibenzeneacridone, 3',6'-dimethylantraquinone-2,1(N)-1',2'(N)-benzeneacridone, phenylantraquinone-2,1(N)-1',2'(N)-benzeneacridone and anthraquinone-2,3(S)-1',2'-benzenethioxanthone.

**Benzyl ethers.** Imperial Chemical Industries Ltd. Ger. 593,126, Feb. 21, 1934 (Cl. 12o. 5.09). See Brit. 393,937 (C. A. 27, 5752).

**Malonic esters.** Alexander Wacker Ges. für elektrochemische Industrie G. m. b. H. Fr. 758,043, Jan. 20, 1934. Diethylmalonic acid is esterified by alcs. of the fatty series by carrying out the reaction in the presence of a neutral solvent, *e. g.*, benzene or benzine. Examples are given of the prepn. of the di-Et (b<sub>15</sub> 100) and di-Bu ester (b<sub>15</sub> 143-6°).

**Phenols.** Soc. des usines chimiques Rhône-Poulenc Fr. 758,990, Jan. 26, 1934. Phenols are prepd. by hydrolyzing phenates in a molten, pasty or powd form and practically dry, the mass being maintained throughout the operation between 280° and 370° by a current of steam which carries off the phenol. The steam is passed through a mixt. of alkali arylsulfate and caustic alkali.

**Amides of higher fatty acids.** I. G. Farbenind. A. G. Fr. 757,867, Jan. 5, 1934. Amides of fatty acids contg. more than 10 C atoms are prepd. by passing NH<sub>3</sub> gas through a molten mass of the acids at a temp. betw. the m. p. of the acids and about 250°, and in the presence of a solid inorg. substance having a large surface.

**Hydrogenating pyridine or quinoline bases.** Schering Kahlbaum A.-G. Ger. 590,637, Jan. 6, 1934 (Cl. 12p. 1.01). Pyridine or quinoline bases are treated with hydrogenating agents in the presence of a catalyst. Thus, 1 mol. of pyridine is treated with 3 mol. of cyclohexanol and a hydrogenation catalyst at 210-30° in an autoclave

to give a qualitative yield of piperidine and cyclohexanone. Other examples are given.

**Aminodiphenylamine derivatives.** I. G. Farbenind. A.-G. Fr. 759,018, Jan. 27, 1934. Derivs. of 4-amino-diphenylamine are prep'd. by condensing *o*-chlorobenzoic acid or its substitution products with 1-amino-4-acylaminobenzenes substituted in the 3-position by an alkyl or alkoxy group and contg., if desired, other substituents except  $\text{SO}_2\text{H}$ ,  $\text{COOH}$  or  $\text{OH}$  groups, and eliminating the  $\text{COOH}$  and acyl group from the 4-acylamino-diphenylamine-2'-carboxylic acids, substituted in the 3-position. Examples are given of the prep'n. of 4-acetylamino-3-methoxydiphenylamine, m. 167-8° (uncorrected), and its 2'-carboxy deriv., m. 225-6° (uncorrected). Cf. C. A. 28, 781°.

**Anthrone derivatives.** I. G. Farbenind. A.-G. (Georg Kränzlein, Arthur Wolfram and Walter Broeker, inventors). Ger. 593,417, Feb. 26, 1934 (Cl. 12g. 37). 1-Amino-10-anthrone (I) and its homologs and substitution products are prep'd. by treating 2'-amino-2-benzylbenzoic acid and its homologs and substitution products or derivs. thereof with acid-condensing agents, e. g., with  $\text{H}_2\text{SO}_4$  at 60-65%. Examples are given of the prep'n. of I, m. 172-3°, and 3-methyl-I, m. 196-7°. The products yield the corresponding aminoanthraquinones when allowed to stand in the air.

**Albumin decomposition products.** I. G. Farbenind. A.-G. Fr. 757,988, Jan. 8, 1934. Certain plants rich in albumin, or their seeds, e. g., seeds of lupine or cucurbit, are decomposed directly and without preliminary treatment by dild. mineral acids, at a high temp. and preferably under pressure. The amino acids are sep'd. in the form of their heavy metal salts.

**Alkali alcoholates.** I. G. Farbenind. A.-G. (Paul Heisel and Eduard Berghelmer, inventors). Ger. 593,385, Feb. 28, 1934 (Cl. 12o. 5.04). Alkali metal amalgams are treated with vaporized alcs. App. is described.

**Alkaline earth formates.** Rudolph Koepp & Co. Ger. 590,635, Jan. 8, 1934 (Cl. 12o. 11). CO is caused to react on  $\text{Ca}(\text{OH})_2$ , etc., at raised temps. and pressures in the presence of 10-20 parts of alkali formate to each 100 parts of  $\text{Ca}(\text{OH})_2$ .

**Alkali metal oxalates.** Rudolph Koepp & Co. Chemische Fabrik A.-G. Fr. 759,253, Jan. 31, 1934. Alkali metal oxalates are made by heating alkali formates in the presence of an alkali hydroxide, the 2 being heated from the start in intimate admixt. with H, preferably at 200-350°.

**Copper compound of indophenol.** N. S. Tikhonov. Russ. 31,524, Oct. 31, 1933. To a soln. of phenyl-1-naphthylamine-8-sulfonic acid and  $\text{CuSO}_4$ , alkalis are added, the ppt. is mixed with an alk. soln. of *p*-aminophenol and air is blown through the mixt. until indophenol is formed. The Cu compd. of the indophenol is then isolated in the usual manner.

**Potassium and sodium xanthates.** I. Ya. Frenkel. Russ. 31,438, Oct. 31, 1933. Air satd. with  $\text{CS}_2$  vapors is blown through an alc. soln. of  $\text{NaOH}$  or  $\text{KOH}$  until a thick mass is obtained. This is sep'd. from the mother liquor by one of the usual methods such as centrifuging, and the mother liquor is again used in the process.

**Acetyl chloride.** I. G. Farbenind. A.-G. Brit. 102,328, Nov. 30, 1933. See Fr. 754,986 (C. A. 28, 1361°); Brit. 402,335, Nov. 30, 1933. See Fr. 755,052 (C. A. 28, 1361°).

**Organic phosphates.** Chemische Fabrik von Heyden A.-G. Fr. 758,362, Jan. 15, 1934. See Brit. 398,659 (C. A. 28, 1362°).

**Alkyl phosphates.** Hajime Ueda and Kyōhei Murakami. Japan. 99,857, March 1, 1933. The formation of phosphates from alcs. and  $\text{POCl}_3$  is improved by passing inactive gases such as  $\text{H}_2$  or  $\text{CO}_2$  into the reacting liquid. The addn. of metals, metallic halides, acid clay, silica gel or active C also is recommended.

**Aminoalkyl chlorides and alcohols.** Boot's Pure Drug Co. Ltd., Frank L. Pyman and Hyman H. L. Levene. Brit. 402,159, Nov. 30, 1933. Aminoalkyl chlorides of formula  $\text{R}(\text{CH}_2)_n\text{Cl}$ , in which R is a dialkylamino or

piperidyl residue and *n* is 7-11, are prep'd. by treating the corresponding amino alc. with  $\text{SOCl}_2$  at low temp., preferably below 0°, in a solvent such as  $\text{CHCl}_3$ . Examples are given of the prep'n. of  $\lambda$ -diethylaminoundecyl,  $\eta$ -diethylaminoheptyl,  $\alpha$ -dibutylaminodecyl,  $\alpha$ -*N*-piperidyldecyl and  $\lambda$ -dibutylaminoundecyl chlorides. The amino alcs. are obtained by (1) interaction of the appropriate secondary amine and chloro alc. or (2) reduction with Na and alc. of the corresponding amino carboxylic acid alkyl esters, which may be prep'd. by treating the halo-substituted carboxylic acid alkyl esters with the requisite secondary amine. Thus  $\eta$ -diethylaminoheptyl alc. results from the interaction of  $\eta$ -chloroheptyl alc. with diethylamine (I) and  $\lambda$ -diethylaminoundecyl alc. is obtained by treating Et  $\alpha$ -bromoundecate with I and reducing the Et  $\alpha$ -diethylaminoundecate formed.

**Aliphatic acids.** Gilbert B. Carpenter. Can. 339,932, Mar. 13, 1934. Aliphatic acids are produced by the reaction of olefins with formic acid. Diolefins form dicarboxylic acids. Pressures of 25 900 atm. and temps. of 100-500° are preferred for the reaction, and the efficiency is increased by the use of catalysts.

**Aliphatic acids.** Gilbert B. Carpenter. Can. 339,933, Mar. 13, 1934. Aliphatic acids are prep'd. by passing steam, CO and olefins in the vapor phase over a metallic halide. Chlorides, bromides and iodides of the alk. earth metals Ca, Ba, Sr, Mg, Na, K, Cs, Rb and Li and more particularly the iodides of these elements are preferred. Halides of Sn, Fe, Co, Ni, Bi, Mn, Pb, Ti, Zn, Cd and Mo may be used, but they do not generally have as long a life as the halides of the alkali and alk. earth metals. Pressure in excess of atm., say from 25-900 atm. is of advantage. The desired reaction temp. can be obtained at from 200-500°. Can. 339,935 specifies the use as catalyst of one or more acidic oxides of the groups III, IV, V and VI of the periodic table and particularly the oxides of Mo, P, As, W, U, Cr, V, Ti, Zr and B. Can. 339,937 specifies as catalyst acid Zn, Ca, Mg, Na, K, Cu, Ce, Th and other salts of the acids of P, As, W, Mo, U, Cr, V, B, Si and Zr.

**Formic acid.** Gilbert B. Carpenter (to E. I. du Pont de Nemours & Co.). U. S. 1,949,825, March 6. A gaseous mixt. of CO and steam is passed over a catalyst such as a silicotungstic, silicomolybdic or phosphomolybdic acid catalyst (suitably at a temp. of about 325°).

**Acetic acid from formaldehyde.** Stanley J. Green and Roy Sponson (to Celanese Corp. of America). U. S. 1,950,027, March 6.  $\text{CH}_2\text{O}$  vapor is subjected to heat (suitably at a temp. of about 300-400°) under a pressure of at least 100 atm. Cf. C. A. 28, 1055°.

**Separating mixtures of water, acetic acid and acetic anhydride.** Ernst Berl. Ger. 590,856, Jan. 11, 1924 (Cl. 12o. 12)°. Mixts. of water,  $\text{AcOH}$  and  $\text{Ac}_2\text{O}$  are shaken with satd. solns. of salts such as  $\text{NaCl}$ ,  $\text{Na}_2\text{SO}_4$ ,  $\text{NH}_4\text{NO}_3$ , etc., which do not form mol. compds. with  $\text{AcOH}$ , and with aromatic hydroaromatic or aliphatic hydrocarbons, pure or halogenated. In an example, a mixt. of water,  $\text{AcOH}$  and  $\text{Ac}_2\text{O}$  is shaken with a satd. soln. of  $\text{NaCl}$  and  $\text{C}_6\text{H}_6$ . On allowing the layers to sep., the aq. salt layer is run off. The  $\text{C}_6\text{H}_6$  layer contains practically all the  $\text{Ac}_2\text{O}$  and some of the  $\text{AcOH}$ . The aq. layer contains all the water and the rest of the  $\text{AcOH}$ .

**Citric acid.** Arenella (Soc. per l'ind. dell'acido citrico ed affini). Fr. 759,259, Jan. 31, 1934. Juices contg. citric acid are treated to ppt. or remove colloids, then concd. to about 200 g. of citric acid per l., a sol. Ca salt is added to increase the concn. of Ca ions and  $\text{CaO}$  or  $\text{CaCO}_3$  is added to ppt. Ca citrate, but not in amt. to reach the  $p_{\text{H}}$  corresponding to the isoelectric pt. of the colloids still present. The citrate is decomposed with  $\text{H}_2\text{SO}_4$  to obtain pure citric acid.

**Oxalic acid.** V. A. Ioffe and A. V. Vodzinskaya. Russ. 31,436, Oct. 31, 1933.  $\text{Na}_2\text{C}_2\text{O}_4$  is treated with  $\text{H}_2\text{SO}_4$  to ppt.  $\text{NaHC}_2\text{O}_4$ . This is filtered off and further treated with  $\text{H}_2\text{SO}_4$  to form  $\text{H}_2\text{C}_2\text{O}_4$ .

**Benzoic acid and benzoates.** Bozel-Malétra (Société industrielle de produits chimiques). Brit. 402,529, Dec. 7, 1933. See Fr. 753,918 (C. A. 28, 1056°).

**Hydroxy dicarboxylic acids.** Standard Brands Inc. Fr. 759,225, Jan. 31, 1934. These acids or their salts are prepd. by oxidizing a dicarboxylic acid or its salt having an ethylenic structure, in the presence of a catalyst, in a liquid medium in which the proportion of acid to liquid medium is at the start greater than 1 to 10. A concd. soln. of the acid to be produced may be used as medium.

**Hydroxy-3,5-diiodo-2-pyridinecarboxylic acid.** Max Dohrn and Paul Diedrich (to Schering-Kahlbaum A.-G.). U. S. 1,950,543, March 13, 4-, or 6-Hydroxy-3,5-diiodo-2-pyridinecarboxylic acids are produced by the action of I in alk. soln. on 4- or 6-hydroxy-mono- or -polypyrindinecarboxylic acids which contain a carboxyl group in *m*-position to the hydroxy group. The 6-hydroxy deriv. discolors at 240° and seps. I at 272° and the 4-hydroxy deriv. decomposes at 250°. Their alkali metal salts dissolve readily in cold water. Various examples with details of procedure are given.

**2-Furaldehyde.** D. I. Miris and L. M. Sergel. Russ. 31,433, Oct. 31, 1933. 2-Furaldehyde is prepd. by treating in an autoclave in the presence of aq. solns. of H<sub>2</sub>SO<sub>4</sub> and NaCl or NaCl alone, spent tanning solns. alone or together with tanbark.

**2-Furaldehyde.** A. E. Arbuzov and B. P. Lugovkin. Russ. 31,434, Oct. 31, 1933. Pentosan-contg. substances are heated under pressure in a dild. phosphoric acid soln.

**Phenol from monochlorobenzene.** Russell L. Jenkins and James F. Norris (to Swann Research, Inc.). U. S. 1,950,359, March 6. In a process involving reaction of PhCl with steam, the HCl produced is neutralized with lime, and the mixt. is distd. until substantially all the PhCl is removed, CaCl<sub>2</sub> is added to produce a concn. of CaCl<sub>2</sub> equal to about 40% of the aq. layer, the aq. CaCl<sub>2</sub> layer is sepd. from the phenol layer, and the phenol layer is distd. to obtain PhOH. Various details of app. arrangement are described.

**Bornyl oxalates; borneols.** Léon Darrasse, Etienne Darrasse, Lucien Dupont and Fgon Elod. Brit. 402,286 Nov. 30, 1933; Fr. 751,276, Aug. 30, 1933. Bornyl oxalates are prepd. by treating pinene with anhyd. (COOH)<sub>2</sub> under the following conditions; (a) in the absence both of a solvent and of a condensing agent, (b) with continuous agitation at 110-25°, and (c) with elimination of the H<sub>2</sub>O formed, e. g., by Na<sub>2</sub>SO<sub>4</sub>, or in an O-free atm. or under reduced pressure. Borneols may be obtained by sapon. of the products. The O-free atm. may be obtained by passing N, CO<sub>2</sub> or C<sub>2</sub>H<sub>6</sub> through the

mixt. Borneol is obtained from pinene and isoborneol from essence of turpentine (in examples).

**Aminopyridylazoquinolines.** C. I. Boehringer & Soehne, G. m. b. H. Brit. 402,184, Nov. 30, 1933. 2',6'-Diaminopyridyl-8-azoquinolines are manufd. by diazotizing 8-aminoquinoline (I) or its substitution products and coupling with 2,6-diaminopyridine, both steps taking place in the presence of more than 1 equiv. of excess acid. Examples describe the use as diazo components of I and 6-methoxy-, 6-ethoxy- and 6-chloro-8-quinolines, in each case in presence of excess HCl. The free bases are liberated by NH<sub>3</sub> from the hydrochlorides obtained.

**Anthrapyrimidines.** I. G. Farbenind. A.-G. (Max A. Kunz and Karl Köhler, inventors). Ger. 590,747, Jan. 12, 1934 (Cl. 23b. 3.15); Fr. 759,263, Jan. 31, 1934.  $\alpha$ -Nitroanthraquinone or its substitution products are condensed with HCONH<sub>2</sub>. Thus, 1-amino-4-nitroanthraquinone in PhOH is heated with HCONH<sub>2</sub> in the presence of NH<sub>4</sub>VO<sub>3</sub> to give 4-amino-1,9-anthrapyrimidine, m. 278-80°. The prepn. of the following is also described: 1,9,5,10-anthradipyrimidine, m. 345°, 5-benzoylamino-1,9-anthrapyrimidine, and 8-amino-1,9-anthrapyrimidine, m. 276°.

**Terpinol hydrate.** P. P. Kolosov and F. D. Zeltzer. Russ. 31,439, Oct. 31, 1933. A continuous stream of turpentine is passed upward through a layer of wood shavings soaked in H<sub>2</sub>SO<sub>4</sub>.

**3-Hydroxyselenonaphthene.** Wilhelm Schneider (to Agfa Anso Corp.). U. S. 1,949,815, March 6. Reaction is effected between KCN and Se and a diazotized ester of an anthranilic acid such as diazotized methyl anthranilic ester. The reaction product is saponified, the saponified product is treated with monochloroacetic acid and the product thus obtained is transformed into the 3-hydroxyselenonaphthene by boiling with Ac<sub>2</sub>O and subsequent saponification.

***o*-(Carbomethoxymethoxy)- or (carbethoxymethoxy)-benzamide.** E. A. Tzofin and K. Chkhikvadze. Russ. 31,432, Oct. 31, 1933. Salicylamide is condensed with ClCH<sub>2</sub>CO<sub>2</sub>Me or ClCH<sub>2</sub>CO<sub>2</sub>Et in the presence of Na methylate or ethylate.

***N*-Allyl-*o*-(carboxymethoxy)benzamide.** E. A. Tzofin and K. Chkhikvadze. Russ. 31,437, Oct. 31, 1933. *o*-H<sub>2</sub>NOCC<sub>6</sub>H<sub>4</sub>COCH<sub>2</sub>CO<sub>2</sub>Et is treated with Na in neutral *o*-solvents such as C<sub>6</sub>H<sub>6</sub> or its homologs. The Na deriv. thus produced is treated with allyl bromide and the product saponified in the cold.

## II BIOLOGICAL CHEMISTRY

**Diffusion of alcohol in the organism and bounu water.** Maurice Nicloux. *Compt. rend.* 198, 983-5 (1934); cf. C. A. 27, 2969. Philip D. Adams

**Specificity of hydratases. Action of peas and yeast on crotonic acid.** K. P. Jacobsohn and P. Belo Pereira. *Compt. rend. soc. biol.* 108, 208-10 (1931). Crotonic acid is unattacked by peas or yeast at *p*<sub>H</sub> 7.0; hence furmarase is considered sp. B. C. A.

**Action of several alkaloids on invertase.** G. Mezzadrol and A. Amati. *Atti accad. Lincei* 18, 226-31 (1933); cf. C. A. 28, 2388. The enzymic action of invertase is retarded by the presence of larger amts. of alkaloids. Strychnine nitrate at 0.05, 0.1, 0.2 and 0.3% reduces the activity of invertase 70.13, 79.23, 85.07 and 87.02%, resp. In the same concns. caffeine reduces the activity 2.72, 4.76, 4.76 and 4.76%, and quinine sulfate 3.90, 12.34, 20.12 and 20.13%, resp. A. W. Contieri

**The dehydrogenation of the higher fatty acids contained in the liver.** II. F. P. Mazza and C. Zummo. *Atti accad. Lincei* 18, 461-3 (1933).  $\Delta^2$ - $\beta$ -Oleic acid is not dehydrogenated in the presence of liver exts. This is in ac-

cord with the theory of  $\beta$ -oxidation, as the 1st step in the oxidation of a satd. fatty acid is the formation of an  $\alpha$ - $\beta$  double-bond compd. *Es. coli* has been shown to behave in a similar manner (C. A. 28, 1731) as it oxidizes stearic acid, but not the unsatd. oleic acid. When, however, the liver ext. is buffered at *p*<sub>H</sub> 7.5, with phosphate, as described (C. A. 27, 5087) both stearic and oleic acids absorb 82-85% more O<sub>2</sub>, showing that there is present in the liver, a complex system which oxidizes fatty acids, of which dehydrogenase, described in the above paper, is one component. A. W. Contieri

**Preparation of the dipeptide-phosphoric acid from casein.** Comment on the paper of P. A. Levene and D. W. Hill. Gerhard Schmidt. *Z. physiol. Chem.* 223, 86-8 (1934); cf. C. A. 27, 5354. Further details are given of the prepn. of the dipeptide-phosphoric acid, contg. serine, glutamic acid and H<sub>2</sub>PO<sub>4</sub>, by tryptic digestion of casein (*Arch. sci. biol.* (Italy) 19, 313 (1933)). The same product has more recently been obtained by Levene and Hill (C. A. 27, 5354) by essentially the same procedure except that the digestion products were further hydrolyzed by HCl. The fact that the substance can be obtained by enzyme hydrolysis alone characterizes it as a biol. degradation product of casein. The Ba salt has the formula (C<sub>12</sub>H<sub>10</sub>

O<sub>2</sub>N<sub>2</sub>P)Ba. Ba salts with a lower P:N ratio yielded on hydrolysis a leucine in addn. to the serine and glutamic acid. The free acid gives a strong red biuret-reaction.

A. W. Dox

**The phosphatase balance in the tumorous organism.** Franz Köhler. *Z. physiol. Chem.* 223, 98 104 (1934); cf. *C. A.* 27, 4820.—The presence of cancer tissue exerts a profound influence on the activation capacity of phosphatase by MgCl<sub>2</sub>. The regular decrease in phosphatase activity of the aging tumor tissue and that of the muscle run parallel. Muscle phosphatase of the diseased organism falls below that of normal muscle. The kidney, which in the cancerous organism shows increased phosphatase activity, is especially rich in phosphatase in cancer-immune rats. Muscle and kidney phosphatase of normal rats is fully activated. In cancerous rats, on the other hand, the glycerophosphatase is only about 30% active while the tumor itself has much higher activity. Cancerous rats also show a large increase in phosphatase in the blood. It appears that the activator is transferred from the kidney to the blood.

A. W. Dox

**The occurrence of flavins in animal tissues.** Hans v. Euler and Erich Adler. *Z. physiol. Chem.* 223, 105 12 (1934).—Animal organs richest in vitamin B<sub>2</sub> have also the highest flavin content. Liver and kidney contain 10–20  $\gamma$  per g. of fresh wt., suprarenal and corpus luteum 5–10  $\gamma$ , various other organs still less, and blood and serum only 0.025  $\gamma$ . The method of detn. consisted in measuring the intensity of fluorescence of aq. solns. prep'd. from MeAc exts., with pure lactoflavin as the standard of comparison. The fluorescence attains a max. at pH 7 but disappears on addn. of mineral acid or alkali or on reduction by Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> to the leuco form. The retinas of fish eyes are rich in flavin; suggesting a physiol. function in light sensitization. The flavin extd. from corpus luteum of cows is accompanied by a substance with blue fluorescence, probably a secondary product formed during the course of extn. This is stable to acid and alkali, also to oxidation and reduction.

A. W. Dox

**Enzymic histochemistry. VII.** K. Linderström-Lang and Heinz Holter. a. **Peptidase in the eggs of *Psammochinus miliaris*.** Tore Philipson. *Z. physiol. Chem.* 223, 119–25 (1934); cf. *C. A.* 28, 2025<sup>a</sup>. b. **Note on the distribution of the mitochondria of the *Psammochinus* egg on centrifugation.** K. Linderström-Lang and Heinz Holter. *Ibid.* 125–6.—Centrifugation of unfertilized *Psammochinus* eggs at 8000–13000 revolutions per min. causes a stratification into 3 layers; the upper consisting of the yolk and having the greatest peptidase activity toward  $\alpha$ -nitylglycine. The egg fragments collect at the interface between the 2 upper layers. The lower layer of these fragments is richer in peptidase than the upper. A. W. D.

**The activation of "papain" by vitamin C-iron and its inhibition by vitamin C (ascorbic acid).** Ernst Maschmann and Erica Helmert. *Z. physiol. Chem.* 223, 127–35 (1934).—Hydrolysis of gelatin by papain is inhibited by vitamin C but activated by vitamin C plus Fe. Other metals such as Mn and Cu cannot replace Fe in this activation. Minute quantities of Cu completely suppress the activation by vitamin C + Fe. Different brands of commercial papain are not hydrolyzed to the same extent by the same concn. of papain, but after activation of the enzyme by vitamin C the extent of hydrolysis is quite uniform. Activation may occur either by overcoming the influence of inhibitory substances or by making available new points of attack in the substrate, e. g., by reduction of SS to SH. Ascorbic acid completely counteracts the inhibition of papain by vitamin C. Fe not only overcomes the inhibition by vitamin C, but activates the hydrolysis beyond that of the non-activated enzyme. Vitamin C in combination with Fe thus constitutes a special type of activator. Hydrolysis in the presence of this activator is retarded in the initial stages but attains its max. velocity after several hrs.

A. W. Dox

**Reducing substances of living tissues.** R. Bieri and A. Rosenbohm. *Z. physiol. Chem.* 223, 136–43 (1934); cf. *C. A.* 27, 5346.—On the basis of I titration values and feeding expts. evidence is believed to have been ob-

tained that exts. of various animal organs contain ascorbic acid, vitamin B<sub>2</sub> and another reducing substance, in addn. to the glutathione previously demonstrated. In living tissue glutathione occurs only in its reduced form.

A. W. Dox

**The problem of the reaction of protoplasm.** (New experimental studies on amebas.) Josef Spék and Robert Chambers. *Protoplasma* 20, 376–406 (1933).—The reactions of *Amoeba dubia* when injected with the whole series of Clark and Lubs pH indicators from bromophenol blue to thymol blue were studied. These indicators were also used in conjunction with NaOH, HCl, lactic acid and butyric acid. Various salts were also injected along with the dyes, such as CaCl<sub>2</sub>, MgCl<sub>2</sub>, MnCl<sub>2</sub>, ZnSO<sub>4</sub> and Co(NO<sub>3</sub>)<sub>2</sub>, and their effects noted. Twelve references. F. L. D.

**The limiting cell layer.** W. Kopaczewski. *Protoplasma* 20, 407–39 (1933).—A full discussion, including structure of cells, their chem. compn. and phys. characteristics, followed by K.'s conclusions. Two hundred and five references. F. L. Dunlap

**The influence of preservatives on the action of enzymes.** Th. Sabatichka. *Z. Untersuch. Lebensm.* 67, 203–4 (1934); cf. Kluge, *C. A.* 28, 1723<sup>1</sup>. Polemical.

F. L. Dunlap

**Influence of preservatives on animals suffering from avitaminosis.** H. Cremer. *Z. Untersuch. Lebensm.* 67, 205 (1934); cf. Kluge, *C. A.* 28, 1723<sup>1</sup>. Polemical.

F. L. Dunlap

**Influence of preservatives on the action of enzymes and on animals suffering from avitaminosis.** K. Kluge. *Z. Untersuch. Lebensm.* 67, 205–6 (1934).—Polemical with Sabatichka and with Cremer (cf. 2 preceding abstracts).

F. L. Dunlap

**The formation of urea from carbamino acids, hydantoins and albumins by the influence of enzymes (reductases) in neutral solution.** Mitsunori Wada. *Proc. Imp. Acad. (Tokyo)* 10, 17–20 (1934). An enzyme is present in milk, blood and pancreas or liver ext. which splits off urea from various carbamino acids, hydantoins and albumin. The enzyme is thermolabile and its character is not clear, although it apparently is a reductase, since urea formation and reducing power run parallel.

R. C. Elderfield

**Function of pH in the precipitation of blood-serum proteins and lipoids by neutral salts.** G. Sandoz, A. E. Bonnelor and P. Goret. *Bull. soc. chim. biol.* 15, 1472–82 (1933); cf. *C. A.* 28, 1065<sup>a</sup>. When serum proteins are ppt'd. by Macheboeuf's method by (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> at pH 3.0–3.8 the pptn. of both proteins and lipoids is complete. The proteins are not denatured. If a soln. of the proteins contg. much (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> is gradually acidified with H<sub>2</sub>SO<sub>4</sub> the ppt. attains a first max. at pH 6.55, then largely redissolves as more acid is added and again pptn., quantitatively, at pH 3.7.

L. E. Gilson

**Effect of temperature on the activity of amylase.** S. Frautmann and L. Ambuhl. *Bull. soc. chim. biol.* 16, 35–51 (1934).—See *C. A.* 28, 787<sup>1</sup>, 1724<sup>a</sup>. L. E. G.

**Hypoglucemic action of duodenal extracts.** Jean La Barre and Jules Ledrut. *Compt. rend. soc. biol.* 115, 750–2 (1934); cf. *C. A.* 28, 210<sup>1</sup>. Hydrolysis of secretin by pepsin or activated pancreatin gave a product which had no hypopietic action or stimulating effect on intestinal secretion, but which after oral or intravenous administration caused a marked decrease in blood sugar in normal or pancreatectomized dogs.

L. E. Gilson

**The calcium and sodium of [serum] proteins.** R. Cernatesco and I. Ornstein. *Compt. rend. soc. biol.* 115, 786–8 (1934).—The proteins ppt'd. from blood serum by EtOH contain 82% of the total Ca of the serum and less than 1% of the Na.

L. E. Gilson

**Heat-inactivation of crystalline pepsin; the critical increment of the process.** Wilfrid J. Loughlin. *Biochem. J.* 27, 1779–88 (1933).—The process of heat-inactivation follows the theoretical unimol. course. At a given temp. the rate of heat-inactivation varies with the pH, being min. at 3–4.5 and increasing rapidly in either direction beyond this range. With regard to the effect of temp., the critical increment of the process is of the order of 80,000

calories. The heat-inactivation of enzymes and the heat-denaturation of proteins are analogous except for the location of the min. speed (for which no explanation can be offered at present).

Benjamin Harrow

The physicochemical behavior of lecithin. III. The electrophoretic behavior of lecithin-cholesterol dispersions. Christopher W. Price. *Biochem. J.* 27, 1789-92(1933); cf. *C. A.* 27, 4404.—The mobility- $pH$  relationship of dispersions of lecithin + cholesterol in equimol. proportions has been detd. There is no change in the mobility at various  $pH$  values or in the position of the isoelec. point produced by the addn. of cholesterol to lecithin. The bonds or groups responsible for the formation of the lecithin-cholesterol complex cannot be the amphoteric groups of the lecithin or those on which ion adsorption takes place.

Benjamin Harrow

Velocity of solubility of various samples of dental enamel. Frank F. Kanthak. *J. Dental Research* 14, 21-8(1934).—Powd. dried enamel from teeth of individuals of various ages (6-67 yrs.) had the av. Ca:P ratio 2.38, and a quite uniform content of these elements. Both this ratio and the rate of soln. of the enamel in an acetate buffer of  $pH$  4.60 bore no apparent relation to either age or the state of the teeth.

Joseph S. Hephurn

The coagulation of muscle plasma. II. The solubility of myosin. E. C. Smith. *Proc. Roy. Soc. (London)* B114, 494-505(1934); cf. *C. A.* 24, 3044.—The coagulation of muscle plasma is due to the pptn. of myosin from a sol which is not originally present in muscle, but is formed by addn. of salt to the muscle before expression of the plasma. The soly. of myosin depends upon the concn. of salts,  $pH$ , and the total protein concn. In the muscle of a living rabbit, not more than 10% of the total myosin is present as a sol.

Joseph S. Hephurn

Phase changes in enzyme systems: azotase activity in relation to  $pH$ . Dean Burk and Haus Lineweaver. *J. Phys. Chem.* 38, 35-46(1934).—Azotase activity in *Azotobacter* varies abruptly with  $pH$ . A characteristic zero limit at 5.97 is approached reversibly and perpendicularly. Phase-rule analysis implicates a 2-component heterogeneous system with 3 phases in equilibrium at the crit.  $pH$ —aq., active non-aq. and inactive non-aq. The active (basic) component exists above the crit.  $pH$ ; the inactive (acidic) one below. Slight phase non-homogeneity may occur between  $pH$  5.97 and 6.37. Interpretation of the abrupt  $pH$  function, alternative to phase change, such as normal acid-base dissociation, large mol.-wt. change, multiple basicity and minimal charge or p. d. have been discarded as inconsistent with one or more characteristics of the reaction. Phase-rule applications to microheterogeneous systems, surfaces and problems of general enzyme reaction velocity and stability are indicated briefly.

L. K.

Cytochrome and the supposed direct spectroscopic observation of oxidase. D. Keilin. *Nature* 133, 290 1 (1934); cf. *C. A.* 27, 5342.—The absorption bands of cytochrome from microorganisms may be shifted in either direction from the normal. Bands are shown for baker's yeast, brewer's yeasts, *B. megatherium*, *Azotobacter*, *Es. coli* and *B. proteus*, *Es. coli* and CO, *Es. coli* with O and KCN, and oxidized *Es. coli*. All the absorption bands of hematin compds. seen by the direct spectroscopic examn. of cells of different organisms belong either to free hematin or to the different components; not to the oxidase or the O-transporting enzyme (of Warburg).

W. D. L.

Phosphatases of the bovine kidney. IV. V. A study of other enzymes in the enzyme powder of the kidney. Masamichi Morii. *Arb. drilt. Abt. Anat. Inst. Kaiser. Univ. Kyoto Ser. C*, No. 4, 1-9, 16-22(1933); cf. *C. A.* 27, 1647.—By pptn. with MeOH and dialysis M. obtained an enzyme powder from bovine kidney ext. which hydrolyzed carbohydrate  $H_2PO_4$  and Et pyrophosphoric esters, but which had no effect on the glycerophosphoric acid ester. He infers that the agent of bovine kidney ext. which hydrolyzes glycerophosphoric acid differs from the one which hydrolyzes ortho- and pyrophosphoric esters. Methods used for the sepn. of the enzymes by pptn. with  $CuCl_2$ ,  $FeCl_3$  and  $AlCl_3$  are described. The activity of the kidney diastase is expressed by the formula  $D_{25}^{37} =$

5, and that of lipase by  $L_{25}^{37} = 0.4$  cc. 0.1 N NaOH. No evidence was found of the presence in the kidney of disaccharidase, lecithinase, dipeptidase or protease.

B. S. Levine

The perfusion of the kidney with phosphoric acid ester. Masamichi Morii, Kuniaki Shibuya and Yutaka Iwaki. *Arb. drilt. Abt. Anat. Inst. Kaiser. Univ. Kyoto Ser. C*, No. 4, 52-3(1933); cf. *C. A.* 27, 1647.—Perfusion expts. were performed on the isolated kidney of the rabbit. The  $H_2PO_4$  ester is recovered from the perfusion fluid in its original state.

B. S. Levine

Hormones, vitamins, cell growth and carcinoma. Fritz Ludwig and Julius v. Ries. *Schweiz. med. Wochschr.* 64, 141-6(1934).—The influence on the growth of rat carcinoma and wheat seedlings of various hormone and vitamin preps. with and without light is described.

Milton Levy

The organic acids of urine. W. Mecke. *Z. ges. expl. Med.* 92, 688-91(1934).—The dissociation const. of creatinine is  $5.9 \times 10^{-10}$  at 21°. The org. acids of urine fall into 2 groups. One group has constants between  $10^{-3}$  and  $10^{-4}$  and the other between  $3 \times 10^{-4}$  and  $10^{-5}$ . On alk. diets the acids of the second group increase.

M. L.

The heat liberated by the beating heart. VIII. A new method of analyzing waves of heat production, also a study of variability of heat production, associated directly with the contractile act. C. D. Snyder. *Am. J. Physiol.* 107, 551-67(1934); cf. *C. A.* 22, 1786.—Heat production in heart muscle, both in the absence and presence of O, may vary considerably.

J. F. Lyman

Redistributions of water following transfusions and infusions. E. F. Adolph, M. J. Gerbasi and M. J. Lepore. *Am. J. Physiol.* 107, 647-66(1934).—Addn. of fluid to the blood caused concn. whenever the infusion liquid was more dil. than blood with respect to colloids, even though the crystalloids were highly concd. When the infusion fluid was blood itself a similar concn. occurred. When the fluid exerted colloid osmotic pressure only slightly greater than that of the plasma, as 6% gelatin of ucinia, then water was attracted into the blood stream and kept there for at least 1 hr., the limit of observation.

Changes which solutions of monosaccharides undergo when heated in the autoclave. V. Cianci and L. Pannam. *Boll. soc. ital. biol. sper.* 8, 1684-7(1933).—In a previous communication (cf. *C. A.* 27, 2170) the results obtained by heating glucose solns. in the autoclave were reported. The same procedure has been used in studying solns. of fructose and galactose. In general, under the same exptl. conditions, the 3 sugars behave alike; the changes are slightly more marked in fructose than in glucose, and the least in galactose solns. In unbuffered solns. the caramelization of fructose is more intense. Changes which solutions of disaccharides undergo when heated in the auto

clave. *Ibid.* 1687-91.—Sucrose, lactose and maltose solns. were subjected to the same exptl. conditions. Sucrose was least affected while lactose and maltose solns. showed more marked changes than sucrose, but less than the monosaccharide solns. However, the course of the reactions involved is the same for all sugars: solns. of sugars heated to 134° for 30 min. in the autoclave become acid and this acidity increases by increasing (1) temp. and time until a point of equil. is reached; (2) the initial  $p_H$  of the soln.; (3) the concn. of the sugar; (4) the concn. of the buffer. The last is the most important factor since it displaces the equil. of the reaction, thus permitting the formation of caramel and a production of acid proportional to the buffering power of the soln. Peter Masucci

The influence of the buffer veronal-acetate on the changes which solutions of glucose undergo in the autoclave. V. Cianci. *Boll. soc. ital. biol. sper.* 8, 1691-4 (1933).—The results obtained with a phosphate buffer were compared with those with the Michaelis veronal-acetate buffer. The changes produced in heating the glucose soln. were of similar nature if judged from the intensity of color and the amt. of titratable acid produced. These 2 factors are related to the concn. of buffer used regardless of whether it is phosphate or the veronal-acetate buffer. The quant. difference noted is ascribed to the difference in the concn. and disocn. of the substances functioning as buffers in the 2 solns. The more intensive action of the phosphate buffer with respect to other buffers is ascribed to the marked buffer power of the phosphates which probably liberate a larger no. of  $-OH$  ions. The amt. of acid produced is related to the quantity of  $OH$  ions free or capable of becoming free. The velocity of reaction is, therefore, dependent on the concn. of  $OH$  ions or on the  $p_H$ . Peter Masucci

The reaction of articular tissues to various degrees of acidity and alkalinity. Silvio Brambilla. *Sperimentale* 87, 417-34 (1933).—The joint tissue has a high buffering capacity. Only solns. as far from neutral as 0.1 N HCl or NaOH cause inflammation. A. B. Meyer

Changes in tissues caused by papain digestion. M. Calcinai. *Sperimentale* 87, 437-49 (1933).—The resistance of some tissue elements and the changes produced in others by papain activated with cysteine have been investigated. A. B. Meyer

Animal fat pigments. L. Zechmeister and P. Trazou. *Ber.* 67B, 154-5 (1931). From 900 g. of fatty tissue from a cow, 10 mg. of a pigment was obtained by extn. with alk. KOH and subsequent sapon., then extn. with ether. The lipochrome by spectral studies appeared to be a mixt. of  $\alpha$ - and  $\beta$ -carotene. James C. Munch

Reform of the nomenclature of biological chemistry. Anon. *Nomenclatura chim.* 4, 62-5 (1934).—A summary of decisions at the conferences of the International Union of Chemistry, 1923-30. Austin M. Patterson

The electromotive force in biological systems. I. The effect of homologous carbamates on the e. m. f. of frog skin. Edgar J. Bocil and A. B. Taylor. *J. Cellular Comp. Physiol.* 3, 355-83 (1933).—A technic is described by means of which practically continuous detn. of the individual e. m. fs. of a no. of frog skins can be made. The e. m. f. depressions of frog skin are reliable indications of the relative effectiveness of homologous urethans and are in accordance with Traube's rule. The correlation of surface activities and e. m. f. effects suggests that the latter are due to adsorption of the urethans on cellular interfaces. II. The surface activity of homologous carbamate solutions. A. B. Taylor and Edgar J. Bocil. *Ibid.* 385-95. —The depressions of the surface tension of water by homologous carbamates are recorded and are found to be in accordance with Traube's rule. T. H. Rider

Photodynamic action. IV. Photostimulation of skeletal muscle. C. R. Spelman and H. F. Blum. *J. Cellular Comp. Physiol.* 3, 397-404 (1933); cf. *C. A.* 26, 2523. —The production of contracture in frog skeletal muscle by ultra-violet light is independent of the presence of mol.  $O_2$ , whereas the response to photodynamic action (response to visible light in the presence of a photoactive dye)

occurs only in the presence of mol.  $O_2$ . The two actions are believed to involve different mechanisms. T. H. R.

The combination of carbon monoxide with hemocyanin. Raymond W. Root. *J. Biol. Chem.* 104, 239-44 (1934).—The hemocyanin of *Limulus* serum combines with CO to form a compd., but the affinity of the hemocyanin for CO is only about 5% of that for  $O_2$ . One mol. of  $O_2$  or CO is found for every 2 atoms of Cu present in the hemocyanin.  $O_2$  disocn. curves for the serum in the presence and absence of CO are given. K. V. Thimann

The chemical nature of rennin. Henry Tauber and Israel S. Kleiner. *J. Biol. Chem.* 104, 259-66 (1934).—A highly active prepn. of rennin was completely inactivated by dil. pepsin or trypsin in about 10 hrs. at 40°, but unaffected by erepsin. Attempts to confirm the results of Dyckerhoff and Tewes (*C. A.* 27, 2165) by suspending cryst. edestin in rennin solns. were unsuccessful, the edestin never taking on more than half the activity of the original rennin prepn. Rennin is a true protein and is not merely adsorbed on a protein carrier. It is also distinct from pepsin. K. V. Thimann

Studies on trypsin. I. The chemical nature of trypsin. Israel S. Kleiner and Henry Tauber. *J. Biol. Chem.* 104, 267-70 (1934). By autolyzing pig pancreas for 18 months with 33% alc., dialyzing and pptg. 4 times with  $MgCO_3$ , a trypsin prepn. was obtained free from protease. Its activity was about the same as that of Northrup and Kunitz' cryst. trypsin (*C. A.* 26, 5584) and it still possessed some milk-clotting power. Conclusions: Trypsin is not essentially a protein, and milk-clotting power is a property of trypsin. II. The effect of trypsin on casein. Henry Tauber and Israel S. Kleiner. *Ibid.* 271-4. —Milk was not clotted by concd. trypsin solns. but only by solns. of 0.1% concn. or less. After exposure for 10 min. to solns. too concd. to clot, the milk could not be clotted even by active rennin preps. However, this destructive action of trypsin could be prevented by bringing the  $p_H$  to the acid side to depress the hydrolytic action. With pepsin, trypsin and rennin the velocity of milk coagulation increases with the H-ion concn. K. V. T.

Glyoxalase. I. The applicability of the manometric method to the study of glyoxalase. Muriel E. Platt and E. F. Schroeder. *J. Biol. Chem.* 104, 281-97 (1933); cf. Lohmann, *C. A.* 26, 742; 27, 317, 4260; Grišavičius, *C. A.* 26, 1307. —The glyoxalase of acetone-yeast may be detd. manometrically through the  $CO_2$  set free from  $CaCO_3$  by the lactic acid produced. The correction for gas evolved by side reactions is small, and the results are reproducible to  $\pm 2\%$ . At 25° with low concns. of glutathione (GSH) and  $AcCHO$  the rate of reaction is independent of the concn. of substrate and closely proportional to the concn. of enzyme. With increasing GSH concns., the rate increases to a max., then slightly decreases. Further, in the higher GSH concns., the rate is no longer independent of the  $AcCHO$ , but becomes partly proportional to it. Mixts. of  $AcCHO$  with GSH rapidly lose their SH groups, indicating that the 2 substances combine to form a complex; this complex is believed to be the substrate for glyoxalase. However, even with 68 moles  $AcCHO$  to 1 of GSH, combination of the GSH is only 87% complete. When the enzyme has been poisoned with iodoacetate, it can be reactivated by washing the yeast and adding GSH; hence iodoacetate does not destroy the enzyme but exerts its action on the GSH. K. V. T.

Some analyses of azoproteins: casein, gelatin and zein coupled with arsanilic acid. Wm. C. Boyd and Sanford B. Hooker. *J. Biol. Chem.* 104, 329-37 (1934). —The view of Pauly (*C. A.* 9, 2905) that diazonium compds. couple only with the histidine and tyrosine in the protein mol. was tested by coupling casein, gelatin and zein with arsanilic acid and detg. the As:N ratio in the resulting azoprotein. In each product the As:N ratio was greater than that calcd. from the content of these 2 amino acids in the protein, and on subsequently treating again with diazonium compd. coupling continued and the ratio further increased. The amt. of arsanilic acid or of *p*-arsonic acid-azonnaphthylamine which could be adsorbed on the pure protein or the azoprotein was too small to account for the

increased ratio by adsorption of impurities. No evidence could be obtained, however, that diazotized anilic acid couples with any amino acid other than histidine and tyrosine, although 15 pure amino acids were tried. The evidence is thus against Pauly's view, although no explanation is available. K. V. Thimann

**The basic amino acids of keratins.** The basic amino acid content of human finger nails and cattle horn. Richard J. Block. *J. Biol. Chem.* 104, 339-41 (1934).—The finger nails contained, resp., 0.49, 2.42 and 9.3%, and the cattle horn (outer layers) 0.64, 2.76 and 9.8% of histidine and lysine and arginine. The ratios histidine:lysine:arginine are thus 1:5:15 and 1:5:13, agreeing with those previously found for other keratins by Block and Vickery (*C. A.* 25, 5003), but not with those found by Abderhalden and Heyns (*C. A.* 26, 3525, 3527). The view that this ratio is typical of keratins as a class is thus supported. K. V. Thimann

**The basic amino acids of serum proteins. II. The effect of heating to 58°** Richard J. Block. *J. Biol. Chem.* 104, 343-6 (1934); cf. *C. A.* 28, 1064<sup>4</sup>.—After heating cattle serum to 58° for 1-3 hrs. there was no significant decrease in albumin and no increase in globulin. The amts. of basic amino acids in the 2 proteins were also the same whether heated or unheated, the histidine, arginine and lysine constituting 2.0, 5.0 and 9.5% of the albumin and 0.8, 5.0 and 6.3% of the globulin, resp. The albumin is thus richer in lysine. **III. A chemical relationship between serum proteins of various origins.** Richard J. Block, Daniel C. Darrow and M. Katherine Cary. *Ibid.* 347-50. The total proteins of human blood serum—normal and from cases of nephrosis—of dog and cow serum, and of human urine, were analyzed for their basic amino acids and for the albumin:globulin ratio. Though the latter varied considerably, the amts. of basic amino acids were very const., the molar arginine:lysine ratio being 10.17 or 10.18 in every case. Since serum albumin has a higher lysine content than the globulin (cf. above abstr.), it follows that the sepn. into albumin and globulin is an artificial process, depending on the reagent used. The constancy of compn. of the total protein justifies consideration of the serum proteins as a chemically related group like the keratins. K. V. Thimann

**The preparation of a crystalline globulin from the albumin fraction of cow milk.** A. H. Palmer. *J. Biol. Chem.* 104, 359-72 (1934).—After pptn. of the casein from milk whey by acid and concn. of the filtrate by freezing out most of the water, 35% of the coagulable protein could be obtained cryst. The globulin was first removed by  $\text{Na}_2\text{SO}_4$  and the remaining protein then pptd. by increasing the concn. to 36 g.  $\text{Na}_2\text{SO}_4$  per 100 cc. at 30°. The ppt. was redissolved, dialyzed and brought to  $p_{\text{H}}$  5.2 and left to crystallize. Crystals up to 3 mm. in length were obtained. Since the cryst. protein is insol. in water between  $p_{\text{H}}$  4.5 and 5.5 it must be classed as a globulin, although it is not pptd. by half satn. with  $(\text{NH}_4)_2\text{SO}_4$ . Detns. of the soly. in  $\text{NaCl}$  and  $\text{Na}_2\text{SO}_4$  solns. show that over the range studied  $\log S$  is proportional to  $\sqrt{\mu}$ , where  $S$  is the soly. in salt solns. of ionic strength  $\mu$  (per 1000 g. water). K. V. Thimann

**The specific gravity of synthetic solutions of serum albumin and serum globulin.** R. L. Nugent and L. W. Towle. *J. Biol. Chem.* 104, 395-8 (1934).—When using the sp. gr. of plasma as a measure of its protein content, one must know the relative influences of the albumin and globulin on the sp. gr. The sp. grs. of mixts. of beef serum albumin and globulin in 0.9%  $\text{NaCl}$  at  $p_{\text{H}}$  7.3-7.5 were therefore detd. at various protein concns. For all albumin:globulin ratios the sp. gr. =  $1.0067 + 0.00273 C$ , where  $C$  is the total protein concn. in percentage. The 2 proteins thus have identical sp. grs. in soln. K. V. T.

**Activity coefficient of egg albumin in the presence of ammonium sulfate.** Crawford F. Failey. *J. Phys. Chem.* 37, 1075-82 (1933).—The  $\log$  of the activity coeff. of egg albumin in the presence of  $(\text{NH}_4)_2\text{SO}_4$ , calcd. from osmotic data, is a linear function of the salt concn. The activity coeff. is in satisfactory agreement with soly.

measurements when account is taken of the compn. of the solid phase. Frank Urban

**Determination of enzyme dissociation constants.** Hans Lineweaver and Dean Burk. *J. Am. Chem. Soc.* 56, 658-66 (1934).—Graphical methods involving const. slopes and straight-line extrapolations have been developed for testing and interpreting kinetic data and for detg. dissociation constants of enzyme-substrate and enzyme-inhibitor compds. and other related constns. when the data are found to be consistent with an assigned mechanism. Representative analyses are given for invertase, raffinase, amylase, citric dehydrogenase, catalase, oxygenase, esterase and lipase, involving substrate activation, substrate inhibition, general competitive and noncompetitive inhibition, steady states and reactions of various orders. The various methods described are applicable to gen. chem. catalysis, homogeneous or heterogeneous. C. J. West

**Enzymes of lichens and the constitution of umbilicic acid.** Georg Koller and Gerhard Pfeiffer. *Monatsh.* 62, 359-72 (1933); cf. *C. A.* 27, 3925. The presence of orcinol carboxylic acid in exts. of lichens was proved to be due to the action of an enzyme on umbilicic acid. The formula for the latter is believed to be:

**Enzymic splitting of disaccharide glucosides.** Siegfried R. Petersen. *Ber. Verhandl. sächs. Akad. Wiss. Leipzig Math.-phys. Klasse* 85, 154-65 (1933).—When the OH of the fourth C atom of  $\alpha$ -phenol lactoside and of  $\alpha$ -phenol cellobioside is substituted by either MeO or an acid, its hydrolyzability by  $\alpha$ -glucosidase of yeast is almost entirely lost. If the substitution is by another sugar the loss in activity is almost as great. Emulsin contains a  $\beta$ -maltosidase which is probably not identical with its  $\beta$ -glucosidase. J. J. Willaman

**Biol. detection of radioactivity of salts** (Muck) 3  
**Hydration of solute ions in relation to acidity, alkyl and  $p_{\text{H}}$**  (Flint) 2.

## B METHODS AND APPARATUS

STANLEY R. BENEDIC<sup>2</sup>

**Determination of amino acids and peptones in blood serum.** E. Cherbuliez and I. Trisfus. *Compt. rend. soc. phys. hist. nat. Genève* 50, 154-5 (1933) in *Arch. sci. phys. nat.* 15, July-Aug.— $\text{NH}_4$  acids and peptones in blood serum are detd. by addn. of solid and satd. aq.  $(\text{NH}_4)_2\text{SO}_4$ , filtration from pptd. proteins, addn. of a 1% soln. of triketohydrindene, boiling, extn. of the ppt. with  $\text{AmOH}$ , removal of extraneous coloring matter by 0.5%  $\text{NaOH}$ , and color matching of the resulting alc. soln. against a standard glycine soln. B. C. A.

**Iodometric determination of sugars in human milk.** M. Polonovski and A. Laspagnol. *Compt. rend. soc. biol.* 107, 301-3 (1931).—Gynolactose (I) combines with about 33% of the amt. of I corresponding with an equal wt. of lactose or the third sugar of human milk; the Cu-reducing power is, however, the same. The (I) content of milk sera is detd. by hydrolysis and iodometry. B. C. A.

**New Nessler reagent.** Hans J. Fuchs. *Z. physiol.*

**Chem. 223, 144-6 (1934).**—A stable Nessler reagent is obtained by substituting LiI and LiOH for KI and KOH. Dissolve 22.5 g. I in a soln. contg. 32.5 g. LiI.H<sub>2</sub>O in 20 cc. distd. H<sub>2</sub>O and set aside 2 cc. Add 30 g. of purified Hg and shake while cooling until the I color has disappeared. Decant and test for free I with 1% starch soln. Add small quantities of the 2-cc. portion set aside, until the starch reaction becomes pos. Dil. to 200-cc. and pour into 1 l. of LiOH soln. prepd. as follows: dissolve 1 kg. LiOH in 5 l. H<sub>2</sub>O contg. a few cc. of H<sub>2</sub>SO<sub>4</sub> (to remove traces of Ba), heat to boiling with frequent shaking, filter through glass wool into a flask contg. some liquid paraffin which forms a layer to exclude CO<sub>2</sub>, and adjust to 3.5 N alk. by addn. of H<sub>2</sub>SO<sub>4</sub>. The Li-Nessler reagent thus prepd. does not flocculate when kept several months at room temp. and exposed to light. A. W. Dox

**Creatine and creatinine metabolism. I. Method of creatinine determination in urine and blood.** H. Lieb and M. K. Zacherl. *Z. physiol. Chem.* 223, 169-79 (1934).—For detn. of creatinine by the Jaffé color reaction, the measurement of the extinction coeff. by means of the Pulfrich photometer with green filter S53 is claimed to be more reliable than the usual colorimetric method. Details of technic and calcn. of results are given. A. W. Dox

**The potential of the yellow oxidation-reduction pigment.** R. Bierich and A. Lang. *Z. physiol. Chem.* 223, 180-4 (1934).—By using a Au electrode the potential of the yellow CHCl<sub>3</sub>-sol. oxidation-reduction pigment of mammalian tissue was detd. over the  $p_H$  range 1.13-11.46. The normal potential at  $p_H$  7 and 20° is -208 mv. referred to the N H electrode. A. W. Dox

**The technic of the analysis of protoplasm.** W. W. Lepeschkin. *Protoplasma* 20, 321-5 (1933).—For chem. analysis protoplasmic material should be either living or suitably preserved with material which does not denature or dehydrate the protein bodies or affect the polysaccharides. For this purpose, material contg. alc. is unsuited. The salt content of the material should be as low as possible and a high CaCO<sub>3</sub> content is particularly unfavorable. A microscopic control of the protoplasmic material is absolutely necessary. Water-sol. and water-insol. substances of protoplasm should be analyzed separately, because they can play different roles. For the investigation of the compn. of protein bodies of protoplasm, hydrolysis of the material with 5% H<sub>2</sub>SO<sub>4</sub> is recommended. F. L. Dunlap

**Preservation and examination, chemical and optical coloration of urine sediments. Preparation of permanent slides.** Paul Lehugt. *Pharm. Ztg.* 79, 228-31 (1934).—Photomicrographs of urine sediments, wax, hyalin and epithelial casts are shown in connection with a complete description of the technic employed. W. O. E.

**Histochemical detection of fats.** Rich. Wasicky and E. Amarat. *Scientia Pharm.* 5, 1-4 (1934).—The histochem. detection of fats may be effected by specific lipase sapon. To this end a soln. of pancreatin absolute Merck prepd. with a borate buffer  $p_H$  = 8 is used. The enzymic sapon. is recognized by crystn. in needles of the higher fatty acids, after treatment of the sample for several hrs. to days in an incubator at 37°. The unsatd. acids of the oleic and linoleic series appear in droplet form. For the recognition of split acids, recourse is had to their solv. in 95% alc., and their behavior toward a mixt. of satd. Na<sub>2</sub>CO<sub>3</sub> soln. with a 1% NaOH soln. (9:1), as well as toward lime water and toward Cu(OAc)<sub>2</sub> soln. With the Na<sub>2</sub>CO<sub>3</sub> reagent the droplets resulting from the action of lipase show instantly an energetic and characteristic myelin formation. On account of the general distribution of oleic and other unsatd. acids in the fats of organized tissues and cells the myelin reaction results in greater or less degree following this procedure. With lime water in place of the Na<sub>2</sub>CO<sub>3</sub> reagent, the liquid acids yield Ca soaps in the form of blunt-sided or rounded protrusions in the acid droplets, finally gray, not infrequently cryst.-appearing masses. Addn. of 50% H<sub>2</sub>SO<sub>4</sub> transforms the Ca soaps into globules of acids and CaSO<sub>4</sub>, which crystallizes in small or large needles, adhering frequently to the

acid droplets. Cu(OAc)<sub>2</sub> changes the acid droplets into blue transparent globules or blue Cu soaps. The Twitchele cleavage with "Divulson L" did not prove satisfactory in the histochem. fat detection. The elaidin test may be utilized in the characterization of nondrying oils in tissues by exposure of the sample in a hanging drop of H<sub>2</sub>O to the fumes from Cu and HNO<sub>3</sub>, whereby a pos. test is shown by pptn. of fine needle-like stars. A soln. of C(NO<sub>2</sub>)<sub>3</sub> in 95% alc. (1:4) colors oil droplets (with glycerides of unsatd. acids in sections of fat-contg. tissues) yellow. W. O. E.

**The standardization of assayed biological products.** P. Bruère. *Bull. Soc. chim. biol.* 16, 150-9 (1934).—Discussion. L. E. Gilson

**Microdetermination of calcium in the serum of blood.** P. Wenger, Ch. Cimernan and P. Borgeaud. *Mikrochemie* 14, 111-58 (1934).—Details are given for obtaining CaC<sub>2</sub>O<sub>4</sub> from the Ca in 2 cc. of serum and titrating the ppt with KMnO<sub>4</sub> soln. W. T. H.

**Detection of enzymes by spot tests.** B. N. Sastri and M. Sreenivasaya. *Mikrochemie* 14, 159-60 (1934).—As reagents use one or more of the following: 0.5% sol. starch, 0.5% inulin, 0.5% cane sugar, 0.5% salicin, 0.5% indican, 0.2% olive-oil emulsion, 0.2% EtOAc-water emulsion, 1% urea, 1% tincture of guaiacum, tyrosine. Place a drop of the reagent on fat-free filter paper, add a drop of the fluid to be tested and allow to remain under a humidified bell jar for 30-60 min. The colors obtained with diastase, inulase, invertase, emulsin, lipase, butyrase, urease, phenolases and tyrosinase are given. With amylase and urease a modified drop test can be carried out on a glazed porcelain spot plate. Mix a drop of the starch indicator with a drop of the fluid and examine the color from time to time. W. T. H.

**Simple Tyndallimetric method for determining trypsin.** E. Herzfeld. *Mikrochemie* 14, 245-50 (1934).—The principle of the method consists in adding the trypsin to an albumin soln. of definite Tyndall effect and detg. the Tyndall value after 2 hrs. of incubation. A 1% soln. of NaHCO<sub>3</sub> acts as a suitable buffer. Into the 1st and 2nd of a series of tubes place 1 cc. of the body fluid to be tested or a NaHCO<sub>3</sub> ext. of the same. Every tube of the series except the 1st should contain at the start 1 cc. of 1% NaHCO<sub>3</sub> soln. Mix the contents of the 2nd tube and pipet off 1 cc. into the 3rd tube and continue in the same way until 10 or even 25 tubes are obtained in series with each contg. half as much of the material to be tested as the one before. Then, to each tube, add 1 cc. of fresh albumin soln. which is prepd. as follows: Dil. 20 cc. of cattle serum to 100 cc. with distd. water, transfer to a beaker and heat over a small flame while stirring with a rubber-tipped rod. At the boiling temp. add sufficient 1% AcOH (not over 2 cc.) until a coarsely dispersed or strongly opalescent colloidal soln. is obtained without appreciable flocculation. Filter hot through cotton and use after cooling under running water. After adding the fresh albumin soln. mix and heat 2 hrs. in the incubator oven and then det. the Tyndall effects of the various tubes. W. T. H.

**Micro-iodometric determination of iron (iron content of thyroid glands).** Janos Straub. *Mikrochemie* 14, 251-5 (1934).—To 8-9 cc. of the liquid to be tested in a 100-cc. Erlenmeyer flask add 2-3 drops of concd. HCl and 1-2 g. KI. Add a few drops of starch soln. and after 1-2 min. titrate with 0.02 N Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>. The finely powd. gland can be appropriately prepd. for the test by ashing 0.5 g. in an elec. furnace in the usual way, digesting the ash with 2-3 cc. of hot, concd. HCl, rinsing the soln. into a flat porcelain dish, adding 2-3 drops of perhydro and evap. to dryness. Moisten the residue with 2-3 drops of concd. HCl and rinse into the titration flask with less than 10 cc. of water. W. T. H.

**Determination of bromine in blood.** Edmund D. Yates. *Biochem. J.* 27, 1763-6 (1933).—Protein is removed with tungstic acid, a portion of the filtrate is evap. to dryness with KOH and heated at 500° for 20 min., the residue is extd. with water, acidified and the bromide oxidized to Br by a chromic acid-H<sub>2</sub>SO<sub>4</sub> mixt. (this is in

such concn. as to oxidize the bromide but not the chloride). The Br is removed by aeration and absorbed in starch-iodide soln. The  $I_2$  is titrated with  $Na_2S_2O_3$ . Not more than 5 cc. blood need be used. The method is accurate to within 2% for amts. of 5-1000  $\gamma$  of Br. B. H.

Colorimetric determination of vitamin A by the alkali digestion method. Alan W. Davies. *Biochem. J.* 27, 1770-4(1934).—The digestion consists in heating the material with 5% aq. KOH, then extg. with alc. and ether. After evapg. the ether, the residue is dissolved in  $CHCl_3$ , and the vitamin A detd. in the Lovibond tintometer after the addn. of the  $SbCl_5$  reagent. Benjamin Harrow

Standardized collodion membranes in low-pressure ultrafiltration. Sydney J. Kolley. *Biochem. J.* 27, 1775-8(1934).—Details are given for making collodion tubes of standard and reproducible permeability. A method of low-pressure ultrafiltration making use of these membranes is described. The method has been used to det. ultrafilterable Ca in bovine blood serum. Benjamin Harrow

Continuous gas analysis with automatic recording. H. Ullrich. *Naturwissenschaften* 22, 11(1934).—An apparatus for continuous gas analysis is outlined in which a standard gas (air) and a test gas (e. g., air + some  $CO_2$ ) flow through 2 parallel symmetrical capillary systems with equal applied suction. Each capillary system includes an absorption space (for  $CO_2$ ); the pressure differential between the 2 absorption spaces indicates the amt. of gas absorbed. The accuracy is as high as 2 to 3% of the  $CO_2$  content in atmospheric air. The app. is designed for respiration and assimilation expts.; it can be made recording. B. J. C. van der Hoeven

Estimation of tissue phenols. Distribution of phenol in the tissues of the normal and of the poisoned rabbit. Maurice I. Smith. *U. S. Pub. Health Repts.* 48, 1487-96(1933).—The tissue is weighed accurately to the nearest cg. and is thoroughly pulped with pure sand in a glass mortar. From 5 to 10 g. of tissue will usually suffice; ext. with 5 vols. of 10% aq.  $CCl_3CO_2H$  (allow for the approx. 80%  $H_2O$  content of the tissue) and filter. With blood, a definite vol. is simply stirred into 4 vols. of the acid solns. and filtered. An aliquot of the filtrate, varying from 1 to 25 cc. (the equiv. of 0.2 to 5 g. of tissue according to the phenol content), is measured into a small distg. flask of 100-150 cc. capacity, dild. to about 30 cc. with  $H_2O$  and distd. directly into a 25 or 50 cc. vol. flask. To ensure complete recovery of the phenols, it is best that there be not much over 0.3 mg. in about 30 cc.; approx.  $\frac{2}{3}$  of this should be distd. over, about 15 cc. of distd.  $H_2O$  should then be added and the distn. continued until another  $\frac{2}{3}$  of the vol. has distd. over. To the combined distillates, 1-3 cc. of the Folin-Dennis phenol reagent, 4-8 cc. of 20%  $Na_2CO_3$  and  $H_2O$  to vol. are added. After 20-30 min. the reading is made in the colorimeter in the usual manner, with phenol or preferably resorcin as a standard. *o*-Cresol in tissues is detd. in a similar manner except that the final soln., after the reagent and alkali have been added, must be heated at 50-55° for about 20 min. to bring out the max. intensity of the blue color. Total phenol is estd., in the same manner after conjugated phenols have been dialyzed. For tissues contg. 10-200 mg. of conjugated phenols per 100 g., 2 cc. of concd.  $HCl$  added to 2 cc. or less of the 1-5  $CCl_3CO_2H$  filtrate dild. with  $H_2O$  to about 25 cc. is sufficient to hydrolyze completely the combined phenols in the course of distn. The tissue of a normal rabbit (oat and cabbage diet) contains less than 1.0 mg. % and usually not much over 0.5 mg. % of what might be regarded as true phenols. In acute lethal poisoning, free phenol was found in concns. of 7-26 mg. % per 100 g. tissue, the lowest value having been found in the skeletal muscle and the highest in the kidney. Conjugated phenols were not found in appreciable amt. anywhere. In subacute poisoning, conjugated phenols were found in all the tissues examd. with the exception of the central nervous system. Phenol conjugation is not limited to any one tissue although it occurs predominantly in the kidney, liver and intestine. As much as 6-8 mg. free phenol per 100 g. was found in the central nervous system

of the rabbit after the administration of a toxic but non-fatal dose of phenol. G. A. Kennedy

A new test to determine sex from blood traces. W. A. Nadeshdin. *Deut. Z. ges. gericht. Med.* 21, 23-6(1933).—A drop of toluidine blue is mixed with a drop of blood, sperm ext. and ovary ext., respectively. A sample of each mixt. is placed on a filter paper. If the blood spot matches that of the sperm ext. more closely than that of the ovarian ext., then it is of male origin, and vice versa. F. K.

Method of spectroscopic detection of carbon monoxide in blood. Josef Koller. *Deut. Z. ges. gericht. Med.* 21, 275-7(1933).—For concns. of CO over 20% the use of Na stannite gave very good results, even better than the use of  $(NH_4)_2S$ . For concns. below 20% either method was accurate. Frances Krasnow

Determination of urine sugar by calorimetric means. Werner Lanz. *Schweiz. med. Wochschr.* 63, 1289-91(1933).—The increase in temp. on mixing the sugar soln. with powd.  $Na_2CO_3$  and  $KMnO_4$  is compared with a control with water. The difference in temp. is proportional to the sugar concn. Exptl. conditions must be exactly duplicated for accurate results. Milton Levy

Testing gastric function by physicochemical methods. S. Cytronberg. *Wien. med. Wochschr.* 83, 1311-13, 1343-6, 1371-3, 1403-5(1933).—A lecture. M. L.

Microdetermination of iron in biological materials. Wolfgang Lintzel. *Z. ges. exptl. Med.* 86, 268-74(1933).—The material is ashed with  $H_2SO_4$  and  $HNO_3$ , and 30%  $H_2O_2$ . Excess oxidizing agents are removed with  $Na_2SO_3$ , and the soln. is made alk. with  $NH_4$ . The color is developed with dipyrldyl (cf. Hill, C. A. 25, 2387) and hydroquinone. The method is accurate for 2-10  $\gamma$  Fe per analysis. Milton Levy

Lipochrome in human beings. J. G. Thompson. *Z. ges. exptl. Med.* 92, 692-710(1934).—The photometric detn. of lipochrome in the fat of human tissues and organs is described. Milton Levy

A new method for the determination of free and bound water in tissues and blood. Surányi Gyula. *Magyar (russ) Arch.* 35, 71-4(1934).—The amt. of Argon gas under definite pressure, vol. and temp. absorbed in solvent  $H_2O$  is detd. manometrically. The difference between whole  $H_2O$  and solvent  $H_2O$  gives the bound  $H_2O$ . Henry Tauler

The solubility and preparation of phosphorus- and nitrogen-free glycogen. Michael Somogyi. *J. Biol. Chem.* 104, 245-9(1934).—Complete pptn. of glycogen from soln. is given by 47% EtOH at 22° or 43% at 0°; at lower concns. of alc. the soly. of glycogen is increased about 10 times by 1 M NaCl. NaOH, however, decreases the soly. 1 N NaOH giving complete pptn. by 33% alc. These figures are used to modify the method of prepn. of glycogen, the 1st pptn. being made with 33% alc. from alk. soln., the 2nd with 45% from acid soln. The resultant product is free from  $N$ ,  $P$  and inorg. matter. K. V. Thimani

The isolation and detection of bilirubin. Clarence J. May, Ruth Martindale and Wm. F. Boyd. *J. Biol. Chem.* 104, 255-7(1934).—Bilirubin gives highly colored products, stable for many days, with diazotized sulfanilic acid and *p*-nitroaniline, reacting with the former in neutral alc., with the latter in HOAc, and with both in alk. alc. Biliverdin gives no colors under the same conditions. The best salts for pptg. bilirubin from dil. aq. soln. are  $BaCl_2$  with either  $Na_2HPO_4$  or  $Na_3PO_4$ . K. V. T.

The iodometric determination of cystine in the urine. Robert W. Virtue and Howard B. Lewis. *J. Biol. Chem.* 104, 415-21(1934); cf. Lucas and King, C. A. 27, 3164.—The urine is made 3% in  $HCl$ , decolorized with norite, filtered and reduced with Zn dust, and cooled to 0°. An aliquot is added to a slight excess of I in  $KI$ , previously measured and then frozen solid, and thiosulfate is then run in while the I soln. melts, at such a rate as just to destroy the starch iodide as formed. For accurate detns., slightly less than the required amt. of thiosulfate is added first to the frozen I soln. With pure cystine solns. the decolorization is omitted. Cystine added to human or rabbit urine was recovered within 4-5%, the av. 10-

covery in 14 detns. being 101%. Methionine gives no titration value by this method, while homocystine reacts quantitatively. K. V. Thimann

A proximate method of determination of the carbon monoxide content of blood. H. Becker and E. Lempicki. *Wiadomości Farm.* 61, 45-7, 77-9 (79 in German) (1934).—Weizel's spectroscopic method (*Ber.* 22, 842 (1889)) of detg. CO in blood is supplemented by the following observations: It is necessary to standardize each spectro-scope in regard to the CO content at which the reduction with  $(\text{NH}_4)_2\text{S}$  is visible, since in the literature different data are given. The diln. of blood contg. CO must be made with CO-free blood, and the hemoglobin content of both blood samples must be ascertained. Since W.'s method permits detn. only of CO contents above 26.5%, it is advisable, in order to det. lower CO contents, to sat. with CO part of the blood analyzed and to dil. this said sample with the blood analyzed until the reaction is just visible. A simple calcn. then gives the CO content of the blood. J. Wiertelak

Micro methods for detg. proteins in biology (Wasitzky) 17.

## C—BACTERIOLOGY

CHARLES E. MORRIS

Studies on bovine mastitis. IX. A selective medium for the diagnosis of streptococcus mastitis. S. J. Edwards. *J. Comp. Path. Therap.* 46, 211-17 (1933).—A selective medium contg. crystal violet has been devised on which streptococci are more resistant than the majority of milk saprophytes. Organisms which are not inhibited can be differentiated from mastitis streptococci by the inclusion of esculin because of which they produce black colonies. Rachel Brown

Comparison of Koch's old tuberculin with a new synthetic-medium tuberculin. M. Dorset. *J. Am. Vet. Med. Assoc.* 37, 439-49 (1934).—Synthetic medium for the growth of tubercle bacilli is: asparagine 1.2 g.,  $\text{K}_2\text{HPO}_4$  0.18,  $\text{Na}_2\text{C}_2\text{O}_4$  0.09,  $\text{MgSO}_4$  0.15,  $\text{FeC}_2\text{H}_3\text{O}_7$  0.03, dextrose 1.00, glycerol 10.00 and  $\text{H}_2\text{O}$  to make 100 cc. At max. growth 2 g. of bacilli is obtained from 100 cc. of medium or 3-4 times the yield on glycerinated broth. Compn. of synthetic broth culture filtrate is: ash 0.15, protein 0.32, carbohydrates 0.30 and glycerol 0.04%. The proteins in the synthetic culture filtrates are derived entirely from the bacilli and the medium constituents are entirely used up except for a small amt. of mineral salts and a trace of glycerol. This product appears in field work to be more potent and reliable than the old glycerinated broth tuberculin. Rachel Brown

The viability and virulence of old cultures of tubercle bacilli. Studies on twelve-year broth cultures maintained at incubator temperature. H. J. Corper and Maurice L. Cohn. *Am. Rev. Tuberculosis* 28, 856-74 (1933). H. J. Corper

The inhibitory effect of normal blood on the growth of tubercle bacilli at incubator temperature. H. J. Corper and C. Pa Vidal. *Am. Rev. Tuberculosis* 28, 878-83 (1933).—The growth of human and bovine tubercle bacilli on good media is inhibited by normal blood from dogs or rabbits. The effect is due to the development of toxic autolytic products from normal blood, and is absent when the blood has been treated with 1 or 2 vols. of 6%  $\text{H}_2\text{SO}_4$  for  $1\frac{1}{2}$  hr. at 37°, which destroys the autolytic enzymes, and neutralized with isotonic  $\text{NaHCO}_3$  soln. (or other non-toxic alkalis). H. J. Corper

The chemical study of bacteria. Studies on the complex carbohydrates isolated from the culture medium and its ultrafiltrate after the growth of tubercle bacilli. Florence E. Hooper, Alice G. Renfrew and Treat B. Johnson. *Am. Rev. Tuberculosis* 29, 66-72 (1934); cf. C. A. 27, 321.—A carbohydrate fraction, isolated from the whole medium on which tubercle bacilli (H37) had been in culture for 6 weeks, was hydrolyzed. *d*-Galactose, addn. to the previously reported *d*-mannose and *d*-arabinose, was identified in the hydrolysis mixt. The presence of a small quantity of uronic acid in the crude carbohydrate

fraction from the whole medium was indicated by analysis. Some observations on the crystallographic properties of the methylphenylhydrazones of *d*-galactose, *d*-arabinose and *d*-mannose are recorded. A N-free and P-free polysaccharide was prepd. by alk. hydrolysis of the Ac product of the crude carbohydrate from the protein-free ultrafiltrate. This prepn. showed the same degree of sp. reactivity as that exhibited by prepn. from the whole medium characterized by the presence of small percentages of protein and P. H. J. Corper

Oxidation-reduction potential of certain tubercle bacillus strains in relation to their virulence. M. I. Aksianzew. *Z. Tuberk.* 68, 249-53 (1933).—The "Clare and Michaelis" detn. of the oxidation-reduction potential (ORP) for org. and inorg. systems has also found a place in the study of biol. systems. Aerobic bacteria reveal a pos. and anaerobic a neg. potential. The relation to virulence is not as yet clear. Various virulent, moderately virulent and avirulent tuberculosis strains (of bovine and human type) were studied. In the electrometric detns. virulent as well as avirulent tubercle bacilli revealed values of  $E_h = +380$  to  $+5$  mv. Appreciable differences of the ORP of various strains of tubercle bacilli in relation to virulence and the age of the culture were not revealed by the electrometric procedure. Study of the hydration tendency of tubercle bacilli by the methylene blue procedure (methylene blue as H acceptor) showed that the hydration tendency of virulent strains B7 and B8 (bovine tubercle bacilli) was more marked than the avirulent BCG strains. This finding also resulted for the virulent human types. Twenty-day-old cultures revealed somewhat higher hydration tendencies than younger cultures. H. J. Corper

Antivirus and amino acids. Carlos A. Sagastume and Arturo A. Solari. *Rev. facultad cienc. quim. (Univ. La Plata)* 8, Pt. 2, 15-35 (1933). Old cultures of *Staphylococcus aureus*, or *S. aureus* and *Es. coli* together, were killed by heating and then reinfected with *S. aureus* or *Es. coli*. Because of the antivirus present in the old medium the organisms ordinarily grew slowly. The addn. of glucose, fructose, lactose, maltose or sucrose accelerated growth. Alanine and glutamic acid greatly accelerated growth, presumably by inactivating the antivirus. Leucine, cystine, glycine, tyrosine, phenylalanine, arginine and aspartic acid had no effect, while tryptophan had an inhibiting action. L. E. Gilson

The presence of nitrifying bacteria in deep seas. Cornelia L. Carev and Selman A. Waksman. *Science* 79, 349-50 (1934). B. H.

Observations on anti-phage sera. I. "The percentage law." C. H. Andrews and W. J. Elford. *Brit. J. Exptl. Path.* 14, 367-76 (1933). Three phages that attack various strains of *Es. coli* and *S. dysenteriae* have been particularly chosen for study as representative phages of groups of very different sizes; C 13 is a small one, C 36 a moderate-size one and C 16 a large one. The neutralization of these 3 phages does not follow the multiple proportions law. On the contrary, neutralization is only demonstrable in the presence of a large excess of antiserum. A given strength of antiserum neutralizes, over a wide range, a definite percentage of phage, irrespective of the quantity of phage present. This phenomenon is referred to for convenience as the "percentage law." II. Properties of incompletely neutralized phage. *Ibid.* 376-83. Phage which is incompletely neutralized by—perhaps incompletely coated with—antiserum, when it is brought into contact with susceptible bacteria, only begins to multiply after a delay. For this reason it produces smaller plaques on agar than does free phage (C 36, not C 13 and C 16). This incompletely neutralized phage is normally adsorbed by susceptible bacteria (C 36). It is unable to pass a candle or a membrane permeable to phage and antiserum separately. Probably there is aggregation of the phage-serum complex (C 36, S 18). Phage which has been incompletely neutralized or even completely coated by antiserum may be reactivated by diln., provided that there has not been too long contact of phage and antibody (C 36, not C 13, C 16). Phage-

neutralization may be supposed, in common with other antigen-antibody reactions, to consist of 2 stages. The first stage probably takes place very rapidly and may be reversible. The second stage is irreversible and takes place more gradually. With reference to the "percentage law" described in the previous paper, if the affinity of phage for antibody is low the equil. may be of such a nature that the phage cannot receive a big enough coating of antibody to neutralize it, unless there is considerable excess of antibody in the fluid about each phage particle. If this excess is always necessary, it follows that over the whole range under study, phage particles must be few and far between compared with the available antibody.

Harrket F. Holmes

**Polyarthritides of sheep.** J. A. Howarth. *North Am. Veterinarian* 14, No. 9, 20-39 (1933).—The organism consistently isolated from the joint lesions of sheep suffering from polyarthritides is a pleomorphic diptheroid, nonmotile, Gram-pos., nonsporulating, facultative rod, which grows best under  $\text{CO}_2$ . All strains of the organism isolated from sheep and goats and several European strains of *Erysipelothrix rhusiopathiae* fermented dextrose, lactose and maltose when they were grown on Hiss serum water and Dunham's peptone solu. at 22° for more than 48 hrs. Several of the sheep strains slightly fermented galactose, levulose and sucrose. The organism belongs to the same family, order and class as *E. rhusiopathiae* but it is not pathogenic for hogs. Seventeen references.

K. D. Jacob

**Mechanism of bacteriophage lysis.** J. Broutenbrenner. *Am. J. Pub. Health* 24, 398-9 (1934).—The primary effect of phage apparently consists in the stimulation of bacterial metabolism. The lysis proper is a secondary phenomenon, which occurs as a direct result of imbibition of water by the bacteria following the osmotic changes set up by the increased metabolism. Whenever this imbibition of water is interfered with, the lysis is prevented.

J. A. K.

**Sensitivity, in vitro, of bacteria to the  $\beta$ - and  $\gamma$ -rays of radium.** R. R. Spencer. *U. S. Pub. Health Repts.* 49, 183-92 (1934).—The effect of Ra rays ( $\beta$  and  $\gamma$ ) upon broth cultures of actively multiplying bacteria (*S. scarlatinae*, *Proteus X<sub>18</sub>* and *Es. typhosa*) is first manifested by a retardation of growth within the first 6 hrs. after plating. After 24 hrs. there may be no perceptible difference between the gross appearance of irradiated and non-irradiated cultures. After several transfers the continuously irradiated cultures may be stimulated to a more vigorous growth, and the organisms tend to display pleomorphism and stain more deeply. Bacteria kept at sufficiently low temps. to prevent multiplication are gradually killed by irradiation. The lethal effect appears to be due to the  $\beta$ -rays. These expts. suggest rather strongly that the sensitivity or vulnerability of bacteria to Ra rays is in some way assoc. with the activity of the cell.

J. A. Kennedy

**Studies on specific precipitable substances and on carbohydrates extractable from bacteria of the dysentery and pseudodysentery group.** A. Fieschi and L. Cattaneo. *Boll. soc. ital. biol. sper.* 8, 1679-80 (1933).—These substances contained a high percentage of carbohydrate and a small amt. of N. Serologically they behaved differently. The polysaccharides extd. from the Shiga-Kruse organisms reacted specifically with anti-Shiga serums, while those extd. from the Flexner and Hiss-Russel bacteria were inactive against their resp. specific serums.

P. M.

**The influence of phosphate buffer on the acid fermentation of glucose by *Escherichia coli*.** V. Cianci. *Boll. soc. ital. biol. sper.* 8, 1694-8 (1933).—Acid fermentation caused by *Es. coli* in Naegeli glucose medium was studied in the presence of decreasing amts. of a phosphate buffer and at 25° and 37° incubation for 10 days. The results show that an increasing amt. of buffer ( $\text{KH}_2\text{PO}_4\text{-Na}_2\text{HPO}_4$ ) caused an increase in the growth, velocity of growth, amt. of acid formed and an increase in gas formation. The residual unfermented sugar was a min. in those cultures having a high concn. of buffer. The influence of veronal-acetate buffer on the acid fermentation of glucose caused by *Escherichia coli*. *Ibid.* 1698-1701.—The in-

fluence of veronal-acetate buffer was compared to that of  $\text{KH}_2\text{PO}_4\text{-Na}_2\text{HPO}_4$  buffer previously described. Since the Michaelis buffer has a weaker buffering action with respect to the phosphate buffer within the limits of the  $\text{pH}$  and concn. used, the results show (a) that the buffer action of the culture medium is the principal regulator of the acid fermentation of glucose by *Es. coli*; (b) increasing the amt. of buffer increases the velocity of reaction and the amt. of acid produced.

Peter Masucci

**The presence of salicylic and phenylacetic acids in the acetone-soluble fat of tuberculosis bacilli.** Nils Stendal. *Bull. sci. pharmacol.* 41, 69-72 (1934).—See C. A. 28; 23874.

**Bacterial calorimetry. III. The production of heat in two percent peptone water by a strain of *Escherichia coli*.** Clarence F. Schmidt, Jr. and Stanhope Bayne-Jones. *J. Cellular Comp. Physiol.* 3, 405-18 (1933); cf. C. A. 23, 2200.

T. H. Rider

**The lipases of bacteria.** E. S. Tammisto. *Ann. Acad. Sci. Fennicae A38*, No. 5, 101 pp. (1933).—From 14 strains of *Ps. fluorescens* the most active in fat-splitting and ester-hydrolyzing power was selected. This and a strain of *S. marcescens* were far more active than any others of a no. of cocci, bacilli, etc., tested. In most cases the extent of hydrolysis of butter fat paralleled that of Et butyrate or tributyrin. The lipase activity of living cells of the two species used increases with increasing  $\text{pH}$ , no optimum being attained. Its optimum temp. is 32-7°, and it is relatively thermostable, 10 min. at 95° causing only 30% inactivation. The dried and toluene-treated cells, on the other hand, had a  $\text{pH}$  optimum 8.3 and were 90% inactivated by 10 min. at 70°. The enzyme in the dried bacteria is inhibited by quinine and by NaF, but not by atoxyl (cf. Rona, C. A. 19, 85; 17, 1077); it acts better on tributyrin than on olive oil or trilaurin, and is almost inactive on Me or Et butyrate. By Willstätter's elution method about 60% of the lipase could be extd.; this prepn. had a  $\text{pH}$  optimum 8.3-8.6, was completely destroyed by 10 min. at 60°, and was increased in activity 800% by addn. of 0.04%  $\text{CaCl}_2$  + 0.04% Na oleate. The living or dried cells were completely unaffected in lipase activity by these activators, which are therefore probably already in the cell. By continued adsorption and elution a purified prepn. of enzyme was obtained, giving a weak biuret and a neg. Molisch reaction, and responding to quinine, NaF and to  $\text{CaCl}_2$  + Na oleate in the same way as the crude prepn. The properties of this purified lipase correspond closely to those of pancreas lipase, and differ from those of other tissue or plant lipases. When the bacteria were grown in media in which tributyrin was the only C source, the lipase activity was about 10 times that reached on a peptone medium; media contg. both tributyrin and peptone gave intermediate activities. A mixt. of glycerol and  $\text{PrC}_2\text{H}_5$  added to peptone gave no increase in enzyme. The lipase of the bacteria is thus partly constitutive and partly adaptive in the sense of Kürström (C. A. 24, 4529).

K. V. Thimann

**Chemistry of *Lactobacillus acidophilus*. II. Composition of the neutral fat.** J. A. Crowder and R. J. Anderson. *J. Biol. Chem.* 104, 399-406 (1934); cf. C. A. 26, 5603. The total ether-sol. material, amounting to 7% of the dry wt. of the bacteria, yielded 35% neutral glyceride, 32% phosphatide and 28% free fatty acids, of which 3.4% was identified as dihydroxystearic acid. The fatty acids set free on hydrolysis of the neutral fat contained 57.8% of solid satd. acids which were sepd. by methylation and distn. into lauric acid 5, myristic acid 10, palmitic acid 45 and stearic acid 40%. There were 36.9% of unsatd. acids, yielding only stearic acid on reduction, a small amt. of liquid satd. acid, and 6.7% of unsaponifiable matter, mostly cholesterol, which may have been derived from the medium on which the bacteria were grown.

K. V. T.

**Therapeutic substances derived from unsymmetrical biphenyl compds. [killing power against *Eberthella typhi* (Harris, Christiansen) 17. Microbiol. analysis of butter (Parfitt) 12.**

## D—BOTANY

THOMAS G. PHILLIPS

Chemistry of corn-seed germination. R. C. Malhotra. *Cereal Chemistry* 11, 105-9(1934).—See C. A. 28, 804.

Endocellular hydrogen donors of yeast and their variation with the age of the culture. F. Chodat and M. Junquera. *Compt. rend. soc. phys. hist. nat. Genève* 50, 190-203(1933) in *Arch. sci. phys. nat.* 15, July-Aug.—The amt. of endocellular H donors in yeast increases slightly with the age of the culture for 2-3 days and then decreases rapidly, being nearly 0 after 6 days. B. C. A.

Quantitative investigation of the soluble carbohydrates of the unripe fruit of pumpkin (*Cucurbita pepo*) and the hydrolysis of its cellulose. M. G. Tikhmenev. *J. Applied Chem.* (U. S. S. R.) 6, 320-5(1933).—Pumpkin flour was freed from fats and extd. with 55% EtOH and boiled for 2 hrs. on a water bath after the addn. of chalk. The ext. was filtered through strong cloth and the extn. repeated twice. The ext. contained mainly monoses; mannose and galactose were absent; large amts. of *d*-fructose with an admixt. of dextrose were found. Galactose, mannose and arabinose were not found and the bi-rotation curve indicates the absence of an appreciable amt. of acid. A. A. Bochtlingk

Cultures of *Penicillium candidum*. L. Schioppa. *Ind. ital. conserve aliment.* 9, 39-42(1934).—Cultures of the organism (isolated from a sample of French Camembert cheese) show optimum growth at 12-25° on substrata contg. flour, maize flour and cheese. G. A. Bravo

The function of essential oils in plants. F. Bruno. *Lavori ist. botan. Palermo* 4, 11-23(1933). By distn. of the leaves, flowers and apexes of *Gymbopogon nartini* Stapf. var. *Molia*, were obtained: A insol. essence from 2-year-old leaves, B insol. essence from 1-year-old leaves, C sol. essence from 1-year-old leaves, D insol. essence from flowers, E sol. essence from flowers, F sol. essence from apexes, with the following properties:

	A	B	C	D	E	F
dis	0 9208	0 9201	0 9134	0 9201	0 9280	0 9010
$\alpha$	+43	+42	+17	+25	3	1 29
$\beta$	1 4096	1 4175	1 3685	1 3680	1 3690	1 3683
Acid no.	0 019	0 001	0 000	0 007	0 008	0 009
Water no.	16.80	16.80	7.47	18.67	13.07	18.67
Free alc. (as geraniol)	32.56	31.87	29.51	28.86	31.09	52.09
Sol. in 70% alc.	1.10	1.11	1.4	1.13	....	1.10
Sol. in 80% alc.	1.1	1.2	1.2	1.2	....	1.2

The presence of methylheptenone was shown in A, B and C (about 12%), D (14%) and E (20%); dipentene was found about 2%. Essential oils in this plant are probably gaseous materials. G. A. Bravo

Spectroscopical study of the green pigment of the funiculus and of the immature seeds of *Yacarándia mimosae-folia*. F. Bruno. *Lavori ist. botan. Palermo* 4, 155-67(1933).—The dark green pigment does not give the absorption spectrum of chlorophyll; the fluorescence of chlorophyll is blood-red, while that of the funiculus pigment is violet, and that of the seed pigment is pale red. G. A. Bravo

Factors affecting the sporulation of *Phyllosticta solitaria* in artificial culture. A. J. Mix. *Phytopathology* 23, 503-24(1933).—Quantity of nutrient exercises the greatest influence on spore production in cultures. As sources of C, dextrose, levulose, mannose and sucrose are equally favorable. KNO<sub>3</sub> is the best N source. Fertile pycnidia were produced when the initial pH of the media used was between 4.2 and 5.8. R. C. Burrell

Pathology of tobacco blackshank. F. T. Wolf. *Phytopathology* 23, 605-12(1933).—A thermostable, non-volatile compd., probably a protein, seems to be the toxic material responsible for the wilting and collapse of tobacco plants infected with *Phytophthora nicotianae*. The fungus secretes enzymes which enable it to utilize the middle lamella, the secondary membranes, starch, sucrose, dextrose and maltose. R. C. Burrell

An improved method of bleaching and clearing leaves.

1 Roy W. Strain. *Phytopathology* 24, 82-4(1934).—By introducing Cl into alc. instead of using aq. bleaching mixts. contg. it, better preps. of leaves for the study of vein endings, stomata, etc., may be obtained. In either case a final clearing must be carried out with the usual acid-phenol-glycerol soln. R. C. Burrell

Intermittent germination as illustrated by *Helianthemum guttatum* Miller. D. V. Juby and J. H. Phensant. *J. Ecology* 21, 442-51(1933).—The rate of germination was not increased by increasing the partial pressure of O<sub>2</sub> in the atm. in which seeds of *H. guttatum* were germinated. The rate of germination seems to be conditioned by the rate at which the testa is rendered permeable to water and salts in soln. K. D. Jacob

Autumn coloration [of leaves]. A. B. Stout. Natl. Shade Tree Conference, *Proc. 9th Ann. Meeting* 1933, 46-9.—The chem. changes involved in the autumn coloring of leaves are discussed. K. D. Jacob

A physiological study of fruit development in the pecan (*Hicoria pecan*). Charles L. Smith and Clifford J. R. Thorn. Texas Pecan Growers' Assoc., *Proc. 13th Ann. Meeting* 1933, 71-6.—The 1st period of growth until late Aug. or early Sept. was characterized chiefly by formation of structural elements of the shuck and shell. During the 2nd period, filling of the kernel was of major importance. Most of the oil, protein, mineral and acid-hydrolyzable polysaccharide content of the kernel developed during Sept. Very nearly the whole sugar content of the kernel, which is almost exclusively in a nonreducing form, appeared during the 1st half of Oct. Indications were that much of the sugar in the mature kernel may be a result of translocation from the shuck during the later stages of maturity. After the beginning of the filling process near Sept. 1st, the amt. of ash in the shell and of total N and acid-hydrolyzable polysaccharides in both shell and shuck remained practically const.; the ash content of the shuck increased rapidly during the filling process. Practically all of the oil content of the pecan kernel is formed from materials brought into the fruit from other parts of the tree at the time of oil formation; there is evidence that this is also true of the protein in the kernel. Different varieties of nuts showed no distinct differences in compn. K. D. Jacob

*Azygozygum chlamydosporum* nov. gen. et sp. A phycomycete associated with a diseased condition of *Anthriscum majus*. Chas. G. C. Chesters. *Trans. Brit. Mycol. Soc.* 18, 199-214(1933).—When the fungus was grown on any synthetic medium the greatest growth was obtained with maltose as the source of carbohydrate and KNO<sub>3</sub> as the source of N. When glucose was substituted for maltose the amt. of growth was almost the same but less aerial mycelium was formed. Sucrose was a poorer source of carbohydrate. When an org. source of N was substituted for KNO<sub>3</sub>, staling and abnormal development of the mycelium occurred in proportion to the concn. of the substance used. K. D. Jacob

A systemic disease of red clover caused by *Botrytis anthophila-anthophilthophila* Bond. R. A. Silow. *Trans. Brit. Mycol. Soc.* 18, 230-48(1933).—When the fungus was grown on Dox's synthetic medium the mycelium was very irregular and very frequently septate into short cells which were often swollen to approx. twice the diam. of the mycelium; spores were formed less abundantly than on prune and malt agars. On peptone agar there was much less development of mycelium both in and above the substratum; conidia were less abundant, frequently formed below the surface, and a large proportion of them were irregular in shape. K. D. Jacob

Regularity in the biosynthesis of plants. V. I. Nilov. *Sotsialistich. Rastenievodstvo* (Plant Ind. U. S. S. R., Lenin Acad. Agr. Sci., Inst. Plant Ind.) Ser. A, No. 7, 3-34(1933).—N. investigated the regularity in the dynamics of the accumulation and conversion of oils in a no. of plants with the purpose of establishing the mechanism of the synthesis of these oils. In the synthesis of these oils, parallel with the process of oxidation, a process of isomerization takes place. An examn. of the oil of *Trachispermum copiticum* during the various stages of its vegetative

period has shown that isomerization, accompanied by oxidation, takes place from terpenes through *p*-cymene to thymol. He investigated a series of other plants and presents data on *Lavandula vera* and *L. spica*, *Rosmarinus officinalis* and *Poenicium officinalis*. The plants obtained from various geographical regions were grown and analyzed botanically and agronomically and chemically-technologically over a no. of years. Within the specie, the varieties showed no marked differences in the quantity of oil nor in quality; the hybrids showed differences both in quantity and quality. N. attempts to bring out the regularity in the chem. attributes of the oils, making it possible to classify these plants on the basis of their chem. constancy. By this method the law of homologous series, established by Vavilov, may be proved. N. denies the contention of Blagoveshchenskiĭ that with the phylogenetic aging of the plant the no. of cyclic compds. increases. J. S. Joffe

Determining the condition of winter grains by the conductivity of their tissues. S. M. Ivanov. *Sotsialistich. Rastenievodstvo* (Plant Ind. U. S. S. R., Lenin Acad. Agr. Sci., Inst. Plant Ind.) Ser. A, No. 7, 49-50(1933).—1. detd. the cond. of the juices of plants subjected to various freezing temps. It was found that long before a casual examn. can detect injury there is a change in cond. With the injury the resistance drops, decreasing with the degree of injury. The next step was to use the plant tissue in place of the plant juices and the same results were obtained. A special type of cell was made to accommodate the plant material. The difficulty and tediousness of obtaining the same weight of material for every detn. make this method not strictly quant., but the tendencies are well expressed. The different varieties of any grain show a different behavior with respect to cond. It was possible to det. which of the varieties was subject to more or less injury. J. S. Joffe

A laboratory method of determining the drought resistance of plants. M. T. Timofeeva. *Sotsialistich. Rastenievodstvo* (Plant Ind. U. S. S. R., Lenin Acad. Agr. Sci., Inst. Plant Ind.) Ser. A, No. 7, 69-74(1933).—Seeds to be examd. are partially germinated between filter paper, placed in a 2 M soln. of sugar, kept there for 6 days, and then plated in sand cultures. The sugar soln. exts. the water and the more drought-resistant plants seem to be able to withstand the soaking in the sugar soln., as exhibited by continuing their growth when placed in sand cultures. J. S. Joffe

Changes in the living plant cell as a result of the action of chemical agents. I. Ultramicroscopic observation of the cells of *Allium cepa*. M. N. Melsel. *Bull. acad. sci. U. R. S. S., Classe sci. math. nat.* 1933, No. 7, 985-95(in German 995-6).—The nuclei of the living cells of the epidermis of *Allium cepa* show in the dark field transitions from a light opalescence to well-formed granulations. In the limits of physiol. conditions the reduction of the activity causes the nuclei to become homogeneous and approx. optically empty. Narcotic substances of the type of alc. and  $\text{CHCl}_3$  cause an increase of opalescence and granulation of nuclei. The nuclei of dead cells differ from the live ones, under narcosis, by their whiter color and coarse lumpy contents. KCN and arsenic acid cause the same nuclear changes. V. D. Karpenko

The influence of boron and other accessory elements on the development of flax. M. Ya. Shkolnik. *Bull. acad. sci. U. R. S. S., Classe sci. math. nat.* 1933, No. 8, 1163-88.—Normal plant growth of flax was obtained when there were added per l. of nutrient mixt.: B 0.5-1 g., Mn 0.0015 g., Al 0.0005 g., Cu 0.000125 g. and I 0.00025 g. None of these elements improved the growth of flax when B was absent. V. D. Karpenko

Determination of the acids of plant tissue. II. Total organic acids of tobacco leaf. Geo. W. Pucher, Hubert Bradford Vickery and Alfred J. Wakeman. *Ind. Eng. Chem., Anal. Ed.* 6, 140-3(1934); cf. C. A. 27, 4274.—Plant org. acids can be extd. with ether if acidified with  $\text{H}_2\text{SO}_4$  to  $p_H$  of 1. They are then detd. by electrometric titration. Amy Le Vesconte

Permeability in large plant cells and in models. W. J.

V. Osterhout. *Ergebnisse Physiol.* 35, 968-1021(1933).—A review. C. M. McCay

A study of *Endomyces capsulatus* (Reybridge, Dodge and Ayers). A causative agent of fatal cerebrospinal meningitis. Morris Moore. *Ann. Missouri Bot. Gardens* 20, 471-568(1933).—Expts. with 29 different media on which to grow the organism indicate that H-ion concn. influences growth as shown by thin hyphae and numerous conidia on acid media and thick-walled, shorter cells on alk. media. Optimum  $p_H$  for growth is 7.4, with no growth at  $p_H$  greater than 9.3 or less than 8.3. Optimum growth temp. is 25°, with no growth above 37° or below 8°. The carbohydrates used cause no acid or gas to be formed, and require a variation in time for production of alk. Gelatin is slowly liquefied. Under proper conditions, indole and skatole reactions are present. Light, white or red, has no effect on the organism. Certain dyes affect growth; others do not. N. M. Naylor

Sources of carbohydrate for germination and growth of orchid seedlings. F. Lyle Wynd. *Ann. Missouri Bot. Gardens* 20, 569-81(1933); cf. C. A. 27, 5374.—The relative growths of orchid seedlings over a period of 8 months, observed on sugars each added to 3 inorg. media in amts. to give 7 g. C per l., were  $d$ -mannose >  $d$ -glucose > maltose >  $d$ -fructose > sucrose > raffinose. No growth was obtained on  $d$ -galactose,  $l$ -arabinose,  $l$ -rhamnose and  $l$ -xylose. The mineral nutrient medium of La Garde plus  $d$ -mannose is considered the best symbiotic culture medium for orchids. N. M. Naylor

Kinetics of photosynthesis and allied processes. E. C. C. Baly and L. B. Morgan. *Nature* 133, 414(1934).—Math. equations are developed which show the effect of chlorophyll concn., light intensity and concn. of hydrated  $\text{CO}_2$  on the rate of photosynthesis. The equations agree well with the data of Emerson (C. A. 23, 3729) and Warburg (C. A. 14, 2361). The final equation is identical with the Michaelis equation for enzyme action. Gerald M. Petty

Growth rate and radiosensitivity in *Triticum vulgare*. P. S. Henshaw and D. S. Francis. *J. Cellular Comp. Physiol.* 4, 111-22(1933). T. H. Rider

Chemical investigation of the corns of *Arisaema triphyllum* (L.) Schott. Leo Marion. *Can. J. Research* 10, 164 9(1934).—The dried and ground corns lost 5% of their weight when extd. with petr. ether, and a further 0.9% on subsequent extn. with MeOH. Besides a trace of an essential oil, the MeOH ext. yielded water-sol. and water-insol. portions. The former contained an acid,  $\text{C}_{18}\text{H}_{32}\text{O}_8$ , m. 184°;  $\alpha$ -inositol,  $\text{C}_6\text{H}_{12}(\text{OH})_6$ , m. 224°; a sugar-forming phenylglucosazone; and a cryst. substance,  $\text{C}_{11}\text{H}_{16}\text{O}_4$  or  $\text{C}_7\text{H}_{12}\text{O}_4$ , m. 120°, exhibiting the properties of a lactone. In the water-insol. portion combined with the petr. ether ext., the following substances have been found present: myricyl alc.,  $\text{C}_{30}\text{H}_{60}\text{O}$ , m. 82-83°; a new sterol, arisacsterol,  $\text{C}_{30}\text{H}_{50}\text{O}_2$ , m. 135°; phytosterolin,  $\text{C}_{28}\text{H}_{48}\text{O}_2$ , m. 207°; and a mixt. of fatty acids. J. W. Shipley

A contribution to the chemistry of tomato pigments The coloring matter in American red and purple tomatoes (*Lycopersicon esculentum*). M. B. Matlack and Charles B. Sando. *J. Biol. Chem.* 104, 407-14(1934); cf. C. A. 28, 836.—The pigments from Italian-grown red, American-grown red and American-grown purple tomatoes were extd. with  $\text{CS}_2$ , pptd. with 3 vols. EtOH and recrystd. from a mixt. of  $\text{CS}_2$  and petr. ether in an atm. of N. The pigments were chemically and spectrographically identical. K. V. Thimann

Chlorophyll production under various environmental conditions. Gus B. Ulvin. *Plant Physiol.* 9, 59 81(1934).—The production of chlorophyll by radish and soybean plants grown in quartz sand in a greenhouse with Davidson's 4-salt nutrient soln. (*Proc. A.M. Soc. Hort. Sci.* 25, 354 (1928)) under conditions of (1) a short light period (10 hrs. daily), and (2) continuous light as supplied by natural daylight supplemented by three 1000-w. Mazda lamps was greater under conditions of continuous light. The chlorophyll content of sweet corn (Golden Bantam) grown in quartz sand in a 3-salt soln. with  $\text{Ca}(\text{NO}_3)_2$  as the source of N was increased by the addn.

of 1 p. p. m. Fe. No increase of chlorophyll was produced by addn. of 1 p. p. m. Mn; although it is recognized that impurities in the sand may have been disturbing factors.

Walter Thomas

**Responses of Kentucky blue grass to variations in temperature, light, cutting and fertilizing.** Chester M. Harrison. *Plant Physiol.* 9, 83-106 (1934).—The plants were grown under greenhouse conditions in white quartz sand with Jones and Shive's nutrient soln. (C. A. 15, 3659). Rhizomes of plants left uncut during the bright cool days of spring, early summer and early fall and continuously supplied with N gradually emerged into the light with the advent of the short cloudy days of late fall and winter. But if the amt. of N was limited or the light increased these rhizomes remained below the soil level, became stockier and new ones produced. A decreased supply of N resulted in decreased top growth relative to roots and rhizomes. The addn. of N during periods of short and frequent cutting at high temps. (80-100°F.) resulted in decreased growth because of the using up of available carbohydrates stored in the rhizomes, and in ultimate death provided carbohydrates were not made available through the activity of addnl. leaf area.

Walter Thomas

**Greenhouse studies on growth of Kentucky blue grass.** C. M. Harrison. *Bull. U. S. Golf Assoc., Green Section* 13, 23-39 (1933); cf. preceding abstr. K. D. J.

**Certain poisonous plants of Wyoming activated by selenium and their associates with respect to soil types.** O. A. Beach, J. H. Draize, H. F. Efron, C. S. Gilbert and O. C. McCrory. *J. Am. Pharm. Assoc.* 23, 947 (1934).—Several poisonous range plants owe their toxicity at least in part to Se. *Astragalus bisulcatus*, *A. grayi*, *A. pectinatus*, *Xylorhiza parryi*, *Onoposis condensata*, *Stanleya bipinnata* and *Mentzelia decapetala* contain Se. If grown on certain slate formations such plants also possess an offensive odor. Poisonous plants growing on the Niobrara, Steeple or Pierre shales are more toxic to stock than the same species on other formations. The root systems contain less Se than the above-ground portions of the plants. On the air-dry basis Se may amount to 0.1%. It is not known whether most of these species would be poisonous to stock if Se-free. *Astragalus bisulcatus* is toxic to animals if Se-free but much less so than otherwise. *Xylorhiza parryi* has not been found to be Se-free. In this plant the Se is probably combined with a toxic, saponaceous compd. Certain plants have a selectivity for Se, while others on the same soil do not take it up.

L. B. Warren

**Chemistry of mold tissue. IV. The lipides of *Aspergillus sydowi*.** F. M. Strong and W. H. Peterson. *J. Am. Chem. Soc.* 56, 952-5 (1934); cf. C. A. 27, 3237. Extn. of dried *Aspergillus sydowi* with EtOH-Et<sub>2</sub>O (1:1) gives 12% of a dark red liquid, contg. 22% free acid; this oil has  $d_{20}^{25}$  0.9198,  $n_D^{25}$  1.4682, I no. 114.4, sapon. no. 169.5, acid no. 43.4, ester no. 126.1, insol. acids 80.8%, volatile acids 0.46%, unsaponifiable 8.18%, P 0.26%, N 0.39%. The phospholipide was sepd. by pptg. with EtOH-MgCl<sub>2</sub> in Me<sub>2</sub>CO at -4°; purification by pptn. from CHCl<sub>3</sub> by Me<sub>2</sub>CO and treatment with MeOH-NH<sub>3</sub> gave a light brown product with P:N:Mg = 1.2:2. The Me<sub>2</sub>CO mother liquor contains an oil with 0.028% P, designated "simple lipides"; sapon. with 5% EtOH-KOH in N atm. gives C<sub>18</sub>H<sub>34</sub>(OII)<sub>2</sub> and oleic (I), linoleic (II), palmitic (III), stearic (IV) and tetracosanic acids (V). Ergosterol was isolated from the unsaponifiable material. The simple lipides contain 80.8% fatty acids, 0.46% volatile acid (calcd. as PrCO<sub>2</sub>H), 22.6% satd. acids (8.8% III, 11% IV and 0.9% V), 52.9% unsatd. acids (29.6% I, 16.3% II and 1.7% higher acids), 8.18% unsaponifiable (5.36% total sterols), 4.2% glycerol.

C. J. West

**Chemical composition of the fat produced by *Penicillium javanicum* van Beijma.** Geo. E. Ward and Geo. S. Jamieson. *J. Am. Chem. Soc.* 56, 973-5 (1934).—*Penicillium javanicum* van Beijma was cultured on 20% glucose soln. at 30°; 6240 g. of dried mycelium, extd. with petr. ether, gave 691 g. (11%) of orange-colored oil, with the following characteristics: solidification pt. 6-7°, m. p. 15°,  $d_{20}^{25}$  0.9145,  $n_D^{25}$  1.4680, acid value 10.6, sapon. value 191, I value (Hanus) 84, Reichert-Meissl value 0.3, Ac value

10.7, unsaponifiable matter 2%, satd. acids 30.8%, unsatd. acids 60.8%, m. p. of mixed satd. acids 52.5°. The unsatd. acids gave only stearic acid on hydrogenation and contain 52.1% oleic and 47.9% linoleic acids (percentage of acid in oil, 31.7 and 29.1, resp.); the satd. acids consist of 69.5% palmitic, 28% stearic and 2.5% of tetracosanic acids (percentage of acid in oil, 21.4, 8.6 and 0.8, resp.). This oil is entirely different from the fat isolated from a *Citromyces* by Browne (*J. Am. Chem. Soc.* 28, 465 (1906)).

C. J. West

**Nucleic acid of rye ergot.** M. Gatty-Kostyal and J. Tesarz. *Wiadomości Farm.* 61, 17-19, 31-2 (32 in French) (1934); *Bull. intern. acad. Polonaise, Classe sci. math. nat.* 1933B, I, 1-12 (in French).—Older findings that ergot contains large amts. of P (45-51% of the ash) induced G. and T. to verify the analyses and to identify the P compds. present. Ergot contains 1.40-1.60% P<sub>2</sub>O<sub>5</sub>, based on the dry wt. of the substance, which is distributed as follows: lecithinic 0.096-0.118%, total sol. 1.01-1.14%, nucleic 0.29-0.32%. Nucleic acid, C<sub>10</sub>H<sub>14</sub>N<sub>11</sub>O<sub>10</sub>P<sub>3</sub>, was demonstrated by P and N detns. and by color reactions.

J. Wiertelak

**Physiology of the leaf-roll disease of potatoes.** W. Ruhland and K. Wetzel. *Ber. Verhandl. Sachs. Akad. Wiss. Leipzig, Math.-phys. Klasse* 85, 141-9 (1933). Dextrin and reducing sugars were detd. by the methods of Lehmann (C. A. 26, 3812) and of Kerstan (C. A. 27, 3898). In leaves and in dormant and sprouted tubers of diseased plants there was always found a far higher dextrin, and lower sugar content than in the healthy plants. The diastase activity was much lower in the diseased leaves.

J. J. Willaman

**Plant sap and juice. I. Hydrogen-ion concentration and other data.** Arthur W. Barton. *Trans. Kansas Acad. Sci.* 36, 72-5 (1933). The sap from 20 species of trees growing at Hays, Kansas, was tested for pH values in 1932. All saps were acid, with an av. of about 6. The same held for a no. of herbaceous plants, *Oxalis* having the lowest, 1.8. No values above 7 were found. II. Data obtained in the spring of 1933. L. A. Breunen, Raymond Darland, Floyd M. Lee and A. W. Barton. *Ibid.* 76-7. All phanerogam saps were slightly acid. Studies on the grape (*Vitis palmata*) during the month of March showed that much moisture in the soil favors the flow of sap; that the flow is more copious when the air is warmer; and that the flow ceases when the buds burst.

## E- NUTRITION

PHILIP B. HAWK

**Calcium and phosphorus metabolism in rhizomelic spondylosis.** J. Morelle and J. Steenhoudt. *Rev. belge sci. méd.* 4, 623-39 (1932).—In 3 males suffering from spondylosis and receiving diets contg. less than 0.15 g. of Ca daily, but otherwise adequate, the serum Ca was 15.1, 11.6 and 10.5 mg. per 100 cc., resp. Plasma inorg. P was normal in all and there was a neg. Ca balance up to 0.7 g. in three-day periods, while a virtual equil. in P existed. In one case the hypercalcemia was controlled by low Ca. Irradiation of the spine caused no difference in mineral balance. Amelioration was produced in 2 cases, but activity of the disease recurred.

B. C. A.

**Calcium content of cow blood. I. Effect of feeding cod-liver oil.** W. L. Little and E. C. V. Mattick. *Vel. Record* 13, 238-45 (1933).—Although it leads to slight increase in the av. value for total and diffusible Ca and

P in the serum, administration of cod-liver oil (I) (4 oz. per day for 11-51 days *ante partum*) has no effect on the fall in the Ca content of the blood which occurs at calving. This fall is relatively greater in the diffusible fraction. Low values persist during 2-3 days *post partum*; I has also no effect on the fall in the P content of the blood which occurs at calving. Again the fall is relatively greater in the diffusible fraction. The return to normal value of P is almost always complete in the first 2 or 3 days. A simple technic for the detn. of diffusible Ca and P is given. B. C. A.

Vitamin D content of vegetable oils. T. Berzaczky and K. Rupilius. *Wien. klin. Wochschr.* 45, 1156-8 (1932).—Olive oil and a vegetable table oil contained prophylactic quantities of vitamin D for rats; they had also some therapeutic effect. B. C. A.

Influence of diet on the urinary excretion of oxalic acid and protective colloids in man. K. Eimer and H. Bartels. *Z. klin. Med.* 122, 1-22 (1932).—Normal daily urinary excretion of  $H_2C_2O_4$  in man is 12-20 mg.; it is independent of the vol. of urine and under the same dietary conditions is nearly const. in individuals. Raw vegetable diets increase the quantity 2-3 times; spinach and tomatoes have a particularly marked effect, although the  $H_2C_2O_4$  content of tomatoes is small compared with that of spinach. A raw vegetable diet diminishes, and a protein diet increases, the amt. of protective colloids in the urine. Cooking of food has no influence on the effects. B. C. A.

Changes in the blood picture in vitamin A deficiency. Th. Hart de Ruyter. *Nederland. Tijdschr. Geneeskunde* 77, 11, 2672-9 (1933).—Vitamin A-deficient rats, if not infected with *Bartonella*, show no anemia. But if this infection occurs after 5 months of vitamin A deficiency, a fatal anemia of the hyperchromic type occurs, as a result of the atrophy of the entire lymphoid system which appears in prolonged vitamin A deficiency. This atrophy leads to lymphopenia and to a decrease of the size of the spleen and thymus gland. R. Bentner

Amount and cost of salt for livestock. V. Buenacmino. *Sugar News* 15, 25 7 (1934).—The value of salt in the diet is reviewed and the proper rations are established for farm animals. L. Cusachs

Assay of vitamin A. J. B. Orr and M. B. Richards. *Nature* 133, 255 (1934).—"In carrying out a series of assays, by the curative method, of the vitamin A content of various samples of fish oils and dried milk, it was found that in a large proportion of cases the wt. curve did not give a reliable indication of the state of depletion of the vitamin A stores of the animal, and that increase in wt. after administration of a supplement could not always be ascribed to its vitamin A content. The evidence which has been obtained shows that when vitamin A is the only known factor absent from the diet, there is no cessation of growth, if growth is interpreted as increase in size. This has been detd. by measurements of length of the body in the live animal, and by comparison of the lengths of the bones, measured post-mortem, with Donaldson's values for the standard rat. It would appear that vitamin A has no greater claim to be considered essential for growth *per se* than any other of the many factors which are responsible for increase in wt. The characteristic loss in wt., which has been termed 'cessation of growth,' appears to be due entirely to pathol. conditions arising from the vitamin A deficiency. Even in animals killed at a stage when they are still increasing in wt., these conditions may be found on macroscopic examn. The diversity of the pathol. symptoms which may arise during the preliminary 'depletion' period makes it impossible to secure uniformity in the exptl. animals at the beginning of the test period. This constitutes a source of error which makes the curative method of vitamin A assay of doubtful value. It seems probable that the various discrepancies so frequently reported in such assays may find their explanation in the above observations." F. L. Dunlap

Occurrence of antirachitic vitamin in green plants. Ottar Rygh. *Nature* 133, 255 (1934).—Meadow hay,

consisting of Gramineae and some clover, which had been dried at 68° for 2 hrs. was investigated. Daily doses of 4 mg. of an  $Et_2O$  ext. cured rickets (method of Poulsson and J. Svenskjöld), showing the same antirachitic effect as a high-quality cod-liver oil, contg. about 250 Oslo units of vitamin D per g. This corresponds to 0.25 unit vitamin D per g. of hay powder. On treatment with alc. KOH, 8 g. of the  $Et_2O$  ext. yielded 0.508 g.  $Et_2O$ -sol. unsaponifiable matter. This was dild. with inactive peanut oil to make 8 g. With this soln., it was necessary to use 20 mg. in order to obtain the same antirachitic effect as was found in the  $Et_2O$  ext. before sapon. Vitamin D in green plants shows, accordingly, the characteristics described by Kon and Booth for vitamin D in butter, which is markedly different from the vitamin D of cod-liver oil and that obtained by ultra-violet irradiation of ergosterol; whereas 80% of the vitamin D in butter is lost by the usual sapon., this is not the case with vitamin D from the other 2 sources. Tintometric readings of the peanut-oil soln. of the unsaponifiable matter gave 10 blue units. Twelve hundred yellow and 20 red units were recorded as self-color on the Lovibond tintometer. F. L. Dunlap

Comparative nutritive values of dry matter in silage and fodder. A. D. Weber and W. E. Connell. *Kans. Agr. Expt. Sta., Director's 6th Biennial Rept.* 1932, 57.—Atlas sorgo dry fodder plus cottonseed meal was compared with Atlas sorgo silage with cottonseed meal. On a dry-matter basis, the silage contained 2.82% less reducing sugar, 1.54% less crude protein, 0.304% less true protein, 0.038% more free amino-N and 2.12% more N-free ext. than the ground fodder. The apparent digestibilities of the dry fodder and silage were practically identical at 73-73%. C. R. Felle

The relation between vitamin A metabolism and susceptibility to diphtheria toxin. Calvin C. Torrance. *Am. J. Hyg.* 18, 375-92 (1933).—The survival time of guinea pigs after an injection of diphtheria toxin was not increased by feeding increased amts. of vitamin A. A high degree of correlation was found between the vitamin A stored in the livers and the survival time, but no such relation existed between these stores and the amt. of vitamin A fed except with animals raised on an A-deficient diet. S. B. Foster

Increase in hepatic protein by a diet containing a natural mixture of amino acids. C. Gautier. *Bull. soc. chim. biol.* 15, 1563-5 (1933), cf. C. A. 26, 5128.—Frogs were fed pills consisting of crepsin, peptone, glucose, butter, salts and yeast ext. in the manner previously described. Their livers increased to about 2.25 times their original wt. The protein percentage of the livers decreased but the total wt. of liver protein increased 90-125%. L. E. Gilson

Do carbohydrates favor the development of experimental xerophthalmia? G. Mouriquand and Mme. P. Chaix. *Compt. rend. soc. biol.* 115, 528-30 (1934).—Rats on vitamin-A-deficient diets high and low in carbohydrates developed xerophthalmia after the same no. of days. L. E. Gilson

Influence of massive doses of vitamin A on animals on a normal diet. A. Chevallier, J. Cornilant, P. Chabre. *Compt. rend. soc. biol.* 115, 541-3 (1934).—Rats kept 45 days on a diet contg. 3200 times their normal requirement of vitamin A (an ext. of cod-liver oil was used) lost a little wt. but otherwise appeared healthy. Guinea pigs kept 50 days on a diet contg. 100 times their normal requirement of vitamin A gained wt. and appeared particularly vigorous. When the daily dose was increased to 3200 times their normal requirement they lost wt. and appeared miserable but no lesions were produced. Influence of massive doses of vitamin A on animals previously deprived of vitamin A. *Ibid.* 543-4.—When rats and guinea pigs in an unhealthy state from lack of vitamin A were given large doses of vitamin A (cod-liver oil ext.) their condition became worse and many of them died in a few days. L. E. Gilson

Lactic acid oxidation in the brain of hens suffering from avitaminosis B. P. E. Galvão and C. H. Florence.

*Arch. ges. Physiol.* (Pflügers) 233, 714-21(1934).—The ability of the brain tissue of hens to oxidize lactic acid is markedly decreased in avitaminosis B. The oxidation of succinic acid is unaffected. The accumulation of lactic acid in the brain may thus account for certain symptoms of avitaminosis B. Arthur Grollman

**Vitamin D milk from yeast-fed cows.** R. A. Woelffer. *Cornell Veterinarian* 23, 313-24(1933).—When cows that yielded an av. of 30 lb. milk daily were fed 10 oz. irradiated yeast (30-D potency) per day the milk had a vitamin D potency of 160 Steenbock units per qt. Fifteen references. K. D. Jacob

**Wool growth in sheep as affected by the carbohydrate content of the diet.** A. H. H. Fraser and J. E. Nicholls. *Empire J. Exptl. Agr.* 2, 9-19(1934).—Addn. of 200-500 g. corn starch daily to a basal ration of linseed-cake meal, turnips, oat straw and minerals caused a significant increase in the body wt. and gross fleece wt. of young Cheviot sheep. The increase in gross fleece wt. was reflected in the wt. of clean wool; this increase was due to a definite increase in fiber thickness, a slight increase in fiber length, and possibly also to an increase in the proportion of follicles actively elaborating fibers. It is suggested that the influence of starch in increasing wool production is due to the protein-sparing action of carbohydrates, thereby permitting the protein in the diet to be used for wool production rather than as a source of energy. K. D. Jacob

**Mineral metabolism. XXVII. The effect of two different calcium:phosphorus ratios upon the growth of calves.** P. J. du Toit, A. I. Malan and J. W. Groenewald. *Onderstepoort J. Vet. Sci.* 1, 421-4(1933); cf. C. A. 27, 5381.—Altering the CaO:P<sub>2</sub>O<sub>5</sub> ratio between the limits 1:0.3 and 1:1.4 had no significant effect. K. D. Jacob

**The chemistry of vitamins A and C.** Paul Karrer. *Chem. Rev.* 14, 17-30(1934).—A brief review. I. K.

**Digestion of fat.** II. The calculation of the digestive coefficient of fat. Shigeo Suzuki. *J. Agr. Chem. Soc. Japan* 9, 803-19(1933); cf. C. A. 28, 2758.—There is a relation between the digestive coeff. of the solid matter in the diet (x) and the ether-extractive matter of the dry feces which results from the fat-free diet (y), expressed by  $\log y = 0.09345(x - 88.1)$ . Hence the true digestive coeff. is calculated by subtracting y from the ether-extractive matter of the feces. This method was tested by animal expts. in which pure tristearin was given and the quantity of stearic acid in the feces was detd. The difference was only 0.5-1.5%. Y. Kihara

**The yellow color of the milk of goats deprived of the thyroid.** H. Fasold and E. R. Heidemann. *Z. ges. exptl. Med.* 92, 53-6(1933).—Normal goat butter contains vitamin A but no carotene. After thyroidectomy vitamin A is absent and large amts. of carotene are present. The lowered metabolism limits the change of carotene to vitamin A. Milton Levy

**The antagonism between vitamin A and thyroxine.** II. Fasold and H. Peters. *Z. ges. exptl. Med.* 92, 57 (1933).—Hypervitaminosis A in rats can be prevented or cured by thyroxine treatment. In exptl. thyrotoxicosis vitamin A restores normal growth. In this condition the liver stores carotene and vitamin A but not fat or glycogen. Milton Levy

**Fecal "fat" and its relation to fat in the diet.** A. Krakower. *Am. J. Physiol.* 107, 49-54(1934).—In human beings the I no. of the fecal lipins is uniform and unaffected by the degree of unsatn. of the dietary fat. There is comparatively little relationship between the amt. of fat in the diet and that recovered in the feces. J. F. Lyman

**Zinc in the nutrition of the rat.** W. R. Todd, C. A. Mvehjem and E. B. Hart. *Am. J. Physiol.* 107, 146-56(1934).—A ration low in Zn, contg. 1.6 mg. Zn per kg., caused interference with the normal fur development in rats fed thereon. The addn. of Zn accelerated the rate of growth. J. F. Lyman

**The vitamin A content of the livers of depancreatized dogs and its relationship to the symptoms occurring in**

**these animals.** R. P. Ralli, G. Pfau, P. Joffe and G. Stueck. *Am. J. Physiol.* 107, 157-63(1934); cf. C. A. 27, 2715.—The symptoms observed in dogs, whose pancreas glands have been removed, are not cured by the administration of vitamin A. J. F. Lyman

**Utilization of various carbohydrates by the depancreatized animal.** J. L. Bollman and F. C. Mann. *Am. J. Physiol.* 107, 183-9(1934).—Fifty g. of carbohydrate added to the basal diet of depancreatized dogs which received 6 units of insulin daily was completely recovered in the urine in those cases where digestion and absorption occurred. The following sugars, thus, are not utilized in the diabetic animal: glucose, galactose, corn starch, fructose and sucrose. Fructose appeared to be utilized at first but eventually all the fructose administered appears in the urine. Inulin is only slightly digested. J. F. Lyman

**The effect of diet, of insulin and of thyroxine upon the adrenaline content of the suprarenal glands.** II. A. F. Gohar. *J. Physiol.* 80, 305-13(1933).—A fat diet in the rat leads to a loss in the adrenaline content of the adrenals and to a decrease in the size of the glands. A carbohydrate diet also leads to a diminution of the absolute content of adrenaline with a slight loss in wt. of the glands. A protein diet has no effect. Repeated doses of insulin in small doses increase the wt. of the adrenals and their adrenaline content. In convulsive doses, insulin leads to a depletion of the adrenaline store. Repeated doses of thyroxine also lead to an increase in wt. and adrenaline content of the adrenals. J. F. L.

**The total fatty acids of the liver and of the blood after the administration of various fats.** G. Peretti and D. Tore. *Boll. soc. ital. biol. sper.* 8, 1429-33(1933).—The max. percentage increases in the liver fatty acids of rabbits produced by the following fats were: iodized fat (radiopol) 281.2, margarine 72.3, olive oil 46.5, sesame oil 40.6, poppy-seed oil 27.4, linseed oil 6.2. The max. increase occurred usually 9 hrs. after administration of the meal; after longer intervals the values decreased so that at the end of 72 hrs. the values approached those found in normal livers. The max. percentage increases in the blood fatty acids produced by the same fats were: 234, 161, 127, 90, 102, 282, resp. The max. values were found, in general, at a time when the fatty acid titer in the liver had shown a marked diminution. P. M.

**Parallelism between the course of avitaminosis C and the reducing power of the suprarenals of the guinea pig.** I. De Caro. *Boll. soc. ital. biol. sper.* 8, 1558-61(1933).—Guinea pigs were kept on a scorbutic diet. They were killed after 1, 2, 4, 10, 14 and 20 days, and the suprarenals extd. with 2.5% CCl<sub>3</sub>COOH. The reducing action of the clear exts. was detd. by Tillman's method with 2,6-dichlorophenolindophenol as indicator. The results show: (a) The reducing power of the suprarenals diminishes regularly and is a function of the duration of avitaminosis C; the diminution is very rapid during the early stages and gradual later (a hyperbolic curve). The decrease in wt. is very slow at first and rapid later. (b) The decrease in wt. becomes marked after the suprarenals have lost about 1/3 of their initial reducing power. (c) The total disappearance of reducing power of the suprarenal exts. precedes a few days the death of the animal from avitaminosis C. These results confirm the existence of a strict parallelism between the reducing power of the suprarenals and degree of avitaminosis C in the guinea pig. Peter Masucci

**The specific dynamic action of aliments. The behavior of glutamic acid administered to fasting pigeons.** Marco Stassi. *Boll. soc. ital. biol. sper.* 8, 1642-4(1933).—The specific dynamic action of glutamic acid in fasting pigeons is more than double that after the administration of the same substance to normal animals. P. M.

**Vitamin content of certain Italian cheeses.** Antonio Allegri. *Boll. soc. ital. biol. sper.* 8, 1574-8(1933).—Conclusions: (1) Pigeons treated with polished rice and with provolone or gorgonzola erborinato showed very attenuated symptoms of avitaminosis and survived much longer than the controls. No improvement over the

controls was shown by the pigeons receiving grana lodigiano, pannerone or pecorino Sardo. (2) Guinea pigs receiving a scorbutic diet plus the 5 mentioned cheeses showed no improvement over the controls: (3) Rats receiving a rachitic diet plus provolone showed a marked increase in wt. and recalcification processes; those receiving gorgonzola erborinato showed marked recalcification processes; slight recalcification was shown by the animals receiving grana lodigiano or pannerone and no effects were shown by those receiving pecorino. P. M.

**Studies of capillary resistance.** I. Lowered resistance due to vitamin C deficiency and other conditions in hospitalized patients. Paul Schultzer. *Acta Med. Scand.* 81, 113-32(1934).—The technic and special app. for detg. the capillary resistance are described. Among 149 patients taken at random 42 showed a lowered resistance. Of these 25 suffered from vitamin C avitaminosis, either originating before entering the hospital or resulting from the hospital fare. The lowered resistance was likewise observed in cases of gastric achylia in some of which vitamin C treatment brought about an improvement in the capillary resistance. In others no such improvement resulted even when HCl was also given. The remaining 17 patients with lowered capillary resistance, representing a variety of functional or systemic disorders, neither showed evidence of a vitamin C deficiency in their diet nor did they respond to treatment with vitamin C. S. Morgulis

**Biological value of the protein from peas.** I. P. and M. N. Chukichev. *Biochem. Z.* 268, 83-92(1934).—The authors' feeding expts. with the pea protein fractions (legumin, vicilin and legumelin) are contrary to the findings of Osborne and Mendel (*C. A.* 6, 3448, 7, 635), and of McCollum (*C. A.* 19, 2094) of the biol. inferiority of these proteins. S. Morgulis

**Vitamin C in invertebrates.** M. van Rekel. *Acta Brevia Neerland. Physiol., Pharmacol., Microbiol.* 3, 119-20(1933).—Ascorbic acid was determined by titration with 2,6-dichlorophenolindophenol before and after reduction with  $H_2S$ . Exts. from 13 marine invertebrates showed values before reduction ranging from 8 to 213 mg./kg.; after reduction from 41 to 687 mg./kg. Exts. of 7 marine plants showed values before reduction ranging from 62 to 675 mg./kg.; after reduction 394 to 770 mg./kg. In every case treatment with  $H_2S$  produced a definite increase in ascorbic acid content. J. C. M.

**Lyochrome and vitamin B<sub>2</sub>.** Erich Adler and Hans v. Euler. *Svensk Kem. Tids.* 45, 276-80(1933)(in German).—Macerated animal organs are extd. with acetone, and the acetone soln. is extd. with petroleum ether, which washed with  $H_2O$  gives an aq. soln. of the lyochrome from the tissue. Lyochrome in 80% MeOH is fluorescent and the relative degree of fluorescence is correlated with the vitamin G ( $B_2$ ) of the tissues. Flavin substances also occur in vegetable tissues known to be rich in vitamin G, e. g., yeast. A. R. Rose

**Vitamin A content of foods and feeds.** G. S. Fraps and Ray Treichler. *Tex. Agr. Expt. Sta., Bull.* 477, 34 pp.(1933); correction to *C. A.* 28, 1385.—The Bulletin no. should be 477. J. D. S.

**Studies on pregnant, puerperal and infant beriberi.** IV. Vitamin B content of various organs and secretions including blood, urine and embryo from pregnant or unmated rabbits fed on vitamin B deficient diets. Hitsuko Shin. *J. Chosen Med. Assoc.* 23, 423-40(1933); cf. *C. A.* 27, 4566.—The method of analysis used in III is extended to rabbits fed on deficiency diets. In these series, non-pregnant rabbits show a marked decrease of vitamin B content in the liver, brain and blood, and to a less degree in lung, heart and urine. The pregnant rabbits also show a great decrease, particularly in kidney and liver, as do the puerperal rabbits. V. Vitamin B content of the liver from very young rabbits. *Ibid.* 623-42 (English Abstract), 41-50(1933).—The vitamin B content of livers of the rabbits nursed by a mother fed on the deficient diet for only a short time during the puerperium or pregnancy is less than that of the liver from the young nursed by the normally fed mother. S. Tashiro

**Effect of B-avitaminous diets on pregnancy.** Hitsuko Shin. *J. Chosen Med. Assoc.* 23, 968-72 (English Abstract 76-7)(1933).—In rabbits, lack of vitamin B in the first half of pregnancy produces a miscarriage. Similar deficiency in the latter half of pregnancy gives normal delivery but the young have very low vitality. The effect of B-avitaminous diets on the estral cycle of female mice. *Ibid.* 973-6 (English Abstract 77).—If female mice are fed on avitaminous-B diets for 4-13 days, estrum disappears. If 3-5 units of folliculin are given at this time, the estral cycle reappears. This break in the estral cycle in vitamin B deficiency is brought about directly by a lack of ovarian hormone, and not by the avitaminosis B itself. S. Tashiro

**The diet of infants.** J. H. Burn. *Pharm. J.* 131, 737-9(1933).—A discussion, with detailed directions. S. Waldbott

**Physiologic activation of milk (Supplee, Dorcas) 12.** Ring-system of sterols and bile acids (Rosenheim, King) 10. Carotene (Smith, Milner) 10. Oxidation-reduction relations and a color reaction for lactoflavin (vitamin  $B_2$ ) (Kuhn, Wagner-Jauregg) 10.

## F—PHYSIOLOGY

\* HOMER W. SMITH

**Loss of sensitivity to anterior pituitary-like hormone of pregnancy urine.** II. Selye, J. B. Collip and D. L. Thomson. *Proc. Soc. Exptl. Biol. Med.* 34, 487-8 (1934).—Zoudek (*C. A.* 25, 2766) and others found that under the prolonged daily injection of exts. contg. the anterior pituitary-like hormone (A. P. L.) of pregnancy urine the rat ovary at first became greatly enlarged and later decreased in wt. The ovaries of 8 out of 10 rats which had been injected with 200 units of A. P. L. daily for 4 months were normal in size and had lost their sensitivity to the hormone as evinced by the absence of luteinization. In 4 similarly treated rats the daily injection of an aq. ammoniacal gonadotropic ext. of pig pituitary in addn. to A. P. L. caused great enlargement of the ovaries and the formation of many fresh corpora lutea. C. V. Bailey

**Influence of the uterus on ovary and mammary gland.** Hans Selye. *Proc. Soc. Exptl. Biol. Med.* 31, 488-90 (1934).—In 10 pregnant rats, during the 2nd half of gestation, the uteri were emptied and the spaces filled with paraffin (m. p. 42°). During the succeeding 6 weeks only 2 of these animals came to estrus; the ovaries weighed 75-100 mg. and contained many large corpora lutea such as are found during gestation; the pituitary gland weighed 11-17 mg.; the mammary glands were completely involuted. In control animals in which the uterus was not filled with paraffin normal estrus set in on the 3rd day, the ovaries weighed 40-45 mg., the corpora lutea of gestation shrank rapidly, the pituitary gland weighed 7-8 mg. and lactation occurred. In 10 other rats the distention of the uterus with paraffin stopped normal postpartum lactation and caused involution of the mammary glands. C. V. Bailey

**Survival of adrenalectomized rats after cortical hormone treatment.** Robert Gaunt and Jo Howland Gaunt. *Proc. Soc. Exptl. Biol. Med.* 31, 480-3(1934).—Approx. 50% of adrenalectomized rats survived for 30 days or longer after the withdrawal of prolonged treatments with cortical hormone; not more than 5% of the untreated animals survived. Cortical accessories capable of hypertrophy are present in many rats; the administration of cortical hormone causes a higher survival rate by allowing time for the cortical rests to hypertrophy. C. V. B.

**Glycogen and fat contents of liver in pregnant albino rats.** Carbohydrate metabolism in pregnancy. O. Bokelmann and W. Scheringer. *Arch. Gynäkol.* 152, 562-72(1933). In pregnancy the abs. value for the liver glycogen is greater and the relative value less than in the normal animal. The abs. liver fat is also on the av. higher in pregnancy, but the distribution is about the same as in the nonpregnant animal. Generally, there is evidence of

glycogen-fat antagonism in the livers of pregnant animals. Liver glycogen varies widely in different animals, but is related inversely, while liver fat is related directly, to the duration of pregnancy. Increased consumption of carbohydrate occurs in pregnancy. B. C. A.

Physiological variations in the concentration of various sugars in human milk. M. Polonovski, A. Lespagnol and H. Warembohr. *Compt. rend. soc. biol.* 107, 303-5 (1931).—Variations in concn. of the three forms of lactose are at first inconsiderable; after several months that of gylactose and that of the sugar sol. in MeOH appear to fall. B. C. A.

Action of the testicular hormone on cockscombs and seminal vesicles. K. Matsuzaki. *Proc. Imp. Acad.* (Tokyo) 9, 342-4 (1933).—Hormone preps. from male urine, active in promoting comb growth (I), showed no activity on the vesicles of rats (II). The testicular hormone (III) from pigs, on the other hand, showed activity in respect to both (I) and (II), although on treatment with  $KMnO_4$  in  $Me_2CO$  soln. (II) was no longer apparent. (III) is therefore considered to contain two different hormones. B. C. A.

Male hormone from pig testicles. A. Ogata and S. Hirano. *Proc. Imp. Acad.* (Tokyo) 9, 345-6 (1933).—An improved method for the isolation of the testicular hormone is described. Sapon. with 10% KOH in EtOH almost, oxidation with  $KMnO_4$  in  $Me_2CO$  soln. completely, destroyed the gonadotropic activity of the preps. B. C. A.

Approximation of certain components of the ash of the milk of cow and sheep to those of blood. F. E. Nottbohm and K. Philipp. *Z. Unterschl. Lebensm.* 65, 551-61 (1933).—With increasing Cl content, Na in cow milk regularly increases, K remains const. and the alkali no. diminishes until a crit. Cl content of approx. 0.2% is reached, when Na becomes irregular, K and the alkali no. fall to the value for blood, while the initial relation  $Cl > Na$  becomes, as in blood,  $Na > Cl$ . In sheep blood with high Cl the approximation of the ash constituent to those of the ash of blood is still more marked. The crit. Cl content marks the breakdown of the selective secretory activity of the alveolar cells with respect to blood constituents. B. C. A.

Studies of the blood in normal pregnancy. II. Hemoglobin, hematocrit and erythrocyte determinations and total amount of variations of each. Wm. J. Dieckmann and Carl R. Wegner. *Arch. Internal Med.* 53, 188-207 (1934); cf. C. A. 28, 1745<sup>2</sup>. III. Hemoglobin and cell volume coefficients; erythrocyte volume, hemoglobin content and concentration; color, volume and saturation indexes. *Ibid.* 345-52. IV. Percentages and grams per kilogram of serum protein and fibrin and variations in total amount of each. *Ibid.* 353-66. J. B. Brown

The digestion of beef proteins in the human stomach. Ernest J. Malby. *J. Clin. Investigation* 13, 193-207 (1934).—Peptic hydrolysis of beef proteins occurs rapidly in the human stomach; the rate of digestion varies widely in different individuals and in the same individual under different conditions. Patients with pernicious anemia fail to show appreciable gastric digestion of proteins; pepsin could not be demonstrated in such patients. Pepsin and acid secretion appeared to parallel each other under these conditions. The  $pH$  of the gastric contents varied from 1.23 to 0.63 in normal human beings. No patient with anemia had a  $pH$  below 5.75. The normal titratable acidity ranged from 151 cc. 0.1 N acid per 100 cc. to zero. Bile occurred in the stomach in 25% of the normal people and 18% of the subjects with anemia. J. B. Brown

The distribution of blood phosphorus after suppression of renal function. Alta Ashley and George M. Guest. *J. Clin. Investigation* 13, 219-35 (1934).—Renal function in rabbits and dogs, produced by intravenous injection of diphtheria toxin and  $HgCl_2$  and by bilateral ligation of the ureters, resulted in the following changes in the blood: increased org. phosphates, greater in the plasma than in the cells; increased inorg. acid-sol. P (ester P) in the cells; decreased Cl in both plasma and cells; increased

non-protein N. A reciprocal relationship exists between Cl and phosphoric esters as anions bound to alkali in the cells. J. B. Brown

Kidney function and blood pressure. H. C. A. Lassen and Erik Husfeldt. *J. Clin. Investigation* 13, 263-78 (1934). J. B. Brown

The lipemia of pregnancy. Eldon M. Boyd. *J. Clin. Investigation* 13, 347-63 (1934).—Discrepancies in former work on the lipemias of pregnancy may be explained by the fact that the lipide content of whole blood, plasma and red cells have not been followed simultaneously. This lipemia is due almost entirely to increase in plasma lipides. In plasma neutral fat begins to increase during the first trimester, followed by increase in phospholipide and cholesterol in the second trimester. At term neutral fat is most elevated (over 100%). With increase in total fatty acids no change in their compn. is evidenced by I no. J. B. Brown

Absorption of oxygen from the peritoneal cavity and the stomach. Indarjit Singhi. *Quart. J. Exptl. Physiol.* 24, 45-54 (1934).—In the decapitated dog the lungs are about 20 times more efficient in absorbing O than is the peritoneal cavity filled with pure O; and about 50 times more efficient than the stomach contg. 100 cc. O. In human subjects living in Rangoon the pulse rate in the prone position is always higher than in the supine. The cat stomach when filled with 100 cc. saline apparently slows the flow of fluid through the inferior vena cava when the animal is in the supine position. R. B.

"Fat-metabolism hormone" and hyperglucemia. Benjamin Harrow. *Science* 79, 272-3 (1934).—Preliminary work with an ext. of urine prep'd. according to Funk's method shows that a marked hyperglucemia comparable to that resulting from Doisy's exts. and a very definite increase in acetone in the blood can be produced. Rachel Brown

The female sexual hormone. XI. Constitution of the follicular hormone. 2. The degree of saturation and the aromatic character of the follicular hormone. Adolf Butenandt and Ulrich Westphal. *Z. physiol. Chem.* 223, 147-68 (1934); cf. C. A. 27, 4286.—Conclusive proof is now advanced that the follicular hormone is a 4-ring system with 3 conjugated double bonds in 1 benzene nucleus. Catalytic hydrogenation of the hormone hydrate gives a hexahydro deriv. which forms a cryst. triacetate, and, by removal of 1 OH, 2 by-products which are stereoisomeric diols, viz. hexahydrodesoxyhormone hydrate m. 152° and hexahydrodesoxyhormone hydrate, m. 162°, the ratio of these 3 products depending on the nature of the catalyst. The 2 diols form acetates, m. 84° and 131°, resp., and by distn. with  $KHSO_4$  in high vacuum yield the corresponding ketones  $C_{19}H_{28}O$  which form semicarbazones, m. 202.5° and 278.5°, resp. A 4th double bond is not present in the hormone, since all the hexahydro derivs. are stable to  $KMnO_4$ ,  $BzO_2H$ ,  $O_3$  and  $C(NO_2)_4$ . Detns. of mol. refraction corroborate the presence of 3 double bonds. The double bonds and the OH are on the same benzene ring as shown by color reactions for phenol, stability of the Me ether to hydrolysis, and absorption spectrum. The hormone forms an insol. addn. product with 1 quinoline, which decamps. 200°, gives a clear melt at 230°, and may be used for purposes of purification. Catalytic hydrogenation of the desoxyhormone gives a hexahydro deriv.  $C_{19}H_{28}O$   $H_2O$ , m. 80-90°, m. anhydrous 110°. The soly. of the hormone in  $H_2O$  is 2.1 mg. per l.; the dissocn. const. is  $K = 0.44 \times 10^{-9}$  and that of its hydrate is  $K = 0.77 \times 10^{-9}$ . Reduction of the hormone by the Clemmensen method, or of its semicarbazone by the Wolf-Kishner method, gives the desoxyhormone  $C_{18}H_{22}OH$ , m. 134°,  $[\alpha]_D^{20} 89^\circ$  (Me ether, m. 76.5°,  $[\alpha]_D^{20} 85^\circ$ ). A. W. Dox

Standards of basal metabolism for children of retarded growth. A. Topper. *Am. J. Diseases Children* 45, 1203-10 (1933). G. G.

Biological electronegativity of potassium. Rudolf Keller. *Arch. phys. biol.* 11, 31-9 (1933).—Some peculiarities in the distribution and behavior of K salts in living organisms are reviewed. L. E. Gilson

**Calcium balance.** C. O. Guillaumin. *Bull. soc. chim. biol.* 16, 152-5(1934).—Discussion. L. E. Gilson

**Theoretical basal metabolism of infants.** E. Léauté and R. Nattan-Larrier. *Compt. rend. soc. biol.* 115, 802-4(1934).—Discussion. Discussion of some results obtained in the study of the respiratory metabolism of infants. *Ibid.* 804 (1). L. E. Gilson

[Decrease in] the phosphorus of the liver of the fetal calf during embryonal development. Z. Grzewska and G. Roussel. *Compt. rend. soc. biol.* 115, 951-2(1934). L. E. Gilson

**The problem of hibernation.** H. Uiberall. *Arch. ges. Physiol. (Pflügers)* 234, 78-97(1934).—Hibernation is not associated with hypofunction of the thyroid. Administration of thyroid substance to hibernating hedgehogs did not affect their dormancy. Thyroidectomy did not induce hibernation. Arthur Grollman

**The mechanism of the second phase of secretory gastric function.** O. F. Scharovatova. *Arch. ges. Physiol. (Pflügers)* 234, 124-9(1934).—Removal of the pyloric portion of the stomach does not affect gastric secretion. Excision of the pylorus increases the pepsin and mucin contents of the gastric juice. The chem. stimulation of the pyloric mucosa by food is not essential for the occurrence of the 2nd phase of gastric secretion. A. G.

**The growth of the oviduct of the carp when subjected to the female sex hormone.** H. Walter Fleischmann and Susanne Kann. *Arch. ges. Physiol. (Pflügers)* 234, 130-6(1934); cf. C. A. 27, 120.—Progynon when added to the aquarium stimulated the growth of the oviduct of carp (*Rhodeus amarus*) within 48 hrs. In the castrated male fish, sex reversal, as indicated by hyperemia of the genital papilla, occurred after progynon medication. A. G.

**Oxidation of fatty acids in the liver.** Juda H. Quastel and Arnold H. M. Wheatley. *Biochem. J.* 27, 1753-62(1933).—By means of the Warburg tissue slice method, a study has been made of the oxidation of fatty acids by guinea-pig liver. All fatty acids, except formic acid, increase markedly the respiration of the liver. All fatty acids with an even no. of C atoms give rise to acetone production. Odd-C fatty acids produce little or no acetone bodies. Crotonic and isocrotonic acids (unsatd. acids) are vigorously oxidized to acetoacetic acid. A manometric method of estg. acetoacetic acid is described. Acetoacetic acid is not broken down appreciably to acetone and CO<sub>2</sub> in the liver; it is apparently the final oxidation product of butyric acid in the organ. Benjamin Harrow

**Effects of saliva upon gastric digestion.** Earl A. Zaas and Leonard S. Foslück. *J. Dental Research* 14, 3-13(1934).—The av. flow of saliva (cc. per min.) was 0.5 or less under basal conditions, and 2.5 under stimulation. The av. neutralizing power of basal saliva was approx. equal to 0.017 N NaOH; that of stimulated saliva was approx. equal to 0.025 N NaOH. Chewing sweetened and flavored indifferent substances caused "appetite" secretion of approx. 2.1 cc. of gastric juice per min.; this juice contained 340 mg. of 1:10,000 pepsin per 100 cc. The Gates gelatin film method for the detn. of pepsin was found superior to the Mett tube method. Swallowed saliva influenced the concn. of the solutes in gastric juice by diln., and the concn. of its free HCl by neutralization; at the height of the secretory curve, 100 cc. of gastric juice would be neutralized by 140 cc. of stimulated saliva. Saliva stimulated the acid-secreting glands, probably by virtue of the sugar and flavor used as salivary stimulants. Saliva influenced peptic activity directly by alteration of the pH of the gastric juice. With a const. pH, saliva inhibited peptic activity by 10%, while gastric mucin had a somewhat greater inhibitory power. The combination of salivary constituents with gastric-free HCl early in the digestive cycle promoted the action of ptyalin for some time after the food had entered the stomach. Joseph S. Hepburn

**Postmortem breakdown of glycogen and accumulation of lactic acid in fish muscle.** I. James G. Sharp. *Proc. Roy. Soc. (London)* B114, 506-12(1934).—In fish muscle

after death the rates of glycogenolysis and accumulation of lactic acid decrease with the temp. between 15° and 0°. The tissue freezes at approx. -1°. In the frozen state, these rates are almost the same at -2° as at 15°, but are reduced to practically 0° at -10°. When the original glycogen content of the muscle does not exceed 0.3%, during storage at either 0° or -2° glycogenolysis and the accumulation of lactic acid proceed with equal velocity until only a trace of glycogen remains. When the original glycogen content is 0.6-0.85%, the accumulated lactic acid at 0° corresponds to only 50-70% of the glycogen loss; a max. lactic acid concn. of 0.40-0.45% is attained; apparently a pH is reached which inhibits further glycogenolysis. Joseph S. Hepburn

**The glutathione content of the suprarenal glands.** A. D. Marenzi and B. Braier. *Anales farm. bioquim.* (Buenos Aires) 4, 50-4(1933).—The glutathione content of the suprarenal glands had been variously stated in the literature in values higher than the real ones, because of the fact that the methods used included the ascorbic acid and the adrenaline. M. and B. note that since the presentation of their work similar results were reported by Hirsch and Dann, C. A. 27, 3242. B. S. Levine

**The active principle of organ extracts for the treatment of vascular spasm.** Tiemann. *Münch. med. Wochschr.* 81, 58 9(1934). Milton Levy

**The effects of operative procedures on the anterior lobe of the pituitary on the metabolism of depancreatized dogs.** H. Lucke, E. R. Heydemann and O. Berger. *Z. ges. expil. Med.* 92, 711-23(1934); cf. C. A. 29, 1090.—Injury to the anterior lobe of the pituitary of depancreatized dogs improves their carbohydrate metabolism. Animals without either pancreas or anterior pituitary respond violently to insulin or anti-insulin because of the absence of the normal antagonist. Milton Levy

**The effect of hemorrhage on the normal and adrenalectomized dog.** W. W. Swingle, J. J. Pflüger, H. M. Vars and W. M. Parkins. *Am. J. Physiol.* 107, 269-74(1934).—Dogs whose adrenal glands have been removed develop symptoms of profound hemorrhagic shock after the removal of 4-8 cc. of blood per kg. of body wt.; whereas, in the normal dog such symptoms appear only after the removal of 40-54 cc. Administration of the cortical hormone restores the ability of the organism to regain normal blood vol. after hemorrhage. J. F. L.

**Seasonal and temperature factors and their determination in pigeons of percentage metabolism change per degree of temperature change.** O. Riddle, Guinevere C. Smith and F. G. Benedict. *Am. J. Physiol.* 107, 333-42(1934).—The seasonal difference in metabolism of adult tumbler pigeons, measured at 20°, is 15% in males and 8% in females, with lowest metabolism in spring and highest in autumn. The change in metabolism due to a change of 1° in temp. is variable depending upon the season of the year and the range of temp. scale which is used in measurement. J. F. Lyman

**The influence of exercise on the digestive work of the stomach. I. Its effect on the secretory cycle.** Frances A. Hellebrandt and Sara L. Hooper. *Am. J. Physiol.* 107, 348-54(1934).—Severe and exhausting exercise inhibits the initial gastric response and is assoc. with hypoacidity or anacidity lasting as long as one hr. Mild activity increases or leaves the peak of acidity unchanged. II. Its effect on emptying time. Frances A. Hellebrandt and Rubye H. Tepper. *Ibid.* 355-63. III. Its effect on the relation between secretory and motor function. Frances A. Hellebrandt and L. L. Dimmitt. *Ibid.* 364-9.—Gastric acidity and motility at rest and during muscular activity are parallel. IV. Its relation to the physiochemical changes in the blood. Frances A. Hellebrandt, H. D. Baernstein and Sara L. Hooper. *Ibid.* 370-7.—During strenuous exercise, physiochem. variation in the blood are concomitant rather than causal in their relation to alterations in gastric function. J. F. L.

**The acid-base composition of hepatic bile.** I. J. G. Reinhold and D. W. Wilson. *Am. J. Physiol.* 107, 378-87(1934).—The concn. of each of the cations of dog bile is usually higher than the concn. of the same cation

in the serum. The principal anions are cholate, Cl and  $\text{HCO}_3$ . The bile acid is quantitatively the most important constituent, although the amt. of phospholipin is nearly as great. The bile acid concn. appears to be the dominant factor in the regulation of the acid-base compn. of the bile. II. The changes induced by the injection of hydrochloric acid and inorganic salts. *Ibid.* 388-99.—Bile becomes more alk. after the intravenous injection of HCl because of rise in  $\text{NaHCO}_3$  and fall in cholate concn. of the bile. After injections of  $\text{NaHCO}_3$ , the concn. of the injected ions rises somewhat in the bile; but there is little change in the reaction of the bile. Large amts. of NaCl must be injected in order to bring about a change in its concn. in the bile. III. The effects of the administration of sodium taurocholate, sodium cholate and sodium dehydrocholate (decholin). *Ibid.* 400-5. After intravenous injection of Na taurocholate the total cholate and Na concns. increase in the bile while bicarbonate decreases. The total anion-cation concn. of the bile rises so that the total considerably exceeds that of the serum. Injection of Na dehydrocholate or of Na cholate causes the total anion-cation concn. of the bile to diminish to values approx. equal to those in the serum. J. F. Lyman

The occurrence of citric acid in the urine and body fluids. W. M. Boothby and Mildred Adams. *Am. J. Physiol.* 107, 471-9(1934).—Citric acid is present in normal human urine equal to about 0.5 g. daily. Analyses of over 300 hospital urines indicate no practical clinical value for the citric acid detn. Ingestion of  $\text{NaHCO}_3$  usually will increase citric acid elimination to about 2.0 g. daily; administration of HCl decreases or stops its excretion. Its chief function probably is not acid-base regulation. Rather it is an important intermediate in metabolism. J. F. Lyman

A comparison of intragastric and duodenal factors in lowering the acidity of gastric contents. C. M. Wilhelmj, I. Neigus and F. C. Hill. *Am. J. Physiol.* 107, 490-507 (1934); cf. *C. A.* 28, 1091<sup>4</sup>.—Both pyloric and duodenal secretions reduce acidity more by diln. than by neutralization and the greater efficiency of regurgitated duodenal contents is due to its larger amt. It is a mistake to consider the entire neutral Cl of gastric contents as arising from neutralized HCl. J. F. Lyman

The nervous control of lactation. H. Seyle. *Am. J. Physiol.* 107, 535-8(1934).—The act of suckling in the rat stimulates the production of prolactin in the pituitary gland. J. F. Lyman

The hydrogen-ion concentration of the mammalian voluntary muscle under various conditions. C. Voegtlin, R. H. Fitch, Herbert Kahler and J. M. Johnson. *Am. J. Physiol.* 107, 539-50(1934).—Normal rat skeletal muscle has a  $p_{\text{H}}$  of about 7.55. Death caused by asphyxia, CN,  $\text{CO}_2$  or curare is followed by a gradual decrease in  $p_{\text{H}}$ , rigor mortis appearing at  $p_{\text{H}}$  6.85-6.68. Death following intravenous injection of iodoacetic acid is followed by a rise in  $p_{\text{H}}$  to as high as 7.96. J. F. L.

The chemical stimulation of pain endings associated with small blood vessels. R. M. Moore, Ruth E. Moore and A. O. Singleton, Jr. *Am. J. Physiol.* 107, 594-602 (1934).—The pain which follows the intra-arterial injection of various solns. arises from stimulation of afferent endings which are located close to the capillary bed. Solns. having  $p_{\text{H}}$  values between 6.0 and 9.2 do not produce pain unless their mol. ionic concn. is 0.7-0.8 or unless they exert irritant action. Arranged in order of increasing power to stimulate the pain receptors comes: Na, Li, Cs, Ca, Mg, Sr, K, Rb, Ba, and for anions, thiocyanate, acetate, sulfate, thiosulfate, lactate, fluoride, phosphate, citrate. J. F. Lyman

The lysin present in normal urine. J. C. Abels. *Am. J. Physiol.* 107, 603-9(1934).—The lysin of human urine has properties like those of the lysin of *Es. coli*. It is not bile salt, soap or glucoside. J. F. Lyman

Lactic acid metabolism of muscles made non-irritable by sugar solutions. A. H. Hegnauer. *Am. J. Physiol.* 107, 667-76(1934).—The large increase in O consumption of muscles in isotonic glucose is qualitatively but not

quantitatively explained by the 5-6-fold increase in lactate content. Some other cause such as the electrolyte balance probably is involved. J. F. Lyman

The removal of lactic acid from the body during recovery from muscular exercise. R. Margaria and H. T. Edwards. *Am. J. Physiol.* 107, 681-6(1934).—The removal of lactic acid in mice, after exercise, is of the same character and speed as in the blood of man, thus indicating free diffusion of lactic acid between muscles and blood. At the beginning of recovery, when a rapid payment of O debt occurs, no corresponding rapid removal of lactic acid is observed; hence this fraction of the O debt is not related to lactic acid. There is a delay in the removal of lactic acid, which lasts 3-4 min., after the end of a 5-min. period of exhaustive exercise, indicating a delayed lactic acid formation. The speed of lactic acid removal is higher the smaller the amt. of lactic acid produced. J. F. Lyman

The lactic acid, total carbon dioxide and hydrogen-ion concentration of venous blood during recovery from severe exercise. E. P. Laug. *Am. J. Physiol.* 107, 687-92(1934).—The highest lactic acid and lowest  $p_{\text{H}}$  values in blood were obtained not immediately but within 3-6 min. after exercise. Total  $\text{CO}_2$  continues to decrease during recovery in face of a rise in  $p_{\text{H}}$  and a fall in lactic acid. J. F. Lyman

The second phase of thrombin action: fibrin resolution. Ruby S. Hirose. *Am. J. Physiol.* 107, 693-7(1934).—The syneresis of clots is in reality a resoln., ending finally in complete liquefaction. Unaltered prothrombin and a new protein are liberated, but there is no unchanged fibrinogen, active thrombin, free cephalin or Ca. J. F. Lyman

The alleged presence of "hemopoietine" in the blood serum of rabbits either rendered anemic or subjected to low pressures. A. S. Gordon and M. Dubin. *Am. J. Physiol.* 107, 704-8(1934).—Serum of anemic rabbits and of rabbits subjected to low pressures does not contain any substance possessing erythropoietic properties. J. F. Lyman

Changes in the chemical elements of the blood of rabbits during emotional excitement. II. L. Katz and L. B. Nee. *Am. J. Physiol.* 107, 700-16(1934).—In emotional excitement of rabbits the following constituents of the blood were increased: glucose, nonprotein N, urea, preformed creatinine, total creatinine, uric acid, cholesterol and hemoglobin. Inorg. P was decreased. Amino acids, Ca and Cl were unchanged. In rabbits after removal of the spleen the same changes were observed as in normal animals except hemoglobin was not increased. J. F. Lyman

Problems of histophysiology. A. Noll. *Ergebnisse Physiol.* 35, 50-81(1933).—This brief review covers liver cells, kidney secretion, muscle contraction and nerve function. C. M. McCay

The biochemistry of the testicular hormone. K. Tscherning. *Ergebnisse Physiol.* 35, 301-17(1933).—A review. C. M. McCay

The female sex hormones. Inge Störmer and Ulrich Westphal. *Ergebnisse Physiol.* 35, 318-41(1933).—A review of the chemistry and physiology of the follicular hormone. C. M. McCay

The comparative physiology of digestion in mammals. W. Lenkeit. *Ergebnisse Physiol.* 35, 573-631(1933).—This review devotes considerable space to digestion in the ruminant as well as in the more familiar omnivorous species. C. M. McCay

Recent advances in the chemistry of certain blood constituents. Claude Rinnington. *Ergebnisse Physiol.* 35, 712-43(1933).—New developments in the chemistry of proteins, blood sugar, P and S compds. are discussed. C. M. McCay

Chemical changes during the contraction of muscle. R. Lehnartz. *Ergebnisse Physiol.* 35, 474-486(1933).—A review. C. M. McCay

Factors capable of changing the functional activity in physical exercise. Cardiac and respiratory rhythm in running under a condition of alkalosis. G. Di Maccio.

*Boll. soc. ital. biol. sper.* 8, 1681-2(1933).—The expts. were performed on 9 individuals. Each one ran 2 races with and without previous administration of  $\text{NaHCO}_3$ . The results show that  $\text{NaHCO}_3$  produced an acceleration of the pulse while at rest and a more marked acceleration after the race compared to the controls. The pulse returned to normal values much more slowly in comparison with the controls. Peter Masucci

The delay in the appearance of prolactin in the body fluids of women after fecundation of the ovum. A. Brindeau, H. Hinglais and M. Hinglais. *Bull. acad. méd.* 110, 108-11(1933). A. E. Meyer

Basal metabolism and sedimentation of erythrocytes. León Goldemberg. *Semana méd.* (Buenos Aires) 1934, 1, 595-603.—The sedimentation of the erythrocytes is accelerated in most cases of increased basal metabolism caused by hyperthyroidism. The diagnostic value of this observation is limited. A. E. Meyer

The action of liver on blood serum to prevent the reversion of hemolysis due to sodium chloride. Arrigo Montanari. *Sperimentale* 87, 327-36(1933).—Rabbits deprived of the liver show in the peripheral blood serum an increase of the power to inhibit the reversion of hemolysis from solns. of  $\text{NaCl}$ . A. E. Meyer

The existence of factors in tissues capable of modifying cellular permeability. The action of testicle extract, of some calcium salts and of ethyl carbamate. Giovanni Pavilli. *Sperimentale* 87, 451-69(1933); cf. *C. A.* 27, 5813.—Testicle ext. injected into tissues together with substances of low permeability as urethans and  $\text{Ca}$  gluconate, or injected after such substances, spreads less into the tissue than when injected alone. The inhibition of vaccinia lesions in the skin prep'd. with urethan or  $\text{Ca}$  salt is explained by the decreased skin permeability. A. E. Meyer

Follicular hormone in the urine of males. Bernhard Zondek. *Arkiv Kemi, Mineral. Geol.* 11B, No. 24, 5 pp. (1933); cf. *C. A.* 25, 1853.—The nonpregnant mare excretes urine contg. less than 500 mouse units of follicular hormone per l.; the gravid mare over 100,000 units per l. Urine obtained from the jack showed an av. of 42,000 or more mouse units per l. The urine from the castrated jack contained less than 400 mouse units per l. Acetone-benzene extn. of the testicle showed 54,000 units per kg. Only 10-25% of the follicular hormone is directly extractable from the urine of the jack with ether or benzene. If the urine is boiled with a mineral acid the remainder is extractable. James C. Munch

The oxygen consumption of stimulated nerve. Susumu Harashina. *J. Cellular Comp. Physiol.* 3, 419-24 (1933).—The excess  $\text{O}_2$  consumption of nerve is practically the same whether stimulation is made on a portion inside or outside of the respiration chamber so long as the action current is of the same magnitude. T. H. R.

The anoxic recovery of asphyxiated nerve. R. H. Cohen and R. W. Gerard. *J. Cellular Comp. Physiol.* 3, 425-36(1933).—An asphyxiated nerve can be restored to function when, in place of free  $\text{O}_2$ , other oxidizers yielding sufficient energy on reduction are made available. Conclusion: The energy is necessary rather than any particular substances formed or removed. T. H. R.

The spectrophotometric differentiation of the hemoglobins of different species. Howard M. Winegarden and Henry Borsook. *J. Cellular Comp. Physiol.* 3, 437-48(1933).—The authors hold that with adequate technic it is possible by spectrophotometric methods to observe interspecific, and in the case of the rabbit even intraspecific, differences in the hemoglobins. T. H. R.

Gastric impulses in the vagus. Ruth C. Partridge and M. J. Wilson. *J. Cellular Comp. Physiol.* 4, 123-6 (1933); cf. *C. A.* 27, 3246. T. H. Rider

Respiration due to natural nerve impulses. A method for measuring respiration. R. W. Gerard and H. K. Hartline. *J. Cellular Comp. Physiol.* 4, 141-60(1934).—See *C. A.* 28, 2400<sup>a</sup>. T. H. Rider

The quantitative measurement of the permeability of the erythrocyte to water and to solutes by the hemolysis

method. M. H. Jacobs. *J. Cellular Comp. Physiol.* 4, 161-83(1934); cf. *C. A.* 28, 1724<sup>a</sup>.—Tables based on math. calcn. are presented with which a detn. of the time of hemolysis in water and in an isosmotic soln. of a penetrating substance are sufficient to det. permeability consts. for both water and solute. Where hemolysis in an isosmotic soln. requires more than 2-3 min. the permeability const. for the solute is approx. inversely proportional to the time of hemolysis. T. H. Rider

The effect of rapid changes in hydrostatic pressure upon the contraction of skeletal muscle. Dugald E. S. Brown. *J. Cellular Comp. Physiol.* 4, 257-81(1934). T. H. Rider

The chemical processes accompanying embryonic induction. M. W. Woerdenman. *Proc. Acad. Sci. Amsterdam* 36, 842-9(1933). W. Gordon Rose

Gastric juice. I. The relation of ions in gastric juice in various patients. S. Kozawa, K. Fukushima, M. Umeno, K. Kurihara, C. Takata and M. Horiuchi. *Japan. J. Med. Sci. VIII, Internal Med., Pediatrics and Psychiatry* 3, 15-32(1933).— $\text{Cl}$ ,  $\text{Na}$ ,  $\text{K}$ ,  $\text{NH}_4$ ,  $\text{P}$  and  $\text{Mg}$  were found in the gastric juice of fasting as well as of intoxicated persons ( $\text{Ca}$  was not estd.). The amt. of  $\text{Na}$  was usually greater than  $\text{K}$ ; where free  $\text{HCl}$  was lowest, the amt. of  $\text{K}$  exceeded the amt. of  $\text{Na}$ .  $\text{Cl}$  and  $\text{NH}_4$  in the blood serum were less than in the gastric juice, but  $\text{Na}$  and  $\text{K}$  were greater. The  $\text{Na}/\text{K}$  ratio for serum was 17:1; for gastric juice it was 2.8:1. K. Sugiura

Crepsin in liquor amnii and fetal intestines in every stage of pregnancy, and in the meconium of the newborn. M. Abe. *Japan. J. Obstet. Gynecol.* 16, 225-30(1933).—The optimum  $\text{pH}$  of crepsin of the human liquor amnii was 7.0-8.0. This enzyme was found in the liquor amnii as early as the 2nd gravid month and was markedly increased in the succeeding gravid months. Of the liquor amnii at the delivery, the one which had the meconium mixed with it showed more intense enzymic action than that which did not have the meconium. The crepsin was found even in the fetal intestines of the 3rd gravid month and its action increased with the advance of pregnancy. K. Sugiura

Quantity of "anterior pituitary lobe hormone" in human chorion and decidua. K. Mizuno. *Japan. J. Obstet. Gynecol.* 16, 238-41(1933).—The substance which caused the pregnant reaction (Aschheim-Zondek test), the so-called "anterior pituitary hormone," was present in the decidua in large quantities as well as in the chorionic tissues. The hormone content of these tissues decreased in the latter months of pregnancy. The pos. reaction was not shown by the decidua menstrualis in any case. K. Sugiura

Coagulation time of blood during pregnancy. Nemcszky Tivadar and Krompassky Sarolta. *Magyar Orvosi Arch.* 35, 54-7(1934).—The coagulation time is shorter. In 50% of cases there is a rise in blood  $\text{Ca}$ . Blood platelets show a slight increase. Fibrinogen increases considerably. Henry Taylor

Occurrence of growth substance B in urine. Vagu Hartelius. *Compt.-rend. trav. Lab. Carlsberg* 19, No. 18, 20 pp.(1933).—The substance promoting the growth of *Aspergillus niger* (Nielsen and Hartelius, *C. A.* 26, 4256, 4368) is present in human urine, its amt. increasing with increasing d. of the urine. However, the necessary co-growth substance, which is present in filter-paper ash, is not present in urine in sufficient amts. to allow of max. effect of the substance B.—On addn. of the  $\text{HCl}$  ext. of 5 mg. ash to 50 cc. of culture soln., the effect of added urine was trebled, and further addn. of ash produced no further increase. Under these conditions, the effect of increasing growth-promoting activity with increasing d. was still maintained. The concn. of growth substance B in urine is increased after meals. The co-growth substance present in urine is not the same as that in filter ash; it is probably  $\text{Zn}$ . The growth substance B itself is thermostable, insol. in  $\text{Et}_2\text{O}$ , and is not destroyed by  $\text{H}_2\text{O}_2$ ; hence its properties are similar to those of the

substance previously described, though the identity is not established. A further similarity is the necessity for the addn. of the co-growth substance or of Zn in small amts. K. V. Thimann.

**Excretion of ammonia and neutrality regulation.** A. P. Briggs. *J. Biol. Chem.* 104, 231-8 (1934).—Administration of KCl to dogs or men caused an increased excretion of metallic cations in the urine, the urine becoming more alk. as a result. At the same time the excretion of  $\text{NH}_3$  in the urine was decreased. On the other hand, when  $\text{Na}_2\text{SO}_4$  was given, anions were increased in the urine, with resultant increased acidity, and the excretion of  $\text{NH}_3$  was also increased. The excretion of  $\text{NH}_3$  is therefore not controlled by the acid-base balance in the tissues but rather by that of the glomeruli of the kidney. K. V. Thimann.

**Calcium content of the aqueous and vitreous humors and serum.** Peter W. Salit. *J. Biol. Chem.* 104, 275-80 (1934).—The Ca content of the aq. humor increases rapidly on standing a few hrs. after death, reaching or exceeding that of the vitreous humor. This may account for some of the discrepancies in the literature. The av. Ca content of the aq. humor falls from 5.8 mg. Ca per 100 g. fluid, in calves, to 4.60 in aged cattle, while that of the vitreous humor falls from 8.3 to 6.8 and that of the serum from 11.5 to 9.7. The ratios between the Ca of the aq. or vitreous humor and that of the serum are very const., 1.9-2.1 and 1.30-1.44, resp., indications of the direct dependence of the Ca content of the humors on that of the serum. K. V. Thimann.

**Recognition and comparison of prolan and prolan-like substances.** Herbert M. Evans, Miriam E. Simpson and Paul R. Austin. *J. Exptl. Med.* 58, 561-8 (1933).—The synergism phenomenon has made possible the recognition of substances ("prolan-like") in a wide variety of conditions, even in the urine of normal men. The method has shown a wide distribution of prolan-like substances in serums and urine of non-primates without demonstrating, however, significant difference in the reactions secured from pregnant as contrasted with non-pregnant states or in males as contrasted with females. The synergic principle with pregnancy prolan causes a definite increase in the development of the seminal vesicles in immature male rats. C. J. West.

**Concentration of the gonadotropic hormone in pregnant mare serum.** Herbert M. Evans, Edwin L. Gustus and Miriam E. Simpson. *J. Exptl. Med.* 58, 569-74 (1933).—For an abstr. of this paper see the abstr. entitled "Recognition and comparison of prolan and prolan-like substances" in C. A. 28, 2053, where the wrong title was printed. C. J. West.

## G PATHOLOGY

H. GIDRON WILLS

**Postoperative amino acid excretion in Graves' disease.** W. Krech. *Arch. klin. Chir.* 174, 662-6 (1933).—After operations on the thyroid (I) in Graves' disease, the urinary output of amino N increased; in other (I) conditions there was a postoperative fall in amino N. The urinary amino-N curve seemed to bear no relation to changes in temp. The differences between Graves' disease and other (I) conditions are attributed to the defect in the former of protein synthesis and the effect of preoperative I medication on the storage of protein in the (I). B. C. A.

**Postoperative changes in blood fat.** F. Frochnow and L. Findeisen. *Arch. klin. Chir.* 175, 121-37 (1933).—The total blood fat (I) in operative as distinct from metabolic diseases varies in the fasting condition from 230 to 310 mg. %. In cholelithiasis and cholecystitis (I) varies from 214 to 354 mg. %. The lowest values are 200 mg. (tuberculous peritonitis) and the highest 530 mg. (xanthomatosis). The normal individual variations are 13% (fasting) and 20-22% (fed). No significant change of (I) occurs with  $\text{K}_2\text{O}$  narcosis alone, but hyperlipemia arises as soon as operative work begins. Variation of (I) as a result of operations under local anesthesia

is very small and postoperative hypolipemia is rarely observed. B. C. A.

**Experimental fever in man. II. Energy exchange in fever: thermogenesis and metabolism.** E. Delcourt-Bernard. *Rev. belge sci. mid.* 5, 229-92 (1933).—In cases (I) exhibiting rigor, the metabolism tends to diminish beforehand, rises markedly (112%) during rigor, and remains approx. 30% high afterward until the temp. begins to fall. In cases (II) without rigor the mean rise is 16%. On deducting the extra metabolism due to shivering, the increase in (I) is similar to that of (II). Fat combustion increases, especially in the middle and later periods of expt., in (I) or (II). Carbohydrate combustion increases in (I), in which it is proportional to intensity of shivering, but diminishes in (II). Protein metabolism varies. B. C. A.

**Lipids and lipid diseases. II. Xanthomatosis (Schüller-Christian's type).** Dorman E. Lichty. *Arch. Internal Med.* 53, 379-99 (1934).—Analyses were made for lipid, cholesterol and phospholipid in the tissues in Schüller-Christian's disease and in one of anemia for comparison. There were no significant differences except where the xanthomatous masses were located, which were high in total lipid,  $\frac{1}{2}$  of which was cholesterol. J. B. Brown.

**Relation of the plasma cholesterol to obesity and to some of the complicating degenerative diseases.** Maurice Bruger and Charles A. Poindexter. *Arch. Internal Med.* 53, 423-34 (1934); cf. C. A. 27, 5106.—The plasma cholesterol was normal in 53 cases of obesity without metabolic, arthritic or endocrine disturbance; it was high in diabetes, essential hypertension and arteriosclerosis (with obesity); in 4 cases of infectious arthritis it was normal; in degenerative hypertrophic arthritis it was high. Change in cholesterol concn. is a complication rather than an etiologic factor. J. B. Brown.

**Muscular dystrophy and atrophy.** Clinical and biochemical results following the oral administration of amino acids. Carlo J. Tripoli and Howard H. Beard. *Arch. Internal Med.* 53, 435-52 (1934).—Administration of 10-20 g. doses of glycine or glutamic acid to patients with various dystrophies and atrophies resulted in a great increase in the excretion of creatine and creatinine. A new theory of the origin of creatine is given. J. B. Brown.

**Lipids of serum in diabetic acidosis.** Evelyn B. Man and John P. Peters. *J. Clin. Investigation* 13, 237-61 (1934).—During the acute phase of recovery from diabetic acidosis concn. of serum cholesterol, fatty acids and lipid P decreased. Fall of lipid is referable largely to hemodilution. Variations in cholesterol bear little relation to those of fatty acids. There is an extended bibliography. J. B. Brown.

**Pneumococcus antibodies. What are they?** Lloyd D. Felton. *Science* 79, 277-9 (1934). In the serum of a horse immunized against the entire pneumococcus cell there appears to be an antibody for each antigenic substance found in the microorganism. The antigen-antibody complex formed by the action of a sol. sp. substance and antiserum of types I and II can be dissociated by treatment with alkali and the polysaccharide removed by pptn. with  $\text{Ca}_3(\text{PO}_4)_2$ . The resulting antibody appears to be a salt-sol. protein. It has an isoelec. zone between  $\text{pH}$  6.8 and 7.4, is slightly sol. in  $\text{H}_2\text{O}$ , readily sol. in neutral salt, completely precipitable with 44% satn. of  $(\text{NH}_4)_2\text{SO}_4$  and sol. in satd. NaCl. Digestion by pepsin and trypsin is accompanied by loss in immunological activity. Pos. reactions were obtained with this dissociated protein indicating the presence of agglutinins, precipitins, bacteriolysins, opsonins, complement-fixing bodies and protective antibody. Rachel Brown.

**The effect of viosterol (vitamin D) and tuberculin on the healing of tuberculous lesions in guinea pigs.** Eugene C. deSavitsch, Virginia E. Trevorow, Wm. C. Black and Robert C. Lewis. *Am. Rev. Tuberculosis* 28, 699-710 (1933).—The use of a combination of viosterol and tuberculin in the treatment of moderately advanced

tuberculosis in guinea pigs gives definitely beneficial results, as judged by longevity, degree of tuberculous involvement and amt. of fibrosis. The optimum effect of the treatment is apparently obtained when the viosterol and tuberculin are given simultaneously rather than when one precedes the other by 48 hrs. H. J. C.

**Desensitization of tuberculous guinea pigs by means of natural tuberculin prepared from fractured bacilli.** John Weinzirl and Russell S. Weiser. *Tubercle* 15, 210-16(1934).—Desensitization in tuberculosis has previously been tried by the authors with the result that synthetic medium tuberculin was found capable of desensitizing tuberculous guinea pigs against a lethal dose of tuberculin. To this they now add "natural tuberculin" (N. T.) consisting of the inner contents of the tubercle bacillus, liberated by fracturing the organism by freezing with liquid air (about 35 times) according to the method employed by Nelson (C. A. 20, 2365). N. T. contains all the saline-sol. proteins unaltered by heat or chemicals. Solid CO<sub>2</sub> freezing proved less efficient. Tuberculous guinea pigs can be desensitized by means of sublethal doses of N. T. No desensitizing powers could be demonstrated for the cell debris remaining after removal of the N. T. The N. T. successfully desensitized guinea pigs infected with either nonvirulent or virulent tubercle bacilli. Desensitization was effected against both Sci-bert's synthetic medium tuberculin, and against the homologous natural tuberculin. H. J. Corper

**The prevention of pleural effusion with calcium gluconate.** V. V. Pisain and F. J. Smekjal. *Tubercle* 15, 216-21(1934).—Direct clinical observations extending over a period of 14 months indicate that Ca gluconate is of value in the prevention of pleural effusion complicating artificial pneumothorax, confirming the exptl. findings of Gold (C. A. 23, 903) in cats, that Ca injections diminish or prevent the formation of pleural effusion. H. J. C.

**Antitrypsin content of the blood of tuberculous individuals.** Ludwig Vajda. *Z. Tuberk.* 68, 414-17(1933). The blood of tuberculous individuals retards trypsin digestion more markedly than normal blood. In a high percentage of the cases the more marked antitrypsin action paralleled the shift of the leukocytic picture of the blood to the left and the acceleration of the blood corpuscle sedimentation, although incongruent cases were noted. Even active cases of tuberculosis, however, can reveal normal antitrypsin values, similar to the not rare possibility of the presence of a normal blood picture or a normal sedimentation rate in such cases. H. J. Corper

**Alkali reserve of the blood in bone-joint tuberculosis.** M. M. Altschuler and N. W. Strier. *Z. Tuberk.* 68, 417-20(1933).—The alkali reserve of the blood is shifted to an alkalosis in closed forms of bone-joint tuberculosis. In open forms, those with mixed infection, the alkali reserve of the blood is shifted to an acidosis. There occurs a certain parallelism between the severity of the disease and the amt. of alkali reserve of the blood. According to the changes in the alkali reserve, along with the other findings, the severity of the process can to a certain extent be evaluated. In the authors' material there was a 60% parallelism among the cases between the amt. of alkali reserve and the white blood picture. H. J. Corper

**Tumor problem in the light of researches on plant tumors and galls and its relation to the problem of mutation.** (A critical review from biophysical, biochemical and cytogenetical point of view.) Dontcho Kostov. *Protoplasma* 20, 440-56(1933); cf. C. A. 27, 5778. Thirty-seven references. F. L. Dunlap

**Ten years of research on the physicochemistry of cancer.** Fred Viès and A. de Coulon. *Arch. phys. biol.* 11, 5-30(1933); cf. C. A. 28, 2087.—The work of V. and associates (46 papers) is briefly reviewed. L. R. Gilson

**Variations in the metabolism of the thymus during ischemia.** M. Chèvremont. *Compt. rend. soc. biol.* 115, 744-8(1934). L. E. Gilson

**Insulin secretion during hyperaminoacidemia.** Jean La Barre. *Compt. rend. soc. biol.* 115, 748-50(1934).—

In dogs intravenous injections of small quantities of glycine cause a rise in glucemia while large doses (0.5 g./kg.) cause a rise followed by a marked drop to below normal. By the cross-circulation method it was shown that the large doses cause an increased secretion of insulin indirectly by stimulation of the adrenals. L. E. G.

**Thermogenesis during exogenous hyperthermia.** S. Gelineo. *Compt. rend. soc. biol.* 115, 865-7(1934).—Rats which had been raised in a room heated to 30-32° were placed for 30-100 min. in chambers heated to 36-41°. In all cases there was a 20-60% increase in metabolism and their body temps. rose to 1-3° above the temp. of the particular hot chamber employed. Several died 1-10 hrs. later. L. E. Gilson

**The insulin hypoglycemia test in hepatic cirrhosis.** Marcel Labbé and R. Boulin. *Compt. rend. soc. biol.* 115, 907-8(1934).—Insulin has a much weaker action in cases of hepatic cirrhosis than in normal persons. L. E. Gilson

**Catechin (inhibitory substance) of the thyroid gland and its therapeutic use in exophthalmic goiter.** E. Herzfeld and A. Frieder. *Deut. med. Wochschr.* 59, 84-6(1933).—The anti-thyroid substance described by Blum, and named "catechin" was prepd. from blood serum. It prevents the rise in metabolism following the administration of thyroid substance. *Tyronorm*, a proprietary prep. of catechin, was efficacious in patients suffering from Graves' disease when such patients were maintained on a special meat-free diet. "Arthur Grollman"

**Weltmann sero-coagulation test in hepatopathy in relation to the serum-protein picture.** E. Massobrio and U. De Michelis. *Minerva med.* 1934, I, 147-54.—Sero-coagulation, blood protein (Howe) and bilirubinemia were detd. in 12 cases of hepatic cirrhosis, 9 of catarrhal icterus, 8 tumors of the liver and biliary tract and 10 miscellaneous cases of liver disease. There was a marked widening of the area of coagulation in advanced cirrhosis, a moderate widening in precirrhotic conditions and in acute and sub-acute icterus, and lessened or normal values in inflammatory processes of the biliary tract. A certain parallelism was shown between the increase of the area of coagulation and the inversion of the protein quotient. H. L. G.

**The behavior and significance of the Weltmann sero-reaction in some disease conditions—studies on the electrolytic threshold of coagulo-flocculation with heat of exudates, transudates and normal and pathological cerebrospinal fluids.** Mario Pellegrini and Giulio Bafani. *Minerva med.* 1934, I, 154-62.—The Weltmann reaction was detd. on more than 300 sera from patients with various diseases, 28 exudates, 16 transudates, 12 normal and 4 pathol. cerebrospinal fluids. In inflammatory diseases of the biliary tract there was an alteration toward a higher electrolytic concn. while the opposite effect occurred in hepatic cirrhosis, catarrhal icterus, pernicious anemia, diabetes mellitus, chronic alcoholism and post-encephalitic parkinsonism. Exudates showed a more or less marked elevation of the electrolytic threshold of heat coagulation, the opposite occurring in transudates. Meningitic liquids coagulated at an electrolytic concn. of 0.3-0.4%. The abs. protein content was of no value in detg. electrolytic threshold. Equimolar solns. of electrolytes of the same valence (Ca, Ba, Mg) produced coagulation at different concns. Helen Lee Gruehl

**Chloropenic hyperazotemia.** Arcangelo Creazzo. *Minerva med.* 1934, I, 162-5.—A clinical case of chloropenic hyperazotemia of renal origin with arterial hypertension and severe cardiac insufficiency is described. The azotemic titer returned to normal after treatment with NaCl. Helen Lee Gruehl

**Refractometric examination of purified antitoxins.** Charles Siehenmann. *Biochem. J.* 27, 1745-52(1933).—No differences were found between the refractive properties (R. P.) of globulin solns. contg. diphtheria antitoxin and the R. P. of normal horse globulin solns. These findings were confirmed for purified tetanus, scarlet fever and erysipelas antitoxins. Benjamin Harrow

**Status thymicolymphaticus:** a manifestation of diminished calcium utilization. Harold T. Nesbit. *Arch. Pediatrics* 51, 54-57(1934).—In 6 patients exhibiting this syndrome, the Ca concn. of the spinal fluid was subnormal; symptoms ceased upon its elevation to 5 mg. Ca per 100 cc. of spinal fluid. The physiol. response may be produced by x-ray therapy or by intramuscular injection of Ca gluconate and parathormone. J. S. H.

**A soluble specific substance in spirochetes.** E. Hindle and P. Bruce White. *Proc. Roy. Soc. (London)* B114, 523-9(1934).—A highly sp. sol. haptene was isolated from a strain of *Spirochaete (Leptospira) biflexa* by extn. with 0.5% NaOH, differential pptn. with alc. in alk. and acid soln., and final pptn. with acetone. The haptene reacted by pptn. only with its homologous antiserum, and not with antisera derived from 6 other water strains and 8 strains of *S. icterohemorrhagiae*; these reactions demonstrated a sharp serological distinction between the water strains and the leptospira of infectious jaundice. Joseph S. Hephurn

**Sun and cancer: its relation to cholesterol heliotropism.** A. H. Roffo. *Neoplasmes* 12, 257-85, 521-44(1933).—The sun's rays (visible and invisible spectra) play an important role in the formation of keratotic carcinomas of the skin of the face and hands. These follow hyperkeratotic injuries of the skin exposed to the sun's rays. These hyperkeratotic injuries of the skin occur particularly in blondes, while the pigmented skins are more resistant to light rays. All the cases studied gave a history of prolonged exposure to the sun and only 3.62% were less than 40 years of age. The cutaneous hyperkeratosis must be considered as a precancerous condition as these lesions if not arrested form keratomas and finally cancer. The sun's rays produce these injuries by acting on the cholesterol, because of the heliotropic function of this substance. In the parts of the skin exposed to the sun there is an increased cholesterol content, which begins with activities in the sup; under the age of 3 it is very weak, and it does not exist in the fetus. By exposing animals to the sun or ultra-violet rays it is possible to increase the cholesterol content of the skin. There is a direct relation between the high percentage of carcinomas of the skin of the face and especially of the parts most exposed to the sun on the one hand, and the parts containing the most cholesterol on the other hand, which are also the parts most exposed to the sun. The part of the face most exposed to the sun (nose) forms the highest percentage of carcinomas and also contains the highest percentage of cholesterol. Harriet F. Holmes

**Biochemical study of the breaking-down of malignant tumors by cobra venom.** C. Taguet and E. Rousseau. *Neoplasmes* 12, 291-300(1933).—Following the work of Calmette, et al. (*Bull. Ac. Sc.* 3(1933)) that cobra venom injected into spontaneous or grafted tumors of mice had a marked curative effect the authors obtained analogous results from intratumoral injection of cobra venom in certain malignant human tumors. There was a breaking-down of the tumor tissue to a yellowish pseudopurulent fluid. Cobra venom is a complex substance but the enzymes responsible for its effect on the tumor cells are, in the order of their importance, a phosphodiesterase, a proteolysin, a hemolysin and a hemorrhagin. The cobra venom introduced into the tumor forms with the lecithin of the cells a lysocytin which has a pronounced cytolytic effect. In addn., the proteolytic enzyme, always present in abundance in tumor cells, is augmented in action by the proteolytic enzyme of the cobra venom. H. F. H.

**Urea retention in the dog.** Matthew G. Hanson and John J. Hanson. *North Am. Veterinarian* 14, No. 2, 18-9, 40(1933).—Under normal conditions, dog blood contains urea N 12-15, nonprotein N 30-45 and creatinine 1.2 mg./100 cc. In 2 cases of terminal nephritis, blood analyses showed urea N 140, 191; nonprotein N 298, 376; and creatinine 30.0, 22.8 mg./100 cc. The differences are less pronounced in the early stages of nephritis. K. D. Jacob

**Nature of antibodies.** J. Marrack. *Nature* 133, 202-3(1934).—When benzidine is tetrastotized and coupled

to R salt and to the serum proteins, a deep red compd. is formed, and the agglutinin is not wholly destroyed. When a weak soln. of the protein dye is used, a quant. difference can be shown between the degree of adsorption by homologous and heterologous bacteria. Two instances are given. W. D. Langley

**The role of the kidney in diabetes.** L. R. Grote. *Münch. med. Wochschr.* 81, 160-4(1934).—A lecture. Glucosurias due to insulin deficiency, renal, central nervous and hormonal disturbances are discussed. M. L.

**Uremia and loss of chloride.** Chloropenia from ascitic puncture. René S. Mach, Evelyn Mach and François Sciclounoff. *Schweiz. med. Wochschr.* 64, 54-7(1934).—In 3 cases of ascites on a salt-free diet treated with mercurial diuretics drainage of the ascitic fluid produced a true chloropenia with a very low urine Cl excretion. Milton Levy

**Gastric disease and industrial lead poisoning.** Erwin Klein and Alfred Selinger. *Wien. med. Wochschr.* 83, 1240-2(1933).—The high incidence of gastric disturbances in 195 lead workers points to an etiological connection. Milton Levy

**The relation between creatinuria and adrenaline hyperlactic acidemia in rabbits.** F. Quetol and A. Reuter. *Z. ges. expil. Med.* 92, 508-602(1934).—Conditions promoting creatinuria such as hunger, urethan and thyroxine prevent the rise in blood lactic acid which normally follows the injection of adrenaline. The effect disappears if the creatinuria is long continued. Milton Levy

**Uremia.** Joseph Csapó and Edmund Kerpel-Fronius. *Z. ges. expil. Med.* 92, 603-10(1934); cf. *C. A.* 28, 2773<sup>1</sup>.—The cause of acidosis in uremia is discussed with data on the acid-base balance, non-protein N and f. p. of blood in various types of uremia. Milton Levy

**Toxicology in the medicolegal necropsy.** Alexander O. Gettler. *Am. J. Clin. Path.* 4, 50-65(1934). E. R. M.

**Blood lipoids in children with scarlet fever and rheumatic fever.** Albert D. Kaiser and Mary S. Gray. *Am. J. Diseases Children* 47, 9-24(1934). The lipid content of the blood of children 5-16 yrs. of age is const. and somewhat lower than that of normal adults. The content of total lipoids is normally 427 mg. per 100 cc. of plasma; of phospholipide 90 mg.; cholesterol 150 mg. and residual fat 139 mg. In acute and chronic rheumatism and during convalescence from scarlet fever, the values are practically normal but show greater deviations than those of normal blood. There appears to be no difference in the lipid content of the blood of boys and girls. The values are somewhat lower in the summer months than in the winter and are not influenced by ordinary variations in diet. E. R. Main

**Cod-liver oil sensitivity in children.** Ray M. Balyeat and Ralph Bowen. *Am. J. Diseases Children* 47, 529-32(1934).—A coned. prepn. of carotene to which vitamin D has been added can be safely and effectively administered to children who show allergic reactions to cod-liver oil. E. R. Main

**The incidence of sugars in the urine of infants and children.** F. Fikri and Mah. A. El-Sayed. *Arch. Disease Childhood* 8, 409-12(1933).—The presence of lactose is observed occasionally in the urine of healthy children and is frequently assocd. with infectious diseases and with severe disturbances of the digestive tract. The presence of glucose may be indicative of diabetes, which is a possible etiological factor in the marasmus of infants. E. R. Main

**Glycogen disease.** S. van Creveld. *Arch. Disease Childhood* 9, 9-26(1934); cf. *C. A.* 28, 2067.—Glycogen disease (hepatomegalia glycogenica) is characterized by the accumulation in the liver and other organs of glycogen which is not readily mobilized. Glycogen is present in the blood in concns. much higher than normal and shows a marked resistance to splitting upon incubation for 1.5 hrs. at 37°. The glycogenolytic activity of the blood is normal, since added glycogen is split to the same extent as that added to normal blood. The disease is further characterized by the appearance of hypoglycemia and ketosis after fasting, by the absence of an initial insulin

hyperglucemia and of any distinct elevation in blood sugar after the administration of adrenaline. The cholesterol content of the blood is increased; the relation between free cholesterol and cholesterol esters remains normal. A method is described for the detn. of glycogen requiring 1 cc. of blood. E. R. Main

A clinical study of blood iron and hemoglobin. C. W. Dowden and Clyde McNeill. *J. Lab. Clin. Med.* 19, 362-7(1934).—Values for the Fe content of the blood, the hemoglobin and Fe contents of the individual cell furnish more valuable information than red cell counts and percentage hemoglobin, the latter values being variables and based upon an assumption of averages. E. R. Main

The relation of blood glutathione to the hemoglobin and amount of red cells. Rawson J. Pickard and Charles S. Marsden, Jr. *J. Lab. Clin. Med.* 19, 395-404(1934).—There appears to be no quant. relationship between the glutathione and hemoglobin contents of the blood. The glutathione content normally ranges from 20 to 30 mg. per 100 cc. The av. content in nonhemorrhagic secondary anemia is 24.9 mg. After severe hemorrhage the value may be decreased to 17.1 mg., the return to the normal level being more rapid than that of the red cells and hemoglobin. E. R. Main

Serology of syphilis. XIII. The use of the same antigen for the Wassermann reaction and the author's flocculation test; and a recommended Wassermann technic. Harry Eagle. *J. Lab. Clin. Med.* 19, 621-4(1934); cf. *C. A.* 27, 3987. E. R. Main

The partition of potassium between the serum and corpuscles in health and disease. Wm. S. Hoffman and H. R. D. Jacobs. *J. Lab. Clin. Med.* 19, 633-44(1934).—The concn. of K in the serum and red cells appears to be const. both in health and disease, increases in the serum K being noted only in asthma and in Bright's disease. The av. content of K in normal serum is 19.3 mg. and in the red cells 422.7 mg. per 100 cc. A method for the detn. of the K content of whole blood is described in which the K is detd. in a protein-free filtrate, prepd. by treating laked blood with  $\text{FeCl}_3$  and an alk. soln. of Na acetate. E. R. Main

Studies of the physiologic and pathologic chemistry of the skin. Preliminary report. Abraham Rudy. *J. Lab. Clin. Med.* 19, 654-9(1934).—A micro method is described for the detn. of the sugar content of the skin. A 50-mg. sample is minced and extd. with dil. tungstic acid soln. The sugar content of the ext. is then detd. as in Folin's micro method for the detn. of sugar in laked blood (*C. A.* 23, 4492). E. R. Main

A new method for the production of antishemp hemolysin. Margaret Beattie. *J. Lab. Clin. Med.* 19, 666-7(1934).—Hemolysin of unusually high titer is produced in rabbits which receive 5 preliminary intracutaneous inoculations of sheep serum at 48-hr. intervals, the initial dose being 0.5 cc. and the final dose 2.5 cc. After 4 days 3 intravenous injections of 1 cc. of a 10% suspension of sheep cells at 48-hr. intervals are made. E. R. Main

Sugar tolerance in the arthritic. H. Archibald Nissen and K. A. Spencer. *New Engl. J. Med.* 210, 13-19(1934).—A low sugar tolerance is often assoc. with arthritis of Type I or the Mixed Type. In patients with joint involvement or marked crippling, the lowered tolerance may persist over a period of several yrs. without the appearance of signs of diabetes. E. R. Main

Glutathione in the blood in chronic pulmonary tuberculosis. L. Béthoux and G. Carraz. *Bull. acad. méd.* 110, 51-7(1933).—Oxidized glutathione is decreased more than the reduced substance. A. E. Meyer

Phosphoric esters in normal and malignant tissues. E. L. Outhouse. *Trans. Roy. Soc. Can.* 27, 123-33(1933).—The total P content of human and bovine tumor tissues is lower than that of normal tissue. The  $\text{Ba}(\text{OH})_2$ -sol. fraction of the latter contained more org. P than the former. Fibrous tumor tissue contained only a small amt. of acid-sol. P. W. Gordon Rose

The possibility of glucolyzable hapten in tumor. W. R. Franks. *Trans. Roy. Soc. Can.* 27, 135-40(1933).—

Expts. with mice, rabbits and chickens failed to demonstrate a glucolyzable hapten in Rous sarcoma.

Change in the equilibrium of osmotic pressure of tissues in water poisoning. Gömöry Pál and Molnár István. *Magyar Orvosi Arch.* 35, 46-53(1934).—Death of animals poisoned by  $\text{H}_2\text{O}$  is not due to increased intracranial pressure but to osmotic pressure changes of tissues. The  $\text{H}_2\text{O}$  is first taken up by the muscles, then by the liver and finally by the central nervous system. H. T.

I content of Pennsylvania potatoes (Frear) 12.

## H-PHARMACOLOGY

A. N. RICHARDS

Further contributions to methods of barbital research. Theodore Koppányi, Wm. S. Murphy and Stephen Krop. *Proc. Soc. Exptl. Biol. Med.* 31, 373-4(1933); cf. *C. A.* 28, 8261. Effect of barbiturates in the domestic fowl. Theodore Koppányi and Wm. S. Murphy. *Ibid.* 375-6. Effect of barbiturates in experimental nephrosis. Wm. S. Murphy and Theodore Koppányi. *Ibid.* 376-8.—In severe exptl. nephrosis, the dog and the rabbit reacted to barbiturates like totally nephrectomized animals; they remained anesthetized until death; barbital was retained in the blood and very little was excreted in the urine. In milder nephrosis, recovery from the sleep produced by barbiturates was retarded. Acute barbital poisoning in dehydration and diuresis. Theodore Koppányi, Wm. S. Murphy and Stephen Krop. *Ibid.* 31, 451-3(1934).—In the dog, dehydration did not prolong barbital narcosis, nor did the saline diuresis by the method of Gower and Van de Erve (*C. A.* 27, 4309), hasten recovery. The intravenous injection of 0.5-1.0% solns. of  $\text{NH}_4\text{Cl}$  did not shorten the period of depression; it did increase the rate of excretion of barbital in the urine. C. V. Bailey

Blood alcohol after administration of alcohol. O. Graf and E. Flake. *Arbeitsphysiol.* 6, 141-67(1932).—Widmark's analytical procedure (*C. A.* 24, 3029; 26, 2942) is modified; his results are confirmed. B. C. A.

Relation between blood alcohol and the psychological effect of alcohol. O. Graf. *Arbeitsphysiol.* 6, 169-213(1932).—Detn. of blood EtOH indicates the degree of psychological disturbance only within wide limits. B. C. A.

Presence and detection of diethylbarbituric acid in cerebrospinal fluid. G. Vitte. *Bull. soc. pharm. Bordeaux* 70, 255-6(1932); cf. *C. A.* 27, 3961.—In a case of barbital poisoning the substance was found in the cerebrospinal fluid; the procedure of sepn. is described. B. C. A.

Mechanism of the action of narcotics. H. Süllmann. *Protoplasma* 18, 321-44(1933).—Emulsions of olive oil in  $\text{H}_2\text{O}$  contg. soap or gelatin are rendered unstable by the addn. of narcotics, which accelerate phase inversion by  $\text{BaCl}_2$ . Urca and sugar have the reverse effect. The action of narcotics results from its disturbing effect on the emulsifier. Narcotic effects are discussed in relation to the physicochem. condition of living cells. B. C. A.

Pharmacology of evipan sodium. Walter P. Kennedy and Basudeva Narayana. *Quart. J. Exptl. Physiol.* 24, 69-75(1934).—The Na salt of cyclohexenylmethyl-N-methylbarbituric acid (evipan Na) (I) has a depressant action on the frog heart which is rapidly removed by washing and is antagonized by adrenaline. No significant effect is produced on the blood sugar of rabbits or guinea

pigs. Respiration is markedly slowed and temp. reduced. The detoxication of I in mammals is very rapid.

**Toxicity of the nitriles of  $\alpha$ -amino acids.** C. Sannicé. *Bull. soc. chim. biol.* 15, 1436-61 (1933); cf. C. A. 28, 1772<sup>2</sup>.—The literature on the toxicity of nitriles is briefly reviewed. S. prepd. the sulfates of the racemic nitriles of 14  $\alpha$ -amino acids (most of them unrelated to the amino acids of proteins) and studied their toxic effects in rabbits. The min. lethal dose ranged from 0.02 to 0.16 g./kg. Only a small part of the toxicity was due to the splitting off of HCN. In the aliphatic series increasing the length of the chain decreased the toxicity. Those of the type R(R')C(NH<sub>2</sub>)CN were the most toxic. In the aromatic series the toxicity was increased by the introduction of a MeO group on the benzene nucleus or a double bond in any side chain.

**Phlorizin and the formed elements of the blood.** Albert Lambrecht. *Compt. rend. soc. biol.* 115, 720-1 (1934); cf. C. A. 28, 1731<sup>2</sup>, 1772<sup>2</sup>.—Phlorizin is not adsorbed from the plasma by the corpuscles or platelets.

**Adrenaline, ephedrine and average bleeding time.** Jacques Roskam. *Compt. rend. soc. biol.* 115, 724-6 (1934); cf. C. A. 27, 3250.—Washing the cut with dil. solns. of adrenaline or ephedrine has little or no effect. Adrenaline or ephedrine given intravenously or subcutaneously prolongs the bleeding time 30-600% although the total amt. of blood lost may be decreased in some cases.

**Cancerigenic power of benzopyrene.** J. Maisin and P. Liégeois. *Compt. rend. soc. biol.* 115, 733-6 (1934); cf. C. A. 28, 1101<sup>2</sup>.—Benzopyrene was prepd. by the method described by Cook, *et al.* (C. A. 27, 3212). Applied to the skin of mice, it produced cancer in a shorter time than either dibenzanthracene or coal tar.

**Action of insulin on the amino acids of the blood.** René Martens. *Compt. rend. soc. biol.* 115, 752-4 (1934); cf. C. A. 27, 3507.—Insulin decreases the blood amino acids, probably by inhibiting proteolysis and promoting the synthesis of peptides.

**Sparteine and spinal anesthesia.** Fernand Mercier and C. Rizzo. *Compt. rend. soc. biol.* 115, 760-72 (1934). In dogs anesthetized with chloralose, sparteine causes a drop in arterial pressure but if the chloralose is supplemented by a spinal injection of pseudocaine-HCl (Delcaine) the sparteine causes a rise in arterial pressure.

**Influence of vagotropic and sympathicotrophic substances on the cholesterol and lecithin contents of [human] blood.** J. Ornstein, M. Sibi and F. Branover. *Compt. rend. soc. biol.* 115, 779-83 (1934).—Repeated hourly injections of pilocarpine produced slight increases in cholesterol and lecithin; atropine and adrenaline produced decreases; and the effects of Cynergene were irregular.

**Action of vagotonin on the acid-base equilibrium of the blood of normal animals [dogs].** D. Santenaise, E. Stankoff and M. Vidacovitch. *Compt. rend. soc. biol.* 115, 795-8 (1934); cf. C. A. 28, 1407<sup>2</sup>.—Vagotonin causes a slight increase in the alk. of the blood and a small decrease in combined CO<sub>2</sub>.

**Curative action of atropine in secondary cardiac syncope produced by chloroform.** L. Garrelon, R. Thuillant and R. Maleyrie. *Compt. rend. soc. biol.* 115, 801-2 (1934); cf. C. A. 25, 3392.—Previous results were confirmed.

**The phenomenon of double inversion of the effects of adrenaline.** Raymond-Hamet. *Compt. rend. soc. biol.* 115, 810-13 (1934).—Adrenaline normally has a hypertensive action, but after the injection of yohimbine its action is hypotensive. Sparteine or a com. hypophysis prepn. (Pituglandol) counteracts the effect of the yohimbine and the action of adrenaline again becomes hypertensive.

**Comparative actions of hyperthermia-producing agents in normal rabbits and rabbits habituated to morphine.** R. Cahen. *Compt. rend. soc. biol.* 115, 817-18 (1934).—

Injections of yeast juice or tetrahydro- $\beta$ -naphthylamine produced a much greater rise in temp. in rabbits habituated to morphine than in controls.

**Comparative actions of hypnotics in normal dogs and dogs habituated to morphine.** R. Cahen. *Compt. rend. soc. biol.* 115, 819-20 (1934).—Habituation of dogs to morphine made them more susceptible to the action of chloralose but had no effect on their sensitivity to butylethylmalonylurea.

**Mode of action of pilocarpine.** L. Lapique and M. Lapique. *Compt. rend. soc. biol.* 115, 827-30 (1934).

**Mescaline, a hallucination-producing substance.** Henri Claude and Henri Ey. *Compt. rend. soc. biol.* 115, 838-41 (1934).—The physiol. effects of mescaline are described, especially the effects on the mental state of the subject.

**Hypertensive action of atropine and pilocarpine.** Victor Papilian, Titu Spataru and Victor Preda. *Compt. rend. soc. biol.* 115, 802-3 (1934).

**The penetration of lipid-insoluble nonelectrolytes of relatively large molecular volume into mammalian erythrocytes.** Hans Ulrich. *Arch. ges. Physiol. (Pflügers)* 234, 42-50 (1934).—The rate of penetration of pentoses, hexoses, hexitols, disaccharides and amino acids into mammalian red blood cells was studied photometrically. The permeability of the erythrocytes of different animal species shows certain fundamental differences which contradict the lipid ultrafilter theory. The results indicate the existence of sp. affinities of the cell membrane for the penetrating mol.

**The action of drugs on the denervated gastrointestinal tract.** J. Le Heux and A. de Kleyn. *Arch. ges. Physiol. (Pflügers)* 234, 98-100 (1934).—The gastrointestinal tract of cats was denervated by cutting the vagi and the post-ganglionic fibers of the sympathetic nerves to the alimentary canal. After a Bi meal, the effect of drugs on this denervated system could be studied by the x-ray on the otherwise intact animal.

**Skin reactions to histamine and glaucoma.** Paolo Guerra. *Minerva med.* 1934, I, 254-61.—A review of the literature with discussion.

**The excretion of aloes.** G. F. Hall. *Analyst* 59, 152-5 (1934); cf. C. A. 27, 5277.—During the passage of the drug through the intestines, progressive hydrolysis occurs. The greatest absorption occurs in the large intestine and is mainly of the hydrolyzed product which is excreted fairly rapidly by the kidneys. After the peak has passed in urine excretion, some unchanged glucoside is still present and the modified Schoutelen test for the unhydrolyzed drug is more delicate and distinctive than the Borntrüger test for the hydrolyzed product. Tests on urine, therefore, in which the unhydrolyzed drug is sought are advantageous after the early stages of intense drug excretion have passed.

**Gold tribromide (aurum tribromidum) in the treatment of pertussis and other spasmodic and spasmophilic disorders with a note on gold in tuberculosis.** J. Epstein. *Arch. Pediatrics* 51, 58-62 (1934); cf. C. A. 27, 1939.—The action of AuBr<sub>3</sub> is neurosedative, antispasmodic and antibacterial. It is administered as an elixir.

**Stomatitis medicamentosa.** Sigmund S. Greenbaum. *Dental Cosmos* 76, 353-6 (1934).—Stomatitis can be produced by ingestion, parenteral injection or external application of certain compds., such as members of the acetanilide-antipyrine group, derivs. of As (arsphenamines), Bi, Hg and Au, bromides and iodides, the barbit group, cinchophen, phenolphthalein and derivs. of salicylic acid.

**Epithelial phagocytosis. II. A method for demonstrating the origin of dust cells.** H. M. Carleton. *Proc. Roy. Soc. (London)* B114, 513-23 (1934); cf. C. A. 21, 3971.—Administration of benzene to rabbits causes almost complete atrophy of the bone marrow, reduces the leucocyte count to a negligible value, and has little, if any, effect on the reticulo-endothelial system. The treated rabbits retain the power of phagocytosis of intratracheally intro-

duced colloids (e. g., hydrokollag); the dust cells do not take a vital stain like trypan blue, and are derived from the alveolar epithelium.

The toxicity of ethylene glycol, propylene glycol and diethylene dioxide (dioxane). G. Malcolm Dyson. *Ind. Chemist* 10, 102, 108(1934).

Histology of certain organs and teeth in chronic toxicosis due to fluorine. P. H. Phillips and A. R. Lamb. *Arch. Path.* 17, 169-76(1934).—As a direct result of including F (20-30 mg. per kg. per day) in the diet of rats, either in the form of the Na salt or as rock phosphate, pathol. changes have been noted in the kidneys, incisor teeth and thyroid glands. To a lesser and more variable extent, pathol. changes have been noted in the liver and suprarenal glands. Pathol. conditions in other tissues were not detected.

A combined treatment for neoplasms of Röntgen therapy and isamine blue. Denier. *Neoplasmes* 12, 545-52 (1933).—Favorable results may be obtained in tumor cases by a combination treatment of intravenous injections of isamine blue (tri- $\beta$ -naphthyl- $p$ -rosaniline) followed by radiotherapy. A freshly made sterile 0.5% soln. of isamine blue is injected in increasing amts. every other day until 1-1.2 g. has been injected if followed by radiotherapy or 2-2.5 g. injected if x-ray therapy is contraindicated. The isamine blue soln. is almost completely nontoxic and tends to accumulate about the tumor and sensitizes the tumor to radiotherapy. Isamine blue alone seems in some cases to improve the condition of the patient and there is a lessening of pain and of cachexia, but many injections are required and the results are not often permanent if isamine blue alone is used.

Studies of horses treated for strongylidosis. E. E. Slatter, S. E. Park and Robert Graham. *North Am. Veterinarian* 14, No. 3, 19-33(1933).—A study was made of the effects of various drugs on the hemoglobin, red blood cell count, body wt., etc., of horses after treatment with oil of chenopodium and  $\text{CCl}_4$  for *Strongylus* spp. infestation. Na cacodylate given subcutaneously seemed to exert a favorable influence as compared with tartar emetic alone or combined with  $\text{FeSO}_4$ , and  $\text{CuSO}_4$  alone or combined with  $\text{FeSO}_4$ , administered in the feed.  $\text{FeSO}_4$  given alone may have exerted a favorable effect.

Experimental studies on acute mercurial poisoning. Sanford M. Rosenthal. *U. S. Pub. Health Repts.* 48, 1543-60(1933).

Gelsemium poisoning. Victor A. Recko. *Deut. Z. ges. gericht. Med.* 21, 9-14(1933).—A review of the literature regarding dosage and symptoms of poisoning.

Fatal hydrocyanic acid poisoning due to the use of bitter almonds. Jacobi. *Deut. Z. ges. gericht. Med.* 21, 15-17 (1933).—A case report.

Prolonged alcohol retention in traumatically conditioned unconsciousness. Test in the presence of cardiazole. R. M. Mayer. *Deut. Z. ges. gericht. Med.* 21, 337-41 (1933).—Deep traumatically conditioned unconsciousness hinders removal of alc. from the human organism. Cardiazole (0.6 g.) administered during the unconscious period does not influence the results.

Experimental investigations on the pathology of industrial araine. G. Schfader. *Deut. Z. ges. gericht. Med.* 21, 342-58(1933).—Important degenerative changes were observed in the kidneys, liver and heart. Subacute AsII<sub>2</sub> poisoning in animals was studied in order to ascertain whether the changes were permanent. Histological exams. showed permanent degeneration of heart and liver.

Thallium poisoning. R. Fridle. *Deut. Z. ges. gericht. Med.* 21, 461-2(1933).—A case report.

Conjugated-phenol concentration of the blood in the different organs. Agustin D. Marenzi. *Anales farm. biogum.* (Buenos Aires) 4, 36-8(1933).—The portal vein carries more conjugated phenols than the vena cava or the carotid artery. Conclusion: The conjugation occurs in the greater part before the entrance of the phenol into the liver.

The phosphatase and pyrophosphatase in the sputum of

tuberculous patients. II. The phosphatase contents of sputum following yatoconin treatment. Yoshiaki Imagawa. *Arch. Brit. Abt. Anat. Inst. Kaiser Univ. Kyoto Ser. C*, No. 4, 143-4(1933); cf. C. A. 27, 1941.—After the 1st 10 injections of yatoconin the phosphatase of the sputum increases. After the 2nd 10 injections it decreases. The prognosis of tuberculosis cases showing phosphatase increase following 10 yatoconin injections is favorable, of those showing a decrease unfavorable, of cases with a low original phosphatase sputum content unfavorable, and vice versa. The richer the phosphatase content of the sputum the more rapidly the tuberculosis bacilli vanish. The phosphatase content of the sputum of tuberculous patients is an addnl. index in the clinical evaluation of tuberculosis cases.

The treatment of hyperthyroidism with diiodotyrosine. Annemarie Buresch. *Munch. med. Wochschr.* 81, 320-3 (1934).—Diiodotyrosine benefits ambulant cases.

Isalton, a new ephedrine derivative for bronchial asthma. Hans Handovsky. *Munch. med. Wochschr.* 81, 326-7 (1934).—1-Phenyl-2-[methyl(diethylaminoethyl)] amino-propanol is 0.5 as toxic as ephedrine, has practically no effect on blood pressure and has a strong bronchospasmolytic action.

Inter-relations of the action of neuro-vegetative pharmacological agents. E. Rothlin. *Schweis. med. Wochschr.* 64, 188-91(1934).—Pharmacol. relations of adrenaline, pilocarpine, ergotamine and atropine are discussed.

The fate of caffeine in the animal organism. A. Krupski, A. Kunz and F. Almasy. *Schweis. med. Wochschr.* 64, 191-7(1934).—The urine of horses contains 7-16% of ingested caffeine. With doses less than 50 mg. per kg. the blood caffeine does not rise above 15 mg. per 100 cc. The concn. of urine caffeine is 1-3 times that of the blood but parallels the latter.

The effect of x-rays on the spleen and iron metabolism. I. I. Arkusski. *Strahlentherapie* 49, 455-62(1934).—X-radiation of the spleen or its extirpation produces a diminished and not an increased Fe excretion.

The circulatory and diuretic effects of intravenous glucose injections. R. Pfeiffer. *Wien. med. Wochschr.* 83, 1243-5(1933).

Cerebrospinal fluid. XI. The effects of spinal anesthesia. Michio Kasahara and Nagao Kawashima. *Z. ges. expil. Med.* 92, 623-5(1934); cf. C. A. 28, 2764. XII. Changes after subdural infection with B. C. G. strains. Michio Kasahara and Hideo Ichikawa. *Ibid.* 626-8.

The lead content of blood in experimental lead poisoning with special reference to age. Michio Kasahara and Kusuo Arimichi. *Z. ges. expil. Med.* 92, 629-30(1934).—The injection of the same amt. of Pb acetate produced less rise in the blood Pb of old rabbits than in young rabbits.

The effect of glucose derivatives upon animals (rabbits) after hepatectomy. D. R. Drury and W. T. Salt. *Am. J. Physiol.* 107, 406-13(1934).—A large no. of hexose derivs. and triose derivs., which in the intact animal can be transformed to glucose, are incapable of prolonging life in an animal whose liver has been removed.

The effect of varying levels of iodine intake on the thyroglobulin content of the thyroid gland. Mildred B. Jones. *Am. J. Physiol.* 107, 511-17(1934).—There is an increased formation and storage of thyroglobulin during the administration of KI.

Pilocarpine and insulin secretion. S. Appelrot. *Am. J. Physiol.* 107, 526-8(1934).—Large doses of pilocarpine product a slight rise in blood sugar in normal dogs and a very pronounced rise in dogs whose pancreas has been removed. Pilocarpine stimulates the islets of Langerhans, also the adrenals and possibly the thyroid.

Resistance of surviving spinal animals to hypoglycemia induced by insulin. C. M. Brooks. *Am. J. Physiol.* 107, 577-83(1934).—Surviving spinal animals with the cord cut in the cervical region have a diminished resistance to insulin.

J. F. Lyman

The action of oxygen in counteracting alcoholic intoxication. A. L. Barach. *Am. J. Physiol.* 107, 610-15 (1934).—The ingestion of alc. markedly diminishes the efficiency of the performance of muscular work, but this efficiency can be partially restored by inhalation of O<sub>2</sub>. The influence of O<sub>2</sub> on alc. intoxication of men at rest is generally to improve their sensory functions and to increase their intelligence. J. F. Lyman

The oxygenation of mineral water from La Bourboule and glucemia in the rabbit. René Clogne and Andrée Drilhon. *Bull. acad. méd.* 110, 85-8 (1933).—The action on the blood sugar is destroyed by O<sub>2</sub>. A. E. Meyer

The disappearance of keratitis lesions and experimental opacities in the cornea after treatment with benzyl cinnamate. J. Jacobson. *Bull. acad. méd.* 110, 104-8 (1933).—The lesions were produced by injection of diphtheria toxin into the cornea of the rabbit. The treatment consists of subcutaneous injections of a 3.2% soln. in olive oil for 12 days, followed by a 2nd treatment after 15 days. The lesions heal and the opaque spots clear up in contrast with the controls. A. E. Meyer

The prevention of infection with syphilis by bismuth in monkeys and anthropoids. C. Levaditi, A. Vaisman and Y. Manin. *Bull. acad. méd.* 110, 176-80 (1933); cf. *C. A.* 27, 2215.—Injections of Bi compds. combined with cholesterol and myricin show a prophylactic effect against syphilis infections. A. E. Meyer

Injections of large doses of glucose and arterial pressure. M. Roch, E. Martin and M. Scielouff. *Bull. acad. méd.* 110, 244-9 (1933). From 400 to 500 cc. of a 20% soln. were given daily 10-20 times. Good results were obtained in nephritis with hypertension. It is supposed that a stimulation of the pancreas is responsible for the effect. A. E. Meyer

The inhibiting action of some mixtures of amino acids in cancer development. F. Vlès and A. de Coulon. *Bull. acad. méd.* 110, 714-7 (1933).—See *C. A.* 28, 1775. F. Vlès and A. Gussset. *Ibid.* 717-51. A. E. Meyer

The possibility of poisoning with fluorine during uterine life. H. Veln. *Bull. acad. méd.* 110, 799-800 (1933).—Young animals born from mothers exposed to the influence of F develop dental alterations which must have origin from the time before birth, since dental changes become evident only after 6 months of poisoning. A. E. Meyer

Ammonium chloride in the treatment of sclerodermia. René Leriche and Adolphe Jung. *Presse méd.* 41, 1041 (1933).—A case has been treated with excellent results. The mechanism of the action could not be explained. A. E. Meyer

Sclerosis of varicose veins by treatment with potassium chromic sulfate and glycerol. H. Jausion. *Presse méd.* 41, 1061-3 (1933).—A sterilized soln. of 1.5 g. KCr(SO<sub>4</sub>)<sub>2</sub> in 126 g. glycerol and 200 cc. H<sub>2</sub>O was injected in quantities of 5 cc. A. E. Meyer

Amino acid therapy and hay fever. Jacques Lenormand. *Presse méd.* 41, 1141-2 (1933).—Intradermal injections of 2-4 cc. of a soln. contg. 4% histidine and 2% tryptophan gave good results. A. E. Meyer

Preventive treatment of stomatitis produced by mercury and bismuth. L. Le Bourg. *Presse méd.* 41, 1153-4 (1933). A. E. Meyer

The mechanism of diuresis produced by mercurials (novasurol). Emilio Trosce. *Semana méd.* (Buenos Aires) 1934, I, 630-50.—The min. effective dose of novasurol given intravenously to dogs is 0.052 cc. per kg. The diuresis is inhibited by pilocarpine, increased by atropine and not influenced by pituitrin. Hypertonic glucose soln. given intraperitoneally has no influence; general anesthesia completely inhibits the diuresis. The vol. and pressure of the spinal fluid increase during the diuresis. The perfused kidney is not influenced by asurol. It has no influence on the imbibition of tissues. The alkali reserve and gas in the blood remain unchanged. The Na and Ca ions are considerably reduced, the total N only slightly. The plasma viscosity is increased. A. E. Meyer

The action of certain proteins in the treatment of pulmonary tuberculosis. Enrique de Cires. *Semana méd.* (Buenos Aires) 1934, I, 667-79. A. E. Meyer

The influence of urethan on the absorption of diphtheria antitoxin. Enrico Ciaranfi. *Sperimentale* 87, 471-6 (1933).—The absorption is delayed. A. E. Meyer

The effect of activated ergosterol administration on the calcium of the cerebrospinal fluid. C. R. K. Johnston and E. J. King. *Trans. Roy. Soc. Can.* V 27, 87-9 (1933).—Oral administration of activated ergosterol (1 cc. per 8 kg. body wt. to 1 cc. per 3 kg. body wt.) to adult dogs increased serum Ca, the max. being reached in 48-60 hrs. The Ca content of the spinal fluid increased only after the serum Ca had reached the max. value. Five to 8 days after ergosterol administration, a secondary increase in serum and spinal-fluid Ca was observed. This is attributed to an observed vacuolization of the cells of the parathyroid gland. W. Gordon Rose

Effects of narcosis on the quantity of glutathione in tissues, organs and blood. I. Kushiya. *Japan. J. Obstet. Gynecol.* 16, 360-4 (1933).—The av. glutathione contents in the organs of normal rabbits were: liver 0.27, intestines 0.197, spleen 0.191, suprarenal capsule 0.187, kidney 0.131, ovary 0.131, lungs 0.116, stomach 0.108, thyroid gland 0.102, pancreas 0.098, thymus gland 0.093, bone marrow 0.080, spinal cord 0.076, heart 0.071, brain 0.067, muscle 0.038, blood 0.023%. Twenty-four hrs. after inhalation of CHCl<sub>3</sub> for 30 min. at the rate of 0.5 cc. for each 5 min. there was increase in the glutathione content in the heart, kidney and blood, but there was marked decrease in the other tissues. Immediately after narcosis with ether, the glutathione content of the spleen, kidney, heart and liver increased, but no sp. change was noticed in the other tissues. In 24 hrs. after the ether narcosis, neither increase nor decrease was recognized. K. Sugiura

The effect of insulin and adrenaline on the amino acid content of the blood of adrenalectomized rabbits. Burt L. Davis, Jr., and Walton Van Winkle. *J. Biol. Chem.* 104, 207-15 (1934).—The administration of insulin to adrenalectomized rabbits, glucose being given at the same time to prevent convulsions, causes no fall in blood amino acids. Injection of adrenaline under the same conditions lowers the blood amino acid content to 50% of its initial level. Conclusion: The lowering of blood amino acids, observed in normal animals after injection of insulin, is due not to the insulin itself but to the increased secretion of adrenaline which the insulin stimulates. K. V. T.

The pigeon as a hematopoietic test animal. Wm. A. Peabody and R. C. Neale. *J. Am. Pharm. Assoc.* 22, 1231-7 (1933).—Studies were made by injecting normal saline soln., leucine, histidine, tryptophan, ash of liver ext. and several intramuscular liver preps. The technique is described in detail. The results of the studies show that inorg. constituents (liver ash and Cu), leucine and probably histidine and tryptophan are not the constituents of liver ext. which are effective in increasing the reticulocyte percentage in the blood of grain-fed pigeons. Injections of liver ext. significantly increase the concn. of red blood cells and probably the hemoglobin in such birds. These results strengthen the assumption that the pigeon response is a measure of the substance or substances effective in pernicious anemia. However, limited clinical comparisons indicate that pigeon effectiveness may not parallel the clinical response. Further clinical comparisons are necessary. L. E. Warren

Further study of the toxicity of derivatives of rotenone with the goldfish as the test animal. W. A. Gersdorff. *J. Am. Chem. Soc.* 56, 979-80 (1934); cf. *C. A.* 27, 2219.—The compds. studied have, according to each of 3 criteria (threshold of toxicity, max. rate of increase of the velocity of fatality and min. survival time), the following decreasing order of toxicity to goldfish: rotenone (I), acetyl-dihydro-rotenone (II), dihydro-rotenolone (III), its Ac deriv. (IV) and acetyl-rotenolone (V). Comparison according to the 2nd of these criteria, which is the more serviceable from the standpoint of practicality (inasmuch as it has reference to that portion of each curve in which the proportional change in the 2 variables, concn. and time, is not greatly different), shows that the results are consistent with those previously published in permitting the following

generalizations to be drawn: The dihydro compds. produced by satn. of the double bond in the side chain with H have appreciably higher toxicities than the corresponding unsatd. compds.; the enol acetates and the Ac derivs. of the HO compds. have appreciably lower toxicities and the HO compds. have much lower toxicities than the parent compds. The theoretical threshold of toxicity and the min. survival time are: I 0.01 mg. per l., 110 min.; II 0.02, 120; III 0.05, 150; IV 0.08, 305; V 0.09, 380.

C. J. West

Medicaments and nutrients in the treatment of tuberculosis (Schröder) 17. Fe compd. of gluconic acid (Proskouriakoff, Titherington) 10.

Larsen,<sup>6</sup> Esper and Stürup, Georg!<sup>1</sup> Farmakologi i Grundstræk. 2nd ed., revised by Erik Hagens. Copenhagen: Store Nordiske Videnskabsboghandel. 432 pp.

## I—ZOOLOGY

R. A. GORTNER

Chemical heterogeneity and the ground plan of animal growth. Joseph Needham. *Biol. Rev. Cambridge Phil. Soc.* 9, 79 (1934); cf. *C. A.* 27, 768.—A discussion of the application of the concept of heterogeneity to the chem. changes in growing metazoa including the heterogeneity equation, uniformity, similarity in the same organ, nutritive factors, effect of temp., heat production and ground plan of animal growth.

R. C. V. B.

Respiration of the ciliate *Glaucoma piriformis*. Marguerite Lwoff. *Compt. rend. soc. biol.* 115, 237-41 (1934).—HCN and CO, which block the Fe of respiratory hemins, caused but a transient decrease in the respiration of *G. piriformis*. As<sub>2</sub>O<sub>3</sub> and CH<sub>3</sub>ICOH, which block—SH groups, caused a lasting decrease. The urethans also caused a decrease. In all cases the organisms lived and recovered their normal rate of respiration when placed in fresh normal medium.

L. E. Gilson

Albumin and globulin contents of the serums of various fishes. G. Deunenier. *Compt. rend. soc. biol.* 115, 555-7 (1934).—In the 6 species studied the values varied greatly with the species and the season. Albumin ranged from 3.4 to 17.8 g. per l. and globulin from 10.8 to 44.7 g.

L. E. Gilson

Reactions of various isolated tissues of the squid, *Loligo pealii*, to adrenaline, acetylcholine, ergotamine and certain ions. Z. M. Bacq. *Compt. rend. soc. biol.* 115, 716-17 (1934); cf. *C. A.* 28, 1779.

L. E. Gilson

The ratio between the calcium and phosphorus contents of fish. A. de Clercq. *Natuurw. Tijdschrift* 15, 229-36 (1933).—A table is given of percentage of H<sub>2</sub>O, ash, P and Ca of 21 fish species with sep. figures for the meat and offal. The P:Ca ratio varies from 1.58 to 0.29 in the meat, from 0.75 to 0.12 in the offal. For 477 herrings with or without filled gonads the ratios are 0.42 and 0.73 resp., for *Pleuronectes platessa* 1.25 and 0.68, for *Scomber scombrus* 1.57 and 0.65, resp. This ratio is favorable for metabolism of vitamin D (cf. Massengale and Nussmeier, *C. A.* 24, 4082, Bethke, et al., *C. A.* 27, 750).

B. J. C. van der Hoeven

The relation of respiration of fishes to environment. I. Introduction. Edwin B. Powers. *Ecological Monographs* 2, 387-9 (1932). II. Behavior of gases in solution. *Ibid.* 389-94. III. Methods used in determining the oxygen content and the carbon dioxide tension of experimental water. *Ibid.* 394-5. IV. Relation of carbon dioxide and oxygen contents of the blood to the carbon dioxide and oxygen tensions of the environmental water. Edwin B. Powers, Florian G. Hopkins and Thressa A. Hickman. *Ibid.* 396-414.—The vol. percentage of the CO<sub>2</sub> of the venous blood of the blue catfish (*Ictalurus punctatus* Rafinesque) increases with an increase in the O content of the water; this is less obvious in the case of the German carp (*Cyprinus carpio* Linnaeus). The vol. percentage of the CO<sub>2</sub> of the blood of both the blue cat and the carp increases with an increase in the CO<sub>2</sub> tension of the water; this tendency is more marked in the carp than in the blue cat. The vol. percentage of the O in the blood

of the blue cat increases with the O content of the water; this relation if present in the carp is very slight. There is a very slight, if any, relation between the vol. percentage of the O in the blood and the CO<sub>2</sub> tension of the water in either the blue cat or carp. V. Effect of the oxygen and carbon dioxide tensions of the water upon the number of red corpuscles in the blood of the blue cat, *Ictalurus punctatus* Rafinesque. Edwin B. Powers and Lula Mac Shipe. *Ibid.* 414-20.—The no. of red blood corpuscles in the venous blood of the blue cat increases with a decrease in the O content of the water and *vice versa*; the CO<sub>2</sub> tension of the water has the reverse effect. VI. Oxygen and carbon dioxide dissociation curves of whole blood. Edwin B. Powers and Thressa A. Hickman. *Ibid.* 421-30.—The O disson. curves of the blood of the yellow catfish (*Leptops olinas* Rafinesque) followed the general form of the curves detd. by Bohr (*Contr. Physiol.* 17, 688 (1904)). The O disson. curves of blood in contact with O contg. 0.03 and 2.0% CO<sub>2</sub>, resp., differed from each other as would 2 different bloods contg. different amts. of hemoglobin; this indicates that the hemoglobin was changed either in kind or in content. At low CO<sub>2</sub> tensions, the CO<sub>2</sub> content of the blood of the yellow cat increased rapidly when it was equilibrated with small amts. (0.015-0.24%) of CO<sub>2</sub>; this was followed by a less rapid but irregular rise. Carp blood deteriorated too rapidly for any detns. to be made on it. VII. Relation of the p<sub>H</sub> to the carbon dioxide tension used to modify the blood. *Ibid.* 430-6.—Marked physicochem. changes occur in fish blood when it is exposed to CO<sub>2</sub> tensions 10-100 and more times greater than the CO<sub>2</sub> tensions of the water normally bathing the gills of fishes. This change in CO<sub>2</sub> tensions is sufficient in a stable physicochem. system to raise the H-ion concn. 10-100 and more times.

VIII. Notes on the formation of crystals in drawn blood. Edwin B. Powers, Lula Mac Shipe and Thressa A. Hickman. *Ibid.* 436-8.—The crystals first appeared within the red blood corpuscles, the amts. increasing with the age of the drawn blood. The types of crystals varied with different species of fish; their chem. nature was not detd. IX. The effect of the carbon dioxide tension with which the blood has been equilibrated upon the oxygen and carbon dioxide capacities of the blood. Edwin B. Powers and Thressa A. Hickman. *Ibid.* 438-42.—When fish blood is brought to a CO<sub>2</sub> tension 0.6-1.0 atm. higher than the CO partial pressure of the atm. it loses in capacity to combine with CO<sub>2</sub> and O, which when outside the body is not completely reversible. X. Mechanism of the deposition of gases into the swim-bladder. Edwin B. Powers. *Ibid.* 443-65. XI. General summary. *Ibid.* 465-7. One hundred and thirty-nine references. E. D. Jacob

The effect of chlorotone on the oxygen consumption of amphibian larvae (*Rana clamitans*). Herman Bernhard. *Physiol. Zool.* 7, 17-35 (1934).—The depression of the O consumption increased with chlorotone concn. from 0.005 to 0.06%.

Milton Levy

The phosphorus distribution in resting fly muscle. Ernest Baldwin and Dorothy M. Needham. *J. Physiol.* 80, 221-37 (1933).—The muscles of flies contain adenylyl pyrophosphate in about the same concn. as do the muscles of frogs or rats. The argininephosphoric acid content is small and the hexose ester content high in comparison with the frog or rat.

J. F. Lynan

Osmotic and ionic regulation in the shore crab, *Carcinus maenas*, with notes on the blood concentrations of *Gammarus locusta* and *Ligia oceanica*. J. B. Bateman. *J. Exptl. Biol.* 10, 351-71 (1933).—The Cl concn. of the body fluids of the crab varied from 0.396 to 0.641 moles per 1000 g. H<sub>2</sub>O. No consistent relation between foreign ion and the Cl of the body fluids was found. The gill membrane is almost impermeable to water. The detn. of the vapor pressure of the body fluids of the crab exposed to various external conditions proves that the crab has temporary osmotic independence.

C. M. McCay

Metabolic changes associated with endocrine activity and the reproductive cycle in *Xenopus laevis*. III. Changes in the calcium content of the serum associated with captivity and the normal reproductive cycle. II.

Zwarenstein and H. A. Shapiro. *J. Exptl. Biol.* 10, 372-8 (1933).—Throughout the reproductive cycle the serum Ca is higher in the females. This is assocd. with ovarian activity. In the male toad this value remains const. at 8.3-9.8 mg. throughout the year. The female exceeds the value of the male by 46% in August at the beginning of the breeding season. C. M. McCay

The carbon dioxide dissociation curves and the buffering of crab muscle and nerve preparations. S. L. Cowan. *J. Exptl. Biol.* 10, 401-11 (1933).—An almost linear relation holds between pressure of  $\text{CO}_2$  and  $\text{pH}$  over the greater part of the range 50-760 mm. for nerve and 70-400 mm. for muscle. C. M. McCay

An experimental study of hemopoiesis in *Necturus*: effect of lead poisoning on normal and splenectomized animals. Andrew B. Dawson. *J. Morph. Physiol.* 55, 349-86 (1933).—The blood stream of *Necturus* is an important site of red cell differentiation. The anemia that results from lead poisoning appears more rapidly after splenectomy and the regeneration of erythrocytes is delayed. C. M. McCay

Are isoreactions present in invertebrates? Leone Lattes. *Boll. soc. ital. biol. sper.* 8, 1433-5 (1933).—

Expts. *in vitro* or *in vivo* failed to reveal the existence of group-sp. isoreactions in silkworms. Peter Masucci

The action of cocaine on fishes. R. De Marco. *Boll. soc. ital. biol. sper.* 8, 1488-90 (1933).—Doses of cocaine  $\frac{1}{2}$ -1 mg. injected in fishes 10-30 g. in wt. produced no visible manifestations; larger doses at first produced an increase in respiration and in movements for locomotion but later a decrease of all muscular movements such that they failed to respond to stimuli. The M. L. D. was 0.166 g. for *Box boops*, 0.200 g. for *Mugil* and *Oblate*, 0.700 g. for *Pagellus* and 0.93 g. for *Scorpaene*. Peter Masucci

The consumption of oxygen by *Lumbriculus variegatus* and *Rhyncelmis limosella*. Jaroslav Lang. *Biol. Zentr.* 54, 85-8 (1934). A. E. Meyer

The snails of Snail Shell Cave. Geo. Davis, Arlie A. O'Kelly and Dorothy Bachtel. *J. Tenn. Acad. Sci.* 9, 47-50 (1934).—Chem. analysis of the shells of 17 species collected in Snail Shell Cave gave results varying widely according to species. The  $\text{CaO}$  reported was, in 11 cases, above that for pure  $\text{CaCO}_3$ , the highest being 65.5%. The authors suggest that a possible complex of  $\text{CaO}$  and  $\text{CaCO}_3$  is formed when there is a deficiency of  $\text{CO}_2$ . A. Lloyd Taylor

## 12—FOODS

C. C. BLANCK AND H. A. LITPLER

Some fundamental scientific problems in the food industry. L. W. Lampitt. *Chemistry & Industry* 1934, 283-90. E. H.

Performance tests of some laboratory emulsifiers. R. I. Johnson and J. F. Morse. *Food* 3, 173-5 (1934). The "Empire," "Universal Emulsor," "Cremac," "Q. P. Lab. Emulsifier" and "Impulsor" emulsifiers are briefly described. By means of a test mixt. consisting of a salad cream contg. 45% oil and prepd. in a mech. whisk, treatment in the "Cremac" and in the "Q. P. Lab. Emulsifier" produced emulsions of a degree of dispersion approaching that obtained in a com. viscolizer. A Papineau-Couture

Identification of organic preservatives and commercial sweetening substances in foodstuffs. R. Fischer. *Z. Untersuch. Lebensm.* 67, 161-72 (1934). A method is described for identifying 11 of the most important preservatives and sweetening substances. These substances are nipagin, Et *p*-hydroxybenzoate, nipasol, benzoic acid, *o*-chlorobenzoic acid, salicylic acid, cinnamic acid, *p*-hydroxybenzoic acid, dulcin, *p*-chlorobenzoic acid and saccharin. The extn. is carried out in the usual fashion with  $\text{Et}_2\text{O}$ ; the  $\text{Et}_2\text{O}$  ext. is then shaken out with an aq. alk. soln. The dulcin remains in the  $\text{Et}_2\text{O}$  soln., all other substances going over into the aq. alk. soln. After sepd. the aq. soln. from the  $\text{Et}_2\text{O}$ , it is acidified and thoroughly shaken out with petr. ether. The petr. ether ext. contains all the aromatic preservatives except *p*-hydroxybenzoic acid and saccharin, which are insol. in petr. ether. These 2 substances can be removed from the acidulated aq. alk. soln. by means of  $\text{Et}_2\text{O}$ . The soly. of *o*-chlorobenzoic acid in petr. ether is small, but the repeated use of this solvent removes the acid quantitatively. Dulcin is sepd. from the original  $\text{Et}_2\text{O}$  ext. by evapn., taking up in hot  $\text{H}_2\text{O}$ , filtering, taking up again in  $\text{Et}_2\text{O}$  and evapn. of the solvent. The other  $\text{Et}_2\text{O}$  and petr. ether exts. are evapd. and the residues submitted to microsublimation. The identification of the crystals obtained follows through a detn. of the micro melting point. The temp. of sublimation and behavior under polarized light are likewise considered. Exact methods of procedure are given for the investigation of sirups, fruit juices, wine, beer, must, vinegar, marmelade, milk, fats, preserved fish and meat and cheese. On the av. 3-10 g. of any substance is used for the test. The sensitivity of the identification varies between 0.01 and 0.001%. Particular weight is laid on the sepn. of the individual substances in dealing with a mixt. of preservatives, for recently such mixts. are frequently employed in foodstuffs. The sepn., which for all

substances is described in detail, depends in part on fractional sublimation, partly on the destruction of certain substances, partly on the identification of conversion products. A short practical method is also given for identifying hexamethylenetetramine and  $\text{CH}_3\text{O}$  in the presence of each other. F. L. Dunlap

Methods for determining sulfur dioxide in food products. I. A. Oberhard, A. D. Lebedev, G. F. Goldberg, A. N. Moshkova and E. V. Oshrina. *Schriften zentral. Forschungsinst. Lebensmittelchem.* (U. S. S. R.) 3, 337-60 (1933). Iodometric, acidimetric and gravimetric (sulfate) methods of detg.  $\text{SO}_2$  (preservative in fruit juices, etc.) are compared. Sulfate detn. in the oxidized distillate is accurate; so is sulfate detn. in the sample before and after oxidizing the  $\text{SO}_2$ ; but iodometric detn. is more convenient, especially in strongly acid juices. In faintly acid juices the Tzerevitinov method, modified by adding the sample to a known vol. of standard I soln. and titrating back, is preferable. Direct titration with I is least accurate. For sulfited berries in kegs a proposed standard method is to take juice only, in a wide 20 cc. sampling tube, add to 25 cc. of 0.1 N I in a flask and titrate back after 10 min. Procedures are described for strongly and weakly acid fruit juices. Julian F. Smith

Need for uniform practices in the microbiological examination of food products. Lawrence H. James. *Am. J. Pub. Health* 24, 325-6 (1934). J. A. Kennedy

Formation of spots on tin cans. Freitag. *Oberflächentechnik*. 11, 53 (1934). Yellow-brown spots which are often found on the inner walls of tin cans of food are caused by org. S compds. contained in the food, as albumin, cystine, allyl sulfide, etc.; they are not injurious to the food. A thin layer of Sn sulfide is formed, and the Fe under the Sn is also sometimes attacked. The use of a lacquer contg. Sn sulfide for coating the interior wall is recommended instead of the ordinary copal lacquer; the sulfide lacquer remains intact also in the sterilization process. M. Hartenheim

Cereal foods, their advertising and the Committee on Foods of the American Medical Association. Raymond H. Hertwig. *Cereal Chem.* 11, 74-80 (1934). An explanation is given of the functions of the Comm. on Foods of the Am. Med. Assoc. The conditions under which a food is acceptable by the comm. and the procedure for having a food accepted by the comm. are given. L. H. Bailey

The possibility of characterizing hardened soft wheats according to the ratio between total and amino nitrogen of their seeds and energy of autolysis of the latter. A. V. Blagoveshchenski and N. I. Sosodov. *Cereal Chem.* 11,

117-20(1934).—All conditions of growth being identical, the seeds of hard wheats possess a higher amino index, i. e., a higher ratio between total N and the  $\text{CH}_2\text{O}$ -titratable N of the free amino groups (Sørensen), than the seeds of soft wheats. The energy of autolysis of the seeds shows a pos. high correlation ( $r = +0.8$ ) with the amino index and therefore it is higher in hard wheats than in soft ones. In the majority of cases vitreous seeds are characterized by a higher amino index than starchy ones. Semi-vitreous seeds occupy an intermediate position.

L. H. Bailey  
The quality of German wheat. P. Pelshenke. *Mühlentab.* 4, 1-8(1934); cf. *C. A.* 28, 833<sup>1</sup>.—Analytical data on 7500 samples, representing 73 winter and 10 spring wheat varieties of the 1931-33 harvests, indicate that varietal differences, especially in gluten quality (as detd. by the gluten-swelling and dough-ball tests) are not obscured even under extremely favorable or adverse conditions. By taking gluten quality as the criterion, the percentage of the best varieties grown in different districts is estd.

Clinton L. Brooke  
The wheat-meal fermentation time tests for evaluating soft wheat. O. B. Winter and Ardie G. Gustafson. *Cereal Chem.* 11, 49-56(1934).—The wheat-meal fermentation time test was compared with 3 other tests (protein content of flour, vol. of loaf and expansion of dough) for detg. quality of wheat. The wheat-meal fermentation time test shows a fair pos. correlation with vol. of loaf and expansion of the dough, but not with the protein content of the flour. This test shows proportionally greater differences between samples of flour than do any of the others. However, since there is only a fair correlation between the results by this test and the vol. of loaf or the protein in the flour, no attempt has been made to interpret the results obtained by its use. A modification of the test is described whereby the expansion of the dough ball is measured instead of the time of fermentation. Preliminary results by the modified test compare favorably with those of the time test and the modification requires less of the operator's time.

L. H. Bailey  
Some effects of heat exposure on wheat starches. C. E. Mangels. *Cereal Chem.* 11, 86-94(1934).—Exposure to 80°, 100° and 120° for 8 hrs. has very little effect on the specific rotation of wheat starch, but there is a tendency for specific rotation to decrease. Exposure to 100° for 8 hrs. decreases slightly the resistance of starch to diastase. When starches are exposed to dry heat for 8 hrs. at 80°, 100° and 120°, resp., the starch from hard red spring wheat flour shows relatively little change in swelling capacity. The starches from winter wheats, when subjected to heat treatment, show a much greater increase in swelling capacity than starches from hard spring wheat similarly treated. Exposure at 80° or 90° however, gives relatively small changes as compared to exposure at 100°. Durum starch shows about the same increase in viscosity as the winter wheat starches when exposed to heat.

L. H. Bailey  
The effect of fertilizers upon the baking quality of wheat. L. Borasio. *Giorn. risicoltura* 23, 254(1933).—A "Pneumodinamometer" was used in detg. the quality of the flour, viz., the tenacity, elasticity, extensibility and strength. The percentage of gluten was also detd. The yield of dough was const., 159-161; yield of bread 128-129; the vol. of bread varied from 730 to 760 cc. (based upon 300 g. dough). No great difference in quality was noted as the result of the different fertilizer treatments.

J. A. LeClerc  
Evaluating flour. C. O. Swanson. *Natl. and Am. Millers*, 61, No. 10, 11-21(1933).—The following characteristics should be known about flours used for bread making with yeast: (1) mixing tolerance or resistance of dough to mech. action; (2) rate of development; (3) sugar requirements or reserve yeast food; (4) sponge or straight dough; (5) reaction toward oxidation.

L. H. Bailey  
Flour from denatured wheats. Detection of coloring matter. Clément Gicquel. *Ann. fals.* 26, 91-2(1934).—

At the present time French wheat which is not to be milled for human consumption is denatured with methylene blue or eosin. Unscrupulous millers use such wheat; but small particles of dye are detached from the bran during the milling and remain in the flour, where they may be detected.

A. Papineau-Couture

A simplified method for the determination of carotene in flour extracts. W. F. Geddes, D. S. Binnington and A. G. O. Whiteside. *Cereal Chem.* 11, 1-24(1934).—The fundamental basis of the simplified method is the use of Hg-arc radiation as illumination for colorimetric comparison of flour exts. obtained with colorless redistd. solvent (gasoline). The carotene equivs. obtained are not comparable with those from methods in which other light sources have been used or solvents that are not entirely colorless. The only addnl. equipment required is a simple Nessler comparator and a suitable set of plane-parallel bottom comparison tubes. A comparison of the gasoline color values obtained by the Hg-arc illumination with spectrophotometric detns. of carotene on the same exts. in the instance of 358 flours of varying pigment concn. gave a pos. correlation of 0.985 and a straight-line regression. The arbitrary gasoline color value units may thus be expressed in terms of carotene by employing the regression equation as given.

L. H. Bailey

Practical observations on bread and cracker flours. Jan Micka. *Cereal Chem.* 11, 110-12(1934).—Flour is the major ingredient used (86.16%) in bread and (89.77%) in crackers. There are certain desired characteristics which are similar in both bread and cracker flours, viz., (1) general appearance and flavor as related to the finished product; and (2) working quality from a standpoint of high-speed, com. production. The following are certain characteristics which are very dissimilar in bread and cracker flours: (a) color, (b) absorption and (c) fermentation.

L. H. Bailey

The use of flour substitutes in baking. L. Borasio. *Giorn. risicoltura* 23, 193-212(1933). B. uses a "Pneumodinamometer" to measure the tenacity, extensibility, elasticity and strength of flour. Flour substitutes should be as finely granulated as wheat flour for the best results. Breads were made with amts. of substitutes (brown rice, broken rice, rye, oats, barley, corn, starch, beans) varying from 10 to 50% of the wheat flour. The basic wheat flours used were from (1) Manitoba wheat; (2) native wheat. The following bread measurements and tests were recorded: vol., sp. wt., sp. vol., vol. per 100 g. dough, vol. per 100 g. bread, baking quality. The standard bread made was based upon 300 g. dough fermented at 30° and baked at 250°. The compns. of the various substitutes are given. The quality of the bread depends upon the quality of the basic flour used and upon the amt. and kind of substitute. The amt. of substitute used in normal times should not exceed 5-10%. Barley and beans are the least adaptable; brown rice, rye, white corn and potato starch give good results. In emergencies, as much as 40-50% of rye and 25-30% of rice could be used.

J. A. LeClerc

Improvement of the baking quality of wheat flour through storage. Sten Abdon. *Mehlprobleme* 2, 39-40(1933).—Farinograms are used to support the contention that the improvement in baking quality of flour usually noted after storage for about 3 months can be effected at once by means of proper conditioning of the individual wheats in the mill mixt. A flour milled from a mixt. of two or more wheats is superior to one made by mixing the flours milled from the individual wheats.

C. L. B

Improvement of flour by means of sodium chloride Ferenc Gruzl. *Mezőgazdasági Kutatások* 7, 1-6(1934). The effect of addn. of 2.5% NaCl to flours of various qualities was studied. NaCl-contg. doughs were harder, and bread made from these doughs rose higher than bread made without NaCl. The effect of NaCl is attributed to the pptn. or the prevention of soln. of gluten-forming substances.

S. S. de Finály

Improvement of flour by means of sodium chloride, potassium bromate and ammonium persulfate. Lőránd

Å. Sæegf. *Meddelelser fra Statens Landbrugsforskningsanstalt* 7, 7-12(1934).—The farinograms of 8 different flour samples on addn. of 2% NaCl were detd. and the sol. albumin contents of the 10% flour suspensions measured. NaCl brought about a longer time of developing, greater stability and breadth of farinograms and a decrease in sol. albumins. The normal curve of the farinograph was not influenced by bromate and persulfate. Suspensions contg. persulfate were much higher, those contg. bromate much lower, in sol. albumin than untreated flour suspensions. The prepn. of a farinographic curve made with NaCl and yeast is necessary for the evaluation of improving agents.

S. S. de Finály

Banana or pisang, flour. W. Spoon. *Ber. Afdel. Handelsmuseum Koloniaal, Inst. No. 84; Indische Mercur* 57, 199-202(1934).—Banana or pisang flour from the Dutch Indies is prepd. by peeling the  $\frac{3}{4}$ -ripe fruit, slicing, drying and grinding. Av. analyses show  $H_2O$  12-13, ash 2.0-2.2, starch 72-3, albumin 3-4, fat 0.5-1%, sugars 0 trace; max. absorption of  $H_2O$  is 20% at 20° and relative humidity 90%. The viscosity of pastes prepd. from banana flour is much too low to be of interest in the textile industry. The vitamin content of banana flour corresponds approx. to that of whole-wheat flour, but is less than that of the fresh ripe fruit; in other respects the product is an easily digested starchy food.

O. W. Willcox

The determination of ash (in flour). Gerhard Mueller. *Mehlprobleme* 2, 35-6(1934).—The usual sources of error in the detn. of ash in flour are discussed, and a new muffle oven equipped with automatic temp. regulator and improved air circulation is described. Clinton L. Brooke

Quick ash methods. Earl B. Werking and E. J. Anderson. *Cereal Chem.* 11, 94-8(1934). An ash micro method is proposed. 0.3 g flour weighed on a light 4-oz scoop is transferred to a Pt dish (No. 2 or No. 3 Pt crucible cover) and flattened out by tapping. By means of a micropipet 0.35 cc of a soln. contg. 10 g. cryst.  $Mg(NO_3)_2$  in 500 cc. of 70% EtOH is dropped into the center of the flour. As soon as the soln. has penetrated it is ignited with a match, during which process the dish should rest on a cold plate of porcelain, metal or other material that will prevent it from becoming hot enough to cause spattering. As soon as the alc. is burned off the dish is placed in a muffle at 550° and the burning is usually complete in 5-10 min. The dish is cooled in a desiccator and weighed directly on a balance pan.

L. H. Bailey

The right gassing power at the right time. Gerhard Mueller. *Mehlprobleme* 3, 5-6(1934); cf. *C. A.* 27, 1952. German bakers require flours in which optimum gassing power and optimum gluten development extend over 1-2½ hrs. With the farinograph and fermentograph as means of control, such flours can be prepd. by selection of malts streams combining high gassing power with good gluten quality, by over-grinding certain streams to increase the fermentability of the starch, and where these measures are inadequate, by adding malt or malt flour. Care should be taken to select a malt with high diastatic and low proteolytic activity. C. L. B.

Should the large bakery install a laboratory? C. W. Brabender and C. Vavrena. *Mehlprobleme* 2, 27-9(1933).—A brief outline with diagrams illustrating the use of the farinograph and fermentograph in checking flour quality and controlling fermentation. C. L. B.

The Brabender Hydromat an automatic water-measuring device for bakeries. C. W. Brabender. *Mehlprobleme* 2, 26(1933). A device for delivering any desired quantity of water to the dough mixer at any desired temp. is described. Clinton L. Brooke

Four years' work with the farinograph and fermentograph. C. W. Brabender. *Mehlprobleme* 2, 47-9(1933).—An outline of the principal applications of the farinograph and fermentograph in the mill and bakery. Clinton L. Brooke

The standard baking test under English conditions. D. W. Kent-Jones. *Cereal Chem.* 11, 57-65(1934).—The results of applying the A. A. C. C. standard baking

test to European conditions are given and discussed. From the data obtained these results are not encouraging and suggest that this test is not useful in evaluating the baking properties of the various types of com. flours usually encountered. A suggestion is made that progress is most likely to be made by a more thorough study of the phys. properties of doughs. L. H. Bailey

Some comments on the paper by Kent-Jones entitled "The standard baking test under English conditions."

W. F. Geddes, R. K. Tarmour and C. E. Mangels. *Cereal Chem.* 11, 63-9(1934); cf. preceding abstr. These authors point out that Kent-Jones seems to have misunderstood the fundamental philosophy underlying the A. A. C. C. basic baking test and try to correct the wrong impression. L. H. Bailey

The laboratory baking test a science or a fine art?

M. J. Blish. *Cereal Chem.* 11, 70-3(1934); cf. preceding abstr. This paper largely justifies the existence of the A. A. C. C. standard baking test and further calls attention to misinterpretations of the method as made by Kent-Jones. L. H. Bailey

Diastatic activity in doughs and suspensions. Quick Landis. *Cereal Chem.* 11, 24-35(1934); cf. *C. A.* 28, 14117. Chem. methods of analysis of fermenting doughs for total sugars are at present inadequate. Some fermentation methods are described which are believed to be suitable for the present requirements of baking chemistry.

The potential sugar concn. ( $S_p$ ) after 1 hr. in buffered suspensions and yeast-free doughs at a const. temp. may be expressed by the equation  $S_p = (s/\log 2) \log t + p$ , where  $t$  is time,  $p$  is percentage of sugar at 1 hr. and  $s$  is the amt. of sugar formed during the 2nd hr. of diastasis. The potential sugar level in certain fermenting doughs and suspensions is shown to be higher than in yeast-free doughs and to consist of a linear and a logarithmic phase. L. H. Bailey

Roller-process and spray-process powdered skim milk in bread. L. J. Bohn. *Can. Baker and Confectioner* 46, No. 9, 33-5(1934).—There is no advantage in adding roller-process powd. skim milk to bread other than increase in nutritive value. With non-heated spray process powd. skim milk, 2% improves the score, 4% gives bread about equal to the standard without milk and 6% gives bread inferior to it. With preheated spray-process powd. skim milk there is a const. improvement up to 6% of the milk powder. L. H. B.

The staling of bread. J. R. Katz. *Baker's Weekly* 81, No. 3, 43-6(1934).—A monograph giving details of early investigations that led to intensive research. L. H. B.

Can we retard or prevent the staling of bread? J. R. Katz. *Baker's Weekly* 81, No. 6, 35-6, (8)(1934).—Results of research showing the influence of temp., humidity and added substances on the keeping quality. L. H. Bailey

Destroying mold spores on bread by ultra-violet radiation. J. W. Read. *Cereal Chem.* 11, 80-5(1934).—Freshly baked bread was heavily infected with the mature spores of the more common species of *Aspergillus*, *Penicillium*, *Rhizopus* and *Mucor* and subjected for varying lengths of time at given distances to the ultra-violet radiation from the different sources employed. The infected loaves were then wrapped in sterile waxed paper and incubated at 93-5° F. Expts. were made with 3 models of the Hg-vapor lamp and with the open C<sub>4</sub> type of the C lamp without reflectors or screens. For com. use the Hg-vapor lamp does not appear to offer the advantages to be obtained by use of the C lamp. Results obtained with the "C," "U," "K" and "Mg" carbons showed decreasing fungicidal potency in the order named. L. H. B.

The neutralization of milk and of cream by an electrical method. Otto Gratz. *Lait* 14, 145-54(1934).—A process is discussed for neutralizing dairy products by means of an elec. current. The electrolysis not only reduces the acidity but also improves the flavor and keeping qualities and reduces the bacterial count. Al electrodes are used on which a deposit is formed, which deposit reduces the total solids content of the milk by 0.1-0.4%. Some Al goes into soln. from the electrodes but most of it is re-

deposited. To prevent soln. of Al, the use of C electrodes is suggested. H and O formed by the electrolysis give rise to considerable foam on the milk surface but this foam is readily broken down and no loss of milk occurs.

A. H. Johnson

**Analysis of milk samples preserved with formaldehyde.** Marc Fouassier. *Ann. fals.* 26, 24-7(1934).—The best method of preserving milk samples seems to be to add to 250 cc. of milk 2 drops of formalin + 1 g. of paraformaldehyde which has been compressed sufficiently to prevent its disintegration, thus ensuring a slow and continuous supply of  $\text{CH}_2\text{O}$ . No trouble is encountered if the analysis is carried out within a few days. At the end of a variable period, the  $\text{CH}_2\text{O}$  combines with the casein, causing a slow pptn. thereof in very fine particles, which do not agglomerate, but which entrain and tenaciously hold part of the fat, giving results that are up to 0.4% low on the fat detn. This is most readily overcome by modifying the Gerber method as follows: first place 11 cc. of milk in the bottle, slowly add 10 cc.  $\text{H}_2\text{SO}_4$  with const. shaking, immerse completely in a boiling-water bath for 10 min. or until the fine brown ppt. is completely dissolved, add 1 cc. AmOH and complete as usual.

A. P.-C.

**Acid-free butyrometry.** G. Nadai. *Z. Untersuch. Lebensm.* 67, 178-80(1934).—A description of a new butyrometric "acid-free" method for the detn. of fat in milk through the use of BuOH as a distributing agent and complex Al tartrates or oxalates for the soln. of albumin and fat sepn. from the milk.

F. L. Dunlap

**Comparison of the Mathieu-Ferré molecular constant, and the serodensometric method of Olivari in recognizing addition of water to milk.** Giulio Buogo. *Ann. chim. applicata* 23, 598-604(1933).—The 2 methods are found to be equally reliable in detg. watering of milk.

A. W. Contieri

**The detection of the heating of milk.** M. Jansen. *Chem. Weekblad* 31, 156-62(1933).—Methods of detg. the degree of heating of milk in connection with pasteurization are discussed.

E. Schotte

**The physiologic activation of milk from the viewpoint of biology and of physics.** G. C. Supplee and M. J. Dorcas. *Lait* 14, 1-12, 125-32(1934).—By the use of the proper quality and quantity of radiant energy it was possible in a few sec. to increase considerably the antirachitic and calcifying properties of milk without producing undesirable secondary reactions which occur after longer irradiation periods. Satisfactory results were obtained by use of the quartz Hg-vapor lamp and the C lamp of the flaming arc type. From extended lab. studies, coordinating phys. and biol. observations confirmed by numerous clinical tests, it was found that standard antirachitic milk (liquid, dry or concd.) can be practically and economically produced. Irradiated milk which was dried by the Just process was found to be an excellent source of vitamin D.

A. H. Johnson

**Studies with standard agar as employed in milk control work.** C. S. Bowers and G. J. Hucker. *Am. J. Pub. Health* 24, 396-8(1934).

J. A. Kennedy

**Comparison of methods of determining *Es. coli* in milk.** K. J. Demeter, F. Sauer and M. Miller. *Milchwirtschaft. Forsch.* 15, 265-60(1933).—Ten different methods, including plate counts and gas formation, were carried out on a no. of milks and studied statistically. Crystal-violet broth and the indole test in tryptic broth gave the lowest results, and gas-production methods gave lower counts than did plate methods. Klimmer's bromothymol blue-trypanflavin-lactose-agar method gave the most satisfactory correlation with the remaining methods and is recommended as a standard.

B. C. A.

**Some causes of spoilage in sterilized milk.** L. M. Horovitz-Vlasova and A. D. Sontag. *Schriften zentral. Forschungsinst. Lebensmittelchem.* (U. S. S. R.) 4, 3-7(1933).—Spoilage of sterilized milk was traced to survival of coagulating and peptonizing organisms. If cooling is too slow, surviving organisms multiply rapidly. Local overheating, as revealed by color change, also favors spoilage. Preventive measures are strict sanitation in production, (low initial bacterial count); temp. control in

the autoclave for uniform heating at not above 120°; and rapid cooling of the sterilized milk.

J. F. Smith

**Why not make grape ice?** J. C. Hening and A. C. Dahlberg. *Ice Cream Trade J.* 30, No. 2, 19-20(1934).—The flavor of grape juice is quickly impaired when it comes in contact with tinned Fe or Cu. This flavor injury and the discoloration caused by the reaction between the metal of which the equipment is made and the tannin of the grape juice are the chief difficulties encountered in the development of satisfactory grape ice. By freezing the basic ice mixt. before adding the grape juice to the freezer, and thereby reducing the time of contact between grape-juice tannin and metal, it was possible to prepare satisfactory grape ices.

A. H. J.

**Butter from goat milk.** R. Casares López. *Anales soc. españ. fis. quim.* 32, 105-7(1934).—Av. analyses of goat-milk butter gave m. p. 34.2°, f. p. 20.1°, refraction at 40° 41.6°, I no. 26.2, butyric acid 16.0, caprylic acid 17.7, sapon. no. 239.9, Reichert-Meissl no. 24.2, Polenske no. 7.1. The high caprylic acid no. is notable.

E. M. Symmes

**Biacetyl and other butter aromas.** O. Gerhardt. *Seifensieder-Ztg.* 61, 113-14, 131-2(1934).—A review of the objections to the use of biacetyl in oleomargarine, arising from an application for a German patent 5-25 24 by the Unilever Concern for the use of biacetyl or other diketones as a butter aroma, or its production within the margarine. Austria has just granted a patent for its use to the amt. of 0.0003-0.0004%.

P. Escher

**Methods for the microbiological analysis of butter.** E. H. Parfitt. *Am. J. Pub. Health* 24, 303 8(1934).

J. A. Kennedy

**Detection of adulteration in butter by determining the temperature of freezing of its acids.** Enrico Zunini. *Ann. chim. applicata* 23, 557-67(1933).—Heat the butter to 60° and decant through filter paper to dehydrate it, and pipet off a 2-cc. sample. Saponify this with 5-cc. alc. KOH (80 g. KOH in 80 cc.  $\text{H}_2\text{O}$  dild. to 1 l. with EtOH). Add just enough dil. AcOH to neutralize the 5-cc. KOH soln. and 4 cc. pure isoamyl alc. Heat the soln. to 30-5° to dissolve the fat, then chill to det. the approx. temp. of clouding. Reheat the soln. to 35°, and cool slowly; det. the temp. at which clouding starts (I). Add 4 cc.  $\text{H}_2\text{O}$ , melt the fat again, and redet. the cloud temp. (II). For pure butter, temps. I and II lie between 19° and 20°, and the difference between them should be less than 0.3°.

A. W. Contieri

**The microscopy of food products. II. Butter and margarine.** Charles H. Butcher. *Food* 3, 140, 142(1934); cf. C. A. 28, 1415.—The technic of the prepn. of butter-fat samples for detection of foreign fat by microscopic examn. is described. III. Lard. *Ibid.* 176 8.—A description of the microscopic characteristics of lard, both as such and after crystn. from Et<sub>2</sub>O, more particularly from the standpoint of the detection of adulteration.

A. Papineau-Couture

**Examination of cheese.** R. Strohecker. *Z. anal. Chem.* 96, 295 7(1934).—A review.

W. T. H.

**Effect of heat, acidity and preservatives on anaerobic gas formers in pasteurized cheese.** J. Csizsar. *Milchwirtschaft. Forsch.* 15, 201-27(1933); cf. C. A. 27, 1682; 28, 1787.—Spores of *B. sporogenes*, *B. saccharobutylicus* and *B. putrificus*, the presence of which caused pasteurized cheese to be "blown," could be destroyed only by temp. and acidities too high to make a satisfactory product.

B. C. A.

**Control of mold fungi in dairy factories and meat works.** J. C. Neill. *New Zealand J. Agr.* 48, 70-5(1934).

**Renewed sporulation of *Penicillium puberulum*, *P. expansum* and *Cladosporium herbarum* on small blocks of unseasoned white-pine timber was completely inhibited by treatment of the blocks with 1 part of formalin (38.5%  $\text{CH}_2\text{O}$ ) in 20 parts of water. A 5% borax soln. inhibited renewed sporulation of the *Penicillia*, but failed to do so with *Cladosporium*. Proprietary Cl sterilizer, 10%  $\text{Na}_2\text{CO}_3$ , 5%  $\text{Na}_2\text{PO}_4$  and 5% soft soap solns. failed to control the molds, the last 2 stimulating renewed growth**

and sporulation.  $\text{CuSO}_4$  solns. (1-2%) controlled *Cladosporium*;  $\text{NaCl}$  and  $\text{NaNO}_3$  solns. (10%) stimulated the mold, and various Cl disinfectants were completely ineffective; effective control was obtained by thoroughly washing the wood with hot water (134-50° F.). The relative roughness of the wood surface and the degree of establishment of the mold colonies materially affected the degree of control obtained by steaming and by hot-water treatment.

**Meat and meat preparations.** J. Henry. *Food* 3, 127-30, 189-90, 229-30 (1934).—A rapid survey of the technology of the subject under the following headings: slaughtering, chilling and cold storage; curing; manufd. meats; preservation, by sterilization; by-products; prepn. of articles for pharmaceutical preps. A. P.-C.

**Chemical changes of muscle proteins in canning.** Yuzuru Okuda and Kazuo Yamafuji. *Bull. Chm. Soc. Japan* 9, 75-83 (1934).—Set C. A. 28, 2424. G. G.

**Chemical engineering and the edible fat industry.** Viscount Leverhulme. *Food* 3, 213-16 (1934).—An address. A. Papineau-Couture

**Fluorescence phenomena in ultra-violet light of fried-out lard.** Raimund Neseni. *Z. Untersuch. Lebensm.* 67, 192 5 (1934).—The fluorescence colors of native lards obtained by trying out depend essentially on the temp. at which the fat was obtained. Native fats obtained at a temp. over 150° cannot in general be distinguished from American fats under the lamp. Hence it is impossible, on the basis of findings with a quartz lamp, to distinguish whether a fat is a pure native lard or a mixt. F. L. Dunlap

**Chemical changes occurring during the salting of chicken and duck eggs under different treatments.** F. T. Adriano and T. V. Rigor. *Philippine J. Agr.* 4, 151 65 (1933).—Periodic analyses of eggs, preserved in 10%  $\text{NaCl}$  soln., satd.  $\text{NaCl}$  and a mixt. of soil and  $\text{NaCl}$ , showed that the different treatments had approx. the same effect upon the compn. The percentage of shell in the treated eggs remained const.; albumen increased and yolk decreased. The  $\text{NaCl}$  content increased and the ash content of the shell decreased during treatment. The  $\text{NaCl}$  and ash contents of the albumen and yolk increased. There was no relative change in the fat and protein contents.

**Microscopic detection of decomposition in fruit and vegetable products.** B. W. Clarke. *Food* 3, 223-4 (1934).—A brief description and explanation of the microscopical examn. of tomato and fruit products for mold, bacterium and yeast counts. A. P.-C.

**The storage behavior of limes.** Claude W. Wardlaw. *Imp. Coll. Trop. Agr., Trinidad, Low Temp. Sta.* 1933, 23 pp.—For prolonged storage limes should be picked at the yellow-ripe stage. Fruit picked at the full-grown, dark green stage undergoes excessive dehydration during prolonged storage. For best results, limes should be stored at a temp. of 45° F. and at a relative humidity of not less than 85%. For any given maturity, the loss in wt. of limes in storage proceeds at a steady rate over long periods, provided temp. and humidity remain const., and is directly related to the area of fruit-surface exposed. Losses in wt. during storage are lowest from limes wrapped in silver foil, followed in order by those (1) wrapped in Cellophane and (2) treated with wax dissolved in  $\text{Et}_2\text{O}$  or  $\text{C}_2\text{H}_5$ . Grease-proof and ordinary wrappers are ineffective. Numerous data are given on the loss in wt. of limes under different conditions of storage. K. D. Jacob

**Variations in the citric and malic acid and sugar contents of Alsatian whortleberries.** A. Guillaume and L. Léo. *Ann. fals.* 26, 12 18 (1934); cf. Muttelet, C. A. 19, 683.—The citric acid contents of green, semi-ripe and fully matured fruit, resp., were: 0.135, 1.10, 0.832%; 0.075, 1.72, 1.89 mg. per fruit. Corresponding values for malic acid were 0.100, 0.040, 0.044%; 0.055, 0.002, 0.100 mg. per fruit. Corresponding values for: (1) reducing sugars: 0.480, 1.51, 2.24%; 0.272, 2.350, 5.090 mg. per fruit; (2) sucrose 0.219, 0.20, 0.50%; 0.121, 0.312, 1.130 mg. per fruit; (3) total sugars: 0.708, 1.71, 2.74%; 0.393, 2.662, 6.220 mg. per fruit. A. P.-C.

**Fundamentals of the strength test for fruit juices.** B.

1 Alberti and B. Rossmann. *Z. Untersuch. Lebensm.* 67, 180-7 (1934).—A quant. study of the effect of diln. on the odor of raspberry juice and sirup. F. L. Dunlap

**Peas.** Raimund Neseni. *Z. Untersuch. Lebensm.* 67, 195-7 (1934).—An investigation of a considerable no. of samples of peas shelled and unshelled, halved and whole, showed that, in the main, they did not conform to the requirements of the Austrian Codex. A quartz lamp offers a simple means for the identification of the presence of fungi. F. L. Dunlap

**Changes in the composition of potatoes during winter storage.** Ladislaus Erdős. *Z. Untersuch. Lebensm.* 67, 198 202 (1934).—Twelve different types of potatoes were investigated. Tables are given of changes in sg. gr., dry substance, ash, protein and N-free ext. No regularity in the changes could be established, but storage results in the loss of valuable substances. F. L. Dunlap

**A study of the iodine content of Pennsylvania potatoes.** Donald E. H. Frear. *J. Agr. Research* 48, 171-82 (1934).—The I in 135 samples of potatoes grown in as many localities in Penna. ranged from 10 to 216 pts. per billion on a dry basis with an av. of 77.8 pts. per billion. The mean I content of the potatoes grown in the south-eastern section of the state was higher than that of the potatoes grown in the north-central section but no other sectional differences in I content were significant. Potatoes grown on glaciated soils contd. slightly more I than those grown on similar nonglaciated types. The I content of the potatoes analyzed was not affected by fertilization. No significant correlation was found between the I content of the potatoes and the size of the individual potatoes, between the I content and variety, or between the I content of the potatoes from the different parts of the state and the incidence of goiter in the same localities. W. H. Ross

**A poisonous adulteration of lentils.** Pierre Brun. *Ann. fals.* 26, 88-90 (1934).—An adulteration which caused illness of people consuming the lentils consisted in the addn. of a triphenylmethane dye, probably impure fuchsin contg. As. A. Papineau-Couture

**Mushroom proteins.** M. A. Gudlet. *Schriften zentral. Forschungsinst. Lebensmittelchem.* (U. S. S. R.) 4, 8 19 (1933).—Although mushroom proteins are unusually resistant to acid hydrolysis, they are about 80% dissolved by gastric juice, with an unusually high yield (up to 55%) of diamino acids. The test, made with dried mushrooms after extn. with  $\text{EtOH}$  and  $\text{Et}_2\text{O}$ , indicated high nutritive value. Julian P. Smith

**The refining of Philippine honey.** F. T. Adriano and S. Oliveros. *Philippine J. Agr.* 4, 201-13 (1933).—The problems involved in the various methods of filtration, the use of decolorizing C, and the heating of Philippine honey are discussed. The  $\text{H}_2\text{O}$ , invert sugar, sucrose, ash, dextrin and acid contents of Philippine honey are compared with those of foreign honeys. Thirteen references. John O. Hardesty

**Determining pectin in fruit and berry preserves.** V. V. Aleksandrov and A. I. Salishcheva. *Schriften zentral. Forschungsinst. Lebensmittelchem.* (U. S. S. R.) 4, 97-106 (1933).—Results of the Mehlitz method for detg. pectin are more concordant if the soln. is filtered through baiting and hydrolyzed and the clear filtrate used for pptn. Both the Mehlitz method and the modified procedure are superior to the A. O. A. C. method. The new procedure is superior in reagent economy and in convenience; and its accuracy is not affected by the commonly occurring amts. of dextrans, starch and sugars. Use of the method for judging the quality of preserves is discussed. Julian F. Smith

**Refractometric determination of sugar (extract) content of marmalades, fruit jellies, malt extracts, honey and similar substances.** D. Schenk. *Z. Untersuch. Lebensm.* 67, 187 91 (1934); cf. C. A. 27, 2735-6.—These addnl. investigations of S. show the value of the butter refractometer as an aid in the detn. of ext. and  $\text{H}_2\text{O}$  in marmalades, etc. The refractometric detn. may be used as a preliminary test in sorting out suspected samples, which may then be submitted to further investigation. F. L. Dunlap

**Determination of sugar, starch sirup and invert sugar in**

caramel and in fruit preserves. V. V. Aleksandrov and A. I. Saliabcheva. *Schriften zentral. Forschungsinst. Lebensmittelchem.* (U. S. S. R.) 4, 33-81 (1933).—A modified Kruisheer (C. A. 23, 3520; 24, 3064) method is superior to the Juckenack-Pasternak, Scherbakov and Grossfeld-Hollatz methods for detg. sucrose, starch sirup and invert sugar in caramel, jams, preserves, etc. For reagent economy 5 cc. of sugar soln. may be added to 5 cc. of 0.2 N I, after which alkali, acid, sulfite and alkali are added in succession, the vol. is made up with H<sub>2</sub>O to 25 cc. and the titration is completed with 0.1 N KMnO<sub>4</sub>, with no more I soln. Procedures are described in detail for detg. sucrose, fructose and invert sugar. J. F. Smith

Determining the hygroscopicity of caramels. A. N. Lebedev and A. S. Nechaeva. *Schriften zentral. Forschungsinst. Lebensmittelchem.* (U. S. S. R.) 4, 107-17 (1933).—The hygroscopicity of caramel preps. can be detd. with sufficient accuracy by keeping the samples over dil. (5.5%) H<sub>2</sub>SO<sub>4</sub> in a glass desiccator at 28° for 1 hr. The sample (about 30 g.) should be weighed to 1 mg. Equil. is practically attained in 1 hr.; deviations beyond that time are negligible. Julian F. Smith

A survey of the walnut position in England, 1932. J. B. Hamond. East Malling Research Sta., 20th Ann. Rept. 1932, 73-8 (1933).—Good control of the fungus *Chalaropsis thielavoides* which forms a sooty layer between the stock and scion of walnut grafts, thus preventing a union from taking place, was obtained by thoroughly spraying the propagation house with 1% formalin before the grafting season commenced. Rich-flavored walnuts that remained plump on storage contained approx. 50% or more of oil; nuts that contained approx. 30-40% oil were insipid in flavor and shrivelled considerably during storage. Storage of walnuts.—The hygroscopicity of NaCl in which walnuts were stored was reduced by mixing it with coconut fiber or Na phosphate; the fungicidal properties of the NaCl were not impaired by the admixts. K. D. J.

Walnuts—curing and storage trials. J. B. Hamond and A. W. Witt. East Malling Research Sta., 20th Ann. Rept. 1932, 32 (1933); cf. C. A. 28, 1790<sup>1</sup>.—Deshucked and dried walnuts were preserved more effectively by packing in direct contact with solid NaCl than by simply dipping in a satd. soln. of NaCl. Promising results were also obtained by dipping the nuts in molten paraffin before storing. When they were dipped in high-strength CaOCl<sub>2</sub> solns. a white deposit appeared on the nuts when dry. K. D. Jacob

A study of the chemical composition of chufa nuts. M. G. Ruitikov. *Schriften zentral. Forschungsinst. Lebensmittelchem.* (U. S. S. R.) 4, 136-44 (1933).—The chufa nut, or earth almond, is fairly rich in oil, starch and water-sol. carbohydrates; its edible oil has excellent flavor. If the tech. difficulties of efficient sepn. of shells and kernels at low cost can be solved, the chufa nut will provide a good but cheap substitute for the more expensive nuts in confections and baked goods. Analytical data are given for the sugars, starch and oil of the nuts. J. F. S.

Coating roasted coffee with resins. Francesco Di Stefano. *Ann. chim. applicata* 23, 577-81 (1933).—Gum copal and gum acroides have been used in coating roasted coffee. They can be detected as follows: Ext. 5-6 coffee beans in boiling EtOH, and evap. the ext. to dryness on a watch glass. Ext. with petr. ether, decant this, and dissolve the residue in Ac<sub>2</sub>O. When a drop of concd. H<sub>2</sub>SO<sub>4</sub> is added, gum copal gives a yellow-brown coloration, and gum acroides a deep-red color. If a weighed amt. of coffee is taken, then the residue on the watch glass may be weighed and the sum of the resins used detd. A. W. Contieri

Some pasture plants in Kenya. D. C. Edwards. Kenya Colony Dept. Agr., Bull. 1933, No. 1, 33 pp.—Data are given on the percentages of crude protein, Et<sub>2</sub>O ext., sol. carbohydrates, fiber, ash and SiO<sub>2</sub> in the leaves, stems and total herbage of *Chloris gayana*, *Cynodon plectostachyum*, *Pennisetum clandestinum*, *Amphiplophus perflua*, *Paspalum dilatatum*, *Panicum coloratum*, *Paspalum scarbiculatum*, *Pennisetum purpureum*, *Sorghum*

*sudanense*, *Panicum trichodadum*, *Pennisetum salifex*, *Echinochloa pyramidalis* and *Echinochloa stagnina*, grown in Kenya. K. D. Jacob

The seasonal variation of the feeding value of certain strains of grasses of the *Digitaria* species. D. J. R. van Wijk. Union S. Africa Dept. Agr., Sq. Bull. 126, 12 pp. (1933).—Data are given on the percentages of H<sub>2</sub>O, ash, fiber, carbohydrates, Et<sub>2</sub>O ext., P<sub>2</sub>O<sub>5</sub>, CaO and protein in 151 sample. of various strains of *Digitaria polevansii*, *D. littoralis*, *D. geniculata*, *D. smutsii*, *D. decumbens*, *D. swasilandensis*, *D. longiflora*, *D. eylesii*, *D. milanijana*, *D. pensii*, *D. valida* and *D. glauca* grown in S. Africa and cut at various stages of growth. In general, the young plants of a species contained the highest percentages of ash, P<sub>2</sub>O<sub>5</sub> and protein; the amts. of fiber, carbohydrates and Et<sub>2</sub>O ext. were remarkably uniform in plants of all ages. The Ca content usually increased as the plants matured, and did not seem to be related to the P content. When the growth of the plants was not allowed to exceed 3 in. (frequent cutting), the P and protein contents were maintained at uniformly high levels throughout the season. K. D. Jacob

Glycerol [application to food uses] (Hoover) 27. Detn. of hydroquinone in salt herrings (Preiss) 7. Application of refrigeration to the preservation of grapes (Billardon) 16. Disposition of drainage water from milking barns (Walker, Belton) 14. Foams (Dumanski, et al.) 2. Cong. fruit juices (Fr. pat. 750,299) 16. Stock feed from slaughter-house refuse (U. S. pat. 1,950,360) 15.

Bornand, Louis: La technique de la conserve. Paris: Pierre Johanet. 400 pp. Reviewed in *Ann. fals.* 26, 109 (1934).

Fortschritte in der Nahrungsmittelindustrie. Berichte des Fachausschusses für die Forschung in der Lebensmittelindustrie beim Verein deutscher Ingenieure und Verein deutscher Chemiker. Heft 2. Berlin: V. D. I.-Verlag in Komm. 44 pp. M. 2.50. Cf. C. A. 27, 3260.

Preserving foods. Halvor S. Egeberg. Ger. 593,054, Feb. 21, 1934 (Cl. 53c. 3.03). See Brit. 374,927 (C. A. 27, 3261).

Testing the vacuumizing of canned goods. Joseph B. High. U. S. 1,950,304, March 6. Various details of app. and of temp. and pressure regulation are described for producing "swells" in cans having less vacuum than a predetd. standard.

Treating cereals. John L. Kellogg. Brit. 402,188, Nov. 30, 1933. Cereal grains are cooked\* in the presence of moisture, rolled while moist and hot, partially dried, and sprayed or otherwise treated with some substance which, after drying, leaves a coating that prevents the escape of steam from within the grain during subsequent heating to a high temp. until the grains are browned and puffed by the steam pressure within. A soln. contg. a small amt. of egg albumin or a soln. of NaCl 2.5 and sugar 3-5 in H<sub>2</sub>O 20 parts may be used.

Cereal food. Luigi Bernardini. U. S. 1,949,895, March 6. Lipoids are extd. from the embryos of corn resulting as a by-product in corn milling; the extd. residue is milled to produce a flour high in phytin, and the phytin flour and corn meal are emulsified with the lipoids and added water to form a product in which the lipoids and phytin are present in the same ratio as in the original corn kernels.

Treating buckwheat. Rinjiro Sasaki and Zaidan\* Hojin Ryoshoku Kenkyu-Kwai. Brit. 401,884, Nov. 23, 1933. Buckwheat has its black outer husks removed by mech. means and is then immersed in an aq. soln. of protein-coagulating reagents, e. g., AcOH, propionic, lactic and malic acids, Et, Me, Pr and Bu alcs., the product being then treated with H<sub>2</sub>O vapor and finally rolled or flattened into flakes. In a modification, the dehusked grains are treated with H<sub>2</sub>O vapor contg. vapor of 1 or more volatile protein-coagulating reagents and then flaked.

**Soy-bean milk.** Max Adler. Brit. 402,948, Dec. 14, 1933. See Fr. 719,187 (C. A. 27, 5841).

**Stable malt product.** Konrad F. Schreier. U. S. 1,950,418, March 13. The grain is impregnated with water and permitted to germinate at a suitable germinating temp. until the coleorhiza in wheat and rye, or acrospire in barley, has reached a development where emergence of the primary rootlet is indicated, and the grain is then dried at a temp. not exceeding about 55° to obtain a product which may be ground to flour and bleached with "Novadel" or other standard bleaching agent.

**Flour preparations.** The Procter & Gamble Co. Fr. 758,058, Jan. 10, 1934. Synthetic glycerides of the group comprising mono- and diglycerides of fatty acids or of partially hydrogenated fats, or mono- and diglycerides

derived from hydrogenated vegetable oils of an I index of 60-70, are added to flour or flour preps. as flaking agents.

**Vacuum treatment of butter.** George H. Abel. Ger. 593,098, Feb. 21, 1934 (Cl. 53e. 6.10). See Brit. 306,541 (C. A. 27, 1685).

**Chocolate.** N. V. Algemeene Beleggings Maatschappij. Fr. 759,074, Jan. 29, 1934. The necessary fluidity of chocolate is obtained by means of a compd. prepd. by causing a polyhydric alc., a compd. introducing an acid radical contg. P and O and fatty acids or oils to interact. Examples are given.

**Fodder.** I. G. Farbenind. A.-G. Fr. 758,993, Jan. 26, 1934. Fodder is kept green by means of wetting agents such as sulfonated hydrocarbons or sulfonated fatty acids. Known preserving agents such as  $\text{SO}_2\text{Cl}_2$  may also be added.

### 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

**Legal pitfalls for the chemical engineer.** J. Davidson Pratt and G. S. W. Marlow. *Chemistry & Industry* 1934, 235-44, 261-7. See C. A. 28, 17917.

**New method developed to produce pure carbon dioxide gas and lime.** Edward P. Gillette. *Pit & Quarry* 26, No. 3, 37-8 (1933).—A new method for producing lime, with  $\text{CO}_2$  content controlled within 1%, and dry ice at about 1/2 the present cost is described briefly. A. H. E.

**Calculation of condensation with a portion of condensate layer in turbulent motion.** Allan P. Colburn. *Ind. Eng. Chem.* 26, 432-4 (1934).—Math. derivation of formulas which are shown to check literature data (cf. Kirkbride, C. A. 28, 5443).

**Elutriation as an aid to fine grinding.** A. L. Curtis. *Sands, Clays and Minerals* 2, No. 1, 21-6 (1934).—Expts. made with the Andrews kinetic elutriator with a view of ascertaining the practical value of the app. in the control of crushing and grinding minerals to a fine state of subdivision are described. M. V. Kondoidy

**Combining drying and grinding operations.** L. T. Work. *Chem. Met. Eng.* 40, 306-9 (1933).—Combined drying and grinding is effected by closed-circuit operation, with warm air as carrier. Applications include the pulverization of coal and the combined grinding and dehydration of crystals as in the production of  $\text{CaSO}_4$ . Filter-press cakes may be treated in this way. Any type of mill may be used, the crucial point being the temp. of the air. The ground material is classified in an air separator. As an equil. curve exists between the  $\text{H}_2\text{O}$  content of any solid and the humidity of the air, the latter must be controlled to give even results, but the characteristic merit of warm-air grinding is that caking does not occur. H. C. A.

**Heat transfer by condensing vapor on vertical tubes.** C. G. Kirkbride. *Ind. Eng. Chem.* 26, 425-8 (1934); cf. C. A. 28, 5443.

**Heat contents of gases from 0° to 1900°.** Guy B. Taylor. *Ind. Eng. Chem.* 26, 470 (1934).—Tables give heat contents at 100° intervals for  $\text{H}_2$ ,  $\text{O}_2$ ,  $\text{N}_2$ ,  $\text{CO}$ ,  $\text{CO}_2$ ,  $\text{CH}_4$ ,  $\text{C}_2\text{H}_2$  and  $\text{H}_2\text{O}$ . These values are useful in calcs. for processes that include heating or cooling of, or by means of, gases. E. H.

**Use of liquefied gases in refrigerators.** F. Bordas. *Ann. fals.* 26, 95-103 (1934).—A discussion of the dangers arising from the various liquefied gases used in mech. refrigerators with regulations proposed governing their use. A. Papineau-Couture

**Methods of controlling ammonia in the refrigerating system.** A. N. Barnes, Jr., and D. P. Schivetz. *Ice Cream Trade J.* 30, No. 3, 27-9 (1934). A. H. Johnson

**Breathing through gas masks.** O. Bruns. *Draeger-Hefte* No. 170, 2436-9 (1934).—Two types of gas masks are described. In one type both inhaled and exhaled air pass through the air filter. In the other type inhaled air passes through the air filter and exhaled air passes out through an exhalation valve in the face piece. The

advantages and disadvantages of each type are described, and all factors of a gas mask as they relate to respiration are discussed. A. I. Kibler

**Iodized carbon as filter charge for respiratory masks in protection against mercury vapor.** Karl Ed. Putter and Max Hirsch. *Angew. Chem.* 47, 184-5 (1934); cf. Stock, C. A. 28, 20777. Tests with special "mercury" filters gave the following results: the filter affords reliable protection for about 100 hrs. under ordinary working conditions, and with an air consumption of 25-30 l./min. If no phys. work is being done, the air consumption decreases, and the protective period is considerably extended. This is also the case when dust of liq. compds. or colloidal liq. is present in the air. However, if the temp. is unduly high and hard phys. work is accomplished, where the air consumption rises to 50 l./min., an earlier exhaustion of the filters must be expected, but even under such conditions the min. protective period is not less than 50 hrs.

**The development and application of synthetic liquid dielectrics.** F. M. Clark. *Trans. Electrochem. Soc.* 65, 12 pp. (preprint) (1934).—Synthetic liquid dielectrics consisting of chlorinated aromatic mols. which contain at least a chem. equiv. of Cl and H are discussed. With such an equiv. not only are the chlorinated products themselves noninflammable in the usual sense, but in addn. show no tendency toward autogenous ignition and when decompd. by an elec. arc evolve only gases which are noninflammable and nonexplosive. New types of chlorinated aromatic hydrocarbons are indicated. These products, normally solid when pure, may be obtained in the liquid state. Properly blended, synthetic dielectrics having pour points lower than 20° are possible. These materials have several advantages over mineral insulating oils for use in elec. design. C. G. F.

**The thermal conductivities of various insulators at room temperature.** C. D. Niven. *Can. J. Research* 9, 146-52 (1933).—The values for thermal conds. of various common materials chiefly used in the walls of houses are given. By plotting the results obtained, as well as those obtained by other experimenters, on a density-cond. diagram there is a general indication that at higher densities thermal cond. increases with increase of density much more rapidly than it does at low densities. J. W. Shipley

**Calvet, E.: Química general aplicada a la industria con practicas de laboratorio.** T. I. Química inorganica. Pt. 1. Preliminares y cuerpos simples. Barcelona: S. A. Salvat Editores. 1105 pp. Ptas. 60; bound, Ptas. 67. Reviewed in *Chimie & industrie* 31, 754 (1934).

**Istruzione sull'impiego della nebbia artificiale.** Rome: Istituto poligr. dello Stato, Liberia. 66 pp. L. 6. V. D. I. Jahrbuch, 1934. Die Chronik der Technik. Berlin: V. D. I.-Verlag. 189 pp. M. 3.50.

**Exothermic reactions.** Zahn & Co. G. m. b. H. Fr.

758,040, Jan. 26, 1934. In strongly exothermic catalytic oxidation processes, removal of heat is effected by ariyl ethers such as diphenyl, naphthyl phenyl, and hydroquinone phenyl ether. The ether passes through a condenser in a closed cycle.

**Gas determinations.** Hugo Junkers. Fr. 758,228, Jan. 12, 1934. The d. or viscosity of a gas with respect to a standard gas is detd. automatically by passing equal quantities of the 2 gases per unit of time each through a constriction and detg. the pressure in front of each constriction by manometers which register the variation through the movement of the arms of a lever.

**Separating gas mixtures.** The Silica Gel Corporation. Brit. 402,470, Dec. 7, 1933. Condensable gases or vapors are removed from gaseous mixts. by passing them successively into contact with 2 batches of adsorbent, e. g., silica gel, conditioning the mixt. to activate one batch and to charge the other with the condensable components, removing any condensable gases from the mixt. in passing between the batches and periodically reversing the position of the batches in the circuit. App. is described.

**Separating gases.** Gesellschaft für Lindes Rismaschinen A.-G. Fr. 759,087, Jan. 29, 1934. The gases are condensed, and the vapors formed by the fractionated vaporization are passed in a continuous manner over an adsorbing agent, the temp., pressure and amt. of which are regulated so that at the end of the vaporization, it is approx. satd. by the component of next to the lowest b. p.

**Rectifying column suitable for separating constituents of liquid air.** Richard Linde (to Ges. für Linde's Rismaschinen A. G.). U. S. 1,950,313, March 6. Structural details.

**Apparatus for dispensing liquefied gases.** Leo I. Dana (to Linde Air Products Co.). U. S. 1,950,353, March 6. Various structural and operative details are described.

**Treating solids with gases.** Mikael Vogel-Jørgensen. Fr. 757,800, Jan. 5, 1934. The solids are passed in the form of fine grains and in a thin layer onto a screen-like surface, through which the grains tend to fall but are prevented by the pressure of ascending gas. The process may be applied to the recovery of heat and dust from furnace gases.

**Dispersions of solids.** Andrew Szegvari (to International Latex Processes Ltd.). Brit. 402,946, Dec. 14, 1933. See Fr. 750,305 (C. A. 28, 869').

**Manufacturing mixtures enriched in oxygen from air.** Mathias Frankl. Brit. 402,078, Nov. 17, 1933. A liquid mixt., rich in O, obtained in the base of a rectifying column, is conveyed through a pipe, with a regulating valve, to the top of a vaporizer, the liquid and the gas resulting from its vaporization passing down together to the bottom, where the liquid is completely vaporized and the gas forced passes away by an outlet. Air entering the column at its lower end passes upward between the vaporizer elements and is partially liquefied, N passing off at the top and O falling to the base. The vaporizer comprises corrugated double tubes, the liquid being spread along the walls by metallic gauzes pressed against them by bent plates. The process may be applied to the richer O obtained in 2-stage rectification.

**Washing liquids.** W. C. Holmes & Co. Ltd. Fr. 758,404, Jan. 17, 1934. Liquids of different ds. which do not mix, e. g., oils and acids or alk. solns., are brought into intimate contact in a horizontal tunnel-shaped vessel in which they travel in an undulating course and are agitated by impulses caused, e. g., by the to-and-fro motion of a piston.

**Colloidal solutions of metal compounds.** I. G. Farben-ind. A.-G. (Fritz Stöwenel, Josef König and Hermann Schula, inventors). Ger. 593,416, Feb. 20, 1934 (Cl. 12n. 1). A sol of silicic acid or  $\text{Al}(\text{OH})_3$  is used as a protective colloid in prepg. sols of metal compds. Preferably, the metal compds. are formed by double decompn. in the presence of the protective colloid. The products

are generally reversible sols. They may be freed from sol. electrolytes by dialysis, or in some cases the sols may be evapd. and the electrolytes removed by extn. with an org. solvent or by volatilization. Details of the prepn. of  $\text{AgCl}$  sols are given.

**Crystallizing.** Appareils et évaporateurs Kestner. Brit. 403,240, Dec. 21, 1933. See Fr. 731,065 (C. A. 27, 355).

**Crystallization.** The Dorr Co. Inc. Fr. 757,888, Jan. 5, 1934. The size of crystals of a solid reaction product resulting from the continuous reaction of 2 chem. agents, one of which is solid or relatively less sol. and the other, is liquid or relatively more sol., is regulated by dissolving the solid agent and simultaneously pptg. the soln. obtained. The pptn. of a coating on the undissolved solid particles is prevented by a continuous control of the concn. of the liquid reagent by the return to the reaction of a portion of the unsepd. products of the reaction, taking care that the concn. of the liquid reagent does not exceed a 6% excess over the theoretical amt. of the reaction.

**Granulating material.** Friedrich Uhde. Fr. 757,814, Jan. 5, 1934. An app. is described in which materials are made plastic with water and granulated by heating during movement.

**Washing granular material.** Thomas Chance. Brit. 403,150, Dec. 21, 1933. In the sand-flotation process coarse sand and refuse are withdrawn from the scpg. chamber through an upward current classifier contg. a fluid medium of lower sp. gr. than that of the fluid mass in the scpg. chamber. App. is described.

**Freezing agent.** Escher Wyss Maschinenfabrik A.-G. Ger. 590,577, Jan. 5, 1934 (Cl. 12a. 7). A freezing agent for compression freezing machines consists of unsatd. halogenated hydrocarbons b. above  $13^\circ$  at atm. pressure, such as vinyl bromide,  $\alpha$ - and  $\beta$ -bromopropylene or  $\alpha$ - and  $\beta$ -chloropropylene.

**Solid carbon dioxide.** Charles L. Jones and John D. Small (to American Dryice Corp.). U. S. 1,950,180, March 6. Liquid  $\text{CO}_2$  is expanded in a chamber against a pressure below the triple point, and the chamber pressure is then raised to or above the triple point; a second portion of liquid is discharged into the chamber in contact with the solid product made in the earlier step, and the liquid is then evapd. at the triple point at a slow rate regulated to produce crystals of large average size. App. is described.

**Protecting the skin against chemicals.** Drägerwerk Heur. u. Bernh. Dräger. Ger. 590,818, Jan. 11, 1934 (Cl. 30i. 10). The skin is protected against chemical of the dichloroethyl sulfide type by soaps made from bi- or trivalent metals and oils or fats.

**Oils, etc., used as dielectrics.** Compagnie française pour l'exploitation des procédés Thomson-Houston. Fr. 758,072, Jan. 10, 1934. The formation of muds in oil and waxes is prevented by the addn. of aromatic NO<sub>2</sub> compds., e. g., *p*-nitrochlorobenzene,  $\alpha$ -nitronaphthalene, *m*-dinitrobenzene, *o*- and *p*-nitrophenol, and nitrochlorophenol, and by making the containers of material cutting off the short-wave rays.

**Insulating material.** Carl Alfeis. Fr. 758,370, Jan. 15, 1934. A material which is insulating against moisture and does not swell is made from glass threads or wool and a plastic material such as asphalt, bitumen, paraffin, pitch, etc. The glass may be preliminarily treated with adhesives or agglomerants such as ethyl, acetyl or vinyl cellulose, rubber or synthetic resins.

**Electric insulating compositions.** Jaroslaw's Erste Glimmerwaren-Fabrik. Ger. 593,072, Feb. 21, 1934 (Cl. 21c. 2.02). Thin sheets or small particles of mica are united by an adhesive comprising a soln. of an inorg. colloid in an org. solvent. A suitable adhesive is an org. solvent soln. of  $\text{SiO}_2$  prepd. by sapon. an ester of silicic acid. Cf. C. A. 28, 842'.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**Variation of the composition of natural waters according to the amount of rain.** Enrico Poda. *Ann. chim. applicata* 23, 581-4 (1933).—Electrometric detns. on the cond. of river water show it varies in compn. according to the amt. of rain falling. This change is noted immediately after a rain storm, whereas well waters show a change only some time later.

**The geyser area near Beowawe, Eureka County, Nevada.** T. B. Nolan and G. H. Anderson. *Am. J. Sci.* 27, 215-29 (1934).—The occurrence is described. Analyses of  $H_2O$  from 3 geysers and hot springs are given; they appear to be related to the alk.  $H_2O$  of Yellowstone Natl. Park.

**Keeping up with the demand for adequate pure water.** Harry R. Jordan. *Am. J. Pub. Health* 24, 111-16 (1934).—J. discusses (1) the probable trend of water demand in American cities, (2) the phys. elements in public water supply that need particular strengthening to meet this probable demand, (3) how water-works operating personnel measures up to its responsibility and (4) the trend in water-supply quality.

**The fundamental chemistry of water supply: How to read a water analysis.** J. H. Coste. *Water and Water Eng.* 34, 361-2, 408-12 (1932); *J. Am. Water Works Assoc.* 25, 1042.

**Simple graphic determination of ground-water yield by the Smreker potential law.** H. Weiland. *Gas u. Wasserfach* 77, 88-90 (1934).

**Step-photometric microanalysis of drinking and service water.** VIII-IX. Carl Urbach. *Mikrochemie* 14, 189-218 (1934); cf. C. A. 27, 4327.—Step-photometric methods are described and comprehensive tables given for the detn. of  $H_3PO_4$  and  $H_2SiO_3$  in water. The methods are based upon the formation of blue complexes of reduced phosphomolybdic or phosphosilicic acids. It was found that the former complex is less stable than the latter. By heating 3.5 min. on the water bath at  $70^\circ$ , the blue color due to reduced phosphomolybdic acid disappears while that of the corresponding Si complex remains. This fact permits the easy detn. of both. On the basis of the prior work of Tschopp and Tschopp (*C. A.* 26, 5112) the  $H_2SiO_3$  can be detd. in the presence of  $H_3PO_4$  by destroying the yellow phosphomolybdate complex with a 5-cc. portion of 4% oxalic acid soln. and  $H_3PO_4$  can be detd. in the presence of  $H_2SiO_3$  by adding 5 cc. of 7%  $NaHSO_4$  soln., before adding molybdate reagent, which prevents the formation of the silicomolybdate and not that of the phosphomolybdate.

**Variations in the carbonation coefficient of sea water.** P. T. Danilchenko and N. S. Spiro. *Bull. acad. sci. U. R. S. S., Classe sci. math. nat.* 1933, 1430-58.—Carbonation coeff. ( $HCO_3^- \times 100/\Sigma = K$ ) is 1259 for av. river water and 0.15-0.72 for water from ocean or salt lakes. It is inversely proportional to salinity ( $S$  = total content of salts). The av.  $HCO_3^-$  content of fresh and sea waters is 0.0149% and 0.0148%, resp., and that of salt lakes is 0.0173%. For saline waters in direct contact with  $CaCO_3$  and atm.  $CO_2$   $KS = C = \text{const.}$  (av.  $C = 3.0$ , but varies from 5.1 for Caspian Sea to 1.7 for the Gulf of Kuyal'nitzkil and is 2.8 for ocean waters). All natural waters are usually satd. with respect to  $CaCO_3$  but occasionally they may contain an excess (Black and Caspian seas) or a deficient quantity (Baltic Sea) of it. The  $CaCO_3$  in oceans is supplied both by rivers and by the minerals present in the ocean bed. On evapn. ocean waters deposit  $CaCO_3$  and a mixt. of  $MgCO_3$  and  $CaCO_3$ ; this must result in migration of  $CaCO_3$  from the poles toward the equator where evapn. is more rapid.

**Occurrence of heavy metals in mineral waters.** Stanko S. Miholich. *Bull. soc. chim. roy. Yougoslav.* 4, 107-19 (in English 120); *Chem. Erde* 8, 410-8 (1933).—European waters can be divided into 3 groups according to the predominance of the heavy metals: (1) Ni-Cu group corre-

sponding to the Archean folding, (2) Sn group corresponding to the Hercynian folding, and (3) Pb-Zn group corresponding to the Alpine folding. The waters of Norway and Scotland have not been studied and it is not possible to establish any relationship between the presence of their heavy metals and Caledonian folding. G. S. S.

**The bacterial efficiency of certain intermediate stages of water treatment.** H. W. Streeter. *Public Works* 64, No. 12, 17-20 (1933); cf. C. A. 28, 1431.—The 3 stages of treatment studied were: (1) coagulation-sedimentation, (2) rapid sand filtration, (3) post-filter chlorination. S. concludes that the higher bacterial efficiency of double-stage sedimentation is due to the longer total periods of sedimentation rather than to any inherent advantages in sepg. this process into 2 sep. stages. In addn., it was found that (1) the efficiency of bacterial removal by coagulation-sedimentation varied with the ease and completeness of coagulation, which in turn was a function of the individual waters treated; (2) a combined filtration-chlorination treatment resulted in greater bacterial efficiency than the usual filtration followed by post-filter chlorination. Figures are given showing the limiting bacterial content of influent water at the various stages of treatment which should permit the delivery of a final chlorinated effluent meeting the primary requirement of the Treasury Dept. standard with respect to *Es. coli* content.

**Boiler feed waters: deaeration, preheating, accumulation.** M. Marcheix. *Science et ind.* 17, 499-503, 550-3 (1933); 18, 17-21 (1934).—A review. A. P.-C.

**A new boiler-water treatment for the United States Navy.** Thorvald A. Solberg and Robert C. Adams, Jr. *Combustion* 5, No. 6, 21-9 (1933).—After extensive studies of feed water and scales from 20 ships located at widely sepd. stations and comparative trials of the colloidal, coating, electrolytic and chem. methods of feed-water treatment at the U. S. Naval Expt. Station a new Navy formula was evolved. This consists of anhyd.  $Na_2HPO_4$  47, soda ash 44 and corn starch 9%.

**New Navy compound.** R. E. Hall. *Combustion* 5, No. 7, 32-4 (1934). Cyrus Wm. Rice. *Ibid.* 34-6. J. A. Holmes. *Ibid.* 36-7. A. C. Purdy. *Ibid.* 37; cf. preceding abstr.

**Collids in boiler-water conditioning.** Henry T. Hotchkiss, Jr. *Combustion* 5, No. 8, 26-8 (1934).—A discussion.

**A critical study of boiler scales and advanced methods of analysis and identification.** Shuppard T. Powell. *Combustion* 5, No. 3, 15-19 (1933).—Scale formation and methods of scale analysis are discussed. Chem. methods are not adequate because they do not permit accurate identification of the complex cryst. deposits occurring in high-pressure boilers. Petrographic analysis gives a satisfactory identification.

**Solubility of calcium salts in boiler water.** Fredrick G. Straub. *Trans. Am. Soc. Mech. Engrs. (Fuels and Steam Power)* 54, 221-30 (1932); cf. C. A. 27, 1426.—Soly. graphs for  $CaSO_4$ ,  $CaCO_3$ , and mixts. of  $CaSO_4$ ,  $CaCO_3$ ;  $CaSO_4$ ,  $Na_2CO_3$ ;  $CaSO_4$ ,  $Na_2SO_4$ ;  $CaSO_4$ ,  $NaOH$ ;  $CaCO_3$ ,  $Na_2SO_4$ ;  $CaCO_3$ ,  $CaSO_4$ ,  $Na_2CO_3$ ;  $CaCO_3$ ,  $CaSO_4$ ,  $Na_2SO_4$ ;  $CaCO_3$ ,  $CaSO_4$ ,  $NaOH$  are given for detns. at  $360^\circ$ ,  $405^\circ$ ,  $470^\circ$ ,  $540^\circ$  and  $600^\circ F$ . Soly. of  $CaCO_3$  decreases as the temp. increases. At the temps. studied  $CaCO_3$  is practically insol. in the presence of  $Na_2CO_3$  or  $NaOH$ . The soly. of  $CaSO_4$  is not directly proportional to the sulfate in soln., and  $CaSO_4$  cannot exist as a solid phase in equil. with solns. of  $Na_2CO_3$  even at pressures up to 1500 lb. The ratios of  $CO_3$ /sulfate as formerly calcd. to prevent  $CaSO_4$  formation in the solid phase are extremely high.

**The action of water on lead with special reference to the supply of drinking water.** Summary of existing knowledge. H. Ingleson. *Dept. Sci. Ind. Research*,

*Water Pollution Research, Tech. Paper No. 4*, 115 pp. (1934). E. H.

**Chemical behavior of Eternite (asbestos-cement) pipes.** H. E. Richter. *Gas u. Wasserfach* 77, 119-22 (1934).—Water allowed to stand for any length of time in new Eternite pipes becomes unusable. In the presence of aggressive  $\text{CO}_2$ , appreciable amts. of  $\text{Ca}(\text{HCO}_3)_2$  may be formed. In the absence of aggressive  $\text{CO}_2$ , a  $\text{CaCO}_3$  coating may be formed by adding  $\text{Ca}(\text{OH})_2$ , and when this coating is once formed no change takes place in water allowed to stand in the pipe unless aggressive  $\text{CO}_2$  is present. Fe and Mn bicarbonates favor the formation of such coatings. In the absence of these compds. with aggressive  $\text{CO}_2$  present, complete destruction of the pipe may result in time. R. W. Ryan

**Most probable numbers for evaluation of coli-aerogenes tests by fermentation tube method.** J. K. Hoskins. *U. S. Pub. Health Repts.* 49, 393-405 (1934); cf. *C. A.* 27, 4002. J. A. Kennedy

**Examination of Balakhna carton factory with respect to the fungal growths.** R. M. Pavlinova. *Bumashnaya Prom.* 12, No. 10, 51-5 (1933).—The investigation showed that the slime formation in the factory is composed of the fungus *Fusarium* and that of the water pipes of *Sphaerotilus natans* and some *Leptomyces lacteus* and *Fusarium*, which originate from the water supply of the Volga river. *Fusarium* develops within the limits of 2-35° and 3-9.5 pH, and therefore the circulating water must be maintained at 35-6° and either above 9.5 or below 2.5 pH. Chas. Blanc

**Recent advances in the chemical treatment of sewage.** F. W. Mohlman. *Am. J. Pub. Health* 24, 25-31 (1934). J. A. Kennedy

**Building and operation costs of sewage-treatment plants.** H. Rohde. *Gesundh.-Ing.* 57, 90-3 (1934).—Data collected from 40 German cities are presented in tabular form. M. G. Moore

**Sewage treatment at Shanghai.** Walter Buchler. *Munic. Sanit.* 4, 280-2 (1933); *U. S. Pub. Health Eng. Abstracts* 13, S, 70 (Oct. 28, 1933).—Sewage is treated by the activated-sludge process with air drying of the sludge, which is then used for fertilizer. C. R. F.

**Effects of gas liquor on sewage purification.** Walter Scott. *Surveyor* 85, 327 (1934).—One % of gas liquor in sewage has a distinct retarding effect on sewage-purification processes. No economical method for treatment has been devised thus far. Active C removed 86% of the impurities and was especially effective in removal of phenol. A. L. Elder

**Gas hazards in sewers and sewage-treatment plants.** R. R. Sayers. *U. S. Pub. Health Repts.* 49, 145-55 (1934); *Ohio Conference Sewage Treatment, 6th Ann. Rept.* 1932, 11-20.—Properties of the following gases found in sewers and treatment plants are given:  $\text{NH}_3$ ,  $\text{C}_2\text{H}_2$ ,  $\text{CO}_2$ ,  $\text{C}_2\text{H}_4$ ,  $\text{CH}_4$ , gasoline,  $\text{H}_2\text{S}$ ,  $\text{SO}_2$  and CO. S. also discusses prevention and treatment of poisoning by these gases. J. A. Kennedy

**The cause of gas troubles in sewage mains.** K. Dau. *Gesundh.-Ing.* 57, 80-2 (1934).—The results of a questionnaire on this subject sent to 57 German cities of 100,000 or more population are discussed. Sixty-one % of explosions and other accidents due to gases were due to gasoline vapors. M. G. Moore

**Nature and amount of colloids present in sewage.** IV. A comparative study of certain midland sewage liquors. E. V. Mills. *J. Soc. Chem. Ind.* 53, 61-8T (1934).—Methods of sedimentational analysis developed previously (*C. A.* 27, 3272) were applied. There is a sharp distinction between the disperse and dispersion medium. The disperse contained nitrogenous particles unaffected by sedimentational forces of 2000 times gravity. Crude sewage liquors from widely different sources differed only in degree, being similar in general characteristics. Applications of this system of analysis to sedimentation tank effluents divided the disperse into 3 parts: (1) a nitrogenous fraction easily sepd. by centrifuging, (2) a non-nitrogenous fraction sepd. with difficulty, (3) a

nitrogenous fraction not separable by centrifuging.

G. L. Kelso  
**Laboratory investigations and "practical sludge-digestion practice."** W. Husmann. *Techn. Gemeindeblatt* 37, 54-6 (1934).—In 6 flasks the same amts. of the same sludge were digested under identical conditions. The amt. of gas evolved in 35 days varied from 125 to 5200 cc. Thus this type of expt. is not reliable for a study of gas evolution, as the results are not an indication of results which would be obtained on a plant scale. However, detns. of the amt. of sludge decompd. from chem. analyses did check. A no. of recent papers of lab. or "miniature-technical" studies of sludge digestion are briefly criticized. M. G. Moore

**Rural sanitation.** H. E. Miller, et al. *Am. Pub. Health Assoc. Year Book* 1933-34, 88-90.—Report of a joint comm. J. A. Kennedy

**Liquid wastes—their treatment and disposal.** Langdon Pearse. *Am. J. Pub. Health* 24, 117-19 (1934).—Address. J. A. Kennedy

**Treatment of trade wastes.** L. F. Warrick. *Am. J. Pub. Health* 24, 372-8 (1934). J. A. Kennedy

**Contamination of rivers by industrial effluents.** Pequart. *Bull. assoc. chim. sucr. dist.* 50, 75-81 (1933).—Injury to fish and other ill effects attributed to industrial effluents are in many cases due more to a highly infected condition of the rivers, and would not occur in normally clean rivers. The wash waters from the beets in a French distillery are purified by subsidence but contain numerous algae; the diffusion effluent and vinasses are purified with  $\text{CaO}$  and  $\text{Al}(\text{OH})_3$ . The total vol. of effluent is < 1% of the river, which contained already 800,000 organisms per cc., including 5000 *Es. coli* and 40,000 *Micrococcus ureae*, besides numerous algae. The distillery effluent is relatively harmless in itself, though it contributes nutriment to the organisms in the river. The algae belong to the family Nostocaceae and form zoögleic masses which probably injure fish by obstructing the gill passages rather than by depriving the  $\text{H}_2\text{O}$  of  $\text{O}_2$ , for they contain chlorophyll. B. C. A.

**The disposition of drainage water from milking barns.** H. B. Walker and H. L. Belton. *Agr. Eng.* 14, 300-11 (1933).—Effluent water from selected dairies in the Los Angeles district contained total solids 4000-40,000, org. solids 3000-33,000 and inorg. solids 1200-28,000 p. p. m. The org. material was principally feces and urine with some waste feed from mangers. The inorg. material was mostly clay, silt, sand and some gravel. The waste liquid was dark green with the org. and inorg. materials mostly in suspension. Effective separ. of solids from the liquid waste was possible by means of shallow screen chambers. The tank effluent, which contained both org. and inorg. colloidal materials and approx. 45 p. p. m. of total N (equiv. to approx. 40% of the original N content of the sewage), could be used for the fertilization of fields by the broad-irrigation system. The tank effluent was easily clarified by means of  $\text{Fe}_2(\text{SO}_4)_3$ . K. D. Jacob

**Progress in the removal of sulfur compounds from waste gases.** H. F. Johnstone. *Combustion* 5, No. 2, 19-30 (1933).—Economical washing with untreated water of large quantities of gases, such as those from central power station boilers, is shown to be quite improbable. Catalytic oxidation methods of removal of  $\text{SO}_2$ , while successful with pure gases, fail with flue gases because impurities render the catalysts inactive. A regenerative system using alk. reagents is being investigated. Leslie B. Bragg

**Sulfur dioxide for the fumigation of ships. Methods of use and prospects of improvement.** C. L. Williams. *U. S. Pub. Health Repts.* 49, 89-100 (1934).—Liquid sulfur dioxide as a fumigant for ships. *Ibid.* 192-208.—Advantages, methods, app., costs, and expt. tests are given, including 6 photographs and 2 diagrams. J. A. K.

**Efficiency of the open method of burning sulfur for the fumigation of unloaded ships.** P. G. Stock, G. W. Monier-Williams, A. B. Page, O. F. Lubatti and C. F. White. *Bull. Hyg.* 9, 77-90 (1934).—The actual gas concns. obtained as the result of fumigating empty ships by burning S in open pans have been detd. Over 240 samples

of the atm. were collected and analyzed. For purposes of comparison 1 series of expts. was checked with HCN. Concns. of gas which would have been fatal were found at all but 6 of the sampling pts. SO<sub>2</sub> fumes appeared to enter pipe casings more readily than HCN possibly because of convection currents set up by the burning in open pans. Conclusions: In the fumigation of an empty ship by burning S in trays (3 lb. per 1000 cu. ft. of space) a lethal concn. of SO<sub>2</sub> is reached and maintained for more than the lethal period.

What are the essentials of typhoid fever control today? Geo. H. Ramsey. *Am. J. Pub. Health* 24, 355-62 (1934).

J. A. Kennedy  
Essentials of typhoid fever control today. Edwin O. Jordan. *Am. J. Pub. Health* 24, 349-54 (1934). J. A. K.

Swimming pools and bathing places. W. D. Stovall and W. L. Mallmann. *Am. Pub. Health Assoc. Year Book* 1933-34, 105.—Comm. rept.

J. A. Kennedy  
Bacterial pollution of swimming baths. B. L. Davis. *J. Roy. Army Med. Corps* 60, 181-90 (1933); *U. S. Pub. Health Eng. Abstracts* 13, Sw, 8 (July 8, 1933); cf. *C. A.* 28; 1124-5.—Conclusions from studies on the bacterial flora and the presence of pathogenic organisms in swimming pool waters are: No disease in epidemic form is spread by this agency although the possibility of infection does exist. The no. of cases of infection are negligible compared with the no. of bathers. Filtration and chlorination will entirely eliminate individual cases of infection.

Water.\* I. G. Farberland. A.-G. (Kurt Ochatz, in-

ventor). Ger. 590,779, Jan. 9, 1934 (Cl. 85b. 1.35). Water-cooled surfaces for condensations are treated with an acid such as H<sub>2</sub>SO<sub>4</sub> to remove deposited carbonates, and with Cu waste to form a Cu salt with the acid to destroy algae.

Sterilizing water. Hrvoje Ivekovic. Ger. 593,303, Feb. 26, 1934 (Cl. 85b. 1.01). Water is slightly acidified, e. g., to a H-ion concn. of  $p_H$  5, and then treated with an oligodynamic metal, e. g., Cu, or a salt thereof.

Apparatus for chlorinating water. Wallace & Tiernan Products, Inc. Ger. 190,805, Jan. 12, 1934 (Cl. 12i. 4).

Washable sand or gravel filter for water. Adolf Graumann. Ger. 593,304, Feb. 24, 1934 (Cl. 85b. 2.01).

Softening water. Permutit A.-G. (Otto Læbknecht, inventor). Ger. 590,927, Jan. 15, 1934 (Cl. 85b. 1.05). Base-exchanging reactions, especially for softening water, are carried out by adding alkali salt such as NaCl and granulated minerals of the serpentine group. Serpentine minerals contg. amphoteric oxides such as Al<sub>2</sub>O<sub>3</sub>, Fe<sub>2</sub>O<sub>3</sub>, as well as Mg silicate, are preferred.

Apparatus for softening water. L'Auxiliaire des chemins de fer et de l'industrie. Fr. 758,828, Jan. 24, 1934.

Preventing incrustation of boilers. Joakime Kohseff. U. S. 1,950,494, March 13. An emulsion which is added to boiler feed water is prep'd. by passing steam, during its condensing stage, through a mass of seeds contg. mucilaginous material and oil, such as flaxseed, while the seeds are maintained in a quiescent state, and continuously withdrawing the emulsion formed from the seeds. App. is described.

Removing or preventing deposition of boiler scale. Allis Chalmers Manufacturing Co. Ger. 590,800, Jan. 11, 1934 (Cl. 85b. 1.35). Boiler scale is removed or prevented from deposition by addn. of colloidal metals of the Fe group, stabilized by Na<sub>2</sub>SiO<sub>3</sub>.

Sewage. Erz- und Kohle-Flotation G. m. b. H., "Eko" (W. Schafer, inventor). Ger. 590,780, Jan. 9, 1934 (Cl. 85c. 1). Sewage or waste water is clarified by accelerating the sedimentation by addn. of NH<sub>4</sub> resinate.

Apparatus for the biological purification of sewage. Fritz Stötzl. Ger. 593,366, Feb. 24, 1934 (Cl. 85c. 3.01).

Apparatus for sterilizing, deodorizing or otherwise treating air with vapor prior to use for ventilation. Hope's Heating & Lighting Ltd. and Albert E. Windram. Brit. 402,557, Dec. 7, 1933

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

Soils from the British Solomon Islands Protectorate. Anon. *Bull. Imp. Inst.* 31, 497-500 (1933).—Chem. and mech. analysis are given and briefly discussed of 4 samples of dark brown, heavy clay soil from Malaita Island, taken from a block yielding very poor crops of coconuts. Chemically the soil is poor, and is unlikely to repay artificial fertilizing, as the main cause of the poor crops produced probably lies in its phys. character, which is unusually heavy.

A. Papineau-Couture  
Studies in West Indian soils. VI. Some soil types of Jamaica. Their origin, formation and agricultural relationships. F. Hardy and H. H. Croucher. *Imp. Coll. Trop. Agr. Trinidad* Aug., 1933, 44 pp.; cf. *C. A.* 28, 2821<sup>9</sup>.—The agricultural soils of Jamaica are classified into calcareous and noncalcareous. These are further subdivided and the origin and characteristics of each soil series are discussed. The soils show a close connection with the geological features. Various detns. were made on soils taken from different layers exposed in 6-foot pits including index of texture,  $p_H$ , org. matter, N, C/N ratio, CaCO<sub>3</sub>, cond. of aq. exts., available P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O and in some cases NaCl. The results are tabulated. The relationships between soil factors and productivity of banana and sugar-cane crops are discussed. Typical banana soils are decidedly alk. in reaction (av.  $p_H$  7.7), high in org. matter, have a low C/N ratio, are deep and open in texture, and

are particularly rich in available nutrients. The sugar-cane soils are more varied in quality. VII. The cacao soils of Trinidad. (A.) Montserrat District. J. A. McDonald, F. Hardy and G. Rodriguez. *Ibid.* Oct., 1933, 50 pp. The soil map nearly coincides with the geological map of the area. Twelve distinct soil types have been mapped in detail. Av. values on 85 samples of surface soils are: index of texture 37,  $p_H$  5.8, org. matter 4.0%, N 0.30%, C/N ratio 7.3, available P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O 38 and 162 p. p. m., resp. Individual detns. on 819 samples of soils and subsoils are tabulated and subjected to a statistical analysis. The chief factor controlling growth is the nutrient supply. There is a statistically significant difference between the org. matter, C/N ratio and P<sub>2</sub>O<sub>5</sub> content of the good and poor soils as det'd. in an economic survey. In Brasso clay a high content of sulfate is usually assoc'd. with low productivity of cacao. Balanced ratios between N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O contents of the soils are discussed from the standpoint of fertility.

A. L. Mehring  
Rendzina soils of Polesie. S. Nida. *Abh. Inst. Bodenk. Pulawy* 2, 124 56 (1932).—The parent material of these soils is cretaceous marl with more or less morainic material and varies widely in CaCO<sub>3</sub> content. No traces of podzolization were found in pure rendzinas, but on mixed rendzinas (with loess) distinct podzolization was observed.

B. C. A.

**Icelandic soil types.** F. Weiss. *Kong. Vet.-Landb. Kjöbenhavn, Aarskr.* 1933, 1-18. —These soils are derived from materials of glacial or volcanic origin. Although they contain no free CaO they have a  $pH$  varying from 6 to 7. The fraction sol. in  $(NH_4)_2C_2O_4$  is high, as is the total N. The C:N ratio varies from 10 to 18. The ratio hygroscopic  $H_2O$ :total absorption complex is fairly const. B. C. A.

**Coffee soils of Kenya and their cultivation.** G. H. Gethin Jones. Kenya Colony Dept. Agr., *Bull.* 1932, No. 21, 17 pp. —The general chem. characteristics of the different soil types are discussed. K. D. Jacob

**Analyses of earth profiles of northern Gudbrandsdal.** Harald Bjørlykke. *Norsk Geol. Tids.* 13:79-101(1933). —The northern part of Gudbrandsdal, in the central part of southern Norway, is a pronounced arid region, with a yearly pptn. of about 300 mm. Here there are beds of soils contg. high concns. of salts, rendering such soils incapable of cultivation, in spite of irrigation. In addn. to high-salt areas, there are also podzolized areas, where ground  $H_2O$  is low, and where evapn. is reduced by phys. conditions. Such podzolized areas show that ground  $H_2O$  and phys. conditions of the soil were of greater influence in profile development than the amt. of yearly pptn. E. M. Symmes

**Processes of salinization and desalinization and the salt profile of soils.** B. B. Poluinov. *Trans. Irrigation Commission, Acad. Sci., U. S. S. R.* 1, 107 31(1933); cf. C. A. 27, 1969. —A study of the formation and evolution of saline soils based on an examn. of the salt profile. B. C. A.

**Some soil problems.** A. B. Bryan. *Am. Fertilizer* 80, No. 6, 5, 6, 26(1934). —A review of the needs of the coastal plain soils for K, Mg, Mn and Fe, and of methods of supplying the requirements of the crop for these elements. W. H. Ross

**Soil erosion.** T. Eden. *Imp. Bur. Soil Sci. Tech. Comm.* No. 28, 30 pp.(1933). —Natural factors affecting erosion are discussed, and the influence of phys. and chem. soil properties is examd. Remedial measures are described. B. C. A.

**Adsorption capacity of soils.** E. N. Ivanova. *Trans. Dokuchaev Soil Inst.* 8, No. 8, 23-41(1933). cf. C. A. 27, 3376. —The results obtained in the detn. of the adsorption capacity depend on the diln. of the replacing ion, the abs. amt. of the ion being const. The presence of  $Ca^{++}$  depressed the amt. of  $Na^+$  adsorbed from mixts. of  $CaCl_2$  and NaCl, the depression effect increasing with increasing  $[Ca^{++}]$ . With Na/Ca const. the ratio of Na adsorbed from the mixt. to that adsorbed from a pure NaCl soln. of the same  $[Na^+]$  is a const. for all concns.  $CaSO_4$  acts similarly to  $CaCl_2$ , whereas  $CaCO_3$  hinders but little the adsorption of  $Na^+$ . B. C. A.

**Kappen's method for determination of the sum of adsorbed bases (S) [in soils].** G. A. Weiss. *Proc. Leningrad Dept. Inst. Fert.* 17, 89 100(1933). —The accuracy of the method could not be increased. The soil-acid mixt. is better set aside for 2-3 days. The original method gives good agreement between the S value and the sum of bases detd. by the acetate or the  $NH_4Cl$  methods on account of compensating errors. B. C. A.

**Soil colloids.** L. Smolik. *Věstník Českoslov. Akad. Zemědělské* 8, 750-3(1932); cf. C. A. 27, 3765. —A review. B. C. A.

**Colloidal loam isolated from podzol.** L. Smolik. *Věstník Českoslov. Akad. Zemědělské* 8, 744-7(1932); cf. C. A. 27, 1969. —The colloids from various podzol strata have different chem. properties, those from the illuvium being richest in Fe, Al and frequently phosphate. The chief distinction lies in the mol. ratio  $SiO_2:Fe_2O_3$ . B. C. A.

**Alkalinity and dispersion in solonchak soils.** S. Ya. Sushko and E. F. Dimitrieva. *Proc. Leningrad Dept. Inst. Fert.* 17, 191-208(1933). —These soils are divided into 3 groups: (1) sulfate, (2) sulfate-chloride and (3) chloride. In (1) leaching is rapid because of the presence of  $CaSO_4$ , which prevents the entry of Na into the adsorption complex. In (3)  $CaSO_4$  is present in very small

amts., or is absent, and Na enters the adsorption complex, increasing the dispersion and retarding leaching. In (2) increase in dispersion depends on whether sulfate or chloride predominates, and on the amt. of  $CaSO_4$  present. The presence of  $MgSO_4$  or  $MgCO_3$  in saline soils increases their alky. The detn. of alky. should be made only after all the easily sol. salts have been removed by leaching. B. C. A.

**The combustion of the organic matter of agricultural soils.** Désiré Leroux. *Compt. rend. acad. agr. France* 20, 122-5(1934). —There is no proportionality between the amt. of C initially in the soil and the oxidation of this C to  $CO_2$ . However, there is a relation between this phenomenon and temp. The combustion can occur at very low temps. (below  $0^\circ$ ). Mixing of the medium causes a recrudescence, although rather limited, of this combustion. J. R. Adams

**Application of electrofiltration, electro dialysis and electrolysis to soil analysis.** I. I. N. Antipov-Karatayev and K. N. Krasikov. *Trans. Dokuchaev Soil Inst.* 8, No. 8, 5-22(1933). —Adsorbed Ca and Mg are removed completely by electrofiltration, Mg being removed to a greater extent than by the acetate method. The amts. of K and Na were 2-3 times those of the acetate method. This is due to the destruction of part of the soil mass. Electro dialysis gives results similar to those obtained by electrofiltration, whereas electrolysis gives results for Ca + Mg which are generally < those obtained by the acetate method. B. C. A.

**Volumetric determination of humus in soils.** N. A. Komarova. *Proc. Leningrad Dept. Inst. Fert.* 17, 29 44(1933). —Humus is oxidized by 0.4 N  $CrO_3$  in dil.  $H_2SO_4$  (1:1) with  $HgSO_4$  as catalyst, the mixt. being kept at  $140-180^\circ$  for 5 min. After cooling, diln. and addn. of  $H_3PO_4$ , the soln. is titrated with standard  $Fe(NH_4)_2(SO_4)_2$  contg.  $H_2SO_4$ ,  $NHPh_3$  being used as indicator. Modifications of the method for the detn. of humus in aq., aq.- $NH_3$  and alkali exts. are given. The results agree with those obtained by Knop's method. B. C. A.

**A new method of determining base-exchange capacity of soils.** Amar Nath Puri. *Soil Sci.* 37, 105 8(1934). —A new method is described for the detn. of base-exchange capacity of soils: Leach a 10-20 g. soil sample with 1 l. of N NaCl soln. in 100-cc. lots. Stir the soil with 100 cc. satd.  $Ba(OH)_2$  soln. and leach with 900 cc. of 0.1 N  $Ba(OH)_2$  in 100-cc. lots. Make up the filtrate to 1 l., add phenolphthalein and pass  $CO_2$  through until the soln. just becomes colorless. Allow the ppt. of  $BaCO_3$  to settle and evap. 500 cc. of the supernatant liquid to 50 cc. Again pass  $CO_2$  through until the color is just discharged. Add about 25 cc. of approx. 0.5 N  $NH_4OH$ ; boil, filter and wash the ppt. with  $NH_4OH$ . Boil the filtrate until the vol. is reduced to about  $\frac{1}{2}$ , by which time the  $NH_4OH$  is all removed. Add excess of standard acid, boil and back-titrate, using bromothymol blue as indicator. The results are expressed as milliequivs. per 100 g. of soil. An important feature of the method is that no leaching is required after the NaCl treatment. The results are in good accord with those by the  $NH_4OH$  method (C. A. 25, 2224). M. S. Anderson

**The cryoscopic determination of the osmotic values of soil solutions.** Maximilian Steiner. *Ber. deut. botan. Ges.* 52, 16-25(1934). —The pressure applied (5.6 to 108 atm.) to press out the soln. does not influence the f. p. depression obtained. Lawrence P. Miller

**Influence of light on nitrification in soil.** N. R. Dhar, A. K. Bhattacharya and N. N. Biswas. *J. Indian Chem. Soc.* 10, 699-712(1933); cf. C. A. 27, 3277. —When  $NH_4$  salts mixed with sterilized or unsterilized soils are exposed to 550 hrs. of sunlight in contact with air over a period of a year, the amts. of the  $NH_4$  salts oxidized to  $NO_3$  in sterilized and in unsterilized soil are for  $NH_4Cl$  65% and 58%,  $(NH_4)_2HPO_4$  55 and 60.2% and  $(NH_4)_2SO_4$  16 and 28%. The amts. of  $NH_3$  and  $NO_2$  formed on exposing solns. of urea or suspensions of egg-yellow mixed with either soil to sunlight for 224 hrs. are always greater in light than in the dark and the amts. of  $NH_3$  are greater than those of  $NO_2$  produced. The optimum temp. for

bacterial nitrification in hot countries is 35°. The formaldehyde formed in the photo-oxidation of org. compds. present in the soil is likely to exert a harmful effect on the bacterial process taking place in the soil. The formation of  $\text{NH}_3$  from the amino acids obtained from protein decomps. appears to be mainly an oxidative deamination taking place on the soil surface by the O of air aided by light. Increasing the soil surface, soil temp., aeration or the amt. of light falling on the soil will cause increased  $\text{NH}_3$  formation as well as nitrification. The increased production of  $\text{NH}_3$  and nitrate on drying the soil, on heating it or putting it in sunlight or sterilizing it by volatile antiseptics cannot be explained from the protozoan and other existing theories based on microbial action, because all these processes lead to a decrease in the no. of organisms present in the soil. These processes increase the soil surface and aeration and hence the oxidation of amino acids by atm. O leading to the liberation of  $\text{NH}_3$  and its subsequent oxidation to  $\text{NO}_2$  are increased, these oxidations being accelerated by light. Thus it appears that both ammonification and nitrification in soil are oxidation reactions markedly accelerated by light and heat, and both these processes may actively go on in presence of light even in the absence of microorganisms. J. R. Adams

The effects of soil reaction upon the growth of several types of bent grasses. Mary E. Reid. *Bull. U. S. Golf. Assoc. Green Sec. 12*, 196-212 (1932).—Expts. were carried out on (I) a heavy clay loam relatively low in org. matter and plant nutrients and (II) a rich compost mixt. having a high content of these substances. The  $pH$  values of the soils were varied by the addn. of acids or alkalis. With II, the creeping bents and colonial bent grew well at reactions between  $pH$  4.5 and 8.3; velvet bent was somewhat less tolerant of the higher  $pH$  values. Under certain climatic conditions the best growth of Metropolitan bent occurred in I at  $pH$  8.3 and II at  $pH$  4.5. With I, the creeping bents thrived best at reactions slightly above neutral to strongly acid, and velvet bent at reactions distinctly acid. In general, growth of roots of bent grasses was favored by the same acidity conditions as favored growth of the tops; very high acidities were somewhat more unfavorable to root growth than to top growth. The chief factor causing preferences for rather definite  $pH$  values in poor soils was a deficient supply of some nutrient or nutrients essential for growth. The supply of available P was the chief factor causing variations in growth of Metropolitan bent in I at different reactions; the supplies of available N and P were both detg. factors in II; the supply of Mg was a minor factor. If the alkalization of I with  $\text{CaO}$  or  $\text{CaCO}_3$  plus  $\text{MgO}$  the best growth of Metropolitan bent was usually obtained at  $pH$  7.8-8.3, but with  $\text{KOH}$  the poorest growth was obtained at  $pH$  7.0. Excellent growth was usually obtained in I acidified to  $pH$  4.3-4.5 with  $\text{H}_2\text{PO}_4$ , but very poor growth if  $\text{H}_2\text{SO}_4$  or  $\text{HCl}$  was used, the detrimental effects of  $\text{HCl}$  usually being greater than those of  $\text{H}_2\text{SO}_4$ . There were indications that high concns. of Fe and Al compds. in the soil soln. of highly acid soils may be the chief limiting factor in the growth of bent on certain soils; this may be due either to a direct toxic effect on the removal of phosphates from the soil soln. or to a combination of these factors. The toxic effects of high sulfate concns. in the soil were overcome by application of lime. The acid tolerance of bent grasses seemed to be lower at midsummer than at other times of the year. Lime had a more beneficial effect when applied in summer than at other seasons. K. D. Jacob

Soil acidity and lime for bent turf. John Monteith, Jr. *Bull. U. S. Golf Assoc. Green Sec. 12*, 190-5 (1932).—The acidity of soils under bent turf was decidedly increased by the continued use of  $(\text{NH}_4)_2\text{SO}_4$  or  $\text{NH}_4$  phosphate over a period of years. These plots produced good turf throughout most of the season but showed a tendency to become easily injured in periods of extreme heat during July and Aug. Plots which had been fertilized excessively with  $(\text{NH}_4)_2\text{SO}_4$  were more susceptible to the dollarspot and brownpatch diseases and to nonparasitic injury commonly designated as scald. These injuries were decidedly reduced by an application of lime. On 1 type of soil the

best growth of bent grass was obtained at  $pH$  4.5, and on another type at  $pH$  8.3. Although bent grass usually thrives best on slightly acid soils, there is no definite  $pH$  value at which max. growth occurs on all soil types; the optimum  $pH$  must be detd. experimentally for each soil.

K. D. Jacob

The estimation of the plant-food content of soils by electrodialysis. A. Jacob. *Ernahr. Pflanze* 30, 100-8 (1934).—A review pointing out that difficulties, such as the uniformity of the filter, const. voltage and the rate of filtration, are still to be overcome. J. O. H.

Gas-volumetric determination of potassium in soils. V. M. Gortikov and L. A. Znamenskaya. *Proc. Lenin-grad Dept. Inst. Fert.* 17, 57-68 (1933).—If the conditions of pptn. (temp., vol. and concn.) are similar for both unknown and standard  $\text{KCl}$ , the method of Jander and Faber (*C. A.* 22, 3370; 23, 4639) is rapid and sufficiently accurate for the detn. of K in most soil exts. B. C. A.

The relation between replaceable potassium and field response to potash in Hawaiian soils. O. C. Magistad. *Soil Sci.* 37, 99-103 (1934).—There is a decided relationship between the content of replaceable K in soil and response of pineapples to added potash. When the quantity of replaceable K exceeds 0.5 milliequivs. per 100 g. of soil, no yield increase is obtained. Leaching with  $\text{N NH}_4\text{Cl}$  is used in the detn. of replaceable K. The crop results are in accord with former data by the *Aspergillus niger* method (*C. A.* 27, 3277). M. S. Anderson

The estimation of reserves of potash in the soil by the methods of Mitscherlich and Wiessmann. F. Scheffler. *Ernahr. Pflanze* 30, 101-6 (1934); cf. *C. A.* 22, 2425.—Pot expts. with oats were carried out by the 2 methods on 10 different poor soils. The ratio of soil to sand varied from 1.0 to 1:10. A parallel expt. was carried out in sand cultures with increasing amts. of K. The nutrient content of the soil, in the growing medium used, was greater the wider the ratio of soil to sand. The highest value for the nutrient content of the soil was with a soil-sand ratio of 1.5. These 2 methods may indicate large nutrient reserves in the soil, while under field conditions the effect of the nutrients present is greatly limited. J. O. H.

Magnesium deficiency in Aroostook potato soils. Jos. A. Chuska. *Am. Potato J.* 11, 29-35 (1934).—Approx. 20-30 lb.  $\text{MgO}$  per acre must be added to potato fertilizers to overcome the deficiency of Mg in the soils of Aroostook County, Maine. In fertilizers, sol. Mg compds. ( $\text{MgSO}_4$  and sulfate of potash magnesia) seemed to be more effective than dolomitic limestone in preventing Mg deficiency. Top-dressing the soil with 320 lb. per acre of  $\text{MgSO}_4$  or sulfate of potash magnesia, or spraying the plants with a soln. of  $\text{MgSO}_4$  (60 lb./acre), caused marked increases in the yields of potatoes. It is suggested that, in the case of sprays, the Mg may be absorbed directly by the leaves of potato plants. Lining soils with dolomitic limestone is recommended as the most practical method of preventing Mg deficiency. Addn. of high-Ca limestone to the fertilizers usually caused a decrease in the yield of potatoes. K. D. Jacob

The response of potatoes to magnesium under various soil conditions. H. C. Knoblauch and T. E. Odland. *Am. Potato J.* 11, 35-40 (1934).—In Rhode Island, Mg deficiency was found to be more severe on acid soils (approx.  $pH$  4.0-5.5) and under conditions where com. fertilizers had been used in large amts. for a no. of years. Addn. of  $\text{MgSO}_4$  (150 lb./acre) to P fertilizers (superphosphate and ground phosphate rock) markedly increased the yield of potatoes on acid soils, but had no effect on potatoes grown on limed soils. When they were applied in amts. equiv. to at least 25 lb.  $\text{MgO}$ /acre, dolomitic limestone,  $\text{Mg}(\text{OH})_2$  and  $\text{MgSO}_4$  were equally efficient in overcoming Mg deficiency in acid soils. High-Ca limestone (500-1000 lb./acre), contg. less than 1%  $\text{MgO}$ , increased the potato yield, but to a much smaller extent than did dolomitic limestone; it also increased the no. of scabby potatoes. K. D. Jacob

Some physical constants for certain Hawaiian sugarcane soils. H. A. Wadsworth. *Hawaiian Planters' Rec.* 37, 106-13 (1933).—Data are given on the vol. wt.,

ignition loss, moisture equiv., loss of moisture equiv. on oven-drying, wilting percentage, phosphate fixation and compn. of colloidal fraction (percentage of org. matter and  $\text{SiO}_2\text{-R}_2\text{O}_3$  ratio) for 17 representative soils from the islands of Hawaii and Maui. The nature of the soils as measured by these properties seemed to depend upon the conditions of weathering under which the soils were formed. Soils from windward Hawaii were characterized by low vol. wts., high ignition losses and high phosphate-fixing powers; those from Maui showed high vol. wts., low ignition losses and little or no phosphate-fixing capacity. There was no relation between the phys. characteristics of the soil and the growth failure of cane in certain districts. There were indications that phosphate fixation in the local soils is due to an abundance of Fe and Al in the colloidal separates, and that the presence of  $\text{SiO}_2$  in the separates tends to minimize the fixative characteristic of the Fe and Al with which it is assoc. K. D. J.

The relationship of sprouting in sugar beet to the nutrient content of the soil. E. Claus. *Centr. Zuckerind.* 42, 12-13, c.f. 73 (1934); cf. C. A. 27, 6003.—Detailed soil analyses were made on samples taken at depths of 10, 30 and 40-50 cm. With other conditions the same, a higher ratio of total N to  $\text{P}_2\text{O}_5$  and to  $\text{K}_2\text{O}$  was assoc. with sprouting in an increased no. of the beets. An excess of  $\text{KNO}_3$  nitrogen seemed to be especially effective. C. B. Purves

Summary of the results of the plot tests on various (sugar cane) problems in 1933. E. Demandt. *Arch. Suikerind.* 42, III, Mededeel. Proefsta. Java-Suikerind. 25-36 (1934); cf. C. A. 27, 3024.—Data similar to those given in previous reports are listed. F. W. Zerbán

Summary of the results of the fertilizer tests (on sugar cane) in 1933. E. Demandt. *Arch. Suikerind.* 42, III, Mededeel. Proefsta. Java-Suikerind. 1-24 (1934); cf. C. A. 27, 3024. The total no. of tests was 1574. The optimum dose of  $(\text{NH}_4)_2\text{SO}_4$  was the same as the yr. before, 4.0 quintals per hectare.  $\text{CaCN}_2$  again proved inferior to  $(\text{NH}_4)_2\text{SO}_4$ .  $\text{NH}_4$  phosphates, sold under various trade names, were found to be somewhat better than double superphosphate, Thomas slag giving intermediate results. Fertilization with molasses proved advantageous on a no. of soils of all types. Tests with K and with miscellaneous fertilizers were too few to permit definite conclusions. F. W. Zerbán

Sugar-cane cultivation and manufacture of white sugar at Palur Agricultural Research Station. C. S. Krishnaswami. *Madras Agr. J.* 22, 9-16 (1934).— $\text{NaNO}_3$ , either alone or in combination with peanut cake, was inferior to  $(\text{NH}_4)_2\text{SO}_4$  as a source of N for sugar cane. The stickiness and softness of jaggedy produced from cane fertilized with  $(\text{NH}_4)_2\text{SO}_4$  increased with the amt. of  $(\text{NH}_4)_2\text{SO}_4$  used. A compost prep. from cane trash, to which was added bone meal and cow manure at the rate of 50 and 200 lb./ton, resp., contained (after 3-4 months) N 0.36,  $\text{P}_2\text{O}_5$  0.45 and  $\text{K}_2\text{O}$  0.76%. K. D. Jacob

Studies on tropical soil microbiology. I. The evolution of carbon dioxide from the soil and the bacterial growth curve. A. Steven Corbet. *Soil Sci.* 37, 100-15 (1934); cf. C. A. 23, 2255.—The evolution of  $\text{CO}_2$  from a soil sample under lab. conditions and at const. temp. is expressed accurately by the relation  $y = Ft^m$ , where  $y$  represents the total yield of  $\text{CO}_2$  after time  $t$ , and  $F$  and  $m$  are consts.;  $m$  expresses the retardation in gas evolution due to lab. conditions, while  $F$  is the yield of  $\text{CO}_2$  in unit time at the beginning of the expt. and is a measure of biol. activity *in situ*. The curve obtained by plotting yield of gas in unit time against time elapsed conforms to the usual type of bacterial growth curve. During the phase of increase the relationship between the gas yield in unit time and the time elapsed is exponential. However, during the phase of decrease the relationship is not exponential, but total gas yield is related to time. Rate of evolution of  $\text{CO}_2$  is an accurate measure of rate of growth of the soil population. M. S. Anderson

Titanometric determination of ferric iron in presence of humic matter. P. A. Kryukov. *Proc. Leningrad Dept. Inst. Fert.* 17, 9-19 (1933).—Titration with  $\text{Ti}_2(\text{SO}_4)_3$  may be carried out electrometrically, or with  $\text{NH}_4\text{CNS}$

as indicator, in a current of  $\text{CO}_2$ . Even significant quantities of humus have no serious effect on results. The presence of  $\text{NH}_4\text{CNS}$  is necessary in  $\text{H}_2\text{SO}_4$  exts. and is desirable in other cases. An electrolytic method of prep.  $\text{Ti}_2(\text{SO}_4)_3$  from  $\text{Ti}(\text{SO}_4)_3$  is described. B. C. A.

Inheritance of resistance to copper. S. Frát. *Ber. deut. botan. Ges.* 52, 65-7 (1934).—*Melandrium sibiricum* (Schk.) Roehl, obtained from a region in which the soil contains much Cu, could be grown from seed in a mixt. of 1 part  $\text{CuCO}_3$  and 3 parts garden soil. The same species obtained from another source and exhibiting no morphological differences was much more sensitive. Plants did not survive in soil contg. 3%  $\text{CuCO}_3$ . Lawrence P. Miller

Distribution of nitrates in the soil and root development in coffee. V. A. Beckley and F. McNaughtan. *Nature* 131, 878 (1933).—The curve showing distribution of nitrate with depth for the lower levels of a Kikuyu lateritic red loam growing coffee is always of a definite given form. Comparison of the curves of nitrate distribution with those of root distribution shows that the zone of low nitrate concn. coincides with that of vigorous root growth; this indicates that the coffee bush obtains a substantial part of its N requirements from the lower levels of the soil. B. C. A.

The major coffee diseases. J. McDonald. Kenya Colony Dept. Agr., *Bull.* 1932, No. 20, 13 pp.—Applications of lime and fertilizers had no significant effects on the incidence of the coffee-berry disease which is caused by the fungus *Colletotrichum coffeanum* Noack. Analyses of soils and of coffee tissues indicated that if the coffee bushes are predisposed to attack by berry disease on account of some nutritional deficiency, this deficiency is not likely to be of a kind which can be corrected by applications of the usual com. fertilizers, but may possibly be connected with the intake of some minor element. Expts. on the growth of the fungus in media prep. from coffee berries indicated that berries which are susceptible to attack by the fungus differ in some chem. characteristic from those which are not susceptible to attack. In lab. expts. Cu-contg. sprays prevented germination of the fungus spores. There were indications that simsim-oil emulsion is more effective in controlling the disease than Cu or S sprays. Good control of the coffee-leaf disease, caused by the fungus *Hemileia vastatrix* B. and Br., was obtained by spraying the trees with half-strength Bordeaux mixt. K. D. J.

Choice of uniform and appropriate methods for the determination of fertilizer requirements of soils. Eilhard A. Mitscherlich. *Abh. II. Intern. Kunstdünger-Kongress 1933*, 61-71. A review of the literature. B. Dirks and F. Scheffer. *Ibid.* 72-8.—Methods for the detn. of  $\text{P}_2\text{O}_5$  and  $\text{K}_2\text{O}$  in soils, based on the assumption that plant food is absorbed as ions, are described. The air-dry soil is mixed with  $\text{H}_2\text{O}$  when the  $pH$  of the soil is less than 6 or a carbonate-bicarbonate soln. for those soils having a  $pH$  greater than 7, and the filtrate is used for the detn. of the nutrient elements. H. C. Gerlach. *Ibid.* 77-86. A résumé of the most useful methods for the detn. of fertilizer requirements of soils. Eilhard Alfred Mitscherlich. *Ibid.* 87-108.—Criticisms based on numerous plant physiol. investigations are made of the newest and most widely used of the rapid methods of detg. the fertilizer requirements of soils. Pot-test methods give the most reliable and consistent results. H. Niklas and G. Vilsmeier. *Ibid.* 109-14.—*Aspergillus niger* was used to det. the  $\text{K}_2\text{O}$  and  $\text{P}_2\text{O}_5$  requirements of soils. Thirty cc. of nutrient soln. deficient in 1 of the plant-food elements was placed in a 75-cc. flask with 2.5 or 7.5 g. of soil and incubated at 35° for 5 days. The purified, dried and weighed mold was compared with growths in standard soln. M. H. V. Garner. *Ibid.* 133-40.—A field technic is described, which is sufficiently accurate to det. the fertilizer required for general economic needs. The preliminary tests consist of applications of all combinations of the 3 plant-food elements. The expt. is repeated with double portions of each fertilizer in all combinations. This shows the best proportion of each to use. Nitrogen applied to winter wheat may be lost due to climatic conditions. N (2.5 cwt./ha.) as  $(\text{NH}_4)_2\text{SO}_4$  in 8 applications.

during the winter gave no greater yield than 2 applications of the same amt. in the spring. When cyanamide was used, the spring fertilization increased yields nearly 25%. Application of 2.5 cwt. of  $(\text{NH}_4)_2\text{SO}_4$ /ha. increased the dry wt. of forage from 31.8 to 45 cwt./ha. The amt. of protein was decreased from 11.7 to 8.6% and of legumes from 41 to 20%. The cereals in the hay increased from 19 to 36 cwt./ha. Bronislaw Niklewski. *Ibid.* 204 9. - The mech. structure of soil influences its reaction toward tests designed to det. its fertilizer needs. In pot tests, mixing and screening a soil poor in  $\text{K}_2\text{O}$  reduced its reactivity toward  $\text{K}_2\text{O}$ . Similarly, plowing a field several times increased the amt. of  $\text{K}_2\text{O}$  available to the plant. G. Jonescu Sisezi and Teodor Seidel. *Ibid.* 214-24. - Comparative results from the Mitscherlich test, Neubauer test and chem. tests on various Rumanian soils are given. Typical chernozoms that proved to be deficient in  $\text{P}_2\text{O}_5$  by the Mitscherlich method were found to have sufficient as detd. by the Neubauer test.  $\text{K}_2\text{O}$  requirements of soils were about the same by either test except on podzolic soils and podzols for which the Neubauer tests showed too small a deficiency. For the  $\text{P}_2\text{O}_5$  lab. tests, 5 g. of soil in 60 cc. of 0.05 N  $\text{KCl}$  was satd. with  $\text{CO}_2$  and the soln. was clarified by centrifuging. The  $\text{P}_2\text{O}_5$  was detd. colorimetrically. A soil ext. made with 0.1 N  $\text{NH}_4\text{Cl}$  was used for the K detn. N. Leliedyantzev. *Ibid.* 247-257; cf. *C. A.* 28, 2100<sup>9</sup>. - Comparisons of several methods of detg. fertilizer requirements of Russian soils for the following zones are given: podzolic soils, gray forest soils, chernozoms, chestnut-colored soils in the southeast and gray soils in central Asia. Field investigations showed that the supply of N and  $\text{P}_2\text{O}_5$  in the soils increased regularly from the podzolic soils south to the zone of chestnut-colored soils. The same regularity was not disclosed by pot tests and König's method for N and  $\text{P}_2\text{O}_5$  and no regularity at all was found for  $\text{K}_2\text{O}$ . Lab. tests in all cases showed an excessive fertilizer requirement, while for  $\text{K}_2\text{O}$ , the pot tests and Neubauer method gave low results. Factors for use on various soils and with different tests are suggested.

K. C. Beeson

The preparation of concentrated fertilizers by treating phosphorite with nitric acid. G. I. Gorshtein and T. I. Khakharina. *J. Chem. Ind. (Moscow)* 1934, No. 1, 39-47. - The best results (98% decompn.) were obtained by treating the phosphorite for 30 min. with sufficient 25%  $\text{HNO}_3$  to decompose the  $\text{CaCO}_3$  and  $\text{Ca}_3(\text{PO}_4)_2$ . A concd. phosphate fertilizer was obtained by treating this soln. directly with  $\text{NH}_3$  in sufficient amt. to ppt. the P as  $\text{CaHPO}_4$  and then with  $(\text{NH}_4)_2\text{CO}_3$  to ppt. the remaining Ca as  $\text{CaCO}_3$ . The ppt., which was filtered without washing and dried at  $100^\circ$ , contained a high concn. of citrate-sol. P; at first it absorbed water rather rapidly from the atm., but not in sufficient amt. to affect its phys. condition.  $\text{NH}_4\text{NO}_3$ , contg. about 5%  $\text{Ca}(\text{NO}_3)_2$ , was obtained by evap. the filtrate.

H. M. Leicester

Phosphate fertilizers by calcination process. Action of silica and water vapor on phosphate rock. D. S. Reynolds, K. D. Jacob and L. F. Rader, Jr. *Ind. Eng. Chem.* 26, 406-12 (1934). - The influence of  $\text{SiO}_2$  and  $\text{H}_2\text{O}$  vapor on the calcination of phosphate rock to remove F and increase the citrate soly. of the P was investigated. In the presence of an ample supply of  $\text{H}_2\text{O}$  vapor, 95-100% of the F was volatilized and 85-95% of the P was converted into the citrate-sol. condition when 5-g. samples of phosphate were heated alone for 1 hr. at  $1400^\circ$ , or when mixts. of phosphate rock (3.5 g.) and  $\text{SiO}_2$  (1.5 g.) were heated for 30 min. at  $1400^\circ$ ; the best results were obtained when the particle sizes of the phosphate rock and  $\text{SiO}_2$  ranged between 40- and 80-mesh. A 2-stage reaction probably takes place; this involves 1st the conversion of the  $\text{Ca}_{10}\text{F}_2(\text{PO}_4)_6$  into  $\text{Ca}_{10}(\text{X}, \text{F})(\text{PO}_4)_6$ , X probably being the hydroxyl radical, and 2nd the further volatilization of F and the formation of a citrate-sol. phosphate.

K. C. Beeson

Agronomical evaluation of potassium and potassium-containing fertilizers. D. V. Druzhinin. *Kalif. (U. S. S. R.)* 1934, No. 1, 28-31. - Data on the effect of K-contg. fertilizers on different plants are given.

J. S.

The relative efficiencies of nitrogen fertilizers. S. D.

Conner. *Am. Fertilizer* 80, No. 1, 57, 28, 30 (1934). - Tabulated results are given showing the relative efficiencies of 22 nitrogenous fertilizer materials in pot tests and of 7 of these materials in field tests with grain crops on silt loam soil. The field tests were continued over a period of 5 yrs. and the pot tests over a period of 7 yrs. In the pot expts. the water-sol. inorg. materials were more efficient than the more slowly sol. org. carriers of N;  $\text{AlN}$  was totally unavailable as a source of N;  $\text{NaNO}_2$  was 92% as efficient as  $\text{NaNO}_3$ ; and  $(\text{NH}_4)_2\text{SO}_4$  was more efficient on limed than on acid soil. The use of N in mixed fertilizers for corn is not profitable for Indiana.

W. H. Ross

The effect of sulfur and phosphorus on the availability of iron to pineapple and maize plants. C. P. Sideris and B. H. Krauss. *Soil Sci.* 37, 85-97 (1934). The replaceable base content and  $\text{pH}$  value of Hawaiian soils varies with elevation and rainfall. The acid soils have a relatively high content of replaceable Al and Fe. On the nearly neutral soils pineapple fruit yields increase with increments of added N. S increases the yields at low N concns. but not at high N concns. This is because of the acidifying effect of the N compds. The addn. of relatively large quantities of P to soils with moderate quantities of S decreases yields, while the addn. of large quantities of S and small quantities of P increases yields. Soils with high annual rainfall are very acid, because K, Ca and Mg have been replaced by H ions. On such soils, pineapples respond well to P fertilizers. The compds. formed with Fe or Al release  $\text{H}_2\text{O}$ -sol. P in very small quantities but sufficient for plant development. Soils of  $\text{pH}$  values from 6.0 to 7.0 do not respond well to P fertilizers unless S or some form of acid fertilizer is added. The biol. method of detg. Fe deficiency, at least with certain plants, is of greater sensitivity than various chem. methods. The influence of rainfall upon replaceable constituents is shown for a group of 13 soils.

M. S. Anderson

The influence of copper sulfate on iron absorption by corn plants. L. G. Willis and J. R. Miland. *Soil Sci.* 37, 79-83 (1934). - The dry wt. of corn plants is increased by the addn. of  $\text{CuSO}_4$  to peat soils. The Cu appears to be fixed in some insol. form by the org. matter and does not even affect the accuracy of a H electrode. Ash analysis shows that liming alone increases the ratio of Fe to other ash constituents, whereas the Fe:ash ratio is nearly const. when Cu is added. The influence of Cu on the intake of Fe and the accumulation of this element in the nodes is identical with that of K salts. These symptoms are not sp. for K deficiency and the effect of K in controlling them is probably distinct from its function as an essential nutrient. The Fe accumulations which may be corrected by the addn. of Cu are probably due to a peculiar soil condition rather than to a K deficiency.

M. S. Anderson

Some factors in the fertilizing of coffee. V. A. Heckley. Kenya Colony Dept. Agr., *Bull.* 1932, No. 16, 8 pp. - Ground rock phosphate and bone meal are more efficient than superphosphate and other sol. phosphates as sources of P for coffee grown on acid humus-deficient soils in Kenya; in these soils the sol. phosphates are rapidly converted into insol. forms that are utilized less readily by the coffee tree than are bone meal and rock phosphate. Although Kenya soils are usually well supplied with K, the most of this K is either present in a form unavailable to coffee plants or is so tightly retained by the soil particles that the plants are unable to obtain an adequate supply of K; marked responses are obtained from the application of K fertilizers. In general, the soils are deficient in N.

K. D. Jacob

The change in composition and decomposability of typical Ceylon green manures with age. A. W. R. Joachim and S. Kandiah. *Trop. Agr. (Ceylon)* 82, 3-20 (1934). - Two series of expts., with *Crotalaria anagyroides* and *Tephrosia candida* as typical bush types and *Erythrina lithosperma* and *Gliricidia maculata* as typical tree types of green manures, show that N, ash constituents and pentosan decrease while dry matter and lignin increase with advancing age. The min. N limit (1.73%) for decomposability of lopped material is reached at the time of flowering with the bush crops and about 5 or 6 months

after previously lopping with the tree crops. Twelve references.

John O. Hardesty  
Some physiological factors influencing the production of flax-fiber cells. B. R. Robinson. *J. Am. Soc. Agron.* 25, 312-28 (1933). Photomicrographs from seedling flax stems prove that the flax-fiber cells arise from the pericycle. Flax plants eventually attain the greatest height in short periods of light per day and yield 8 times as much fiber as the long-day plants which elongate and mature the quickest. A complete nutrient soln. was necessary in water cultures to produce the tallest seedlings. N, particularly in combination with other elements, produced the longest stems in field-grown seedling plants, but at maturity plants fertilized with  $P_2O_5$  and  $K_2O$  equaled or surpassed the N plants. Seedling field-grown plants gave the highest percentages of fiber with the following fertilizer treatments: 4-0-0, 4-16-0 and 4-16-8. The percentage of fiber in the mature field-grown plants was twice as great as it was in the seedling plants. The no. of fiber cells increased after seedling plants were 6 weeks old, and in field-grown seedling plants they increased with addns. of fertilizer. There was no significant increase or decrease in mature stems for any fertilizer treatment when compared with the check. Fertilizers tending to increase the area of stem and probably the no. of fiber cells will increase the area of fiber cells. Water cultures which produced the best yields of fiber were high in  $P_2O_5$  and medium high in  $K_2O$ . A fertilizer analysis closely approximating 4-16-8 is the most desirable for fiber flax where little is known regarding the soil requirements.

J. R. Adams  
Derris roots from New Guinea. Anon. *Bull. Imp. Inst.* 31, 469-72 (1933). A sample of fine roots and one of coarse roots, both from New Guinea but from unstated species, contained 3.2 and 2.1%, resp., of rotenone, on the dry basis, as compared with 2.2% in a com. sample of Malaysian roots.

A. Papineau-Couture  
Rotenone. K. Fresenius. *Z. anal. Chem.* 96, 300-2 (1934). - A review.

W. T. H.  
Rotenone and its value in plant protection. H. Krieg. *Zentr. Bakt. Parasitenk.* 2 Abt. 89, 475-6 (1934). - Rotenone seems to be quite valuable.

John T. Myers  
Bordeaux spraying, with particular reference to the leaf and berry fall of coffee. A. D. Trunch and T. L. McClelland. Kenya Colony Dept. Agr., *Bull.* 1932, No. 17, 14 pp. Leaf fall of coffee was entirely prevented by spraying the trees with Bordeaux mixt.; the treatment greatly reduced "die-back," more or less completely prevented "yellowing," and produced an effect on the general appearance of the trees that was very similar to that produced by heavy applications of org. fertilizers. Excellent results were obtained by substituting  $CaCl_2$  for either hydrated or quick lime in the Bordeaux mixt. Because of the absence of gritty material in the carbide mixt. there was less trouble from spray-nozzle stoppage and less wear through friction in the hose and nozzle apertures.

K. D. Jacob  
Two apple-capsid spraying trials and some notes on spray damage. W. Steer. East Malling Research Sta., *20th Ann. Rept.* 1932, 132-40 (1933). - Good control of the apple capsid was obtained with sprays contg. 6% of a light lubricating oil, and the control action was not impaired by the addn. of 4% of a strained anthracene oil. Although neither 6% petroleum oil nor 4% anthracene oil alone caused perceptible damage to the trees, a mixt. of the 2 caused severe bud injury. Petroleum sprays and low-boiling tar-distillate washes caused rather severe damage to strawberry and gooseberry plants growing beneath sprayed apple trees. High-boiling tar-distillate washes were not injurious to gooseberries, and none of the sprays was injurious to currants.

K. D. Jacob  
Development of a standard cage method for testing the effectiveness of stomach-poison insecticides on the Japanese beetle. Walter E. Fleming. *J. Agr. Research* 48, 115-30 (1934). - The best environment in which to conduct controlled tests of stomach-poison insecticides on the Japanese beetle is one with a temp. of 85-90°F., a relative humidity of 90-95% and a continuous illumination from the top with artificial yellow light having an av.

intensity of 85 candle meters. The results obtained with an improved glass cage constructed to meet these requirements confirmed the conclusion that com.  $PbHAsO_4$  is an effective stomach-poison insecticide against the Japanese beetle. The concn. of the arsenical governs the extent of feeding on the foliage and for a certain period the mortality of the beetles, but at the end of this period mortality is independent of the  $PbHAsO_4$  concn.

W. H. Ross  
A new method for the control of insects by means of insectifuges. L. Meunil. *Compt. rend. acad. agr. France* 20, 30-3 (1934). - Encouraging results have been obtained by the substitution of insectifuges for insecticides in the control of the flies which attack beet and cauliflower crops. Emulsions of pyridine, naphthalene, or creosote furnish some protection to cauliflower crops, while the latter 2 were the most effective of the materials tested against beet flies. The emulsion is prep'd. by emulsifying a mixt. of 100 g. of the material to be tested (creosote, nicotine, aniline, etc.) and 900 g. of peanut oil in 50 l. of  $H_2O$  with  $NH_4$  oleate. The emulsion is sprayed on the plants and the odor being objectionable to the flies prevents their laying eggs in these crops and destroying them.

J. R. A.  
The use of wetting agents in the control of plant insects. André Meyer. *Compt. rend. acad. agr. France* 20, 39-42 (1934). - A discussion of the work of Boutaric and co-workers (cf. *C. A.* 26, 5696; 27, 1706; 28, 2109).

J. R. Adams  
Coffee capsid bug (*Lygus simonyi* Reut.) and the use of kerosene extracts of pyrethrum for the control of "lygus" and "antestia." Richard H. Le Pelley. Kenya Colony Dept. Agr., *Bull.* 1932, No. 22, 18 pp. - The spray contained 1 lb. powd. pyrethrum flowers in 1 gal. highly refined kerosene cong. a low proportion of unsatd. hydrocarbons; the pyrethrum was grown in Kenya and contained total pyrethrins 1.5 and pyrethrin I 0.7%. The spray gave excellent control of the coffee capsid bug and antestia on coffee bushes.

K. D. Jacob  
Control of Thrips imaginis Bagnall. J. W. Ryans. *J. Council Sci. Ind. Research* 6, 99-102 (1933). - Among numerous wet-spray and dusting materials exam'd. as deterrents for thrips, a pyrethrum-S dust was the most effective, retaining its repellent action for 2 days. Nicotine dust, aq.  $Ca(OH)_2$  and  $CaO$ -S-resin spray were valueless in this respect.

B. C. A.  
Sod webworms and their control. W. B. Noble. *Bull. U. S. Golf Assoc. Green Sec.* 12, 14-17 (1932). - Practically complete control of sod webworms was obtained by spraying the turf with (1) com. pyrethrum exts., dil'd. to 1 fluid oz. per 4-5 gal. water and applied at the rate of 1 gal./sq. yard, and (2) kerosene emulsion, prep'd. by emulsifying  $\frac{1}{2}$  gal. kerosene in 1 gal. boiling water contg. 1 lb. laundry soap and applied at the rate of 1 gal./sq. yard; the sprays had no apparent injurious effects on the grass. Pb arsenate gave a max. kill of only 30%.

K. D. Jacob  
Further observations on the strawberry tarsonemid mite (*Tarsonemus fragariae* Zimm.). A. M. Mussee. East Malling Research Sta., *20th Ann. Rept.* 1932, 117-31 (1933). When mite-infested strawberry leaves were dipped in spray solns. for 10 sec. and then allowed to dry, microscopical examn. of the leaves indicated that 3% lime-S soln. and 2% high-grade white-oil emulsion had a marked toxic effect on the mites, which, however, was not apparent until some 15-20 hrs. after treatment; neither substance was effective against the egg stage of the mite or the quiescent larval forms. The efficiency of the sprays was increased by the addn. of 1% of com. powd. spray gelatin. Dusting the plants with flowers of S was ineffective. Fumigation of the runners of strawberry plants with HCN just prior to planting was highly toxic to the plants and did not control the mites. Incidence of the mites was reduced by dipping the runners in 3% lime-S soln. just before planting; the treatment had no detrimental effect on the plants. Thirty-eight references.

K. D. Jacob  
Spraying and dusting experiments on the control of apple scab (*Venturia inaequalis*) and apple mildew (*Podosphaera leucotricha*) at East Malling in 1931-1932. M. H. Moore.

*J. Pomology Hort. Sci.* 12, 57-79(1934); cf. *C. A.* 28, 2108<sup>9</sup>.—Field trials of spray<sup>9</sup> and dusts on Cox's Orange Pippin are described. The results are tabulated and discussed with relation to weather conditions. Former results were supported (*C. A.* 27, 1080), but seasonal conditions made 2. preblossom sprayings necessary for excellent scab control in 1932. Colloidal S was less effective than lime-S spray. Post-blossom S-dusting was useful as an adjunct to pre-blossom wet spraying but unreliable when used both pre- and post-blossom. Lime-S with gelatin is less effective against scab. Under some conditions fruit-drop resulted from post-blossom use of lime-S and S dust. Severe fruit-russeting was caused by the pre-blossom use of soft soap and Pb arsenate sprays. Eleven references.

John O. Hardesty

Field experiments on potato scab control in western New York. C. F. Taylor. *Am. Potato J.* 11, 40-5 (1934); cf. *C. A.* 28, 2111<sup>9</sup>. Expts. were carried out in a district characterized by soils of fairly high  $pH$  values (usually at least  $pH$  6.0). Dipping the seed pieces in  $HgCl_2$  and  $HgO$  solns. caused small but significant increases in the percentages of scabby potatoes; addn of  $HgCl_2$  or  $HgO$  (5-17 lb./acre) to the fertilizer also increased the incidence of scab. Small but significant reductions in potato scab were obtained by treating the seed pieces with formalin solns. (1:120-1:240) at 120° F. for 2.5 min. or in the cold for 90 min. Spring applications of S after plowing consistently reduced the occurrence of scab, while applications before plowing had no effect in the current season, with equal rates of application finely ground S was more effective than inoculated S. K. D. Jacob

Poison bait for army worms and cutworms. C. F. Pemberton. *Hawaiian Planters' Rec.* 27, 87(1933); cf. *C. A.* 27, 5465. Addn. of  $\frac{1}{2}$  lb. casein to the bait (ba-gasse 10, molasses 20,  $CaO$ , 1 lb. and water 2 qts.) greatly improved the coherence of the particles composing the mixt. and added considerably to its life by preventing breakage, scattering and washing away when beaten upon by drenching showers of rain. K. D. Jacob

The use of the salts of dinitrophenol and dinitroresol as anticyptogams and parasitocides. André Meyer. *Compt. rend. acad. agr. France* 20, 43-6(1934). Special protective precautions should be taken for the workers in the use of anticyptogams, or parasitocides contg. salts of dinitrophenol, dinitroresol or dinitromaphthol. These materials may poison the workers seriously if not fatally and are also dangerous if they contaminate the food given to domestic animals. J. R. Adams

The cause and control of chlorosis in western Kansas. H. B. Myers and E. W. Johnson. *Trans. Kansas Acad. Sci.* 36, 106-110(1933).—The chlorosis is caused by a lack of iron, probably because the alk. soil makes it unavailable. Spraying the leaves with a soln. of  $FeSO_4$  cured the condition. Treatment of the soil had no effect. J. J. W.

The treatment of grapevine mildew with copper mixtures. J. Branas and J. Lulas. *Compt. rend. acad. agr. France* 20, 34-9(1934); cf. *C. A.* 28, 849<sup>4</sup>, 1131<sup>9</sup> and 2110<sup>9</sup>.—The Bordeaux and Burgundy mixts. commonly used against mildew are ineffective against serious invasions of mildew because of the low soly. of the Cu deposits in rain water. J. R. Adams

Weed control in asparagus planting. R. M. Smock. Ohio Agr. Expt. Sta. *Bamonth. Bull.* No. 164, 124-5 (1933).—Applications of  $CaCN_2$  (either granular or pulverized) at the rate of 500 lb. per acre, when weeds were 1-2 in. high, effectually controlled annual weeds throughout the cutting season. B. C. A.

Eradication of weeds of arable land by sodium chlorate. A. W. Ling and A. Maggard. *J. Ministry Agr. (Engl.)* 40, 224-8(1933). Autumn applications of 2 cwt. of  $NaClO_3$  per acre cleared heavy land of shallow-rooting annual weeds and of couch and creeping bent grasses and crowfoot. Creeping thistle, dock and other fleshy-rooted weeds were not eradicated. B. C. A.

Disposition of drainage water from milking barns [fertilization of fields] (Walker, Belton) 14. Survey of

the walnut position in England [control of fungus] (Hamond) 12. Working up pyrites slag from  $H_2SO_4$  production into  $CuSO_4$  and insecticides or fungicides (Pomerantsev, Sorkina) 18. Apparatus for mechanical analysis of soils by the Sabani method. A. P. Mikhailov and B. V. Arkhangelskii. *Russ. Zh.* 31, 600, Oct. 31, 1933. Construction details.

Fertilizers. I. G. Farbenind. A.-G. Fr. 758,473, Jan. 18, 1934.  $NH_4HCO_3$  for use as a fertilizer is preserved unchanged by mixing it with cementing agents, such as waxes, fats or resins and substances increasing the solidity such as  $CaCl_2$ , plaster,  $NH_4Cl$ ,  $(NH_4)_2SO_4$ . Fr. 758,474. Fertilizers contg. C are made by causing Cl to act on carbonaceous materials such as lignite or humus charcoal and adding basic substances to neutralize the mass.

Fertilizers. I. G. Farbenind. A.-G. Fr. 758,505, Jan. 19, 1934. Granular fertilizers are obtained by agitating wet mixts. contg.  $NH_4Cl$  and an alk. earth carbonate or  $MgCO_3$  in the powder, state and drying the mixts.

Fertilizer. Societá anon. industria ammoniaca and Bruno Tanzi. Fr. 758,888, Jan. 24, 1934. A fertilizer is made by causing powd. lignite and peat to absorb  $NH_3$  and then treating with an acid or acid salt. Instead of  $NH_3$ , urea, cyanamide,  $(NH_4)_3PO_4$ ,  $(NH_4)_2CO_3$ ,  $NH_4HCO_3$  or  $NH_4COONH_4$  may be used.

Fertilizers. Atmospheric Nitrogen Corp. Fr. 757,909, Jan. 8, 1934. A liquid compn. which contains a relatively high proportion of a normally solid fertilizer is prepd. by dissolving urea and a salt of an inorg. acid, e. g.,  $NH_4NO_3$ , in an ammoniacal liquor. The urea may be synthesized from  $NH_3$  and  $CO_2$ .

Fertilizer or stock feed from nitrogenous or protein-containing materials such as slaughter-house refuse. Wm. Laubs (to Packers Equipment Development Co.). U. S. 1,950,360, March 6. The material is digested in a closed steam-tight container while heated in moist steam derived substantially entirely from the moisture contained in the material; the steam is released after the digestion is completed, and the pressure in the container is reduced to below atm. pressure to further removal of moisture. App. is described.

Plant for the continuous, automatic manufacture of superphosphate in the form of powder. Sturtevant Engineering Co., Ltd., Frederick Wm. R. Williams and Alexander Ogilvie. Brit. 402,832, Dec. 11, 1933.

Portable superphosphate chamber. N. I. Vinogradov. *Russ. Zh.* 31, 454, Oct. 31, 1933. Construction details.

Insecticides. Hugh Knight, Lloyd C. Swallen and Wm. J. Bannister (to Emuloids, Inc.). U. S. 1,949,798, March 6. A compn. suitable for spraying on foliage comprises an insecticidal mineral oil such as a white mineral oil mixed with 0.1-2.0% of a polyhydroxy alc. partially esterified with a high-mol.-wt. acid such as glyceryl-mono- or -di-oleate, ricinoleate or acetylricinoleate, etc. Cf. *C. A.* 28, 1133<sup>9</sup>.

Insecticides. Electro Chemical Processes, Ltd. Fr. 758,010, Jan. 9, 1934. An aq. colloidal suspension of an insol. Si fluoride (e. g., the double fluoride of Si and Ba) or of cryolite, is prepd. by heating a mixt. of Si fluoride or cryolite in an aq. liquid with a protective colloid (e. g., a sulfite lye) and, in the case of the double fluoride of Si and Ba, with a small amt. of a Ba salt of an acid more feeble than  $H_2SiF_6$  (e. g., 5% of  $BaCO_3$ ), until a thick aq. paste is obtained. A small amt. (0.2%) of Na caseinate may be added.

Insecticide. Faw Yap Chuck. Fr. 758,152, Jan. 11, 1934. Tannic acid and nicotine are added to milk of soy-

bean flour to form a ppt. of nicotine-glycinine tannate, and I is added to another portion of the milk to form a ppt. The ppts. are mixed and constitute an insecticide.

**Insecticide.** A. M. Finkelgluz. Russ. 81,697, Oct. 31, 1933. Liquid by-products from the prepn. of benzyl chloride, contg.  $\text{PhCl}_2\text{Cl}$ ,  $\text{PhCHCl}_2$  and  $\text{PhCCl}_3$  are used as insecticides.

**Insecticidal oil sprays suitable for application to foliage.** Hugh Knight (to Standard Oil Co. of Ind.). U. S. 1,949,799, March 6. A mineral oil such as "white rose oil" is used with a smaller admixt. (suitably about 2-10%) of an oil-sol. hydroxy ester of a high-mol.-wt. org. acid with a polyhydric alc., such as glyceryl naphthenate or partially esterified glyceryl oleate and Al naphthenate. Cf. C. A. 28, 2840<sup>2</sup>.

**Soil disinfectants.** I. G. Farbenind. A.-G. Fr. 758,000, Jan. 26, 1934. Harmful organisms in soil are destroyed by means of metal carbonyls, e. g., Fe carbonyl, alone or with other disinfectants such as  $\text{CS}_2$ .

**Disinfectant.** Georg Lockemann, Otto Geragross, Kurt Rülke and Werner Ulrich. U. S. 1,950,315, March 6. A thiocyanogen compd. such as NaCNS is used with an acid-reacting substance such as HCl, HOAc or citric or tartaric acid.

**Treating seeds.** Gino Radice. Fr. 759,014, Jan. 27, 1934. Seeds are treated before planting with solns. which increase the content of N and of other essential elements, e. g., a soln. of hemoglobin, casein,  $\text{NH}_3$  and CaO.

**Nutrient salt solutions for use in accelerating germination and growth of seeds.** Paul Spangenberg. U. S. 1,950,068, March 6. For accelerating the germination and growth of seeds, such as those of lupines, oats or rye, without earth, as in the production of an artificial food for animals and human beings, nitrogenous inorg. substances such as Ca basic nitrate and carbonaceous org. substances such as sugar and urea are used in aq. soln. together with a N- and O-contg. acid such as  $\text{HNO}_3$ , etc.

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

**Dehydration of alcohol by means of an absorbent and recovered vapor.** Usines de Melle. *Chimie & industrie* 4 31, 280 (1934).—Polemical with Du Bois (C. A. 28, 2117<sup>9</sup>). Reply. G. Du Bois. *Ibid.* 280-1. Reply. Usines de Melle. *Ibid.* 281. Reply. G. Du Bois. *Ibid.* 281.

A. Papineau-Couture

**Anaerobic fermentation of lignin.** C. S. Boruff and A. M. Buswell. *J. Am. Chem. Soc.* 56, 880-8 (1934).—Isolated lignin ferments very slowly and incompletely under anaerobic conditions? A complete analysis of all the constituents added to and withdrawn from an anaerobic fermentation of cornstalks shows that appreciable quantities of lignin in its natural state ferment to  $\text{CO}_2$  and  $\text{CH}_4$ .

C. J. West

**Note on an electromagnetic method of measuring specific gravity.** L. R. Bishop. *J. Inst. Brewing* 40, 92-4 (1934).—The method of Lamb and Lee (C. A. 8, 1899) is applied to worts.

Quick Landis

**Musts of Anjou (1933 vintage).** L. Moreau and E. Vinet. *Ann. fals.* 26, 18-24 (1934); cf. C. A. 27, 3554.—Analyses of a no. of samples of known origin and purity are given and discussed.

A. Papineau-Couture

**Development of amylases during the germination of barley.** H. Luers and W. Rummel. *Wochschr. Brau.* 50, 297-301 (1933).—The diastatic power, the liquefying power (L. P.) and the dextrinizing const. were detd. on barley samples steeped and grown to various stages up to 8 days. The green malt was dried at 95° to 20% moisture content. The saccharifying power of the barley decreased during steeping and the first day of growth; it increased then considerably to a max. reached on the sixth day and dropped slightly thereafter. The L. P. was found in traces only until the third day of growth; it increased very rapidly up to 4 days and slightly thereafter. The course of the dextrinizing const. was analogous to the L. P. course; this suggests the identity of the enzyme performing these 2 actions. By digestion with papain higher values were obtained; the course of the development, however, was approx. of the same range.

S. Józsa

**Regularities in the carbohydrate composition of barley grain.** L. R. Bishop and D. Marx. *J. Inst. Brewing* 40, 62-73 (1934); cf. C. A. 25, 1944.—Paralleling protein (P) behavior the individual carbohydrates (C) increase regularly with the total C, 2- and 6-row barleys showing differences. "Extract" C and P increase much more rapidly than "cell" C or P, suggesting a mass action equil. during growth. Insol. C is detd. as follows: Reflux 5 g. finely ground barley exactly 10 min. with 200 cc. 0.5%  $\text{H}_2\text{SO}_4$ ; add 20 cc. of 9.50% NaOH and continue the refluxing 10 min. Filter the contents with suction through two No. 41 Whatman filter papers. After

drying 4 hrs. at 110° one paper serves as a counterpoise.

Quick Landis

**Prediction of extract. III. Application of the carbohydrate regularity principle.** E. R. Bishop. *J. Inst. Brewing* 40, 76-91 (1934).—The earlier method and equation (C. A. 28, 2118<sup>9</sup>) is simplified:  $E = 1.0 \text{ lb.} = 134.7 - 9.0 N - 2.8 I$ , where E = brewers' lb. ext. per quarter, N = percentage of N, I = percentage of "insol. C" (cf. preceding abstr.), all on dry barley, independent of variety.

Quick Landis

**Report on malt samples analyzed in May and June, 1933.** F. Ancker. *Wochschr. Brau.* 50, 263-4 (1933).—Moisture, ext., modification, saccharification and various protein compds. were detd. on Pilsen type malt samples. Results on a total of 192 barley malt samples (Pilsen and Munich type and color malt) and 4 wheat malt samples are briefly discussed.

S. Józsa

**Report on malt samples analyzed in July and August, 1933.** F. Ancker. *Wochschr. Brau.* 50, 303-4 (1933).—Figures are given on 144 barley malts and 9 wheat malts.

S. Józsa

**Formation of color of malt on the kiln.** H. Kropff. *Wochschr. Brau.* 50, 278-9 (1933).—The problem is discussed in a general way. The starch is transformed into dextrins by acids present during kilning. The transformation of N compds. is responsible for the aroma. Dextrinization of green malt occurs at 120°; however, in case of abnormally high acidity it will take place at a lower temp. (70°). K. assumes that slow-drying malts become abnormally dark because their acidity increases during slow drying.

S. Józsa

**Distribution of bitter principles and tannin in hops.** H. Wildner. *Wochschr. Brau.* 50, 289-94 (1933).—The components of hops were sepd. mechanically. The dry substance consisted of bracts 66-9, lupulin 49-20, strings 6, stalks 5%. The moisture content of these components was 8% in the bracts, 3% in the lupulin, 9% in strings and stalks. From 77.2 to 79.5% of the dry lupulin was resin, bracts contained 4.9-7.4 resin, strings 3.2-3.4 and stalks 1.7-3.2%. The relative proportions of  $\alpha$ -,  $\beta$ - and  $\gamma$ -resins varied very little in the various components. The tannin content was 6.93-8.23 in the bracts, 1.86-2.39 in the lupulin, 1.10-1.75 in the strings and 1.54-2.05 in the stalks, showing that the tannin distribution is not uniform in the various components.

S. Józsa

**Occurrence of an ester odor in storage tanks from hops (dry hopping).** I. Janensch. *Wochschr. Brau.* 50, 286-7 (1933).—The hops removed from a storage tank showed a very peculiar odor resembling Et or Am acetate. The microorganisms on the sample were examd. It contained chiefly culture yeast with small amts. of *Torula* and a mycodermic yeast of the *anomala* type. The latter is

considered quite harmless in brewing since it is strictly aerobic. In the present case it developed in the storage tank which was only half filled and was, no doubt, responsible for the ester-like flavor. S. Józsa

**Notes from the laboratory of the Abteilung für Trinkbranntwein und Likörfabrikation.** C. Luckow. *Pharm. Zentralhalle* 74, 345-7(1933).—1. Coloring herbal exts. The color of an herbal ext. should be developed to a dark tone without the aid of artificial means. The suggestion is nevertheless made that the color tone may be deepened, without material impairment of the herbal aroma, by addn. of a small amt. of an alc. (60%) infusion of walnut shells, in the proportion of 1:5, or of a suitable amt. of caramel color. 2. Brandy with satisfactory but with unusual secondary aroma. 3. Comparative alc. detns. Both these factors are discussed at some length from the standpoint of the analytical chemist rather than from that of the manufacturer. Thus, in the evaluation of the typical and the cultly volatile wine bouquet, in the detn. of phys. const. and alc. strength, only one skilled in the art can hope properly to evaluate a questionable brandy. W. O. E.

**Estimation of colloidal proteins in wort by adsorption with active carbon.** P. Kolbach and R. Buse. *Wochschr. Brau.* 50, 249-54(1933).—The pptn. method with metallic salts or tannin acts specifically on certain proteins. Adsorption by active C is a simple and easy way to est. colloidal proteins. Details of the method are given. If the total N and  $\text{CH}_2\text{O}$  N is estd. on the original soln. and filtrate, about 50-60% of the total N is adsorbed, including 6%  $\text{CH}_2\text{O}$  N (15-20% of the total  $\text{CH}_2\text{O}$  N). The results are not affected by time of shaking (down to 1 min.) and are but slightly affected by variations of pH and concn. within reasonable limits. Only 1 type of active C was tried. Four grains per 100 cc. soln. is recommended. S. Józsa

**Transformation of proteins during mashing.** P. Kolbach and R. Buse. *Wochschr. Brau.* 50, 265-70, 273-7, 281 5(1933).—Earlier work by Windisch, Kolbach and Schild (C. A. 26, 1382) is supplemented. Ext. pH, total N, permanently sol. (non-coagulable) N not pptd. after boiling for 5 hrs. under the reflux condenser, coagulable N (by difference),  $\text{CH}_2\text{O}$  N, N adsorbed by active C (preceding abstr.), and N pptd. by  $\text{MgSO}_4$ , tannin and uranyl acetate were detd. on mashes. Lundin and Schröderheim's method was used for the pptn. with tannins (cf. C. A. 25, 5683). Pptn. with  $\text{MgSO}_4$  was carried out according to K. and S. Myrback (C. A. 25, 4455); a method by the same authors was used for the pptn. with uranyl acetate (C. A. 26, 5168). The effects of temp. (40, 50, 60 and 70°) and time of mashing ( $\frac{1}{2}$  hr., 1, 2 and 4 hrs.) were first studied. The results are tabulated and graphically represented. Increase of mashing time at a given temp. increases the colloidal N. For a const. mashing time the temps. for highest abs. values are 60-65° for the C fraction, 70° for the  $\text{MgSO}_4$  fraction, 60-70° for the tannin fraction. Expressed in percentage of non-coagulable N the highest values are attained at 70°. Higher temps. are more favorable for colloidal N. The action of peptidase and proteinase is given. Increase in acidity increases the amt. of non-coagulable N. The differences in the relative amts. of the various N fractions are very small when the malt-water proportion is changed except that higher mash concns. seem to have a protective action on the proteolytic enzyme. S. Józsa

**Wort boiling by direct fire and by steam.** H. Stadler. *Wochschr. Brau.* 50, 313-15(1933).—Mashes were prepd. from Munich malt by the usual three-mash process and boiled by direct fire and steam, resp. Maltose, total N and acidity showed no change; with direct firing the amt. of coagulable N was 25% less, the difference being the same on the fermented beer; this had considerable bearing on the stability of the finished beer. The N pptd. by tannin was 27% less with direct firing, and both surface tension and head retention were higher. No difference in final attenuation could be observed. The beer boiled by direct fire was more palatable. The difference is

attributed to more vigorous and intense boiling with direct fire. S. Józsa

**Report on water analysis during the second quarter of 1933.** F. Ancker. *Wochschr. Brau.* 50, 271 2(1933). A discussion of 55 samples of brewing liquor, 2 samples of boiler feed water, and 1 sample of steep water. S. J.

**Steam versus naked flame for heating brew kettles.** P. Petit. *Brasserie & malterie* 24, 1-5(1934).—A brief comparison of the 2 systems. A. Papineau-Couture

**Report on brewing raw material, auxiliary material and by-products for the second quarter of 1933.** F. Ancker. *Wochschr. Brau.* 50, 279(1933); cf. C. A. 27, 5887. —A brief summary covering 125 samples (barley 7, hops 4, pitch 11, wort 41, filter mass 3, malt coffee 32, various 27). S. Józsa

**Characteristics of Philippine vinegars.** F. T. Adriano and J. Banzon. *Philippine J. Agr.* 4, 229-37(1933).—

Analyses of 25 native vinegars from kaong, coconut, nipa, sugar cane and basi showed an av. content of 2.9% AcOH. Palm vinegars have a low sugar content and the total ash is high in sol. ash. John O. Hardesty

**Preparation of vinegar from Philippine fruits and other saccharine materials.** F. T. Adriano and H. L. Ylizarde. *Philippine J. Agr.* 4, 215-27(1933).—Lab. methods are given for the prepn. of vinegar from bananas, perunkila, lipoti, nipa and coconut milk. Alc. and the subsequent AcOH fermentations were carried out at 26.5-35° with the exception of 1 part of the process with nipa sap which was done at 24-26°. A banana cider from the mixed mash of the peel and pulp of Katali, lucatan and Latundan varieties gave the highest amt. of AcOH (8.42%). The banana vinegar is clear, pale brown in color, and retains the aroma of the original substance. Heating the nipa sap to the b. p. and cooling before fermentation increases the yield of AcOH. All of the materials with the exception of coconut milk produced vinegars contg. over 4% AcOH. John O. Hardesty

**Application of refrigeration to the treatment of wines and to the preservation of grapes.** R. Billardon. *Rev. gén. froid* 14, 229-32(1933); *Chimie & industrie* 31, 321. —A brief general discussion. A. P.-C.

**Experiments on the concentration of wine by cold.** E. Hugues. *Rev. gén. froid* 14, 233-4(1933); *Chimie & industrie* 31, 321. —Wine contg. 7% alc. was concd. to an 8.7% alc. content by freezing. There was a corresponding increase in the content of all the constituents except K bitartrate, which pptd. out in considerable quantities. This treatment seems to be favorable to the clearness and taste of the wine. A. Papineau-Couture

**Detection of fruit wine in grape wine by the sorbitol method of Werder and Zöch.** C. von der Heide. *Pharm. Ztg.* 78, 853 4(1933); cf. Kreipe, C. A. 28, 2120\*. —A highly technical procedure is suggested. W. O. E.

**The determination of quinosol in wine.** Luis De Prado. *Anales farm. biogén.* (Buenos Aires) 4, 75 6 (1933).—Into a tube place 30 cc. of the wine. Add 3 g.  $\text{Na}_2\text{CO}_3$ . Heat in a water bath for 5 min. Remove. Add 10 cc. of benzene. Cool slowly, while agitating. Decant the benzene. Filter. To another tube contg. 1 cc. of a weak soln. of colorless  $\text{FeCl}_3$  add 5 cc. of the filtrate. An emerald-green color develops, the intensity of which is proportional to the concn. of the quinosol. Hence the reaction is quant. B. S. Levine

**Application of the (French) regulations relative to the minimum alcohol content of wines.** L. Semichon and M. Planzy. *Ann. fals.* 26, 92-3(1934).—The official French method for detg. alc. in wines consists in distg. the sample and estg. the alc. content of the distillate by means of an alcoholometer. The indications of different instruments, even on the same distillate, vary by as much as 0.4% alc. by vol., and the discrepancies vary at different points of the scale. As the readings of a given instrument gradually change in time, it should be checked at intervals by comparative detns. either with the pycnometer or by the  $\text{K}_2\text{Cr}_2\text{O}_7$  titration method. A. Papineau-Couture

**Preparation of "pseudo-wines" from pure concentrated fruit juices.** J. Henri Fabre and Ernest Brémont. *Ann. fals.* 26, 81-8(1934).—With proper precautions, and

provided the concd. grape juices contain not more than 0.060 g. total Fe per l., they can be advantageously used for sweetening or strengthening wines according to French legislation (used in amts. such that they will not increase the alc. content by more than 2.5%). Fermentation of concd. grape juice after diln. to reconstitute the original juice gives only a "pseudo-wine" which has neither satisfactory compn., odor nor taste. In countries not subject to French (or similar) legislation regarding wine making, it would probably be both easier and more economical to prep. such "pseudo-wines" from dried raisins rather than pure concd. juice.

A. Papineau-Couture

**Report on beer samples analyzed in May and June, 1933.** F. Ancker. *Wochschr. Brau.* 50, 271 (1933).—Results on 104 samples are discussed.

S. Józsa

**Report on beer samples analyzed during the months of July and August, 1933.** F. Ancker. *Wochschr. Brau.* 50, 310-11 (1933).—Figures are given and comments made on 80 bottom- and 3 top-fermented beers.

S. J.

**New method of measuring head on beer.** E. Helm. *Wochschr. Brau.* 50, 241 3 (1933).—The beer flows out from an inverted bottle, with the least preliminary disturbance. Without regurgitation of air the beer flows from a tube into a funnel. Smooth and rapid outflow is assured by means of a double-tube arrangement. Two min. after the outflow the liquid is drawn off and measured and this procedure repeated after 8 min. (vols. a and b). The remaining froth is liquefied by adding 3 cc. alc. and its vol. measured (vol. c). The total head is expressed by the formula  $100(b + c)/(a + b + c)$  and the residual head by  $100c/(a + b + c)$ . Details for the technique are given and illustrated with pictures. The influence of temp. is discussed. The  $CO_2$  content affects the total head to a greater extent than the residual head.

S. J.

**Pseudomonas lindneri** Klayver (*Termodacterium mobile* Lindner). II. K. Schreder, R. Brunner and R. Hampe. *Wochschr. Brau.* 50, 233, 237, 243-5 (1933); cf. C. A. 27, 4872.—The by-products are investigated under aerobic and anaerobic conditions. With sugar on an inorg. nutrient medium  $CO_2$ , lactic acid, AcOH and small amts. of succinic acid are formed. Formic acid, propionic acid and its homologs, malic acid, oxalacetic acid, oxalic acid, tartaric and citric acids could not be detd.

Larger amts. of AcOH than lactic acid are formed. Considerably more AcOH is formed in aerobic fermentation. Small amts. of AcH, higher alcoh., glycerol and esters are formed. Conclusion? The *Termodacterium* seems to have a zymase complex similar to that of yeast.

S. Józsa

**Biological purity of pitching yeast.** I. Jänensch. *Wochschr. Brau.* 50, 237-9 (1933).—Three different types of cultures are made: (a) Drop cultures in sterile water (1:3) to find the infections which are liable to develop from the products secreted by yeast. (b) Drop cultures in sterile hopped wort to det. the presence of infections. (c) The Bettges Heller enclosed culture (*Ibid.* 23, 69-74 (1906)) to detect bacilli and *Sarcina*. The direct microscopical examn. is made with addn. of NaOH to dissolve proteins, and dead cells are detd. by methylene blue. The test requires 2 days. Results on 12 samples are tabulated and discussed.

S. Józsa

**Detn. of sugar content of malt exts.** (Schenk) 12. Tower for drying malt (U. S. pat. 1,950,263) 1. Device for suppressing or reducing froth or scum formation on liquids (Brit. pat. 402,826) 1.

**Non-alcoholic drinks.** J. Ziegler & Co. Ger. 590,574, Jan. 6, 1934 (Cl. 6b. 21). App. for producing drinks free from or poor in alc., from malt with a high content of maltose and dextrin and a small content of albumin and glucose, by fermentation with *Termodacterium mobile* is described.

**Concentrating wines, fruit juices, etc.** Louis Rieutord. Fr. 759,299, Jan. 31, 1934. The liquids are concd. by partial freezing, by adding solid  $CO_2$  in small pieces to effect the cooling.

**Device for accelerating the secondary fermentation of beer.** Josef Prégardien. Ger. 590,575, Jan. 5, 1934 (Cl. 6d. 3).

**Yeast and spirits.** Norddeutsche Hefeindustrie A.-G. Ger. 590,550, Jan. 5, 1934 (Cl. 6a. 17.02). Yeast and spirits are produced by fermenting molasses and mash contg. sugar. The rate of propagation of the yeast is regulated by addn. of nutritive medium and the rate of aeration is also regulated.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

**Hypochlorites as disinfectants.** J. Gibson. *Chemistry & Industry* 1933, 145-6; cf. Rawlinson, C. A. 27, 1713.—The superiority of coal-tar disinfectants in the presence of org. matter is emphasized by the fact that under these conditions the germicidal values of hypochlorites, permanganates and  $HgCl_2$  actually show a reduction.

B. C. A.

**New medicaments and nutrients in the treatment of tuberculosis for 1932.** G. Schröder. *Z. Tuberk.* 68, 253-62 (1933); cf. C. A. 27, 338.

II. J. Corper

**Microchemistry and microscopic identification of santonin.** M. Wagenaar. *Pharm. Weekblad* 71, 260-4 (1934).—A discussion of known methods for crystg. the oily sublimate of santonin and the various color reactions by which the substance is identified.

A. W. Dox

**Microchemistry of quinine carbonate (aristochin).** M. Wagenaar. *Pharm. Weekblad* 71, 316-19 (1934).—A description of the  $C_2O_4H_2 + I$  reaction by which quinine carbonate is distinguished from euquinine, the crystn. of insol. nitrate and the thallioquinine color reaction.

A. W. Dox

**Determination of morphine in opium.** N. Rusting. *Pharm. Weekblad* 71, 333-8 (1934).—Three modifications in R.'s method (C. A. 26, 3616, 4681) consist essentially in the use of coarse instead of finely powd.  $CaO$ , a greater vol. of  $H_2O$  for washing the ppt., and the addn. of glass fragments to the filtrate. The advantages gained are a great saving of time, greater purity of the morphine sep.,

and isolation of the entire morphine content instead of an aliquot.

A. W. Dox

**Volumetric estimation of barbituric acid derivatives.** Hans Budde. *Apoth. Ztg.* 49, 295 (1934).—Dissolve 0.2-0.3 g. of the accurately weighed sample in a mixt. of 30 cc.  $H_2O$  and 1 g.  $Na_2CO_3$ . To the clear soln. add 0.1 N  $AgNO_3$  soln. until a distinct turbidity persists for some time. One cc. 0.1 N  $AgNO_3$  soln.  $\approx 1/10,000$  mol. of the barbituric acid deriv. under examn.

W. O. E.

**Stability of a solution of belladonna extract and a new method for the evaluation of belladonna extract.** Günther Junghans. *Apoth. Ztg.* 49, 325 7 (1934).—A new procedure has been devised whereby consistent results may be obtained in the evaluation of belladonna exts. and nearly related alkaloids. The suggested procedure differs from the official method by the use of magnesia usta instead of  $NH_3$ , as also a smaller amt. of tragacanth. Errors in the official method are emphasized. The soln. of narcotic exts. in alc. and  $H_2O$  in the ratio of 1:1:1 is not only germ-free but stable as well.

W. O. E.

**Examination of drugs for arsenic by means of "sodium phosphite solution D. A.-B. VI."** R. Dietzel and M. Siegert. *Apoth. Ztg.* 49, 357-9 (1934).—A criticism of the official method.

W. O. E.

**Bath preparations.** XIII. W. Peyer and F. Gstriner. *Apoth. Ztg.* 49, 371-5 (1934); cf. C. A. 27, 5143.—A new series of bath preps. is enumerated in connection with their compn. and application.

W. O. E.

**New method for the estimation of phosphorus in phosphated oil.** F. Vieböck. *Arch. Pharm.* 272, 84-7 (1934).—In a small (about 180 cc.) stoppered flask weigh 1.5 cc. of the sample, add 3 g. NaOAc (as buffer to insure complete conversion of the P to  $H_3PO_4$ ), then from a buret run in quickly onto the inside wall of the flask 18-20 cc. 1 soln., thereby avoiding any undue agitation of the liquid, stopper and shake vigorously for 1 min. After a brief interval titrate the unexpended I with thiosulfate (with starch as indicator), 1 cc. 0.1 N I soln. being equiv. to 0.62 mg. P.

**Oxidation of white phosphorus with iodine and explanation of the reaction mechanism in the D. A.-B. VI procedure.** F. Vieböck. *Arch. Pharm.* 272, 88-100 (1934). An exptl. study has been made of the oxidative mechanism, in connection with a criticism of the official method.

**Recent investigations on alkaloids.** H. W. Bersch. *Arch. Pharm.* 272, 114-32 (1934).

**Supplementary data on essential oils.** Th. Ruemele. *Pharm. Zentralhalle* 75, 173 6 (1934).—Tabulated lists are given showing (1) the yields of volatile substance obtainable from 100 g. of the crude material, (2) the d.s., b.p.s. and solidification points (so far as detd.) and other pertinent data, of essential oils employed in perfumery and (3) a series of essential oils (with and without terpenes) with their resp. d.s.

**Evaluation of drugs by means of odor and taste.** C. Luckow. *Pharm. Zentralhalle* 75, 191-5 (1934); cf. Wasicky (*C. A.* 27, 2523).

**Preparation and evaluation of cinchona fluidextract and cinchona tincture and alkaloid determination in cinchona bark.** P. Göttrich. *Pharm. Ztg.* 78, 706-10 (1933).—Methods of prepn. and evaluation are discussed from the standpoint of pharmacopial requirements and suitable procedures are outlined in connection with a method for detg. the alkaloid content of cinchona bark.

**Diacolation of sirups.** H. Breddin. *Pharm. Ztg.* 79, 259-60 (1934).—Certain advantages are discussed in the prepn. of sirups by diacolation (instead of the usual cooking and filtration), notably simple sirup and those of manna, althaea, aurantium and K. guaiacolsulfonate.

**Linimentum ammoniatum D. A.-B. VI.** Otto Rothenkirchen. *Pharm. Ztg.* 79, 286 8 (1934).—An illustrated exptl. study of the official Ger. prepn.

**Determination of ammonia in tobacco smoke.** László Barta. *Magyar Gyógyszerésztud. Társaság Értesítője* 10, 42 4 (1934).—As expts. showed that the amine content of tobacco smoke is very small (about 0.8-0.9 cc. 0.02 N HCl) the ammonia can be detd. by distg. the alk. smoke soln. satd. with NaCl, then titrating the total alky. and deducting the no. of cc. due to nicotine content.

**Comparative evaluations of extractum liquoritiae spiritu depuratum Pharm. Hung. and the commercial succus liquoritiae.** Zoltán Csipke. *Magyar Gyógyszerésztud. Társaság Értesítője* 10, 60-73 (1934).—The detn. of glycyrrhizic acid is essential to the evaluation of commercial preps. of succus liquoritiae. High-grade preps. can be made by extg. drugs with ammoniacal water and purifying with alc. The method of Eder and Sack may well be used for the detn. of pure glycyrrhizic acid by means of furfural-benzotitric acid.

**Determination of mercury in pharmaceutical preparations.** Elemér Schulek and István Flóderer. *Magyar Gyógyszerésztud. Társaság Értesítője* 10, 147-59 (1934).—Hg was isolated from the preps. by treatment with dil. HCl, boiling or decompn. with  $H_2O_2$  and  $H_2SO_4$ . Hg was pptd. free from Bi in a 20% HCl medium. The treatment of a portion equiv. to 0.1 g. metallic Hg required 4-5 min. The soln. was dild. a  $HNO_3$ -contg. soln. of  $Fe(NO_3)_3$  added, 0.1 N  $KMnO_4$  introduced by drops until a pink color was produced, and the mixt. titrated with 0.1 N KCNS. Other methods for the sepn. may be applied.

**The scillin of Scilla maritima and the fructoside of Scilla**

**nutans.** H. Colin and A. Chaudun. *Bull. soc. chim. biol.* 15, 1520-6 (1933).—Different workers have reported different properties for scillin, a fructosan from *S. maritima*. Probably the bulbs contain different fructosans at different seasons. The authors, from bulbs collected in spring, prepd. a fructosan with a mol. wt. of 750 +,  $[\alpha]_{D_{20}} = -27^\circ$ ,  $[\alpha]_{D_{40}} = -32^\circ$ . When hydrolyzed it yielded 6 mols. of fructose to 1 of glucose. A somewhat similar compd., but having a higher mol. wt., was prepd. in impure form from the bulbs of *S. nutans*. L. K. G.

**Micro-methods for determining proteins in medicine and biology.** A. Wasitzky. *Mikrochemie* 14, 85 112 (1934).—A careful review of 102 papers. W. T. H.

**Molds putrefying tobacco.** I. Ryoji Nakazawa, Yoshito Takeda, Tadakatsu Okada and Mitsuo Shimoi. *J. Agr. Chem. Soc. Japan* 10, 135 92 (1934).—From the putrefied tobacco gathered from various places in Formosa, the molds belonging to *Aspergillus*, *Penicillium*, *Citromyces*, *Spicaria*, *Mucor*, *Rhizopus*, *Monilia*, *Syncephalostrium*, *Helminthosporium*, *Cladosporium* and *Fusarium* were isolated. The tobacco was kept in the vapor of chloropierin for 48 hrs., dried at  $70-90^\circ$  for 2-3 hrs., sealed in cans with  $CO_2$  or *in vacuo* (15 mm. of Hg) and then kept in a cool place under  $25^\circ$ . By this treatment it was completely prevented from putrefaction. The sugar contents of tobacco was decreased by the action of *Aspergillus*.

**The essential oils of green tea.** II. Sankichi Takei, Yajiro Sakato and Minoru Ono. *Bull. Inst. Phys.-Chem.-Research* (Tokyo) 13, 116-23 (1934) (abstracts (in English) published with *Sci. Papers Inst. Phys.-Chem. Research* (Tokyo) 23, Nos. 482 7); cf. *C. A.* 27, 2224. —As previously reported, oils of green tea are contained chiefly in the original fresh leaves and only a little is formed in the course of manuf. In order to discover what oils are actually specific to green tea, oils from leaves of tea (I) and some other plants such as the mulberry tree (II), acacia (III) and radish (IV) have been examd. The yield of volatile substances differs widely according to kind of plant and the age of the leaves; thus I, II, III and IV give 0.015, 0.0025, 0.010 and 0.002% yield, resp. From these 4 kinds of oils 5-6% of  $MeCH_2CH_2CH:CH:CHO$  (V) and 30-50% of  $\beta$ -hexenyl alc. (VI) have been obtained as cryst. derivs. V b.  $138-40^\circ$ , gives 2,4-dinitrophenylhydrazones, m.  $144^\circ$ , semicarbazone, m.  $173^\circ$ , and  $p$ -nitrophenylhydrazones, m.  $137^\circ$ . VI gives 4-iododiphenylurethan, m.  $157^\circ$ . In addn. to these two constituents, small amts. of butyraldehyde, isobutyraldehyde and isovaleraldehyde have been found as 2,4-dinitrophenylhydrazones, m.  $123^\circ$ ,  $182^\circ$  and  $123^\circ$ , resp. V and VI have the viridescent odor. The characteristic odors of various leaves are due not only to these lower-boiling constituents but also to the higher-boiling fractions. Therefore, the viridescent odor of all fresh leaves are caused chiefly by VI and a little by V.

**The microscopic identification of cocaine, procaine, estovaine and alypine.** Adolfo Sá and Armando D. Del Boca. *Anales farm. bioquim.* (Buenos Aires) 4, 81-5 (1933).—The appearances under the microscope of crystals formed with salts of  $UO_2^{++}$ ,  $Co^{++}$  and  $Cu^{++}$  are described and shown.

**Disinfectants. II. Monobasic fatty acids.** D. Bach. *Bull. sci. pharmacol.* 39, 425-34 (1932); cf. *C. A.* 27, 118. —The concn. of nonionized  $HCO_2H$  which inhibits the growth of *Aspergillus repens* is between 0.05 and 0.06%. A total concn. of 0.01 N gives only 0.046 nonionized acid and is not sufficient. For bacteria also the nonionized part is decisive for growth inhibition; 20-30 mg. per l. was sufficient for all species studied. *B. mesentericus*, *subtilis* and *Staphylococcus* were the most resistant. *Proteus vulgaris* and *B. kiliense* were the most sensitive. The  $p_a$  develops an addnl. inhibiting power only at high acidity.  $AcOH$  is about 20 times less effective than  $HCO_2H$ . The H ions also show more influence. The activity of  $EtCO_2H$  is slightly higher; the ions have some influence at a concn. of 0.01 N; at higher concn. only the nonionized part is of significance.

**The determination of morphine in opium by the lime**

method. E. Léger. *Bull. sci. pharmacol.* 41, 65-9 (1934).  
—The method of the French Pharm. consists in extn. of 4 g. opium mixed with 1 g.  $\text{Ca}(\text{OH})_2$  with 40 g.  $\text{H}_2\text{O}$ . The morphine is pptd. with  $\text{NH}_4\text{Cl}$  in 26 g. of the filtrate and titrated. The opium should be dried at  $100^\circ$ ; the error, committed by assuming that the 26 g. filtrate corresponds to 2.5 g. opium, is less than 0.00%. Two corrections must be made: for the morphine, which remains in soln., add 0.0285 g.; for the  $\text{CaCO}_3$ , which is admixed to the morphine, subtract 0.0042 g.

A. E. Meyer  
Medicinal plants of Indochina: *Quisqualis indica* L., an anthelmintic. Albert Sallet. *Bull. sci. pharmacol.* 41, 72-7 (1934).

A. E. Meyer  
A pure sulfurized oil from bituminous rocks in the Jura. J. Le Calvé. *Presse méd.* 41, 1205-7 (1933).—A colorless oil was obtained by extn. without further treatment, which contained 15% S. It gives stable emulsions with  $\text{H}_2\text{O}$ , can be incorporated into petrolatum or oil and has the same applications as ichthyol.

A. E. Meyer  
Essential oils of the flora of Tadzhikistan. V. Isaev. *Acta Horti botanici Tadzhikistan* 1932, 17; *Parfums de France* 11, 191-3 (1933).—Distn. of branches of *Juniperus polycarpus* C. Koch, yielded 0.6-0.75% of an oil with characteristic odor and very slight yellowish color which can be eliminated by a 2nd steam distn.; it has d. 0.8480,  $n_D^{20}$  1.4690,  $[\alpha]_D^{20}$  29.43°, acid value trace, ester value 2.3, ester value after acetylation 19.0, aldehydes and ketones 3%, phenols 2.5%. Distn. of *Ephedra procera* F. and M. yields 0.002% of yellowish brown oil. Light yellow oil of *Juglans fallax* Dode, obtained in 0.02% yield in April and in 0.005% yield in Aug., has: d. 0.907, acid value 4.2, ester value 23.4. Yellow oil of *Chenopodium botrys* L., of very disagreeable odor, obtained in 0.03-0.04% yield by distn. of the fresh plant and in over 0.1% yield from the dried plant, has:  $d_{20}$  0.908,  $n_D^{20}$  1.491,  $[\alpha]_D^{20}$  0.10°, b.  $142^\circ$ , acid value 0.6, ester value 22.8, aldehydes and ketones 5%, phenols 1%. A waxy oil is obtained in 0.03% yield by extn. of *Psoralea drupacea* Bge., with petr. ether. Thick dark brown oil is obtained in 0.005% yield by extn. with  $\text{Et}_2\text{O}$  of the steam distillate obtained from *Glycyrrhiza uralensis* Fisch. Deep greenish brown oil is obtained in 0.03% yield by extn. with  $\text{Et}_2\text{O}$  of the distillate from *Peganum harmala* L. Light yellow oil obtained in 0.005% yield by steam distn. of the semi-dried leaves of *Pistacia vera* has  $d_{15}$  0.89. Light yellow oil obtained in 0.07-0.08% yield from *Hypericum perforatum* L., has:  $d_{15}$  0.8726,  $n_D^{15}$  1.489,  $[\alpha]_D^{15}$  -11.72°, b.  $158^\circ$ , acid value 1.6, ester value 10.6, aldehydes and ketones 8.5%, phenols 3.0%. Light yellow oil of strong odor obtained in 0.06-0.07% yield from flowers of *Prangos ulopia* D. C. has:  $d_{15}$  0.8404,  $n_D^{15}$  1.4820,  $[\alpha]_D^{15}$  -12.59°, b.  $155^\circ$ , acid value 1.2, ester value 20.4, ester value after acetylation 44.5, aldehydes and ketones 4%, phenols 4%. Dark brown oil obtained in 0.04-0.05% yield from semi-dried *Nepeta olgae* L. has  $d_{15}$  0.989. Greenish yellow oil of *Salvia sclarea* L., obtained in 0.12-0.15% yield at the time of the falling of the flowers, has:  $d_{20}$  0.8961,  $[\alpha]_D^{20}$  -17.01°,  $n_D^{20}$  1.4680, acid value 0.6, ester value 85.0, aldehydes and ketones 3%, phenols 5%. Oil of *Salvia spinosa* L., obtained in 0.03% yield, has an agreeable odor and d. 1.0177. Steam distn. of the green portion of *Perovskia scrophulariaefolia* Bge., during the blossoming season yielded 0.2-0.45% (av. 0.325%) of lemon-yellow oil, turning rapidly darker in sunlight, with a strong odor recalling those of rosemary and lavender, which softens on aging. The crude oil is not utilizable in perfumery; a second steam distn. yielded a product of more delicate odor, having:  $d_{15}$  0.8775,  $n_D^{15}$  1.4600,  $[\alpha]_D^{15}$  9.01°, acid value 0.25, ester value after acetylation 25.0, b.  $142^\circ$ , ketones and aldehydes (via bisulfite) 3.0%, phenols 6%. Treatment with 10% alc. NaOH greatly improves the odor. Fractional distn. gives 20% of a fraction with a lipalol-like odor. Slightly yellowish oil obtained in 0.6-0.7% yield from *Ziziphora tenuior* L. (whole plant) has:  $d_{20}$  0.935,  $[\alpha]_D^{20}$  16.4°,  $n_D^{20}$  1.4875, acid value 2.8, ester value 40.35. Yellowish brown oil obtained in 0.4-0.48% yield by distn. of semi-dried *Origanum vulgare* L., has:  $d_{15}$  0.9109,  $n_D^{15}$  1.500,  $[\alpha]_D^{15}$  -1.71°, b.

1  $138^\circ$ , acid value 1.5, ester value 3.8, aldehydes and ketones (via bisulfite) 4%, phenols 36%. Rectification by steam distn. yields a product that is almost colorless and could be used in the best Cologne and toilet waters. Oil obtained in 0.009-0.01% yield by distn. of fresh leaves of *Menha silvestris* L., and 0.12-0.15% yield from the semi-dried leaves, has:  $d_{15}$  0.9924,  $[\alpha]_D^{15}$  -16.43°,  $n_D^{15}$  1.4695, acid value 1.4, ester value 52.7, ester value after acetylation 61.0, b.  $138^\circ$ , aldehydes and ketones 5%, phenols 3%.  
2 Steam distn. of the fresh leaves of *Lachnophyllum gossypinum* Bge., in Aug. and early Sept., yields 0.1-0.32% of dark greenish brown oil (obtained for the first time); it yields a mass of long cryst. needles at  $2.8^\circ$ ; b.  $166^\circ$ , ignites spontaneously at  $176^\circ$ , has a particularly strong and disagreeable odor, by redistn. with steam gives 50% of a resinified oil. On treatment with 10% NaOH it loses 35% of its wt. with considerable change in odor; the sepd. oil, on treating a 2nd time with 10% alc. NaOH and Zn dust for 24 hrs. and pptg. with  $\text{H}_2\text{O}$ , yields a yellowish brown liquid having an apricot-like odor, called "Lachnol" which can be used as a "houquet" in perfumery; it has  $d_{15}$  0.9894,  $n_D^{15}$  1.5260,  $[\alpha]_D^{15}$  0.54°, acid value 4.0, ester value 237.5, ester value after acetylation 67.0, aldehydes and ketones 4%, phenols 7.5%. Oil obtained in 0.15-0.2% yield by distn. of semi-dried *Pulicaria salviaefolia* Bge., gathered during the blossoming season, has:  $d_{15}$  0.8974,  $n_D^{15}$  1.4770,  $[\alpha]_D^{15}$  18.52°, acid value 2.0, ester value 22.0, ester value after acetylation 62.8, b.  $148^\circ$ , aldehydes and ketones 2%, phenols 1%; treatment with 10% alkali and Zn dust gives a product having a peculiar, fairly agreeable odor. Dark brown oil obtained in 0.04-0.06% yield from semi-dried *Achillea filipendulina* Lam., has:  $d_{20}$  0.9210,  $n_D^{20}$  1.4730,  $[\alpha]_D^{20}$  0.16°, b.  $140^\circ$ , acid value 1.4, ester value 37.6, aldehydes and ketones 3%, phenols 0.5%. Light straw-colored oil of agreeable odor, obtained in 0.8-1.0% yield from the leaves of *Artemisia scopariiformis* M. Pop., has:  $d_{15}$  0.8756,  $n_D^{15}$  1.4960,  $[\alpha]_D^{15}$  3.01°, b.  $158^\circ$ , acid value 0.2, ester value 7.4, ester value after acetylation 29.4, aldehydes and ketones 3%, phenols 1.5%. Light yellow oil obtained in 0.9-1.1% yield by steam distn. of semi-dried *Artemisia arenaria* D. C., has:  $d_{15}$  0.869,  $n_D^{15}$  1.4820,  $[\alpha]_D^{15}$  -0.06°, b.  $142^\circ$ , acid value 0.3, ester value 33, ester value after acetylation 27.8, ketones 2%, phenols 2%. Oil obtained in 0.15-0.75% yield from *Artemisia maritima* L., has:  $d_{15}$  0.8683,  $[\alpha]_D^{15}$  -2.54°,  $n_D^{15}$  1.4645, acid value 4.4, ester value 23.0, ester value after acetylation 51.5, b.  $135^\circ$ . Dark brownish green oil obtained in 0.06-0.07% yield from the fresh leaves of *Artemisia annua* L., and in 0.085-0.09% yield from the semi-dried leaves, has: d. 0.8254,  $[\alpha]_D^{20}$  -5.2°,  $n_D^{20}$  1.4745, acid value 4.9, ester value 10.30, aldehydes and ketones 3%. Oil obtained by distg. the flowers of *Antanthus glandulosa* Desf., on the same day that they are gathered, is a yellowish, cryst. solid, m.  $36^\circ$ . Steam distn. of *Dianthus crinitus* Sm., and *Elaeagnus angustifolia* gave only traces of oil; treatment of *Elaeagnus* with petr. ether gives about 0.1% of ext. having the same odor as the flowers.  
A. Papineau-Couture.

Effect of the preparation of the product prior to distillation and of the age of the plants on the yields of essential oils. J. B. H. Lejeune. *Agron. coloniale* 22, 161-5 (1933); *Parfums de France* 12, 46.—The materials were prepd. as follows: (1) distd. immediately after reaping; (2) dried slowly in the shade in a hot-air drier and distd. after complete desiccation; (3) dried rapidly in the sun and distd. after complete desiccation; (4) dried in the shade and piled from time to time to produce slight fermentation. Yields, based on the fresh plant, were as follows:  
9 *Acrocephalus masuianus* Briq.—(1) 0.075, (2) 0.162, (3) 0.156, (4) 0.190; *Ocimum viride* Willd., blossoming leafy tops—(1) 0.221, (2) 0.175, (3) 0.158, (4) 0.205; *Ocimum gracile*, blossoming leafy tops—(1) 0.192, (2) 0.220, (3) 0.286, (4) 0.180; *Ocimum basilicum*, blossoming leafy tops—(1) 0.076, (2) 0.072, (3) 0.058, (4) 0.068%. Distn. of *Ocimum viride* at different periods of maturity gave the following yields: (1) blossoming leafy tops 0.221, (2) leafy tops after fructification 0.224, (3) same

as preceding dried in the shade 0.231. Corresponding values for *Ocimum gracile* were (1) 0.192 and (2) 0.403%.

A. Papineau-Couture

Economic possibilities of the cultivation of geranium in Calabria. Francesco La Face. *Bol. uff. staz. sper. Reg. Calabria* 112 (Sept.-Oct., 1933); *Parfums de France* 12, 17-18.—Expts. carried out since 1923 have shown that the production of geranium in Calabria appears favorable in dry soil. Tables are given showing the yields of oil and grass per hectare and the analytical characteristics of the oils.

A. Papineau-Couture

Kino of *Pterocarpus anglicensis* from Southern Rhodesia. Anon. *Bull. Imp. Inst.* 31, 473-5 (1933).—Analysis of 2 samples gave the following results:  $H_2O$  15.4, 15.1; insol. matter 4.3, 4.9; extractive matter (non-tannin) 7.6, 10.5; tannin 72.7, 69.5; ash 1.4, 0.9%. The astringency of the 1st sample was comparable with that of Malabar kino, and its appearance, characters and reactions showed a general, but not entire, concordance with the requirements of the Brit. Phar. 1914. The astringency of the 2nd sample was slightly below the range for Malabar kino, and its appearance was inferior to that of the 1st sample.

A. Papineau-Couture

Analytical characteristics of essential oils: Algerian oil of geranium. B. Angla. *Parfums de France* 11, 180-4, 260-7 (1933); 12, 12-14 (1934); A. Sabatié and B. Angla. *Ann. fals.* 26, 70-81 (1934); cf. C. A. 27, 3289, 4028.—The following limits have been found by analyzing 30 samples of fresh oil of the 1932 crop and over 125 of the 1933 crop:  $d_{4}^{20}$  0.8900-0.9015,  $n_D^{20}$  1.4634-1.4704,  $n_D^{25}$  after acetylation 1.4593-1.4659,  $[\alpha]_D^{20}$  from -5.71 to -8.64°,  $[\alpha]_{\text{yellow}}$  from -7.97 to -12.00°,  $[\alpha]_{\text{violet}}$  from -9.30 to -14.11°,  $[\alpha]_{\text{violet}}/[\alpha]_{\text{yellow}}$  1.101-1.174,  $[\alpha]_{\text{violet}}/[\alpha]_{\text{red}}$  1.520-1.650, acid value 1.4-84, ester value 50-74.2, esters (as geranyl tiglate) 24.5-31.2%, ester no. after acetylation 202-219, free alcs. 42.51% (calcd. according to Gliichitch, C. A. 17, 3226), total alcs. 62 (88.5%, citronellol rhodinol 30-40%). The principal ester of oil of geranium is geranyl tiglate, which could not be used for adulteration because of its high cost. Adulteration with substances contg. esters in approx. the same proportion as contained in genuine oil would not be detected merely by detn. of the ester value. Such adulteration is best detected by fractional distn. and titration of an aq. soln. of the acids by Duclaux' method as follows: remove the alc. from the portion used for detg. ester value by alternate evapn. and addn. of  $H_2O$ , cool, ext. with  $Et_2O$ , evap. the dissolved  $Et_2O$ , add 15 cc. 0.5 N  $H_2SO_4$ , make to 110 cc., distil at the rate of about 1 drop per sec., collecting ten 10-cc. fractions and titrating each fraction separately with 0.05 N KOH (bromothymol blue indicator); for each fraction calc.  $R_1$  (ratio of total acidity distd. to that point to the total acidity of 100 cc. of distillate) and  $R_2$  (ratio of total acidity distd. to that point to the total acids in the sample). The limits for the several fractions of genuine oil of geranium are:  $R_1$ —(1) 10-12, (2) 19-22, (3) 29.5-30.5, (4) 37-39, (5) 46-48, (6) 54-57, (7) 64-66, (8) 73.5-75.5, (9) 85-87, (10) 100;  $R_2$  (10) 69-72. Adulteration with substances contg. no esters does not affect  $R_1$ , but is immediately detected by the lowering of  $R_2$ . Abnormal oils are occasionally found in which 1 or 2 of the consts. fall outside the limits given above, and a verdict of adulteration should be given only when several of the consts. fall outside the above limits. All limits given above are for fresh oils; on aging (about a yr. or more) the compn. of the oil changes resulting in a very appreciable decrease in  $[\alpha]$ , a considerable increase in free acidity, a decrease in the ester content and, especially, a large increase in non-volatile residue (8-9% for fresh oil, over 10%, and sometimes as high as 17-18% for old oil).

A. Papineau-Couture

Measuring rotatory dispersion in the ultra-violet range by photoelectric polarimetry. Y. R. Naves. *Parfums de France* 11, 185-6 (1933) (in French and English); cf. C. A. 27, 372.—Attention is drawn to Bruhat and Chate-lain's photoelec. polarimeter (C. A. 26, 5455, 5447-8) and its usefulness for studying essential oils. A. P. C.

Estimation of the primary alcohols content of essential

oils by phthalization. L. S. Gliichitch and Y. R. Naves. *Parfums de France* 11, 235-41 (1933); cf. C. A. 28, 575 (in French and English).—The method of Radcliffe and Chadderton, as modified by G. and N., is suitable for the detn. of primary + secondary alcs. in essential oils. The analytical characteristics of the products (20 alcs., 32 non-alc. compds., 7 essential oils) used in developing and proving the method are listed. A. P. C.

Bulgarian otto of roses and its rhodinol content. L. S. Gliichitch and Y. R. Naves. *Parfums de France* 12, 6-8 (1934) (in French and English); cf. C. A. 27, 5481.—Five samples of known origin and purity had the following analytical characteristics:  $d_{4}^{20}$  0.8541-0.8609,  $d_{4}^{25}$  (coeff. 0.008) 0.8621-0.8749,  $[\alpha]_D^{20}$  (100 mm.) -2°33' to -4°3',  $n_D^{20}$  1.4538-1.4603,  $n_D^{25}$  (coeff. 0.00045) 1.4560-1.4625, f. p. 15.8-19°, stearoptenes 7.5-20.6%, acid value 2.5-3.5, ester value 8.4-11.2, ester value after acetylation 217.7-248.4, ester value after formylation 153.9-196.9, esters (as  $C_{15}H_{25}O_2$ ) 2.93-3.9%; alcs. (as  $C_{10}H_{18}O$ )—free 68.24-80.04%, combined 2.30-3.08%, total 70.93-83.12%; formylizable products (as rhodinol) 46.3-60.75%. This confirms conclusively that Bulgarian otto of roses can contain considerably more than 40% "rhodinol," irrespective of the method of distn. used and the very large variations in the stearoptene and total alc. contents.

A. Papineau-Couture

Oil of verbena. Établissements Antoine Chiris. *Parfums de France* 12, 15 (1934) (in French and English).—The limits of the analytical consts. of true oil of verbena (*Verbena triphylla* L'Hérit.) of Southern France, based on the analysis of 40 lots of known purity, are:  $d$  0.890-0.912 (exceptionally to 0.920),  $[\alpha]_D^{20}$  -10° to -18°,  $n_D^{20}$  1.4793-1.4880, citral (via bisulfite) 32-38%, sol. in 0.5-6 vol. of 80% alc. sometimes with turbidity on diln. persisting even with 95% alc. The lighter oils are generally the most active and have the lowest citral contents. Distn. of a lot of flowers harvested at Grasse in 1933 gave a normal yield of oil having somewhat abnormal characteristics, as follows:  $d_{15}$  0.8990,  $[\alpha]_D^{20}$  -9°16',  $n_D^{20}$  1.4848, aldehydes (as citral) 50.6%, primary alcs. (as  $C_{10}H_{18}O$  by cold phthalization) 5.1%, sol. in 1.2 vol. of 80% alc. with pptn. of paraffin above 8 vol. and in 0.1 vol. of 95% alc. with pptn. of paraffin above 4 vol. A. P.-C.

Oil of angelica roots. Établissements Antoine Chiris. *Parfums de France* 12, 16 (1934).—The limits given by Gildemeister for the consts. of this oil are applicable to French oils, except that  $n_D^{20}$  should be 1.476-1.483, instead of 1.476-1.478. The majority of French oils fall within the following limits:  $d_{15}$  0.893-0.875,  $[\alpha]_D^{20}$  19-25°,  $n_D^{20}$  1.479-1.482, acid value 0-2.4, ester value 11-19. A batch of old roots gave a heavy oil with the following consts.:  $d_{15}$  0.938,  $[\alpha]_D^{20}$  0°26',  $n_D^{20}$  1.4922, acid value 14.7, ester value 47.6, sol. in 1.5 or more vol. of 80% alc.

A. Papineau-Couture

The constants of oil of clary sage. Georges Igolen. *Parfums de France* 12, 34-5 (1934) (in French and English).—Analysis of a large no. of oils produced in Southern France in the course of the last few yrs. gave the following limits for the analytical consts.:  $d_{15}$  0.8975-0.911,  $[\alpha]_D^{20}$  from -7° to -20° (generally from -8.3° to -11°),  $n_D^{20}$  1.4648-1.4658, acid value 0.1-0.7, ester value 140-194.1, esters (as linalyl acetate) 49-67.9%, ester value after cold formylation 238.9-259.7, frequently sol. in 3-5 vol. of 70% alc. with turbidity on diln., sol. in less than 1 vol. of 80% alc. without turbidity on diln.

A. Papineau-Couture

The ethereal oil of the American spruce *Picea alba* Lk. (*Picea canadensis* Sarg.). Gust. Komppa. *Ann. Acad. Sci. Fennicae* A38, No. 8, 8 pp. (1933).—The oil, constituting 0.3% of the dry twigs and needles, had  $d_{4}^{20}$  0.9235,  $n_D^{20}$  1.4733,  $[\alpha]_D^{20}$  18.32°, acid no. 1.87 and ester no. 46.67. Its properties are thus different from those of com. American spruce oil, which is *l*-rotatory and has an ester no. of 105-15. The constituents isolated include  $\beta$ -pinene, dipentene, *l*-limonene, *d*-camphor (5-8%), bornyl acetate, active fenchyl alc. (0.03%) and cadimene.

K. V. Thimann

The distribution of nicotine in cigaret smoke. Adolf Wenusch. *Chem.-Ztg.* 58, 208-7(1934); cf. Nagy, C. A. 26, 4412.—The amt. of nicotine passing unchanged into smoke varies with the rate of smoking. By burning the cigaret in a closed vessel and passing the smoke through a series of wash bottles contg. dil.  $H_2SO_4$  the whole contents of the smoke could be recovered. The nicotine was steam-distd. and pptd. as the dipicrate. On glowing without suction 45% of the total nicotine was recovered from the smoke; with intermittent glowing and suction (normal smoking) 25% was in the main smoke stream and 14% in the secondary stream from the glowing portion. However, with rapid continuous suction the corresponding figures were 80 and 3%, resp. The stump underwent no enrichment in nicotine. Similar results were obtained from 3 makes of cigalets. Hence with normal smoking more than 50% of the nicotine is decompd. (cf. Kovalenko, C. A. 26, 6066).

The chemical study of ma huang. Alice H. Hayden and C. B. Jordan. *J. Am. Pharm. Assoc.* 22, 616-25 (1933).—The imported ma huang consists of the mixed and broken parts of several species of *Ephedra*. The com. drug was studied. Total volatile constituents of 4 samples 4.7-5.5%. Two samples were subjected to various successive solvents: petr. ether 1.57-1.65;  $Et_2O$  1.34-1.35;  $CHCl_3$  0.58-0.67;  $HIOAc$  4.47-4.72;  $EtOH$  10.28-11.23;  $H_2O$  9.35-10.40; insol. residue 72.33-70.18%; crude fiber 19.5-24.16%;  $Et_2O$ -sol. ext. 0.523-0.736; sol. in 50%  $EtOH$  19.7-21.46;  $H_2O$ -sol. 10.1-15.06; benzene ext. 2.1-2.56%. Eight methods of assay for the drug were compared. The one found most satisfactory is that in which the alkaloids are liberated by  $Ba(OH)_2$ ; also the yield is higher. Mix 20 g. of drug with 75 cc. of 12%  $Ba(OH)_2$  soln., inactivate 2 hrs. and percolate with 25%  $HIOH$  contg. 2%  $NH_4OH$  until exhausted. Remove  $EtOH$  by evapn. and shake 3 times with  $CHCl_3$ . Add  $NH_4OH$  and again shake with  $CHCl_3$ . Unite the solvent portions, evap. spontaneously, and titrate the alkaloids in the residue with the usual precautions. A good grade of ma huang should yield 2% of total alkaloids. A catechin-tannin is present. A cryst. substance having glucosidal properties and a saponin were detected.

The assay of preparations containing pepsin official in the national formulary. Glenn L. Jenkins and Edward M. Hoshall. *J. Am. Pharm. Assoc.* 22, 625-38(1933).—Ten preps. contg. pepsin were prepd. according to the N. F. V. These were subjected to various assay methods. The Greenberg method (cf. C. A. 27, 3621) is not applicable to most of these preps. The methods based on proteolytic digestion of casein and subsequent blocking off of the amino group are inapplicable. The Vollhard-Löhlein method is based on the principle that if casein, which has combined with  $HCl$  be digested with pepsin the combined  $HCl$  is liberated and may be titrated. Corrections are made for the acidity of the original soln. and for the acidity of the pepsin soln. The method is too involved for practicality. The method was modified as follows: Place 3 g. of powd. casein, 50 cc. of  $H_2O$  and 10 cc. of 0.5 N  $HCl$  in a 250-cc. flask and heat the mixt. to  $90^\circ$ . Cool to  $40^\circ$  and add  $H_2O$  to 80 cc. Maintain at  $40^\circ$  for 30 min. with occasional shaking. Add 20 cc. of 20%  $Na_2SO_4$ , agitate and filter. To 50 cc. of the filtrate add a measured excess of 0.5 N  $NaOH$  and titrate back with 0.1 N  $HCl$ , with phenolphthalein as indicator. A blank is carried out with all the reagents except that the pepsin soln. is not added. Just before the back titration  $1/2$  of the vol. of pepsin soln. is added to correct for the acidity of the pepsin. The standard is prepd. by running a series of assays on pepsin of known strength. The method is as accurate as the egg albumin digestion method. On pepsin preps. the method checks within 10%.

L. E. Warren

Assay of glycerite of bismuth. Joseph L. Mayer. *J. Am. Pharm. Assoc.* 22, 653(1933).—The N. F. V. employs the  $H_2S$  method for the assay of glycerite of Bi. M. used this method: Measure 5 cc. of the prepn. into a 400-cc. beaker. Add 100 cc. of  $H_2O$  and heat to boiling. Add concd.  $HCl$  until the ppt. at first formed dissolves.

Add  $NH_4OH$  until a turbidity occurs. Add  $HCl$  until clear. To the boiling soln. add an excess of 10%  $(NH_4)_2PO_4$ , drop by drop. Allow to settle and collect the  $BiPO_4$  in a weighed Gooch crucible. Wash, dry, place in a Ni crucible and heat to const. weight.  $BiPO_4 \times 0.7603 = Bi_2O_3$ . The method is simple, accurate and rapid.

L. E. Warren

Determination of the specific gravity of paraffin. Berl S. Alstodt. *J. Am. Pharm. Assoc.* 22, 653-4(1933).—The U. S. P. X gives the d. for paraffin but prescribes no methods for its detn. A method is given for detg. the d. of yellow wax. This method (modified to warm the  $EtOH$  from "38-40" to "42-45") was applied to a sample of paraffin. The value found was 0.899. By the sinker method the value was 0.888. Several mixts. of  $EtOH$  and  $H_2O$  were made in such proportions that their densities varied from that of paraffin to that of wax. The densities of these mixts. were taken with a pycnometer. By placing a globule of the paraffin in each of these mixts. the d. may be read from the known d. of the diln.

L. E. Warren

A study of vehicles for medicines. Bernard Fantus, H. A. Dyniewicz and J. M. Dyniewicz. *J. Am. Pharm. Assoc.* 22, 655-8, 751-4(1933); cf. C. A. 27, 4028.—Many methods have been suggested for prepg. aromatic elixir. F., D. and D. formulate certain principles necessary to observe if any improvement in the process or product is to be hoped for. (1) Viscosity must be kept low until after clarification. (2) Filtration through talcum or other absorbent powder, must be abandoned because of the losses of oil and time and change in pH. (3) Pptn. of the oils in too fine globules must be avoided to prevent passage through filter paper. If the compd. spirit of orange is added to the mixed solvents and  $H_2O$  is used instead of sirup the subdivision of the oil is satisfactory. (4) Retention of any portion of the solvent until after clarification must be avoided, else the prepn. will not be satd. with oil. A satisfactory formula is: Mix 250 cc. of  $EtOH$  with 55 cc. of  $H_2O$ , add 12 cc. of compd. spirit of orange and agitate vigorously occasionally for 24 hrs. Filter through hard paper, dissolve 320 g. of sucrose in the filtrate and add diluted  $EtOH$  ( $2H_2O:1EtOH$ ) to make 1000 cc. "Isoalcoholic elixirs" are such as are designed to contain the same quantity of  $EtOH$  as the menstruum of the galenical prescriber. An "aqueous" elixir and an "alcoholic" elixir are prepd. which are miscible in all proportions. If these were made official the physician would prescribe them in the proper proportions to meet the  $EtOH$  content of the galenical desired in the prescription.

L. E. Warren

Chemical study of two Chinese drugs. Daniel Tsao and E. V. Lynn. *J. Am. Pharm. Assoc.* 22, 720-2(1933).

(1) Fang Fung is the root of *Siler divaricatum*, *Peucedanum rigidum* or *P. terebinthaceum*. The drug has a sweet, aromatic and mucilaginous taste. The material studied was purchased and was not identified as any single one of the species mentioned. By the A. O. A. C. methods the ground root gave: loss at  $100^\circ$  11.84; total ash 4.34; reducing sugars 6.4; sucrose 3.19; pentosans 11.46; starch (by acid hydrolysis) 2.21; starch (by diastase) 1.60%. To successive solvents the ground root yielded: petr. ether total 2.18; volatile 0.51;  $Et_2O$  total 1.24; volatile 0.38;  $EtOH$  7.90;  $H_2O$  13.77%. Tannins and alkaloids were absent. Traces of unidentified acids were found.  $EtOH$  and  $H_2O$  exts. given orally to rats produced no toxic effects. (2) Hsiung Ch'ung is the root of *Conioselinum univittatum* Turcz., an umbelliferous, cultivated plant. The active ingredient is a volatile oil which has been examd. repeatedly. Roots were purchased in the open market but not further identified. Proximate analysis yielded: volatile oil at  $100^\circ$  16.82; total ash 3.01; reducing sugars none; starch 28.95; protein ( $N \times 6.25$ ) 2.26;  $Et_2O$  ext. 9.06; crude fiber 4.68; tannin 0.38%. Alkaloids were absent. To successive solvents the drug yielded: petr. ether total 7.53; volatile 0.65;  $Et_2O$  total 8.30; volatile 1.22;  $EtOH$  15.73;  $H_2O$  18.43%. Fixed oil was obtained by

extn. with  $\text{Et}_2\text{O}$  and distn. of the volatile oil: d<sub>4</sub> 0.94672; n<sub>D</sub><sup>20</sup> 1.4821; acid no. 31.5 and 31.9; sapon. no. 205.2 and 200.4; ester no. 171.1; unsaponifiable 1.55 and 1.64%; I no. 70.34 and 71.2; R.-M. no. 0.1; Polénski no. 0.25; solid acid 10.78; liquid acids 89.22; titer test 24.3°. Drying tests indicated the oil to be about 80% as efficient as raw linseed oil. A high percentage of hydroxy acids was indicated. The presence of phytosterols was indicated.

L. E. Warren

**Therapeutic substances derived from unsymmetrical biphenyl compounds. I. Some mercury derivatives of 2- and 4-hydroxybiphenyl.** S. E. Harris and W. G. Christiansen. *J. Am. Pharm. Assoc.* 22, 723-7 (1933).—A no. of Hg derivs. of 2- and 4-hydroxybiphenyl were prepd. and their bactericidal properties studied. The compds. mercurated were of 2 types, (a) substituted hydroxybiphenyls and (b) phthaleins prepd. from hydroxybiphenyl. Some of the compds. were bromophenolphthalein derivs. The killing power against *Eberthella typhi* in 5 min. varied from 1-100 to 1-2500. L. E. W.

**A comparative study of the stability of emulsions with variation in the proportion of the ingredients.** Lillian M. Latgevin. *J. Am. Pharm. Assoc.* 22, 728-35 (1933).—The study had 2 objectives: (1) to det. the effect of dilns. upon the stability of emulsions of oils used pharmaceutically; (2) to det. the limits of emulsification or emulsibility of these oils, under variations in the proportions of ingredients. In all of the studies attempts were made to simulate conditions occurring in the av. drug store. The oils used were expressed almond, castor, cod-liver, cottonseed, raw linseed, olive and sesame. Emulsions contg. 5-55% of oil were prepd. from each oil. Cracking or breaking did not occur in any case. Creaming occurred in emulsions contg. more than 30% of oil but the cream layer could be easily incorporated by agitation. An increase in the proportion of acacia decreases the size of the oil globules in the emulsion and *vice versa*. An increase in the proportion of H<sub>2</sub>O results in an increase in the size of dispersed oil globules. Emulsions of low oil content had the smallest oil globules. It is probable that the smaller the range in variation of size of oil globules the more stable is the emulsion. Emulsions can be prepd. of much wider range than the 1:2:4 rule would indicate. Emulsions made according to this rule are not always optimum but are satisfactory. L. E. Warren

**The non-preexistence of azulene in milfoil.** Katherine Graham. *J. Am. Pharm. Assoc.* 22, 819-24 (1933).—The preexistence of azulene in plants has been questioned since 1895. The  $\text{CHCl}_3$  ext. of milfoil flowers contains a compd. which yields azulene during steam distn. The extd. flowers did not yield azulene by steam distn. The nature of this parent compd. has not been ascertained.

L. E. Warren

**Piperazine derivatives as local anesthetics.** W. Baker and W. G. Christiansen. *J. Am. Pharm. Assoc.* 22, 950-3 (1933).—*Et 1-piperazineacetate*, b<sub>m</sub> 153.9°, gives with 1,3- $\text{Cl}_2\text{C}_6\text{H}_3\text{OH}$  +  $\text{K}_2\text{CO}_3$  *Et 4-(γ-hydroxypropyl)-1-piperazineacetate*, yellow, viscous oil. Treatment with  $\text{SOCl}_2$  gives *Et 4-(γ-chloropropyl)-1-piperazineacetate*, yellow, viscous oil. By the action of  $\text{H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{Na}$  was obtained *p*-aminobenzoate of 4-(carbethoxymethyl)-1-piperazinepropanol; viscous yellow oil. As an anesthetic this is comparatively inactive. 1,4-Bis(β-hydroxy-β-methylhexyl)piperazine diphenylurethan, small plate-like crystals, m. 180-181°, was too acid for biol. testing in 2% soln. of the dihydrochloride. L. E. Warren

**A modified assay process for alkali benzoates and salicylates.** Jacob E. Schmidt and John C. Krantz, Jr. *J. Am. Pharm. Assoc.* 22, 953-5 (1933).—The method recommended is a modification of the Henville process (cf. *C. A.* 21, 1787). Transfer 1.5 g. of the dried salt to a tall beaker of 300-cc. capacity, add 75 cc. of  $\text{Et}_2\text{O}$  and 5 drops of methyl orange test soln. Titrate with 0.5 N HCl with vigorous stirring until a permanent pink color is produced in the aq. layer. The method is superior to the U. S. P. X process in accuracy and time required.

L. E. Warren

**Essential oil in desert plants. IV. Examination of the**

**oil of *Tetrademia glabrata*.** Maxwell Adams and Gregory R. Adams. *J. Am. Chem. Soc.* 56, 991-2 (1934); cf. *C. A.* 28, 1814<sup>a</sup>.—The approx. % compn. of the oil of *Tetrademia glabrata* extd. by steam distn. is: α-dipentene 15, dipentene 25, aldehyde fractions 10, caryophyllene 8, nonacosane 7, ketone 1, colophonum and unidentified terpenes 34. The ketone gives a 3,4-dinitrophenylhydrazone m. 132.3°. C. J. West

Notes from the lab. of the Abt. für Trinkbranntwein u. Likorfabrikation [coloring herbal exts.] (Luckow) 16. Fraction of essential oils in plants (Bruno) 11D. Meat preps. **Pharmaceutical compounds. I. G. Farbenind. A.-G.** Fr. 757,989, Jan. 8, 1934. Useful compds. are prepd. by heating aliphatic α,ω-diamino carboxylic acids (in which at least 1 H atom is fixed to the N of the amino group not occupying the α-position) with aliphatic urethans, in the absence of water, and, if necessary in the presence of condensing agents. The amino group occupying the α-position is 1st protected by substituents. Examples are given of the prepn. of α-benzoyl-δ-carbamidoornithine and α-benzoyl-ω-N-acetylcarnamidolysine which is transformed to the corresponding α-carbamidolysine by sapon.

**Medicinal tablets.** Richard Passek. Ger. 593,145, Feb. 22, 1934 (Cl. 30h. 9.02). The manuf. of tablets from finely powd. materials is facilitated by addn. of a small proportion of dried milk or of a product obtained by spray-drying a homogenized mixt. of skim milk and an easily hardened fat.

**Medicinal compositions containing colloiddally dispersed sulfur.** Hans Kaufmann. U. S. 1,949,797, March 6. A H polysulfide is admixed with a medium which is substantially immiscible with water, such as  $\text{CHCl}_3$  and talcum or an ointment base and the H polysulfide is decompd. by means of water.

**Putting up medicines, etc., in gelatin capsules.** Karl Lüdecke. Ger. 593,271, Feb. 23, 1934 (Cl. 30h. 9.03). Oils or fats are emulsified, with the aid of a choline soap, in neutral or alk. aq. solns. which normally dissolve gelatin, whereby compns. are obtained which, when put up in gelatin capsules, do not dissolve them.

**Therapeutic chondroitin compounds.** Lathan A. Crandall, Jr. U. S. 1,950,100, March 6. Various details and modifications of procedure are described for obtaining from cartilage non-toxic Mg, Ca and Fe salts of chondroitin and chondroitin-sulfuric acid, suitable for the treatment of diseases such as migraine, urticarial eruptions, peptic ulcers, multiple sclerosis, various allergic phenomena, cachectic states assocd. with hepatic cirrhosis, obstruc-

tions in the biliary outflow, general nutritional disturbances and especially in nutrition in cases of Eick fistulae.

**Separating quinine from euquinine.** S. A. Elgazin. Russ. 81,441, Oct. 31, 1933. The aq. soln. of quinine and euquinine salts is treated with Na acetate to ppt. euquinine, which is then washed with hot water to remove quinine salts.

**Separating adrenaline from suprarenal organs.** A. A. Shmuk, N. I. Gavrilov and A. M. Krasilnikov. Russ. 31,582, Oct. 31, 1933. In the electrolytic sepn. of adrenaline the cathode is surrounded by a stream of CO<sub>2</sub> or another inert gas to protect the adrenaline from oxidation.

**Bismuth carboxylates.** Société des usines chimiques Rhône-Poulenc. Brit. 402,762, Dec. 4, 1933. See Fr. 752,768 (C. A. 28, 1145<sup>9</sup>).

**Soluble compounds of arsenic, antimony and bismuth.** I. G. Farbenind. A.-G. (Hans Schmidt, inventor). Ger. 590,582, Jan. 5, 1934 (Cl. 12g. 32.30). Addn. to 573,538 (C. A. 27, 4350). Sol. derivs. of aminoarylarsenobenzenic, -antimony or -bismuth compds. of the general formulas (NH<sub>2</sub>ArAs)<sub>n</sub>As<sub>m</sub>, (NH<sub>2</sub>ArAs)<sub>n</sub>Sb<sub>m</sub> or (NH<sub>2</sub>ArAs)<sub>n</sub>Bi<sub>m</sub>, are obtained by treating the derivs. with alkylene oxides or their derivs., alone or in the presence of CH<sub>3</sub>O-bisulfite or CH<sub>3</sub>O-sulfoxylate. Thus, 4-hydroxy-3-aminophenylarsenacetate in epichlorhydrin alc. is treated with SbCl<sub>5</sub> to give the As-Sb compd. Other examples are given.

**Ethylhydrocupreine derivative.** Laboratori Biochimici S. A. Brit. 403,188, Dec. 21, 1933. See Ger. 557,448 (C. A. 27, 810).

**Esters of amino alcohols.** F. Hoffmann-La Roche & Co. A.-G. Ger. 591,677, Jan. 25, 1934 (Cl. 12g. 32.01). Addn. to 586,247 (C. A. 28, 577<sup>7</sup>). Esters of optically active aryl-substituted aliphatic acids with alcs. of the formula RR'C(CH<sub>2</sub>OH)CH<sub>2</sub>NR<sub>2</sub>, in which R is an alkyl group and R' is H or an alkyl group, are prepd. by standard processes. The products are of therapeutic value. The following compds. have been obtained: (1) esters of *l*-α-phenyl-β-hydroxypropionic acid with 2,2-dimethyl-3-diethylaminopropanol (I) (HCl salt [α]<sub>D</sub> -37°), and 2,2-dimethyl-3-benzylmethylaminopropanol ([α]<sub>D</sub> -30°); (2) esters of *d*-α-phenyl-β-hydroxypropionic acid with I ([α]<sub>D</sub> 37°), 2,2-dimethyl-3-dimethylaminopropanol ([α]<sub>D</sub> 44°), and 2,2-dimethyl-3-piperidinopropanol ([α]<sub>D</sub> 39°).

**Mixtures of lecithin and oil.** Noble H. Thörl G. m. b. H. Fr. 759,007, Jan. 27, 1934. Mixts. of lecithin and oil which will keep are made by mixing soy-bean residues with glycerol, concd. solns. of sugar, molasses or a soln. of dry sugar in dry glycerol.

**Sulfur compounds of monoses.** Kali-Chemie A.-G. (Wilhelm Weber and Oskar Herrmann, inventors). Ger. 590,580, Jan. 10, 1934 (Cl. 12o. 23.03). *l*-Fructose, *d*-glucose, etc., are treated with aq. or aq.-alc. solns. of HCN. Examples are given. The products have therapeutic uses.

**Choline salts of bile acids.** Egon Glücksmann. Ger. 593,258, Feb. 23, 1934 (Cl. 12o. 25). These salts are prepd. by treating bile acids with choline, or by double decompn. between salts of bile acids and of choline. Examples are given of the prepn. of choline cholate and desoxycholate. The products are useful as purgatives.

**Antiscorbutic agent.** Chinoin Gyógyszer- és Vegyszertár Termékek Gyára. Hung. 108,184, Feb. 1, 1934. The juice of fresh or dried fruits (e. g., of paprika) is mixed with a soln. of a heavy metal salt (e. g., acetate of Ba or Pb); the ppt. is sepd. and decompd. by H<sub>2</sub>S or H<sub>2</sub>SO<sub>4</sub>. The freed active matter is concd. and purified by recrystn.

**Substance for cancer treatment.** Evagoras J. Georgiou. Brit. 403,269, Dec. 21, 1933. A substance for treating malignant tumors, especially cancer, is obtained by pptg. serum from the blood of individuals in an advanced stage of pregnancy with alc., sterilizing the ppt. with alc., taking up the ppt. in NaCl soln., e. g., physiol. salt soln., and removing the residual alc. by heating *in vacuo*.

**Bismuth salts suitable for use in treating syphilis, etc.** Maxwell M. Becker (to George A. Breon & Co.). U. S.

1,950,132, March 6. A complex double salt of Bi with mannitol and gluconic acid is suitable for use in soln. by injection. Similar compds. may be formed by use of glycerol, erythritol or adonitol instead of mannitol and by the use of tartaric, salicylic or lactic acid instead of gluconic acid. Various details of prepn. are given.

**Salt mixture.** Karl M. Seifert (to Griffith Laboratories). U. S. 1,950,459, March 13. A powder salt mass is formed the particles of which consist predominantly of NaCl with a minor proportion of another assocd. salt such as KI or other therapeutic agents, etc. (luminous compns. also being described).

**Purgatives.** Richter Gedeon Vegyészeti Gyár R. T. Hung. 108,773, March 1, 1934. Isatin or its derivs. are condensed with phenols or their homologs, and may be mixed with protective colloids or adsorbents.

**Bioactive matter.** Irén Hassan. Hung. 107,509, Dec. 1, 1933. Exts. of hormones or organs are mixed with plant or animal fatty oils and irradiated with infra-red rays. To shorten the time necessary for irradiation, org. and inorg. salts (chlorides, carbonates, nitrates, silicates, stearates, etc.) of Ca, Mn, Bi, Hg, Al or Mg are added. The mixt. is dried and converted to powders or incorporated in liniments.

**Hormones.** Allen & Hanburys Ltd., Norman Evers and Cyril J. Eastland. Brit. 402,433, Dec. 4, 1933.

**Hormone-contg. liquids** are obtained from parathyroid gland by adjusting the pH values of exs. of the gland, made by treatment with alkali solns., to 4.5-5.0, e. g., with H<sub>2</sub>SO<sub>4</sub>, sepg. insof. matter, adding alc. to ppt. alkali sulfates, sepg. the ppts. and evapg. off the alc. The aq. soln. after pptn. may be further treated with alc. and H<sub>2</sub>SO<sub>4</sub>, allowed to stand, adjusted to pH 4.8 with alkali, filtered and freed from alc. by evapn.

**Hormones.** Schering-Kahlbaum A.-G. Brit. 403,344, Dec. 21, 1933. Crystd. derivs. of germinial gland hormones are prepd. by combining the hormones with quinoline. Pure hormones may be obtained by decompn. the compds. with dil. acids. In an example follicle hormone is heated with an equal wt. of quinoline, the whole solidifying to a crystal paste on cooling.

**Impregnating bandages, etc., with iodine.** Asociación de productores de yodo de Chile. Ger. 593,329, Feb. 24, 1934 (Cl. 30i. 8.01). Addn. to 585,197 (C. A. 28, 1474<sup>3</sup>). The process of Ger. 585,197 is applied to bandages, etc., made partly of inmaterial other than silk, e. g., cotton, rayon or wool.

**Disinfectants.** Lehn & Fink Inc. Fr. 759,005, Jan. 27, 1934. A disinfectant is composed of an aq. dispersion of tertiary *p*-amylphenol. If disinfectants such as cresols and xylenols are added, the efficacy of the mixt. is much in excess of the arithmetical mean of the 2 disinfectants.

**Composition for germicidal and other uses from cashew nut shell liquid.** Mortimer T. Harvey (to Harvel Corp.). U. S. 1,950,085, March 6. A distillate is produced from cashew nut shell liquid under atm. pressure and at a temp. range of about 300-400°, which is of germicidal phenolic character.

**Depilatory cream.** Éva Dessoö and Mrs. K. Növág. Hung. 107,485, Dec. 1, 1933. The cream consists of BaS 40, American petrolatum 300, spermaceti 100, stearin 70, tincture of iodine 15, K<sub>2</sub>CO<sub>3</sub> 15 and water 400 g., made up to creamy consistency.

**Solid perfumes.** V. Ya. Serdyukov and P. S. Shandarovskii. Russ. 31,533, Oct. 31, 1933. Melted acetanilide is mixed with MgO or ZnO or with ZnCO<sub>3</sub> and aromatic cryst. substances are introduced. Such substances may be heliotropin, coumarin, etc. Beeswax with stearin or Na soap may also be added and finally scent from synthetic aromatic substances and essential oils are incorporated.

**Tissue filler for corpses.** Erling H. Haabstad (to Hydrol Chemical Co.). U. S. reissue 19,099, March 6. A reissue of original pat. No. 1,899,655 (C. A. 27, 1718).

**Nicotine from tobacco.** Tobacco By-Products & Chemical Corp. Fr. 758,487, Jan. 18, 1934. Free nicotine is expelled along with steam from tobacco and passed through an aq. soln. of an acid which combines with the nicotine.

to form a salt, the reaction being exothermic. The soln. is concd. and the steam used to ext. more nicotine. An app. is described in detail.

**Agent for detoxication of tobacco smoke.** Loránd Osvald. Hung. 108,646, March 1, 1934. Plant fibers are satd. with a soln. of  $\text{ZnCl}_2$  and an alkali tartrate, the excess soln. is removed and the product heated to 120–200°.

**Tobacco.** Sergjusz Pawlowski and Szymon Wojtowicz. Ger. 590,852, Jan. 8, 1934 (Cl. 79c. 1). Tobacco is im-

proved by addn. of 10–35% of sol. carbohydrates such as sugar.

**Treatment of tobacco waste.** Rudolf Hofmann. Ger. 503,259, Feb. 23, 1934 (Cl. 12p. 11.10). Tobacco waste is made alk. and steam-distd. to expel nicotine and other volatile bases, and the residue is carbonized in the absence of air and washed with water and HCl to yield a product useful as an adsorbent. The adsorbent may be used to recover ammonia-free nicotine from the steam-distn. products.

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

R. M. SYMMES

**Hydrolysis of magnesium chloride.** G. I. Chufarov and A. P. Lohvitzkaya. *Kaliti* (U. S. S. R.) 1933, No. 8, 24–8. To develop a method for prepn. of  $\text{MgO}$  and HCl from  $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$  and reduce the steam consumption required by the process formerly reported, a no. of expts. were performed, which show that drying of  $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$  in 2 stages, 80–116°, and 116–150°, under atm. pressure produced a porous salt of the following approx. compn.:  $\text{MgCl}_2$  67–71,  $\text{MgO}$  19,  $\text{H}_2\text{O}$  32–20%. This salt easily hydrolyzed in 15 min. with steam at 600°; 0.7 part by wt. of steam was consumed to 1 part  $\text{MgO}$  formed. Yields of 15 g.  $\text{MgO}$  (contg. less than 1% Cl) and 30 35% HCl were obtained from 100 g.  $\text{MgCl}_2$ . Steam consumption was reduced 16 times by raising the hydrolysis temp. from 450° to 600°.

James Sorrel

**New growth in the production of liquid carbon dioxide.** A. I. Solov'ev. *J. Chem. Ind. (Moscow)* 1934, No. 1, 76–7.  $\text{CO}_2$  factories should be located near the point where the  $\text{CO}_2$  is to be used.

H. M. Leicester

**The conversion of a gas containing methane and other hydrocarbons by a continuous process.** V. A. Karzhavin and A. G. Lebusch. *J. Chem. Ind. (Moscow)* 1934, No. 1, 34–8; cf. C. A. 28, 14751. Such a gas is first heated to 650° in a cast Fe tube. The heavy hydrocarbons decompose and deposit C, which must be burned out every 5–7 days. The gas is then mixed with 26 8%  $\text{O}_2$  and passed over a Ni catalyst deposited on chamotte. Partial burning of the  $\text{H}_2$  and CO raises the temp. to 1050–1100°. This yields a gas contg. not more than 0.5%  $\text{CH}_4$ , which may be used for  $\text{NH}_3$  synthesis after removal of the CO. Poisoning of the catalyst by S compds. is reversible and slight at high temps.

H. M. Leicester

**Possible means for avoiding phosgene formation in the thermal decomposition of carbon tetrachloride.** B. Biesalski. *Angew. Chem.* 47, 149–51 (1934).—A no. of substances were investigated with respect to their ability to suppress phosgene formation or decrease it below the danger point in the use of  $\text{CCl}_4$  as a fire extinguisher. The app. which was developed for standardization tests is pictured and described. Addns. with catalytic action and  $\text{NH}_3$  failed completely in their expected action. Of the amines only  $\text{McNH}_2$  showed the desired result.

K. K.

**Substituting iron scrap for zinc used for the preparation of hydrogen for welding purposes.** S. Kondrashkin. *Neft* 2, No. 18, 20–1 (1931).—An app. for the generation of H from iron scrap and  $\text{H}_2\text{SO}_4$  is described.

8

A. A. B.

**Magnesium from Solikamsk carnallite.** I. G. Sheherbakov. *Kaliti* (U. S. S. R.) 1933, No. 8, 22 4.—A review of the method for dehydrating  $\text{MgCl}_2$  preparatory to electrolysis. Construction of a plant for dehydration of  $\text{MgCl}_2$  operated by the process developed at Unikhim is recommended, i. e., dehydrating  $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$  at 400–50° without melting carried out in 2 stages; (a) direct heating to remove most of the  $\text{H}_2\text{O}$  and (b) final drying in electrolytic  $\text{Cl}_2$  in the presence of powd. C in specially designed driers.

James Sorrel

**Commercial extraction of bromine from sea water.** Leroy C. Stewart. *Ind. Eng. Chem.* 26, 301–9 (1934).—Sea water contains 70 p. p. m. of Br. Previous processes (cf. Stine, C. A. 23, 5014) used the reaction  $3\text{NaBr} + 3\text{Cl}_2 + \text{PhNH}_2 = \text{C}_6\text{H}_5\text{Br}_3\text{NH}_2 + 3\text{NaCl} + 3\text{HCl}$ . The new process involves oxidizing NaBr-contg.

brines by  $\text{Cl}_2$  to set free Br, blowing out Br by air, absorbing Br from air by  $\text{Na}_2\text{CO}_3$  to form  $\text{NaBr}$ , from which Br can be obtained as usual or converted into  $\text{C}_6\text{H}_5\text{Br}_3$ . At present, 15,000 lb. of Br per day is recovered as  $\text{C}_6\text{H}_5\text{Br}_3$  at a yield of over 90%.

E. M. Symmes

**Obtaining bromine from bore-hole water in the form of tribromophenol.** A. G. Balchikov, L. A. Demidova and V. S. Efremov. *J. Chem. Ind. (Moscow)* 1934, No. 1, 58–65.—Acidified bore-hole water, from which the  $\text{I}_2$  has been removed, is treated with exactly 1.2 equivs. of  $\text{PhOH}$  and 3 equivs. of  $\text{Cl}_2$  per equiv. of  $\text{Br}_2$ . The reagents are added simultaneously and the mixt. is well stirred for 4 min. The ppt. is allowed to settle for 25–30 min. at 28°, with 2 short periods of light stirring.  $\text{C}_6\text{H}_5\text{Br}_3\text{OH}$  is obtained in 85.4% yield. This is fused with NaOH to recover the  $\text{Br}_2$  as  $\text{NaBr}$ . Full details of com. operations are given. The amts. of  $\text{Cl}_2$  and  $\text{PhOH}$  used may be somewhat reduced when large quantities are used.

H. M. Leicester

**The recovery of fluorine-containing gases in the superphosphate industry.** V. G. Timoshchev. *J. Chem. Ind. (Moscow)* 1934, No. 1, 66–72.—The theoretical reasons for the various steps in the absorption of  $\text{SiF}_4$  are discussed.

H. M. Leicester

**New American iodine industry.** G. Ross Robertson. *Ind. Eng. Chem.* 26, 376–8 (1934).—Oil-well brines in southern California are sand-filtered,  $\text{AgNO}_3$  in amt. equiv. to the I present is added, together with a small amt. of  $\text{FeCl}_3$ , settled, concd., HCl added, scrap Fe added, pptd. Ag removed for re-use, leaving  $\text{FeI}_3$ , which is treated with  $\text{Cl}_2$ ,  $\text{Na}_2\text{Cr}_2\text{O}_7$  and  $\text{H}_2\text{SO}_4$ , or  $\text{NaNO}_2$  and acid, pptg. I, which is melted under concd.  $\text{H}_2\text{SO}_4$ , removed and cooled. The C process involves treating clarified brine with  $\text{H}_2\text{SO}_4$  in amt. equiv. to the  $\text{NaNO}_2$  added later, further settling, adding  $\text{NaNO}_2$  in amt. equiv. to the I present, treating with activated C to absorb the I set free, filtering, treating the C contg. I with NaOH to form  $\text{NaI}$ , which is converted into I by  $\text{H}_2\text{CrO}_4$ – $\text{H}_2\text{SO}_4$ .

E. M. S.

**Obtaining iodine from natural bore-hole water without preliminary acidification.** A. G. Balchikov and V. A. Evstigneev. *J. Chem. Ind. (Moscow)* 1934, No. 1, 54–7.—The  $\text{H}_2\text{O}$  is shaken with 10% of its vol. of kerosene, to remove impurities. It is then shaken for 6–8 sec. with 10% of fresh kerosene and  $\text{Ca}(\text{OCl})_2$  equiv. to 15 g. of active  $\text{Cl}_2$  per l. Free  $\text{I}_2$  is formed and dissolves in the solvent. The kerosene layer is then treated with aq.  $\text{Na}_2\text{SO}_3$ , which reduces the  $\text{I}_2$  to  $\text{NaI}$ . The  $\text{Na}_2\text{SO}_3$  soln. is shaken with fresh kerosene exts. until it contains 2–3%  $\text{I}_2$ . The latter is then liberated with  $\text{KClO}_3$ , and is 90% pure. This method is much cheaper than the acid process.

H. M. Leicester

**Stability of a new chlorine product.** R. H. Aguilar and Lourdes Ocampo. *Philippine J. Sci.* 52, 281–5 (1933).—Lime water is satd. with  $\text{Cl}_2$  under specified conditions and evapd. to dryness, producing a high-test hypochlorite. A freshly prepd. sample contained 61% of available  $\text{Cl}_2$ : after 2 yrs. 35%. Stored for 8 months at 10° there was a loss of 2.46% of available  $\text{Cl}_2$ ; at 28°, 7.80%. This product was more stable than ordinary bleaching powder under conditions in the Philippines.

J. C. Munch

**A new method of formation of rutile.** Heinrich Rheinboldt and Werner Wisfeld. *Ber.* 67B, 375–6 (1934).—

Artificial crystals (colorless, 1-2 mm. long, sp. gr. 4.24) of rutile (pure  $\text{TiO}_2$ , free from Cl) were prepd. by passing 104 g.  $\text{TiCl}_4$  heated on an oil bath at  $134-6^\circ$  and  $\text{O}_2$  (1.5 l. per hr.) for 7 hrs. through a porcelain tube heated to about  $700^\circ$ . Thus 35% of the  $\text{TiCl}_4$  was oxidized. At  $630^\circ$  and  $600^\circ$ , 15 and 10%, resp., were oxidized. The distillate was treated several times in the same manner. No oxychlorides seemed to be present. A. E. Beilich

Industrial utilization of waste materials obtained in the manufacture of alumina from kaolin. P. P. Budnikov. *Chem.-Ztg.* 57, 1000-1 (1933).—Residues from the manuf. of  $\text{Al}_2\text{O}_3$  from kaolin by the  $\text{Na}_2\text{O}-\text{CaO}$  process have the compn.  $\text{SiO}_2$  26.48,  $\text{Al}_2\text{O}_3$  7.59,  $\text{Fe}_2\text{O}_3$  1.35,  $\text{CaO}$  28.50,  $\text{K}_2\text{O}$  1.97,  $\text{Na}_2\text{O}$  13.18, ignition loss 20.72%. Used in suitable proportion (5%) the residue serves as a catalyst in the manuf. of anhydrite cement and as a mixt. (10%) in the manuf. of anhydrite-dolomite cement. When finely ground and mixed with normal sand (1:3) in the Kuhl process it makes a good binder. O. W. Willcox

Working up pyrites slag from sulfuric acid production into copper sulfate and insecticides or fungicides. I. N. Pomerantsev and D. E. Sorkina. *J. Chem. Ind. (Moscow)* 1934, No. 1, 47-54.—One part of ground slag is extd. with 3 parts of 1%  $\text{H}_2\text{SO}_4$ . Each soln. is used for 6 fresh extns., 1%  $\text{H}_2\text{SO}_4$  being used each time. Of the Cu in the slag, 78.7% is removed, and about half as much Fe. Addn. of air during the extn. fails to oxidize the insol. sulfides and so does not increase the yield. The ext. is boiled with  $\text{KClO}_3$  to oxidize all the Fe; then  $\text{CaCO}_3$  is added and the soln. boiled.  $\text{Fe}(\text{OH})_3$  ppts., leaving nearly pure  $\text{CuSO}_4$  in soln. This can be obtained by evapn. of the soln. or the latter may be treated with  $\text{CaCO}_3$ ,  $\text{As}_2\text{O}_3$  or  $\text{Ca}_3(\text{AsO}_4)_2$  to give  $\text{Cu}(\text{OH})_2\text{CuCO}_3$ ,  $\text{CuHAsO}_4$  or  $\text{Ca}_3\text{Cu}_2(\text{AsO}_4)_4$ , resp. If Fe is not first removed, the yields of these compds. fall off, and  $\text{Na}_2\text{CO}_3$  must be added during their prepn. H. M. Leicester

The organic ingredient of fuller's earth. O. Eckart. *Allgem. u. Fett-Ztg.* 31, 9 10 (1934).— $\text{NH}_4\text{OH}$  exts. from 5-g. samples of several earths were acidified and titrated with  $\text{KMnO}_4$ . The amts. consumed were equiv. to 0.00064-0.00136 g. of humic acid. The gravimetric detn. of the org. matter was complicated by the difficulty of removing  $\text{H}_2\text{O}$ . The org. ingredient has no effect upon the activity of the earth. Arnold M. Collins

Concentration of U. S. S. R. graphite ores. I. I. Bekker, D. N. Liffyand, G. A. Osolodkov, S. S. Petrov, S. A. Kamenetskii, V. A. Glazkovskii and P. P. Solov'ev. *Inst. Mekhanicheskoi Obrabotki Polesnuikh Iskh. resur. (Inst. for Mech. Treatment of Ores) Collected Papers on Expl. Concn., Leningrad, 1932, 212 pp.*—The graphite industry in Russia in 1928 reached the pre-war volume of 2000 tons per year. The Pribug district contains about 225,000 tons of scaly graphite; Krivorog graphite is estd. at 1,500,000 tons; the Priazov district has about 1,685,700 tons; and Caucasian deposits are estd. at 1,000,000 tons. Most of these deposits contain about 80% ash and about 15% C. Other deposits are Kureisk and Aliberovsk, estd. at 2,250,000 and 65,000 tons, resp. Deposits recently discovered near Khabarovsk are estd. at 522,316,810 tons. The graphite requirements for the year 1932-3 are, for crucibles 3750, for electrodes 3500, colloidal graphite 2500, metallurgical 12,000, other requirements 4831 tons, a total of 26,531 tons. All concn. methods, except the electromagnetic, were tried out. Pine tar and kerosene, together or separately, were used as flotation agents. Flotation was followed by several washings, in some cases 5. Lab. and com.-scale expts. in various plants gave a large increase in the production of domestic graphite concentrates. Calcns. are given for plants to be located in various parts of the country. Expts. were also made to det. the best method of grinding the ore. The av. results for Russian graphites were graphite 11.5-25, quartz 50-60, mica 5-38, clay 10-27, Fe oxides 0.5-2%. Numerous tables, graphs, photographs and micrographs are given. S. L. Madorsky

Determination of  $p_H$  value in the production of organic urea glasses. Maurice Dérivé. *Rev. gén. mat. plastiques* 9, 406-8 (1933).—The importance of  $p_H$  detns. for

the mfg. control of urea-formaldehyde condensation products is pointed out, and the technic of its potentiometric detn. is described. A. Papineau-Couture

Plastics made from asbestos and rubber base. Dewey. *Rev. gén. mat. plastiques* 9, 414-15, 513-15 (1933); 10, 20-4 (1934); cf. C. A. 27, 1118, 2844, 3571, 3640, 4130, 4717.

A. Papineau-Couture  
The "vegetable ivory" button industry. L. Replat. *Rev. gén. mat. plastiques* 9, 660-3 (1933).—A brief description of the manuf. of buttons from the nuts of *Phytolophus microcarpa*, including dyeing and bleaching. A. P. C.

The making of putty plastics, in all its details. E. Perry. *Paint Varnish Production Mgr.* 10, No. 3, 16-19, No. 4, 24-7 (1934).—Users' requirements of putty vary widely. Formulations for a large no. of types of putty are given. G. G. Sward

The manufacture of wood flour. K. Diesing, P. Heymann and H. Rothgiesser. *Rev. gén. mat. plastiques* 9, 665-70 (1933).—A description of the production of wood flour suitable for use in the manuf. of plastics.

A. Papineau-Couture  
Ethylene oxide as fumigant. A. Hasc. *Arb. biol. Reichs. Land- u. Forstwirtschaft. Berlin-Dahlem* 20, 101-10 (1932).— $\text{C}_2\text{H}_4\text{O}$  has high penetrability. Sixty g. per cu. m. is toxic to insect eggs in 24, but not in 8, hrs. (cf. Z. Parasitenk. 4, 369-80 (1932)). B. C. A.

Use of thallium torpedoes [for rat control]. R. E. Doty. *Hawaiian Planters' Rec.* 37, 96 7 (1933); cf. C. A. 27, 803.—Torpedoes treated with paraffin and corn oil were eaten 4 times as readily by rats as were those treated with paraffin alone. Torpedoes dipped in paraffin that has been heated at too high a temp. became yellowish in color, developed a bad odor and were unpalatable to rats. The dipping should be carried out at a temp. not exceeding  $125^\circ$ , to prevent decmpn. of the paraffin. K. D. Jacob

Bardini, R. I.: Liscive liquide. Milan: U. Hoepli. 128 pp. L. 8. Reviewed in *Nomenclatura chim.* 4, 39 (1934).

Boric acid production from borax. Emil Franke (to Chemische Fabrik Grünau Landshoff & Meyer A.-G.). U. S. 1,950,106, March 6. Borax and concd.  $\text{H}_2\text{SO}_4$  are added to a mother liquor heated to about  $90-100^\circ$  and contg.  $\text{Na}_2\text{SO}_4$  and  $\text{H}_3\text{BO}_3$ , thus pptg. anhyd.  $\text{Na}_2\text{SO}_4$ , which is filtered out of the soln.; the filtrate is cooled to  $30-5^\circ$  to effect crys'n. of  $\text{H}_3\text{BO}_3$ ; the  $\text{H}_3\text{BO}_3$  crystals are removed, and the mother liquor is heated to  $90-100^\circ$  for further use in a cyclic process with more borax and concd.  $\text{H}_2\text{SO}_4$ . Cf. C. A. 28, 2132.

Nitric acid. Harry Pauling. Ger. 593,440; Feb. 26, 1934 (Cl. 12i. 26). See Fr. 752,042 (C. A. 28, 802\*).

Nitric acid. Harry Pauling. Ger. 759,258, Jan. 31, 1934. The interior of reaction chambers for making  $\text{HNO}_3$  is provided with heat exchangers in the form of truncated cones made of good heat-conducting materials and mounted on hanging cables or chains.

Mixture of phosphoric and hydrochloric acids. F. G. Farbenind. A.-G. (Friedrich A. Henglein and Friedrich W. Stauff, inventors). Ger. 590,807, Jan. 11, 1934 (Cl. 12i. 31). The above mixt. is obtained by treating  $\text{PCl}_5$  with water in iron vessels. Cf. C. A. 28, 1477\*.

Phosphoric acid. Chemische Fabrik Budenheim A.-G. (Guido Hedrich, inventor). Ger. 593,370, Feb. 24, 1934 (Cl. 12i. 31). Crude  $\text{H}_3\text{PO}_4$  prepd. from crude phosphates and  $\text{H}_2\text{SO}_4$ , is freed from compds. of Fe, Cr and V, which color it green, by treatment first with an oxidizing agent and then with a ferrocyanide of Ba and (or) K in an amt. corresponding to the amts. of Fe, Cr and V. The oxidizing agent may be  $\text{PbO}_2$ ,  $\text{BaO}_2$  or  $\text{H}_2\text{O}_2$ , and the acid should be treated at a  $\text{P}_2\text{O}_5$  concn. of at least 25% and preferably at the b. p. After the pptd. compds. of Fe, etc., have been removed, the acid may be further purified, if necessary, by treatment with a compd. of Ba, e. g.,  $\text{Ba}(\text{OH})_2$  and (or) a compd. of K, e. g.,  $\text{K}_2\text{CO}_3$ , whereby  $\text{H}_2\text{SO}_4$  and  $\text{H}_2\text{SiF}_6$  are eliminated.

**Sulfuric and nitric acids.** Pierre Kachkaroﬀ and Camille Matignon. Brit. 402,529, Nov. 30, 1933. See Fr. 741,724 (C. A. 27, 2765).

**Sulfuric acid.** Harry Pauling. Fr. 758,147, Jan. 11, 1934. In a continuous process for concg. residual  $H_2SO_4$  wherein the high concn. takes place by the introduction of the acid into boiling concd.  $H_2SO_4$ , the steam which escapes from the dephlegmator of the vessel of high concn. serves to concentrate preliminarily the dil.  $H_2SO_4$  charged with impurities, and a part of the steam condensed during this operation is sent back to the dephlegmator. The  $H_2SO_4$  thus concd. is further concd. by the gases escaping from the high concn. heating before its introduction to the boiling acid, and the steam liberated in this 2nd step is returned to the preliminary concn. under vacuum after being united with the steam from the dephlegmator. An app. is described.

**Sulfuric acid.** Harry Pauling. Fr. 758,460, Jan. 18, 1934.  $H_2SO_4$  contg. oxides of N is denitrated in a column divided into 3 parts, with steam and air. The air is blown into the lower end of the lowest part of the column and passes in the form of a mixt. of air and steam in counter-current with the acid in the upper part, avoiding the central part, while undil. steam is introduced into the central part. The acid traverses the 3 parts of the column downwardly.

**Sulfuric acid.** René Moritz. Ger. 590,003, Jan. 15, 1934 (Cl. 12, 25). The construction of a Pb chamber for the prepn. of  $H_2SO_4$  is described.

**Alkali cyanides.** N. V. Stikstofbindingsindustrie "Nederland." Fr. 759,040, Jan. 27, 1934. See Ger. 588,823 (C. A. 28, 2132).

**Alkali sulfates.** Kali-Chemie A.-G. (Friedrich Rüsberg and Bruno Uchler, inventors). Ger. 590,633, Jan. 6, 1934 (Cl. 12, 5). Alkali sulfates and  $MgCO_3$  are prepd. by treating an aq. soln. of kieserite with  $(NH_4)_2CO_3$  or  $NH_4OH$  and  $CO_2$ . The ppt., which consists of the Mg part of the kieserite in the form of  $MgCO_3$ , is removed, leaving a soln. of  $(NH_4)_2SO_4$ . This is treated with solid alkali chloride and  $NH_4OH$  to give a ppt. of alkali sulfate.

**Converting alkali sulfates to hydroxides or carbonates.** Gyula Zorkóczy and Vilmos Weisz. Hung. 108,039, Jan. 15, 1934. Sulfates are reduced to sulfides and these decompd. by superheated steam or a mixt. of superheated steam and  $CO_2$ .

**Aluminates and hydrochloric acid.** Ivar Rennerfelt and Axel Sigurd Burman. Ger. 590,634, Jan. 10, 1934 (Cl. 12m. 5). Aluminiferous materials are treated with NaCl in the presence of C and  $SO_2$ . The raw material is dissolved in HCl to remove  $SiO_2$  and the resulting soln. evapd. App. is described.

**Aluminum salts.** J. R. Geigy S. a. Fr. 757,907, Jan. 8, 1934. Fe is removed from solns. of acid salts of Al by transforming the Fe to the ferrous state if necessary and treating the hot soln. with a slight excess of  $\beta$ -naphthalene-sulfonic acid or a sol. salt thereof and sepg. the ppt. in the cold by filtration.

**Alkaline earth nitrates.** Harry Pauling. Fr. 758,747, Jan. 22, 1934. See Ger. 588,274 (C. A. 28, 2133).

**Decomposing silicates.** Félix Jourdan. Brit. 402,977, Dec. 14, 1933. The silicate, e. g., 1 contg. Na, K or Li, and an aq. soln. of acid, e. g., HCl,  $HNO_3$ , are placed in the higher and lower parts, resp., of a closed container and the liquid is heated to produce a vapor which condenses over the silicate, the condensate with the dissolved substances falling into the soln. In an example leucite is extd. with  $HNO_3$ . Cf. C. A. 28, 2474.

**"Per compounds" such as percarbonates and peroxides.** Josef Müller. U. S. 1,950,320, March 6. A starting material capable of combining with  $H_2O_2$ , such as  $Na_2CO_3$ ,  $MgO$  or  $CaO$ , is treated with such a restricted quantity of an aq.  $H_2O_2$  soln. and in such a uniform manner that a moist mixt. is not even temporarily produced, and the water content of the product is still further reduced by careful drying before the liquid is fully bound. NaCl or  $MgCl_2$  and Na silicate or other stabilizers are used.

**Peroxide solutions.** H. Th. Böhm A.-G. Fr. 758,986, Jan. 26, 1934. See Brit. 403,035 (C. A. 28, 2923).

**Compounds of sesivalent chromium.** Bozel-Malétra (Société industrielle de produits chimiques). Ger. 590,662, Jan. 8, 1934 (Cl. 12m. 8). These compds. are prepd. by oxidizing  $Cr(OH)_3$ ,  $Cr_2O_3$  or materials contg. them at high temps. and pressure and in the presence of an alk. or alk. earth base. Thus,  $Cr_2O_3$  hydrate contg. 80% of the oxide is heated to 200–300° in an autoclave with O at 50–100° atm. in the presence of NaOH, to give  $Na_2Cr_2O_7$ .

**Molybdates, titanates, tungstates, vanadates and uranates.** Metallges. A.-G. and Max G. Freise. Brit. 403,025, Dec. 14, 1933.  $H_2O$ -sol. compds. of Mo, Ti, W, V and U are obtained by heating materials, contg. said metals, with an alkali metal compd., e. g.,  $Na_2CO_3$ , in a directly heated rotary-tube furnace. A reducing agent, e. g., coke, coal, may be added to the charge and easily reducible metals, e. g., Sn, Pb, Sb, may be reduced and sepd. and the remaining charge concd., adjacent to the reduction zone, in a pasty condition and fused shortly before leaving the furnace. Oxidic compds. of the alk. earth metals or similar substances that combine with or expel As and S may be added when these are present.

**Caustic potash and oxalic acid.** Rudolph Kuepp & Co. Chemische Fabrik A.-G. Fr. 759,316, Jan. 31, 1934.  $K_2SO_4$  is treated with an alk. earth formate to form  $HCOOK$  which is converted to K oxalate by heating and this changed to KOH and alk. earth oxalate. The KOH lye is sepd. and the oxalate treated with  $H_2SO_4$  to obtain oxalic acid.

**Alumina.** Jean C. Séailles. Fr. 759,012, Jan. 27, 1934.  $Al_2O_3$  is made by dilg. a Ca aluminate in water and pptg.  $Al(OH)_3$  or  $Al_2O_3$  and  $CaO$  by an appropriate reagent.

**Aluminum sulfate.** Merriam Chemical Co., Inc. Brit. 403,657, Dec. 27, 1933.  $Al_2(SO_4)_3$  is obtained by the reaction of sludge acid, resulting from the refining of oils with  $H_2SO_4$ , and calcined clay bodies which do not undergo substantial decrepitation under the conditions of the reaction. The acid should be dild. to 30–35% concn. before use, sepd. hydrocarbons being removed. The clay bodies may be molded and of various shapes and sizes. Extg. app. is described. The residue from the extn., after heating to about 700° in an oxidizing atm., consists of chemically active  $SiO_2$  and may be powd. and used for filling paper or filtering and clarifying oils. Cf. C. A. 28, 2475.

**Alum; aluminum sulfate.** Wm. B. Llewellyn and Peter Spence & Sons Ltd. Brit. 402,410, Nov. 20, 1933. Hot  $H_2SO_4$  is circulated through a mass of small pieces of uncalcined freshly mined and (or) unweathered coal-measure shales contg.  $Al_2O_3$  and  $K_2O$ , until the acid is neutralized to the required extent. As the digesting solns. approach neutrality they are maintained at sp. gr. 1.45–1.56 to prevent pptn. of basic salts contg. Al, Fe and K and to assist neutralization of the remaining acid. By sepg. the soln. while still somewhat acid and adding  $(NH_4)_2SO_4$  or  $K_2SO_4$ , alums are obtained. For the production of  $Al_2(SO_4)_3$  a fully neutralized soln. is dild. and cooled to sep. its K content as alum and the remaining soln. is concd. and cooled to crystallize  $Al_2(SO_4)_3$ .

**Ammonium sulfate.** W. C. Holmes & Co. Ltd. Ger. 593,312, Feb. 24, 1934 (Cl. 12, 7). See Brit. 356,283 (C. A. 26, 4422).

**Ammonium trinitrate.** Stockholms Superfosfat Fabriks Aktiebolag. Brit. 403,289, Dec. 21, 1933.  $NH_4NO_3$  is caused to react with a 90–99%  $HNO_3$  and the resulting soln. cooled to or below the m. p. of the  $NH_4$  trinitrate formed, i. e., 29°. The pptd. salt may be sepd. by centrifugal separators.

**Triammonium phosphate; potassium carbonate.** I. G. Farbenind. A.-G. (Robert Suchy and Rudolf Schulze, inventors). Ger. 593,371, Feb. 28, 1934 (Cl. 12, 7). A dil. soln. of a phosphate of K is satd. with  $NH_3$  in the presence of sufficient  $(NH_4)_2CO_3$  to convert all the K into  $K_2CO_3$ . A ppt. of  $(NH_4)_2PO_4$  and a soln. contg.  $K_2CO_3$  are obtained. A suitable starting material is a 23.4% soln. of  $K_2HPO_4$ .

**Barium oxide.** Kali Chemie A.-G. Ger. 590,874, Jan. 13, 1934 (Cl. 12m. 1). Highly porous  $BaO$  is

obtained by heating  $\text{BaCO}_3$  mixed with C in a current of dry inert gas,  $\text{CO}_2$  and oxidizing constituents.

Aqueous barium sulfate suspensions for x-ray purposes. Béla Moskovits. Hung. 108,618, March 1, 1934. Artificial or natural silicates (e. g., bentonite) or  $\text{SiO}_2$  gel, with or without such colloids as gum tragacanth, are used to hold  $\text{BaSO}_4$  in suspension for hrs.

**Beryllium fluoride.** Compagnie de produits chimiques et électrométallurgiques Alais, Fröges et Camargue. Fr. 757,932, Jan. 8, 1934. See Ger. 586,244 (C. A. 28, 588<sup>9</sup>).

**Calcium nitrate.** Otto Kippe and Klöckner-Werke A.-G. Ger. 590,855, Jan. 11, 1934 (Cl. 12m. 2).  $\text{Ca}(\text{NO}_3)_2$  is obtained, together with  $\text{MgO}$ , by treating burned dolomite with  $\text{HNO}_3$ . Examples are given.

**Calcium nitrate; magnesia.** Klöckner-Werke A.-G. Brit. 403,054, Dec. 14, 1933.  $\text{MgO}$ , poor in  $\text{CaO}$ , and a concd.  $\text{Ca}(\text{NO}_3)_2$  soln. are obtained by pptg. a soln. of dolomite in  $\text{HNO}_3$  by  $\text{CaO}$  or calcined dolomite in the presence of  $\text{NH}_3$  or an  $\text{NH}_4$  salt, e. g.,  $\text{NH}_4\text{NO}_3$ . The ammoniacal  $\text{Ca}(\text{NO}_3)_2$  soln. obtained may be evapd. to recover  $\text{NH}_3$  for re-use, and solid  $\text{Ca}(\text{NO}_3)_2$ , or neutralized with  $\text{HNO}_3$  to obtain a mixt. of  $\text{Ca}(\text{NO}_3)_2$  and  $\text{NH}_4\text{NO}_3$  for use as fertilizer.

**Dissolving cadmium with sulfuric acid in the presence of iron.** Harry P. Corson (to Grasselli Chemical Co.). U. S. 1,949,929, March 6. Cd is dissolved with boiling dil.  $\text{H}_2\text{SO}_4$  soln., the Fe serving to accelerate attack of the Cd by the acid.

**Copper and zinc sulfates from brass.** Harry P. Corson (to Grasselli Chemical Co.). U. S. 1,949,927, March 6. In effecting reaction of hot dil.  $\text{H}_2\text{SO}_4$  on brass, compressed air is introduced into the reaction mixt. and it is maintained at a temp. above  $100^\circ$ , in acid condition and under superatm. pressure.

**Copper sulfate from copper and its alloys such as brass.** Harry P. Corson (to Grasselli Chemical Co.). U. S. 1,949,928, March 6. The metal is reacted upon under superatm. pressure, while heated and in the presence of water, with a gas comprising  $\text{SO}_2$  and O.

**Sodium carbonate.** Electrochlore (Soc. anon.). Fr. 758,327, Jan. 15, 1934.  $\text{Na}_2\text{CO}_3$  is crystd. from a satd. soln. in a rotary crystallizer, water being evapd. by compressed air or the action of vacuum, or the soln. is cooled by flowing water on the outside of the crystallizer.

**Packing sodium hydroxide in cylindrical drums.** K. M. Goldberg. Russ. 31,809, Oct. 31, 1933. Disks are inserted in the drums at certain intervals. The molten  $\text{NaOH}$  is poured into the drum and is sepd. into cakes by the disk partitions.

**Sodium phosphate.** Chemische Werke vorm. H. & E. Albert (Hans Huber, inventor). Ger. 590,661, Jan. 8, 1934 (Cl. 12i. 31). Raw material contg. Al phosphate is heated with  $\text{Na}_2\text{CO}_3$  and water to  $500^\circ$  in an autoclave. The resulting Na Al phosphate mass is lixiviated with excess of  $\text{NaOH}$  to give the  $\text{Na}_3\text{PO}_4$  and Na aluminate which are sepd. by usual methods.

**Continuous manufacture of pure carbon dioxide and alkali hydroxides and (or) pure sulfur dioxide and salts of strong acids.** F. Leroy. Belg. 398,729, Oct. 31, 1933. Sulfites are produced from carbonates and gases with low  $\text{SO}_2$  content. The alkali sulfite is treated with lime, with formation of caustic alkali. The pptd.  $\text{CaSO}_3$  is sepd. by filtration and is either returned to the cycle of operations or is treated with  $\text{HNO}_3$  to produce  $\text{Ca}(\text{NO}_3)_2$  and pure  $\text{SO}_2$ .

**Purifying salt solutions.** Geza Austerweil and Charles Jeanprost. Brit. 402,770, Dec. 4, 1933; 402,953, Dec. 14, 1933. See Fr. 739,675 (C. A. 27, 2258).

**Preparing and purifying salt solutions.** Geza Austerweil and Charles Jeanprost. Brit. 403,077, Dec. 4, 1933. Divided on 402,770 (preceding abstr.). The prepn. of salt solgs. from solns. of 2 reacting salts is effected by use of a predetd. excess of a mass of mixed base exchangers contg. mobile cations corresponding to the cations of the reacting salts, the mass being so graded that it contains solely cations of 1 kind at 1 end and only cations of the other kind at the other end and the proportions of

each cation in intervening portions of the mass varying gradually. To effect reaction, relatively small and equiv. quantities of the 2 salt solns. are passed through the mass alternately and slowly in opposite directions (or the mass through the 2 solns., resp.). A pure soln. of a salt may be obtained from solns. contg. 2 salts by bringing the soln. first into contact with that part of the exchanger having the same proportion of cations as exists in the soln., the latter in its flow encountering progressively base exchangers contg. increasing quantities of cations of the salt that is to be produced pure. In 1 example  $\text{KNO}_3$  soln. is obtained by passing solns. of  $\text{Ca}(\text{NO}_3)_2$  and  $\text{KCl}$  alternately in opposite directions through a graded mixt. of Ca and K zeolites. Other examples are given.

**Metals from salts.** Tréfileries et Laminoirs du Havre. Brit. 403,469, Dec. 28, 1933. See Fr. 743,183 (C. A. 27, 3785).

**Oxygen.** Marcel Manen. It. 758,827, Jan. 24, 1934. O is obtained by decompn. of a mixt. contg.  $\text{KClO}_4$  40,  $\text{KClO}_3$  40,  $\text{Fe}_2\text{O}_3$  3, wood charcoal 2 and infusorial earth 15%.

**Carbon.** Georges Boname. Fr. 758,824, Jan. 24, 1934. C is formed by passing  $\text{CO}$ , under high pressure or not, upwards at a speed below the critical (about 5 cm. per sec. at  $400^\circ$ ) through the C deposited by wt. in the reaction vessel contg. a catalyst such as  $\text{Fe}_2\text{O}_3$ . The C accumulates in the app. and finally escapes when it meets a gaseous current having a speed sufficient to carry it toward the exit. An app. is described.

**Carbon black.** N. V. de Bataafsche Petroleum Maatschappij. Brit. 402,322, Nov. 30, 1933. See Fr. 754,767 (C. A. 28, 1483<sup>9</sup>).

**Galalith.** A. S. Ryahov. Russ. 31,610, Oct. 31, 1933. In the prepn. of galalith with soap as plasticizer an acid such as  $\text{HCl}$  is added to the formalin bath.

**Burner of the rotary type for burning elemental sulfur.** Glen H. Prantz (to Grasselli Chemical Co.). U. S. 1,949,933, March 6. The rotary drum of a S burner is provided with internal projecting spikes having a length at least one-eighth the diam. of the shell.

**Catalysts.** I. G. Farbenind. A.-G. Brit. 402,938, Dec. 14, 1933. A catalyst carrier, e. g., (1) carbonaceous materials such as brown coal, coke, active C, wood charcoal, coal and peat, or (2) mineral substances such as bauxite, Florida earth,  $\text{Al}_2\text{O}_3$ , bentonite, active  $\text{SiO}_2$ , burnt clay and magnesite, is treated with (gases supplying free) H, preferably at  $300-50^\circ$  and at least 20 atm., before it is provided with all of the catalytic substance, which may be metals of the 2nd-8th groups or oxides, hydroxides, sulfides, carbonates, halides or other compds. thereof. The catalysts thus prepd. are applicable to the destructive hydrogenation of carbonaceous materials, the conversion of hydrocarbons such as middle oil, benzene, etc., into non-knocking motor fuels, the removal, by hydrogenation, of O, S and N compds. from carbonaceous material, the conversion of O and S compds., e. g., phenols, into hydrocarbons, and the hydrogenation of unsatd. and aromatic hydrocarbons.

**Condensation products.** I. G. Farbenind. A.-G. Fr. 757,841, Jan. 5, 1934. Phenols or their derivs. are caused to react with unsatd. acids such as oleic acid in the presence of B fluoride. The products are either viscous oils or may be drawn into threads.

**Condensation products of phenols with aldehydes.** G. S. Petrov. Russ. 31,614, Oct. 31, 1933. The condensation is carried out in the presence of fillers.

**Condensation products of shale tars with aldehydes.** S. N. Ushakov and G. S. Brodskii. Russ. 31,613, Oct. 31, 1933. The condensation is carried out in the presence of an acidic or alk. catalyst, mainly with a gasoline-stripped fraction of Baltic shale-oil tar b.  $170-320^\circ$  or of the alkali ext. of this tar, whereby the condensation product is freed from hydrocarbons by washing, and the mixt. is dried together with fillers.

**Plastic composition.** Carl F. Prutton (to Dow Chemical Co.). U. S. 1,950,516, March 13. In making a plastic compn. which is suitable for molding, etc., methylene dichloride and Na phenate are caused to react together.

(suitably by heating to 100–90° for 6 hrs. in the presence of a catalyst such as  $(\text{NH}_4)_2\text{CO}_3$ ).

**Plastic compositions.** Dunlop Rubber Co. Ltd., Douglas F. Twiss and John A. Wilson. Brit. 403,142, Dec. 21, 1933. A compn. of 2 or more insol. plastics dispersed 1 within the other so that the product contains 3 or more phases successively enveloping one another, all the phases except the last being in dispersed condition, is made by dispersing 1 of the plastics in another as the continuous phase, dispersing the mixt. obtained in a 3rd plastic, which may be identical with the 1st, and repeating the operations to obtain the desired no. of phases. Examples of 3-phase compns., the innermost phases being placed 1st, are (1) casein (I), rubber, I, (2) urea- $\text{CH}_2\text{O}$ , I, urea- $\text{CH}_2\text{O}$ , (3) vulcanized rape oil, I, rubber, etc.

**Plastic compositions.** Helmut Fritz and Emil Glaser. Brit. 403,230, Dec. 21, 1933. See Fr. 752,452 (C. A. 28, 11547).

**Preparing plastic masses.** N. I. Artem'ev. Russ. 31,811, Oct. 31, 1933. In the prepn. of plastic masses with the application of yeast, the latter is treated in a dry condition with strong  $\text{H}_2\text{SO}_4$ , washed and dried.

**Plastic materials.** I. G. Farbenind. A.-G. Fr. 758,454, Jan. 18, 1934. Polyvinyl halides, the halogen content of which is above 1 but below 2 atoms for each vinyl group, are used with cellulose derivs., pigments, fillers, dyes, softeners, etc., in admixt. if desired with other substances of a high degree of polymerization.

**Hardening plastic compositions containing casein.** International Galath-Ges. Hoff & Co. (Henri Dumont, inventor). Ger. 593,224, Feb. 23, 1934 (Cl. 39b. 18). Addn. to 588,177 (C. A. 28, 14859). Alkali and alk. earth thiocyanates are used as hardening accelerators in the process of Ger. 588,177.

**Apparatus for making films of glue, casein, etc.** Stockholm Bannjolsfabriks Aktiebolaget. Fr. 757,892, Jan. 5, 1934 and 268,000, Jan. 8, 1934.

**Casein glue and polish.** A. S. Ryabov. Russ. 31,532, Oct. 31, 1933. A soln. of casein is prepd. in the usual manner and condensation products of formalin with an excess of  $\text{NH}_3$  are added.

**Adhesives.** Victor C. É. Le Gloahec. Fr. 758,768, Jan. 23, 1934. A transparent adhesive for cellulose sheets contains gelatin,  $\text{H}_2\text{O}$ ,  $\text{ZnCl}_2$  and water.

**Adhesive and coating composition suitable for use on paper, etc.** Louis L. Larson (to Grasselli Chemical Co.). U. S. 1,949,914, March 6. Na silicate and cupramino solus. are mixed together in specified proportions to form a water-resistant adhesive.

**Adhesive suitable for plywood manufacture.** George H. Osgood. U. S. 1,950,060, March 6. An adhesive is prepd. by reaction of a vegetable seed meal or flour such as that of soy beans with water,  $\text{NaOH}$ , lime,  $\text{Na}_2\text{CO}_3$ ,  $\text{Na}_2\text{PO}_4$ ,  $\text{CS}_2$  and a proportion of an aldehyde bisulfite compd. equal to about 0.5–5.0% of the meal or flour which improves the spreading properties of the product.

**Bonding composition.** Joseph Rogerson and Arderne, Scott, Thesen Ltd. Brit. 403,159, Dec. 21, 1933. A wheel for treating fiberboard or wood molding, etc., has abrasive material spread upon, or mixed with, bonding material comprising a mixt. of pptd. chalk 40–50,  $\text{ZnO}$  25–30,  $\text{MnO}_2$  10–15, dry casein 10–15 parts, to which is added Na silicate of 81°Tw. in sufficient amt. to form a cementing mass.

**Multi-colored thermoplastic materials.** Celluloid Corp. Brit. 402,974, Dec. 14, 1933. A no. of portions of the material is worked, in a series of stages, into a coherent mass under heat and pressure so as to distribute throughout the mass a coloring agent, contained in the surface of at least 1 of the portions and of different color than the bulk of the portion. Various plasticizers for the material may be used.

**Porous articles.** Siemens & Halske A.-G. Fr. 757,864, Jan. 5, 1934. Oxides of Al, Be, Cr, Mn, Zr, Mg or Hf are fused, ground, screened to a detd. size, made into a paste by the addn. of a mud, made with the same or a similar material, and activated by a dil. acid, until a friable mass is obtained. The articles are formed by

pressing and agglutinated at a temp. above 1000°. Fr. 757,995, Jan. 8, 1934. A dil. acid is added to the finely ground material and a concd. acid to the larger-grained material so that a uniform extn. of moisture, with a min. period of absorption in the molds, is obtained.

**Adsorption compositions.** "Maximine" Soc. anon. Ger. 593,328, Feb. 21, 1934 (Cl. 30i. 5.01). See Fr. 690,684 (C. A. 25, 1344).

**Coating composition.** Arthur M. Dunstone. Brit. 402,805, Dec. 14, 1933. See Australia 2921–31 (C. A. 27, 3791).

**Artificial sheets.** I. G. Farbenind. A.-G. Fr. 757,786, Jan. 4, 1934. The elec. charge on sheets and other collod products of a high degree of polymerization is diminished by utilizing as constituents either in or on the products, polymeric polycarboxylic acids or their salts, or mixed polymerization or condensation products which contain polymeric polycarboxylic acids or their salts, e. g., a mixed polymerization product of acrylic acid nitrile and Na acrylate in acetone and MeOH, or a mixed polymerization product of polyvinyl chloride and polyacrylic acid in  $\text{CH}_2\text{Cl}_2$ .

**Magnetic cores.** Vladimir J. Polydoroff (to Johnson Laboratories, Inc.). Brit. 403,368, Dec. 18, 1933. A magnetic core material for radio-frequency inductance coils and transformers comprises a compressed mass of finely divided magnetic material bound by an insulating binder, the particles being fine enough to pass through a 400-mesh sieve and insulated from one another by a solid insulating material in addn. to the binder. Thus powd. Fe, prepd. by heating powd. Fe oxides in  $\text{H}_2$  is mixed with China wood oil varnish or a soln. of PhOH resin in  $\text{Me}_2\text{CO}$ , dried in air and baked. The insulated particles are then mixed with an insulating binder, placed in molds heated to 100° and subjected to 5–25 tons per sq. in. pressure, being finally treated so as to harden the binding material.

**Material for magnetic sound records.** Jacques E. Languelin (to Radio Corp. of America). U. S. 1,949,840, March 6. A backing of non-magnetic material such as paper is provided with a layer of magnetic particles which during their application to the backing are subjected to the action of a magnetic field to give them a definite arrangement such as to constitute a sound record.

**Friction facing material for brake linings or the like.** Raymond J. Norton (to Bendix Brake Co.). U. S. 1,950,262, March 6. Thin sheets of fibrous material such as an asbestos material are each treated with a non-oilaceous lubricant such as graphite or talc and bonded with a resinoid such as a furfural-phenol resin.

**Luminous substances.** I. G. Farbenind. A.-G. Brit. 403,233, Dec. 21, 1933. See Ger. 590,256 (C. A. 28, 2738).

**Cleansing agents.** Ramón Kovira-Fábregas and Julio Morin-Ostheim. Fr. 758,188, Jan. 11, 1934. The formation of lumps is avoided and the rate of soln. is increased by mixing with powd. or granulated cleansing agents a product capable of provoking a liberation of gas, e. g., a carbonate or bicarbonate and tartaric acid.

**Cleaning silver articles.** Fritz Sturmthal. Ger. 599,473, Feb. 19, 1934 (Cl. 48a. 1.03). The articles are placed in an Al vessel contg. a soln. of  $\text{NaHCO}_3$ , soap and an alkali. A suitable soln. is prepd. by dissolving in 1 l. of water 10 g. of a mixt. contg.  $\text{NaHCO}_3$  92.5, soap 5 and glucose 2.5%.

**Polishing, impregnating, dressing and other compositions.** I. G. Farbenind. A.-G. Brit. 402,513, Dec. 7, 1933. The compns. comprise waxy polymerized ethers of vinyl alc. and aliphatic alcs. contg. at least 10 C atoms and solvents therefor. Waxes, oils, (synthetic) resins, glues, abrasives, coloring materials and emulsifying agents may be added. Among examples (1) a liquid polish for linoleum, leather or wood is prepd. by dissolving 40 parts of polymerized vinyl octodecyl ether in 60 of a benzine fraction boiling at 150–90° and adding 0.4 part of Sudan Orange R; (2) an impregnating liquid for waterproofing wood consists of 30 parts polymerized vinyl cetyl ether and 2 of mineral oil fraction of sp. gr. 0.899 dissolved in PhMe 68 parts.

**Polishing or grinding appliances.** Deutsche Carborundum-Werke G. m. b. H. Ger. 593,499, Mar. 1, 1934 (Cl. 80b. 11). Polishing or grinding appliances are made from a mixt. of an org. binder, e. g., a  $\text{PhOH}\cdot\text{CH}_2\text{O}$  condensation product, with a trivalent metal oxide, e. g.,  $\text{Al}_2\text{O}_3$ ,  $\text{Cr}_2\text{O}_3$ , or  $\text{Fe}_2\text{O}_3$ , which has been obtained by pptg. and calcining the corresponding hydroxide.

**Floor polish.** János Bárány. Hung. 108,265, Feb. 1, 1934. One part resin and 3 parts paraffin are melted and poured into gasoline (in the ratio 1:6).

**Pencil leads.** (Firm of) J. S. Staedtler (personally responsible partners, Rudolf Kreutzer, Walter Kreutzer and Karl Kreutzer). Brit. 402,959, Dec. 14, 1933. Addn. to 383,330 (C. A. 27, 3302). Leads prepd. according to 383,330 are colored by a coloring material which is sol. in the agent used for fixing the marks and are also preliminarily colored with a fat-sol. coloring material. The coloring material is preferably a Sudan dye, e. g., Sudan yellow, which is sol. in spirit used as the solvent for the fixing agent, e. g., shellac. The fixing agent is applied by means of 2 or 3 very thin coats so that the solvent evaporates before the dye can spread in the solvent beyond

the marks. The leads are preliminarily coated by soaking in a soln. of a fat-sol. dye, e. g., Sudan yellow, in a solvent which is a thin liquid at ordinary temp., e. g., spirit, benzine, and, after removal of the solvent, treated with the fatty mass according to 383,330.

**Closures for bottles, etc.** Crown Cork & Seal Co., Inc. Brit. 402,623, Dec. 7, 1933. A closure comprises a cap with retaining means thereon and a sealing gasket contg. rubber-like material, sufficient lubricating material, e. g., ceresin, to provide a non-adhesive anti-frictional sealing surface and a blooming agent, i. e., a substance which insures that the lubricating material shall exude to the surface of the gasket, e. g., stearic acid, metallic stearates. The rubber-like material consists of compns. contg. (synthetic) rubber or rubber substitutes, a filler, e. g., clay, a vulcanizing agent, e. g., S, and an org. accelerator, e. g., tetramethylthiuramdisulfide, being used. A pigment, e. g.,  $\text{Fe}_2\text{O}_3$ , may be included in the gasket compn.

**Evaporation of natural hot water solutions.** József Székely. Hung. 108,359, Feb. 1, 1934. The evapn. is facilitated by changing the air above the hot soln. Mech. details are given.

## 19 - GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. HARTON, C. H. KERR

**Progress of the glass industry in 1932.** Oscar Knapp. (*Glashtute* 63, 791-92 (1933); cf. C. A. 28, 1827).—A brief review is given of investigations on: (1) the cryst. structure of some glasses; (2) the rate of crystn. of devitrification products of potash-lead glasses; (3) volatility and steam pressure of soda-silica glasses; (4) the system lime-boric acid; (5) formation of silicates; (6) effect of boric acid on the devitrification of soda-lime glasses; (7) behavior of Mn-colored glasses toward reduction; (8) dependence of density and optical properties on the chem. compn.; (9) sp. gr. of glass as a function of temp.; (10) tensile strength of glass; (11) dielec. consts. of glasses and their relationship to chem. compn.; (12) thermal shock and mech. strength of machine-made bottles.

M. V. Kondoidy

**Effect of the anion of the raw material upon the properties of glass.** III. K. Nakanishi. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 64 5 (1934); cf. C. A. 26, 3888.—The comparative effects of sulfates, carbonates and S upon the durability of glass were investigated. Alkali sulfate gave a more durable glass than alkali carbonate of the same strength in alkali oxide. S increased the durability of glass contg. alkali. Glass made from sulfate or a S-contg. batch always contained sulfate. K. K.

**Producing glass from blast-furnace slag.** C. A. Basso. *Chem. Met. Eng.* 40, 309 (1933). Blast-furnace slag offers a cheap source of  $\text{CaO}$ ,  $\text{Al}_2\text{O}_3$  and  $\text{SiO}_2$  for glass-making and its sensible heat is available. Addnl.  $\text{SiO}_2$  may be added in the form of cheap building sand. Such glass will be green, brown or black owing to the presence of Fe. It has good thermal resistance and excellent resistance to corrosive agents. B. C. A.

**Significance of analysis for determining the flow of glass.** A. Thürmer. *Glashtute* 63, 768-70 (1934). Expts. showed that the components of glass always have a different effect on the melt and the flow of the batch pile into the working tank, since the migration velocity of sep. oxides varies; hence the homogenizing of the glass is due not only to the thermal flow but also to the motion of the glass components and their capability of diffusion. It follows that when the batch is altered, the chem. effects on the change of flow should be considered. Slowly diffusing oxides should be varied in smaller amts. than those diffusing rapidly in order that the obstruction of the flow shall not cause a concn. and lowering of the homogeneity of the glass. The change in the glass compn. has no significance with regard to the thermal glass flow.

M. V. Kondoidy

**The expansion characteristics of some common glasses and metals.** F. E. Burger. *Gen. Elec. Rev.* 37, 93-6

(1934).—The comparative thermal expansion characteristics of glasses and metals used in making seals are given in the form of curves for temps. between 0° and 600°. The app., procedure and method of measurement are described.

M. E. Droz

**Calculation of volumes for soda-boric oxide-silica glasses.** O. Knapp. *Keram. Rundschau* 40, 659-62, 673-5 (1932); cf. C. A. 27, 5162.

Q. G.

**The formation of cristobalite in octahedrons in devitrified glass.** M. Bellière. *Verre, silicates ind.* 5, 102-3 (1934).

Herbert S. Willson

**Stones in glass and devitrification.** Albert Granger. *Ceram. verrerie émaillerie* 2, 5-6 (1934); cf. C. A. 28, 1100°. Stones in glass can be easily identified by the polarizing microscope. Outer form alone does not show the nature of such stones, because mineral products of similar appearance may have different chem. compns. The origin, including probable temp. of formation, and characteristic properties of various types of stones are given, including quartz, tridymite, cristobalite, wollastonite, diopside, Na Ca silicate, sillimanite, corundum, nephelite and amorphous substances. *Ibid.* 53-4.—These stones are apparently of 3 types: stones of devitrification, resulting from crystn. of constituents of the glass; stones of compn., due to incomplete soln. of one of the constituents in the melt; glass; and refractory stones, resulting from the surface of the pots. Among stones of devitrification are tridymite, wollastonite, diopside and the Na Ca silicate. Location of the source of refractory stones can be detd. by size and nature of the crystals. Alice W. Epperson

**Chilled glass.** L. v. Reis. *Rev. belge ind. verrerie, céram., émail.* 4, 194-99; *Z. Ver. deut. Ing.* 77, 615-18 (1933). Rapid cooling in the crit. zone produces a glass with marked internal stresses. Such glass is distinguished from ordinary glass by its particular properties, such as (1) great resistance to flexion, (2) resistance to great deformations, (3) high resistance to temp. variation, (4) regularity in the distribution of internal stresses, (5) inalterability, (6) suitability as safety glass. Methods of mfg. chilled glass are described. M. V. Kondoidy

**Shrinkage of clays during drying.** J. W. Mellor. *Brit. Clayworker* 42, 302-8 (1934).—See C. A. 28, 1828°.

Robert F. Ferguson

**Popasnyanskii clay.** V. V. Goncharov and R. Kashtelyan. *Keram. i Steklo* 9, No. 10, 17-19 (1933).—The clay is high in  $\text{SiO}_2$  and in alkali and low in loss on ignition. The  $\text{SO}_2$  and  $\text{Fe}_2\text{O}_3$  contents are low. M. V. Kondoidy

**Effect of thermal insulation on the structure of Dinas brick.** P. I. Yudinson. *Keram. i Steklo* 9, No. 9, 21-4 (1933).—Dinas brick from an insulated crown had a high

mech. resistance and was of a lighter color, while the unisolated brick consisted of several zones easily crumbled. Chem. analysis showed little difference. M. V. K.

**Thixotropy in ceramics.** S. V. Lipskii. *Keram. i Steklo* 9, No. 10, 24-6 (1933).—A discussion of the theory and researches dealing with thixotropy and thixotropic phenomena in colloidal systems. M. V. Kondoidy

**Mullite, a new ceramic substance.** B. A. Khizh and S. I. Skoblina. *Keram. i Steklo* 9, No. 9, 24-6 (1933).—A series of expts., based on the assumption that the size of grain of the  $Al_2O_3$  and its shape have a great effect on the temp. of vitrification, were made on mixes consisting of (1)  $Al_2O_3$  (obtained from corundum) with kaolin in varying proportions and (2)  $Al_2O_3$  (natural corundum) and kaolin. In mixes (2) the porosity increased with the corundum content, while in mixes (1), the reverse was true up to 80%  $Al_2O_3$  and 20% kaolin. Products from the mullite mixes are vitrified and only a little inferior to products from the German "sinter corundum." M. V. Kondoidy

**Employing leucite, plagioclase and porphyry in ceramic products.** V. P. Popova. *Keram. i Steklo* 9, No. 10, 30-3 (1933).—Mixes contg. these materials were compared with those contg. K feldspar. All mixes had about the same shrinkage. Feldspar mixes sintered more rapidly than plagioclase mixes, but leucite mixes sintered sooner than feldspar mixes. The sintering of porphyry mixes was similar to that of mixes contg. feldspar. All mixes had about the same resistance to breaking and the same thermal resistance. The deformation of leucite mixes was greater than that of feldspar mixes, while it was lower in porphyry mixes fired to cones 11, 13 and 14. Leucite and porphyry bodies were yellowish or grayish depending on the atm. and firing temp.; plagioclase bodies were white. Leucite glazes had a lower fusing temp. than feldspar glazes. M. V. Kondoidy

**Employing waste products from the production of aluminum chloride from kaolin in the ceramic industry.** P. P. Hudnikov and M. Ya. Solomin. *Keram. i Steklo* 9, No. 9, 9 (1933).—The waste products composed of 88.96%  $SiO_2$  in a finely dispersed state, 12.14%  $Al_2O_3$  and traces of CaO were used in making faience. The mix was composed of kaolin 33.1, clay 30.2, waste products 31.7 and cullet 5%. The ware was fired to 1280°. Porosity of the body was 14.16%. The ware was then glazed and fired to 1220°. The glaze mix was:  $SiO_2$  13.2, feldspar 33.6, chalk 14.4,  $PbO$  18.4, borax 19.9, kaolin 1.5; the glaze consisted of: frit 82.60,  $SiO_2$  10.60 and kaolin 6.80. M. V. Kondoidy

**Ceramic insulating parts for electric resistance furnaces.** E. Albers. *Elektrowarme* 4, 25 9 (1931).—Ceramic bodies used in elec. furnaces are discussed. Formulas for detg. various properties are reviewed and data are given on phys. properties of corundum-contg. fireclay, coarse-grained fireclay with soapstone, fine-grained fireclay without soapstone and kaolin fireclay. M. Hartenheim

**Notes on the discussion of Viehhaber: Cracked cooking utensils.** A. Dietzel. *Emailwaren-Ind.* 11, 1 5 (1934).—Kaolin as an opacifier produces an enamel of poor quality. The enamel when fired dissolves large amts. of kaolin which do not opacify. During its soln., kaolin disintegrates and its ingredients form various compounds which change basically the properties of the enamel, especially its expansion. With  $SnO_2$  only a little is used for opacification and this does not greatly change the enamel properties. It is not the large amt. of undissolved kaolin that produces faulty enamels but the high soly. of kaolin in the enamel that brings about an abnormal change in the enamel compn. and probably produces an inhomogeneous enamel. M. V. Kondoidy

**Acid lining for melting of nonferrous metals in high-frequency furnaces.** I. A. Klyucharev and S. A. Lowenstein. *Feuerfest-Ofenbau* 9, 157-9 (1933).—A review (cf. *Ogneuporii* 1933, nos. 2 and 3). For replacing Eisenberg sand, various Russian materials were studied. Successful test bodies ( $200 \times 20 \times 40$  mm.) were made of mixes of quartz, glass, Luga sand and Chasov-Yar clay. The sand must be partly pulverized; a certain amt. of

coarse granular quartz improves thermal resistance and d.; the clay binder addn. should be 10-15%; and the addn. of glass is essential. A crucible of 400 kg. content was pressed from a mix of the following compn.: Clay (dried at 100°) 12, glass 15, pulverized sand (through 3000 mesh) 30, natural Luga sand (through 100 mesh) 33, quartz (100-400 mesh per sq. cm.) 10, moisture content 0.7%. The crucible was dried for 30 hrs. and used for the first melt after 5 hrs. Its behavior was satisfactory. B. J. C. van der Hoeven

**New process of making refractories.** Maurice Barrett. *Brit. Clayworker* 42, 164 5 (1933).—Non-plastic material is bonded with about 5% of a clay slip contg. electrolytes. Robert F. Ferguson

**New ceramics of pure, highly refractory oxides.** B. Rishkevich. *Elektrowarme* 4, 30 1 (1934).—The difficulties in using metal oxides with very high m. ps. due to their low plasticity and deformability are discussed. The advantages and disadvantages of  $Al_2O_3$ ,  $BeO$ ,  $ZrO_2$ ,  $MgO$ ,  $ThO_2$ ,  $ZrSiO_4$  and  $MgO \cdot Al_2O_3$  are considered. M. Hartenheim

**The softening temperature of ordinary silica-alumina refractory products.** M. Lepingle. *Verre et silicates ind.* 5, 64 8 (1934); cf. *C. A.* 28, 21431. —Products from 42 firms were examd. Herbert S. Willson

**Sand-clay refractories and their use in glass furnaces.** N. B. Romancha. *Keram. i Steklo* 9, No. 9, 10-19 (1933). Sand-clay refractories contain a mixt. of 35% raw refractory clay and 65% quartz sand. The softening temp. is 1720-50°. They can be used in place of  $SiO_2$  brick in furnace crowns. Their mech. strength is low. M. V. Kondoidy

**Poisonous action of enamel and of enameled ware.** R. Aldinger. *Glashutte* 63, 617 19 (1933); *Emailwaren-Ind.* 11, 7 (1934). M. V. Kondoidy

**Barium nitrate in the production of enamels and glazes.** Thoma Grote. *Glashutte* 63, 492 4, 507 8 (1933); *Emailwaren-Ind.* 11, 7 (1934).— $Ba(NO_3)_2$  replaces alkali nitrates as far as the action of the nitrate is concerned, with less attack upon the melting vessels. One part of  $KNaO$  can be replaced by  $BaO$  without decreasing fusibility; stable and better enamels of purer colors are obtained. Expts. were made with frits in which  $K_2CO_3$  was replaced by  $BaNO_3$ ; a part of the  $Pb_2O_3$  could be replaced also.  $BaCO_3$  did not yield sufficiently fusible frits. M. V. K.

**Boric glaze for faience of the Slavutskii Works.** A. Shtenberg. *Keram. i Steklo* 9, No. 9, 7 (1933).—A leadless glaze was developed: frit: borax 33.65, chalk 11.25, feldspar 2.5,  $SiO_2$  34.7,  $Na_2CO_3$  1.2; glaze: raw kaolin 6.5, fired kaolin 6.5, frit 87.0; compn. of the glaze:  $SiO_2$  57.34,  $Al_2O_3$  13.39,  $CaO$  8.35,  $MgO$  trace,  $B_2O_3$  10.16,  $Na_2O$  6.62,  $K_2O$  2.21. The Seger formula is:  $CaO$  0.529,  $Al_2O_3$  0.162,  $SiO_2$  3.372,  $Na_2O$  0.388,  $F$  0.004,  $B_2O_3$  0.511,  $K_2O$  0.083, acidity 3.01. M. V. Kondoidy

**Permeability of glass to ultra-violet radiations (Doetsch)**  
3. Ore deposits in the Tertiary of Sardinia [material for the manuf. of refractory and porcelain ware] (Pavan)  
8. Thermal treatment of hydrocarbons [in app. made by ceramic process] (Get. pat. 503,257) 10.

**Guimaraes, Feliciano:** Azulejos de figura avulsa. Gaa: Edições Patria. Reviewed in *Times Lit. Supp.* 32, 709 (1933).

**Glass.** Jenaer Glaswerke Schott & Gen. Fr. 754,029, 9 Oct. 30, 1933. A glass which is not attacked by metal vapors contains boric acid 10-40,  $Al_2O_3$  10-35% and bi-valent oxides the rest. The content of  $BaO$  is preferably at least 40%. The total of quadrivalent oxides, alkalis and oxides of Sb, As and Pb should not exceed 5%.  
**Apparatus for feeding mold charges of molten glass.** Wm. T. Barker, Jr. (to Hartford-Empire Co.). U. S. 1,950,339, March 6. Mech. features.

**Ladling device for a glass-making machine.** A. A.

Zaitzev. Russ. 31,588, Oct. 31, 1933. Construction details.

Apparatus for forming glassware such as bottles. Leonard D. Soubier and John E. Collins (to Owens-Ill. Glass Co.). U. S. 1,949,886, March 6. Mech. features.

Manufacture of blown glass articles such as lamp bulbs. Leonard D. Soubier (to Owens-Ill. Glass Co.). U. S. 1,949,887, March 6. Mech. features.

Apparatus for forming glass articles such as bottles. Joseph P. Benoit and Leonard D. Soubier (to Owens-Ill. Glass Co.). U. S. 1,949,894, March 6. Mech. features.

Apparatus for manufacture of glass articles such as bottles and jars. John E. Collins and John E. McLaughlin (to Owens-Ill. Glass Co.). U. S. 1,949,899, March 6. Mech. features.

Glassware. Ernest A. Hailwood. Brit. 402,874, Dec. 14, 1933. Globes for gasoline pumps, etc., are formed in 2 or more parts which are decorated on their inner surfaces and then welded together to form the complete globe. In a modification the colored decoration is applied to the backs of suitable glass panels which are welded onto the globe parts. Also, the decoration may be applied to the outer surface of the globe and a protective coating of glass applied thereover by a suitable device for spraying molten glass.

Apparatus for fire-finishing glass articles such as bottles. Richard A. Cosh (to Owens-Ill. Glass Co.). U. S. 1,949,901, March 6. Various mech. and operative details are described.

Glass-blowing apparatus for making electric bulbs. I. N. Gollenskii. Russ. 31,587, Oct. 31, 1933. Construction details.

Apparatus for drawing glass in sheets. Joseph S. Gregorius (to N. V. Hollandsche Maatschappij voor de Vervaardiging van Glas). Brit. 403,083, Dec. 14, 1933.

Sheet-glass-drawing apparatus, with a skinning bar partly immersed in the molten glass, arranged transversely between the melting and drawing tanks. Howard L. Halbach (to N. V. Hollandsche Maatschappij voor de Vervaardiging van Glas). Brit. 402,690, Dec. 7, 1933.

Apparatus and process for tempering plates or sheets of glass or steel or other metals. Leonardo Mosmieri. Brit. 403,438, Dec. 21, 1933.

Ornamenting glass. Ferguson Pailin Ltd., George Pailin and Arthur Francis. Brit. 402,626, Dec. 7, 1933. Imitation leaded lights are made by roughening 1 or both sides of a sheet of glass in the desired parts and projecting molten metal, e. g., Pb, onto the glass, the metal adhering only to the roughened parts. The deposited metal may be colored chemically or oxidized.

Glass plaques. Soc. anon. des manufactures des glaces et produits chimiques de St. Gobain, Chauny et Cirey. Brit. 402,644, Dec. 7, 1933. Glass elements, which may be set in concrete for paving lights, are made with convex and concave surfaces which merge into each other without angles. For tempering, air or fluid is circulated by extn. or blowing over the concave surface, after solidification, while the convex surface is exposed to the atm.

Surface-coloring vitreous articles. Games Slayter (to Owens-Ill. Glass Co.). U. S. 1,949,844, March 6. A cold hard surface such as that of a glass bottle or block is provided with a layer of coloring material such as a paste of pulverized colored glass and is subjected to heating to approx. an annealing temp. and localized heating of sufficient intensity to fuse the coloring material and integrate it with the surface.

Nonsplintering glass. I. G. Farbenind. A.-G. (Manfred Dunkel, Wilhelm Breuers and Walter Wolff, inventors). Ger. 593,465, Mar. 2, 1934 (Cl. 39b. 27). Hydrogenated rubber or a hydrogenation product of a polymerized butadiene hydrocarbon is formed into a layer between two glass sheets or is used to unite an intermediate layer of another material, e. g., cellulose acetate, to the glass.

Apparatus for making nonsplintering glass. Adolf Kämpfer and Adolf C. Plötze. Ger. 593,016, Feb. 20, 1934 (Cl. 39a. 17.50). Means is described for applying plastic compns. to glass disks.

Safety glass. C. F. Boehringer & Soehne G. m. b. H. Fr. 758,954, Jan. 26, 1934. The intermediate "layer" is composed of at least 3 distinct layers, the outer 2 of which consist of cellulose esters or ethers or their mixts., contg. 100% or more of jelling or plastifying agents, or of resins with an appropriate amt. of softening agents, while the 3rd layer consists of cellulose ester, ether or hydrate contg. a smaller amt. of jelling or plastifying agents. The sheets should be such that they do not affect one another in such a way as to modify their properties, e. g., by diffusion into one another.

Safety glass. Imperial Chemical Industries, Ltd. Fr. 758,994, Jan. 26, 1934. The intermediate layer is composed of wholly or partly polymerized vinyl acetate in which is incorporated 5-25% by wt. of camphor, with or without the addn. of other plastifiers and (or) solvents, provided that the total amt. of plastifier and (or) solvent, including camphor does not exceed 35% by wt. of the polyvinyl acetate.

Apparatus for cutting extruded clay into bricks. Gerald H. Major. Brit. 402,197, Nov. 30, 1933.

Process and apparatus for applying sand and (or) coloring matter to the surfaces of bricks. John A. Johnson and The Norbiton Potteries and Brickworks Ltd. Brit. 402,918, Dec. 14, 1933.

Kiln for burning clay. Emrik I. Lindman. Ger. 590,724, Jan. 11, 1934 (Cl. 80c. 5).

Ceramic mass. Adolf Schondorff. Ger. 590,924, Jan. 12, 1934 (Cl. 80b. 12.01). A ceramic mass consists of a mixt. of finely divided binding agent, flux, mineralized and atomized water.

Vitreous silica ware. Frederick L. Clark and Imperial Chemical Industries, Ltd. Brit. 402,400, Nov. 27, 1933. Vitreous  $\text{SiO}_2$  articles are made by shaping them by casting a mixt. of  $\text{SiO}_2$  and  $\text{H}_2\text{O}$ , the  $\phi$  of which lies between 1.1 and 11.5, in a suitable porous mold or by pressing or molding a compn. obtained by dewatering such a slip, drying and then heating the shaped body to vitrify the  $\text{SiO}_2$ .

Apparatus for molding thimbles for supporting plates, etc., during firing, insulators, etc. Gerard Brammer. Brit. 403,030, Dec. 14, 1933.

Spark plugs. Robert Bosch A.-G. Brit. 403,287, Dec. 21, 1933. The electrode is cemented in the insulator by a silicate cement the  $\text{H}_2\text{O}$  content of which combines, in setting, with the solid ingredient. A mixt. of water-glass soln. and hydrated silicic acid, the latter being powd. naturally occurring hydrated flint ( $\text{SiO}_2 + n\text{H}_2\text{O}$ ) to which powd. Si (compds.) may be added, may be used.

Smoke consumer for ceramic kilns. Firma Hermann T. Padelt. Ger. 590,725, Jan. 9, 1934 (Cl. 80c. 9).

Tunnel kiln for burning refractory brick, etc. Albert B. Agnew. U. S. 1,950,375, March 13.

Refractory compositions. General Ceramics Co. Brit. 402,588, Dec. 7, 1933. In the manuf. of refractory materials contg. a high proportion of mullite from  $\text{SiO}_2$  or Al silicates and added  $\text{Al}(\text{OH})_3$  or  $\text{Al}_2\text{O}_3$ , accelerators are used comprising aluminates and aluminosilicates, e. g., natural or artificial zeolites and ultramarines. The compn. is finely ground, molded and fired at Seger cones 14-40 for 2-30 hrs. Known mineralizers, e. g., if compds., sulfates, phosphates, Ce and Zr compds. and already burnt grog, may be used in addn. Examples of mixts. with details of fineness, firing time and temp. are given.

Refractory compositions. Victor M. Goldschmidt. Ger. 591,747, Jan. 26, 1934 (Cl. 80b. 8.08). Addn. to 583,194 (C. A. 28, 278<sup>a</sup>). The process of Ger. 583,194 is modified by using serpentine in place of talc. Various details are given.

Refractory compositions. Ture R. Haglund. Ger. 593,498, Mar. 2, 1934 (Cl. 80b. 8.17). Refractory products are obtained by fusing  $\text{MgO}$  with a spinel-forming oxide, e. g.,  $\text{Al}_2\text{O}_3$  or  $\text{Cr}_2\text{O}_3$ , and another oxide, e. g.,  $\text{SiO}_2$ ,  $\text{TiO}_2$ , or  $\text{CaO}$ , in such proportions that the solidified products contain more than 50% of crystd.  $\text{MgO}$  spinel and at least 8% of compds. of lower m. p. than the spinel, e. g., silicates, titanates or Ca aluminates. The proportion of  $\text{MgO} + \text{CaO}$  in the compds. of lower m. p. must be less

than 20% or more than 45%. A suitable initial mixt. contains  $MgO$  33,  $Al_2O_3$  61 and  $SiO_2$  6%. The fused mixt. may be cast into bricks, etc., which may be tempered by heating them for at least 5 hrs. to 1000–1500°.

**Refractory bricks.** Heinrich Koppers A.-G. Ger. 593,254, Feb. 23, 1934 (Cl. 80b. 8.18). Dry binding clay is mixed with granular refractory material, e. g., chamotte, which has been moistened with water contg. a dispersing agent for the clay. The mixt. is then molded and fired in known manner.

**Oxide coatings.** The British Refractories Research Association, Arnold T. Green and Francis H. Clews. Brit. 402,203, Nov. 30, 1933. A refractory layer is produced on a refractory backing by introducing into an air or O blast an element or elements which form a refractory oxide on oxidation and directing the flame upon the surface of the material to be coated.  $Al$ ,  $Si$ ,  $Ca$ ,  $Mg$  or alloys thereof are suitable. They may be used alone or in combination with a proportion of refractory, e. g., finely

ground fireclay, firebrick,  $SiO_2$  brick, ganister, chrome ore, chrome brick or magnesite brick. A preferred example  $Al$  25 and finely divided refractory 75%.

**Gas burner for drying and heating refractory linings in pipes.** Gutchoffnungskütte Oberhausen A.-G. Ger. 593,412, Feb. 26, 1934 (Cl. 80c. 17.01).

**Abrasive carbides.** Norton Co. Fr. 758,016, Jan. 9, 1934. An abrasive carbide of  $Si$  or  $B$  is made by treating a mixt. of the oxide and charcoal in an elec. resistance furnace, the charge of the furnace being provided with a cone of granular material composed, for the greater part, of abrasive carbide, through which core the current passes.

**Abrasive sheets.** Minnesota Mining & Manufacturing Co. Fr. 757,776, Jan. 4, 1931. The support is impregnated with a waterproofing compn. and coated with a compn. contg. nitrocellulose, vegetable oil and resin and a material increasing the friction, e. g., ground  $SiO_2$ .

**Enameling.** The O. Hommel Co. Ger. 590,651, Jan. 8, 1934 (Cl. 48c. 2.02).  $TiO_2$  enamels are described.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

**Super-cements.** Dialin. *Rev. matériaux construction trav. publics* 1934, 76-9.—A general discussion.

**Zinc phosphate cement.** Franz Halla and Artur Kutzelnigg. *Z. Stomatol.* 31, 177-81 (1933).— $ZnO$  and 89%  $H_3PO_4$  afford a product giving x-ray lines of  $Zn_3(PO_4)_2 \cdot 4H_2O$  (hopeite); free  $ZnO$  is also present.

**Refractory cements: practical tests.** W. O. Lake. *Sands, Clays and Minerals* 2, No. 1, 35-9 (1934).—A detailed account is given of expts. made with 6 various kinds of refractory cement to test their refractory values and to det. in a practical way the capacity of each cement to bind firebrick.

**Slag cement without clinker by the method of the Ukraine Institute of Silicates.** E. I. Orlov, V. A. Tereshchenko and A. S. Frenkel. State Sci. Research Inst. Concrete, Supreme Council Natl. Economy (U. S. S. R.) Pub. No. 9; *Bldg. Sci. Abstracts* 6, 300-1.—Products having properties satisfying the standard requirements for portland cement are obtainable by addns. of 2% Na silicate, 2% gypsum and 2%  $NaCl$ . Only basic slag with a small proportion of Bessemer pig iron slag should be used. Study was also made of methods of improving the properties of slag for cement manuf. by addns. of gypsum and  $CaCl_2$  before granulating, and on the effect of adding Na silicate,  $CaCl_2$  or  $NaCl$  and  $CaSO_4$  to portland blast-furnace cement during grinding. The cements obtained by the last method satisfy the standard requirements for portland cement. The proportions suggested are 15% portland cement clinker, 85% blast-furnace slag and 2% each of Na silicate,  $NaCl$  and  $CaSO_4$ .

**The addition of calcium chloride to lime-pozzuolana cements.** F. Ferrari. *Cemento armato* 30, No. 6, 53 5 (1933); *Bldg. Sci. Abstracts* 6, 373-4.—The rather slow setting time of mortars and concretes made with pozzuolanic cements is improved by the addn. of  $CaCl_2$ . With a view to detg. the optimum quantity for general use, F. carried out tests on mixes of standard neat cement, mortar and concrete with and without addns. of  $CaCl_2$ . The tests were carried out in 2 series: (1) by adding 1.3% and 1.1% (by weight of cement) of  $CaCl_2$  at the time of mixing the batch, and (2) by adding like quantities at the moment of grinding the cement. The constitution and fineness of the cements used, and curing conditions of the test pieces are stated, and the results of tests at 3, 7 and 28 days, 6 months, and 1 and 2 yrs. are tabulated. F. concludes that an improvement in both setting time and strength is obtained by the addn. of  $CaCl_2$ .

**Impregnated asbestos cement for chemical equipment.** M. Borodulin. *Bautenschutz* 4, 44 (1933); *Bldg. Sci. Abstracts* 6, 386.—For the baths and other app. used in the production of  $Cl$  a mixt. of 92% portland cement and

8% asbestos is used in the U. S. S. R. works. The molded objects are placed in a steam bath for 3 6 hrs., dried in air for 10 days and finally immersed for 8 20 hrs. in melted coal tar. Impregnation with coal tar and pitch did not increase mech. strength.  $Cl$  was least destructive on deeply impregnated specimens. The best results were obtained with specimens impregnated with a mixt. consisting of coal tar contg. 25-30% pitch. Mortar composed of 1 part cement to 1 1/2 parts sand crumbled after exposure to  $Cl$ . The addn. of 3% of asbestos to the sand mortar mix produced good results.

**Effect of different cooling conditions on the quality of cement clinker.** W. R. Chandler. *Rock Products* 37, No. 4, 46 8 (1934).—At the plant where these tests were made, spraying clinker with water tended to cause a false set not found in cement made from air-cooled clinker.

**Recent investigations on the shrinkage of cements and the means of diminishing it.** Edmond Marcotte. *Rev. matériaux construction trav. publics* 1934, 50 3, 84 7.—An app. for testing the expansion and contraction of reinforced concrete which makes use of the combination of solid rods cast within tubes is described. The exptl. results show that pressures as high as 6 kg./sq. mm. existed in the test pieces and that abundant wetting of beams, several months after setting, should be tried to decrease the stresses. This applied likewise to ordinary concrete. The shrinkage distribution over the length of beams is discussed. Test results on pure cement pastes and normal mortars are given, and it is shown that the shrinkage is a logarithmic function of the age of the test piece. Theoretical considerations are presented.

**Production of high-silica cement by Santa Cruz Portland Cement Company.** Robert A. Kinzie, Jr. *Am. Inst. Mining Met. Engrs. Contribution* No. 67, 10 pp. (1934).—Portland cement clinker is ground with a properly calcined mixt. of siliceous material which reacts with the lime as it is liberated by hydration. The resulting high- $SiO_2$  cement has all the utility of portland cement, together with an increased resistance to the destructive action of many solns. Heat of hydration is reduced.

**Developing formulas for determining the "correct" lime content of cement.** Hans Kuhl. *Pit and Quarry* 25, No. 7, 36 43 (1933).—K. reviews various formulas expressing the relationship between  $CaO$ ,  $SiO_2$ ,  $Al_2O_3$  and  $Fe_2O_3$  in good cement, and develops the formula that  $CaO(max.) = 2.8 SiO_2 + 1.1 Al_2O_3 + 0.7 Fe_2O_3$ , regardless of the proportions of these in a cement. K. develops his formula using systems (1) free from  $Fe_2O_3$ , (2) with  $Fe_2O_3$  within range of normal portland cements, (3)  $Al_2O_3$  and  $Fe_2O_3$  in equiv. amts. and  $Fe_2O_3$  greater than  $Al_2O_3$ . A cement plant should aim to have  $100 CaO / (2.8 SiO_2 + 1.1 Al_2O_3 +$

(0.7 Fe<sub>2</sub>O<sub>3</sub>) = 100. If less, prepn. or burning process should be improved; if more, the product is approaching unsoundness.

Alden H. Emery

The reaction between high-alumina cement and water. G. Assarsson. *Sveriges Geol. undersökning*, Ser. C, No. 379. *Untersuchungen Zement* 1933, 22-60; *Bldg. Sci. Abstracts* 6, 374; cf. C. A. 27, 3578.—The hydration of com. cements depends upon 2 series of reactions. One, the primary, is based upon the soln. of the Ca aluminates and the subsequent decompn. of the solu. by crystn. and hydrolysis. The other consists in a slow soln. of the small quantities of alkalis which occur in the cement. This secondary reaction depends to a marked extent upon the quantity of water present; it is very conspicuous with the small quantities of water used in practice, but, with large quantities, this reaction is indistinguishable from the primary reaction. The changes in lime concn. show no discontinuity and are solely governed by the quantity of mixing water. If this is increased, the Al<sub>2</sub>O<sub>3</sub> concn. diminishes and the lime concn. increases. The mol. ratio Al<sub>2</sub>O<sub>3</sub>:CaO is about unity during the 1st hrs. of the reaction and thereafter decreases steadily if the quantity of mixing water is not too great. Very large quantities of water produce a steady rise in the mol. ratio of the solns. With normal quantities of mixing water, the hydration product is a gel formed by the hydration of the anhydrous monocalcium aluminate, a monoaluminate gel (CaO·Al<sub>2</sub>O<sub>3</sub>·10H<sub>2</sub>O), and dicalcium aluminate (2CaO·Al<sub>2</sub>O<sub>3</sub>·8H<sub>2</sub>O). Pentacalcium aluminate (5CaO·Al<sub>2</sub>O<sub>3</sub>·34H<sub>2</sub>O) and sulfoaluminates of various SO<sub>3</sub> content can occasionally be observed. With large quantities of water, Al(OH)<sub>3</sub>, tricalcium aluminate (3CaO·Al<sub>2</sub>O<sub>3</sub>·12.5H<sub>2</sub>O) and 2 other hexagonal aluminates are also found; the last 2 can be distinguished by their *ns*. When the pure aluminates present in the clinker are gaged with water, solns. are obtained in which the changes in concn. correspond to the primary concn. curve of the cements, but the mol. ratio Al<sub>2</sub>O<sub>3</sub>:CaO is very nearly unity if the amt. of water is not too great. When the pure clinker components are hydrated, the principle constituents of the hydrated cement are found. When mixts. of portland and high-alumina cements are gaged, films of liquid which crystallize and coagulate rapidly are formed about the clinker particles and these are indicated by a certain field in the crystn. diagrams of the Ca aluminate solns. In this connection the hydration of portland cement is discussed. The small quantities of alkali in the clinker are only gradually dissolved by the mixing water during the process of hydration. When small quantities of water are used, the alkali content can become so great during the first 3 hrs. that its significance must be taken into account in the interpretation of the results. If only the Al<sub>2</sub>O<sub>3</sub> and CaO contents are considered, the solns. are represented by a region of instability in the crystn. diagrams Al<sub>2</sub>O<sub>3</sub>:CaO:H<sub>2</sub>O. The final solns. must be looked upon as mixed Ca and alkali aluminate solns. The gels obtained from the cements and from the calcium aluminate were examd. by the x-ray method. Three stages of gel formation were observed. The first is a gel that can be observed during the 1st hr., particularly in the hydration of the anhydrous monoaluminate. The 2nd is the hydrated monoaluminate gel CaO·Al<sub>2</sub>O<sub>3</sub>·10H<sub>2</sub>O, while the 3rd is characterized by the formation of Al(OH)<sub>3</sub>. The gel in the 1st stage is of the greatest importance in the set cement. It is not only quantitatively the predominant product of hydration but probably also responsible for the aging (hardening) of the cement.

G. G.

Strength tests of cements require changes in methods. E. W. Reed-Lewis. *Concrete (Mill Section)* 41, No. 8, 26-9(1933).—The use of a graded sand mortar of plastic consistency is recommended for both tensile and compressive tests.

Raymond Wilson

The particle analysis of cement and gypsum by sedimentation. Wallace C. Riddell. *Rock Products* 36, No. 10, 30-1(1933).—A simple app. is described. The time required for a 25-micron sepn. is about 90 min. R. W.

Viscosity of cement slurry. Katsuzo Koyanagi. *Rock Products* 36, No. 12, 30-3(1933).—Tests of viscosity of a

slurry made from limestone and a shaly clay were made in a viscometer which discharged 200 ml. water in 16 sec. The relation between water content and viscosity is expressed by a hyperbola. Temp. has little effect on viscosity. Viscosity is decreased by storage, and by increases in CaCO<sub>3</sub> content, and increased by increased fineness.

Raymond Wilson

Problems encountered in application of filters for cement slurry. C. H. Sonntag. *Pit and Quarry* 26, No. 3, 31-6, 40(1933).

Alden H. Emery

Cementos Rezola plant in Northern Spain fully rebuilt and modernized. Anon. *Pit and Quarry* 26, No. 1, 28-31, 36(1933).—The plant is described and analyses of raw materials and product are given. A. H. Emery

The collapse of the bridge over the Oder near Gartz. P. Moll. *Bautenschule* 4, 35-7(1933); *Bldg. Sci. Abstracts* 6, 458.—M. attributes the failure of the pier to the presence of bicarbonate of Fe in the river. If the water at that time contained a normal quantity of CO<sub>2</sub>, Fe(OH)<sub>3</sub> would be formed and sufficient CO<sub>2</sub> released to combine with a considerable quantity of Ca(OH)<sub>2</sub> and thus prevent the normal setting of the cement. In support of this view M. points out the high CO<sub>2</sub> content shown by analysis of the concrete of the pier, the low O content of the water for a time, the fact that the vel. of the river for a few days during concreting was increased partly by drainage from neighboring fields, and that the water at that time was observed to be brown. (See also G. Haegermann, *Zement* 19, 494-7, 517-21(1930).)

G. G.

A rational expression for fineness of portland cement. E. W. Reed-Lewis. *Concrete (Mill Section)* 41, No. 3, 11-12(1933).—The "coefficient of effective fineness," a function of size distribution akin to specific surface, is recommended.

Raymond Wilson

The clays of portland cement. V. The "technical burning of tuff. Yoshiaki Sanada. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 62(1934); cf. C. A. 28, 1833.—Exptl. data on the ratio of coal shale (fuel) to tuff, on kiln output, and conditions of burning show that the best proportion of coal shale to tuff is 1:4. VI. Effect of burning degree of tuff upon burning and quality of cement. *Ibid.* 62-4. Five different tuff burns, varying in degree, were used to prep. raw mixes with limestone and Cu slag. The proportions, hydraulic modulus and fineness of the mixes are reported. Cements made from these mixes showed that well-burned tuff gave a good product. Exptl. data are reported on oil consumption, condition of burned cement, clinker output, compn. and properties, fineness, sp. gr., setting time, soundness and strength of cement.

Karl Kantermeyer

The [portland-cement] clinker minerals and their formation. Lennart Försen. *Angew. Chem.* 47, 162-6(1934).—The following explanation of the mechanism of cement burning is presented based upon available literature data and addnl. exptl. results: In the melt of CaO-silicates, -aluminates and -alumina ferrites, together with alkalis, Mg, etc., solu. takes place of CaO and siliceous material, or β-2CaO·SiO<sub>2</sub> formed in solid phase, with subsequent crystn. of 3 CaO·SiO<sub>2</sub> and α-2CaO·SiO<sub>2</sub>. The highest lime limit corresponds to 8CaO·SiO<sub>2</sub> and residual melt, without any free CaO. 2CaO·SiO<sub>2</sub> is formed in such a degree as is necessitated by the lack of CaO for the 3:1 ratio. The usual calcn. of the clinker components according to Bogue, which is based upon the assumption of equil. conditions is, therefore, not valid for the tech. portland-cement clinker. A correct mineralogical compn. of the various kinds of clinker can only be established by an investigation of the individual residual melt, without free CaO, which is characteristic of each raw material, and by a microscopic mineral analysis. Fifteen references.

Karl Kantermeyer

The changes that occur during the burning of portland cement. Wm. N. Lacey. *Pit and Quarry* 26, No. 1, 37-8, 40(1933).—The moisture in the raw mix was driven off rapidly near the upper end of the kiln. CO<sub>2</sub> evolution is appreciable in the early stages. CaCO<sub>3</sub> was decompd. at locations in the kiln where the av. temp. of the charge

would be expected to be below that at which such decomposition would occur at an appreciable rate, probably because of local overheating. Undecomposed  $\text{CaCO}_3$  persisted to within 20 ft. of the lower end of the kiln. Production of free lime began slowly at the upper end of the kiln, soon became rapid and a rather large percentage accumulated in the charge, in spite of rapidly increasing recombination reactions. About 25 ft. from the lower end of the kiln the reactions became very rapid and over 40% of the total lime in the charge reacted while travelling 5 ft.

Alden H. Emery

**A practical heat balance for studying problems of cement kilns.** A. W. Robinson. *Pit and Quarry* 26, No. 1, 41-4 (1933).—A heat balance is calcd. for a wet-process 240-ft. kiln, without waste-heat boilers, with limestone-clay as raw material, and coal as fuel, and the effect of several operating variables is studied.

Alden H. Emery

**Cement theory and concrete technic.** Interaction of water and cement in concrete. S. Gieritz-Hedström. *Betong* 1932, 213-19; *Bldg. Sci. Abstracts* 6, 160.—As a result of the reaction with water, cement becomes more or less completely hydrated, part of the water is chemically combined, part is adsorbed and part held in the capillaries, while water contained in the coarser pores may be regarded as free. The strength of the concrete is due to the gradual formation of a framework, the constituents of which—the new compds.—adhere to each other and to the aggregate, and also to the presence of adsorbed water. When concrete is satd., the pores are filled with water; the capillary water does not influence strength. When concrete is exposed to drying some of the pores become filled with air and the surface tension of the water acts as a cohesive force between the constituents where water is held by capillarity and has surfaces exposed to the air. Drying restricts the reaction between cement and water, the air-filled pores preventing the available water from reaching the cement. Freezing of the water in concrete also checks chem. reaction; the effect of temp. of  $-5^\circ$  to  $-10^\circ$  is approx. the same as drying out in air of 70 to 50% relative humidity. Diagrams show the volumetric proportions of aggregate, cement, water and air in the fresh concrete mix and in hardened concrete and the probable change in the vol. and distribution of the water—as free, combined, adsorbed and capillary—with increasing drying.

G. G.

**Vibrated concrete.** A. M. Bouillon. *Ing. New-Record* 112, 330 (1934).—A brief discussion of conditions under which vibration should and should not be employed.

R. E. Thompson

**The development of heat in concrete during hardening.** D. Wernick. *Detong* 1933, 1-9; *Bldg. Sci. Abstracts* 6, 123.—The max. possible rise in temp. due to the chem. reactions taking place during the hardening of concrete can be calcd. if the chem. compn. of the cement is known. Tables show the heat developed during different periods of time by the tricalcium aluminate, tricalcium silicate, brownmillerite and dicalcium silicate, which form the principal components of portland cement clinker, the heat developed or absorbed by the  $\text{Al}_2\text{O}_3$  as detd. by chem. analysis of the clinker, and also a nomogram for calcd. the max. rise in temp. in concrete for different mixing ratios and water/cement ratios, when the heat developed by the cement is known. This nomogram is based on the equation  $t_{\text{max}} = w(0.183 + r + 0.20n)$  in which  $w$  is the heat developed per kg. of cement measured in kg.-cal., 0.183 is the sp. heat of the cement,  $r$  the water/cement ratio, 0.20 the sp. heat of the sand and stone aggregate, and  $n$  the no. of parts by wt. of aggregate to one part of cement.

G. G.

**Decay and repair of concrete and masonry dams.** B. Hellström. *Structural Engr.* 11, 210-28 (1933).— $\text{H}_2\text{O}$  percolating through dams causes disintegration 1st through leaching out of free  $\text{Ca}(\text{OH})_2$ , then by breaking down of hydrated Ca compds. The effect becomes more serious as the  $p_{\text{H}}$  of the  $\text{H}_2\text{O}$  decreases. For repair the best method is considered to be the application of a sheet of a 1:1 cement-sand mortar covering the whole upstream face.

B. C. A.

**Effect on the strength of lime mortar of the addition of**

**molasses.** J. A. Swezey. *Hawaiian Planters' Rec.* 37, 113-21 (1933).—Addn. of 6% of sugar increased the compressive strength of lime mortar by 165%; up to 24% of molasses also increased the compressive strength, the greatest increase (206%) being obtained with 6% of molasses. As compared with sugar, the addn. of the same amt. of molasses produced a less fluid mix and higher compressive strength and gave a mortar which set with few, if any, checks or cracks. Although the strength tests at 6 and 9 months of age were inconclusive they indicated that aging probably will not overcome the harmful effects of insufficient curing of the lime putty. Although the strength of the mortar decreased with increase in its thickness or height, molasses was more effective than sugar in increasing the strength in samples of large thickness.

K. D. Jacob

**Bag lime.** E. Suenson. *Tonind.-Ztg.* 58, 47-50, 62-5 (1934).—As an ingredient for mortar, bag lime ( $\text{CaO}$  air-slaked and finely powd.) was compared with lump lime over 0.5 yr. old. Test blocks ( $2 \times 2 \times 12$  cm.) were made with 8% lime and 92% sea sand. They were aged (a) exposed to the lab. air, (b) same as a plus immersion in  $\text{H}_2\text{O}$  for 10 min. once a week, (c) in an atm. satd. with  $\text{H}_2\text{O}$ . In all samples, the d. after 91 days was the same, 1.87 g./cc.; hardening was complete for a blocks after 4 weeks; for b blocks it was much slower but greater; for c samples it was not appreciable the first month, then very rapid and greatest. Mortars contg. bag lime require less  $\text{H}_2\text{O}$  to give the same fluidity, give 2.1% smaller vol., harden more rapidly and produce a stronger product.

B. A. Soule

**Experiments with stone preservatives.** A. Stois. *Bautenschutz* 4, 1-10 (1933); *Bldg. Sci. Abstracts* 6, 147-8.—The efficiency of stone preservatives was investigated by detn. of the tensile strength of treated stone specimens as an indication of degree of weathering. A stone rich in lime and one contg. no lime were examd. In the case of dense sandstone, such as Abbach stone, pure linseed oil may cause severe damage if carelessly used, as a result of swelling of the oil film in the stone. On coarse-pored, rough sandstone swelling of the oil film has less effect, if any. Abbach sandstone impregnated with linseed oil emulsion did not crack. Cracking was reduced or prevented also when specimens treated with pure linseed oil were given a coating of paraffin. Specimens treated with fluosilicate showed no increase of strength after 13 months, but no harmful effect was observed. Treatment with linseed oil preceded by treatment with fluosilicate gave the same results as linseed oil alone. Cracking was not observed as a result of impregnation with linseed oil stand oil ext., because of the much lower hydrophilic properties of the film compared with those of the linseed oil film. Reduction of tensile strength was, however, observed; as with linseed oil, the stone surface is, apparently, rendered so dense that even a slight change of volume could have a harmful effect on strength. The effect of the atm. on small specimens is very much greater than on large specimens or masonry.

G. G.

**Decay of building stones by soot.** R. Warnes. *Sands, Clays and Minerals* 2, No. 1, 17-18 (1934).—Soot is a contributory cause of the decay of stone; it is due to the presence of  $(\text{NH}_4)_2\text{SO}_4$ ,  $\text{NH}_4\text{Cl}$  and free  $\text{H}_2\text{SO}_4$ . The formation of  $\text{CaSO}_4$  from the  $\text{CaCO}_3$  of limestones and certain sandstones and also of mortars is one of the chief causes of decay, and this very detrimental substance is the result of the action on the  $\text{CaCO}_3$  of stones of not only  $\text{H}_2\text{SO}_4$ , but of  $(\text{NH}_4)_2\text{SO}_4$  in the presence of moisture. Soot when in thick masses holds water tenaciously and will keep the surface of the stone in a moist condition. The presence of moisture materially assists chem. reactions between the various substances contained in the soot and the  $\text{CaCO}_3$  of the stone.

M. V. Kondoidy

**The use of unfired clay as building material.** A. A. Bryushkov. Russo-German Soc. for Culture and Technology. *Trans. Gen. Conf. Standardisation and Manuf. New Bldg. Materials, Moscow* 1932, Feb. 8-15, 56-8; *Bldg. Sci. Abstracts* 6, 112-13.—Various methods have been suggested for modifying the properties of clay so as

to render it suitable for use as building material without firing. In B's "alginization" process, a gel obtained from alk. solns. of carbohydrates of seaweed is introduced into the clay; peptization of the clay colloids takes place and, in course of time, the formation of insol. alginates increases the resistance of the clay to the action of water. Waterproofing clay by treatment with  $H_2SO_4$  (cf. Shvetsov and Elshankin, C. A. 23, 1233; Grigor'ev and Galkin, C. A. 23, 1233) is not applicable to clay containing Ca and Mg salts; in addn., the  $H_2SO_4$  of "Keramolit" has a harmful effect on material contg. vegetable fibers. Other suggestions involve the introduction of Sorel cement, Fe sulfate and bitumen, lime, etc., into the clay. Lime and bitumen admixts. absorb up to 25% water and lack adequate resistance to frost. Clay of the type of "calined clay" but of low water absorption (up to 4%) and requiring considerably less lime and bitumen can be produced by slaking the lime with an aq. emulsion of bitumen. The compressive strength of this product is considerably higher than that required for lime plastering mortar, and its use instead of lime plaster for clay walls is suggested. In general, hydraulic properties were clearly evident in most clays tested on addn. of 10% of a hydraulic substance; CaO must also be added if not present in the admixt. Clay contg. 5% admixt. of lime and 10% of tripoli showed compressive strength at 28 days of 35 kg./sq. cm. (498 lb./sq. in.), and 53-61 kg./sq. cm. (753-867 lb./sq. in.) after curing in steam for 8 hrs. at atm. pressure. G. G.

Sands for building purposes. C. J. Morreau. *Sands, Clays and Minerals* 2, No. 1, 47-54 (1934).—The properties required from sand employed in concrete and cement mixes and in plastering are discussed. M. V. Kondoidy

Heating with producer gas in the building-material industry. Joseph Deforge. *Rev. matériaux construction trav. publics* 1934, 19 20, 46-9, 79-83.—A general discussion.

Karl Kammermeyer

The protection of buildings against the chemical and physical action of water. O. Graf. *Vedag Jahrb.* 1933, 18-28; *Bldg. Sci. Abstracts* 6, 137.—Various forms of staining, weathering and decay are illustrated in a no. of photographs of actual structures, and in each case the cause is discussed and suggestions are made as to methods of prevention or cure. G. G.

Bitumens and their use for the protection of buildings. C. R. Platzmann. *Bautenschutz* 4, 31 5 (1933); *Bldg. Sci. Abstracts* 6, 168.—For protection against the action of water and other deleterious agents bitumen and asphalt products possess certain advantages including the possibility of cold application, high degree of resistance to acid and salt solns., stability within a wide temp. range, impermeability to water and durability. The constitution and properties are briefly described of different types of bituminous coatings, such as fluid paints for protection of iron, concrete, etc., and material of thicker consistence for upkeep of impregnated paper roofing, for corrugated iron roofs, for insulation of concrete roofs and balconies, etc., and also of colored paints of this type. Cf. *Bautenschutz* 2, 100-4 (1931). G. G.

Wood preservation in buildings. K. O. Müller. *Bautenschutz* 4, 20-4 (1933); *Bldg. Sci. Abstracts* 6, 167.—Methods of detg. the value of wood preservatives include tests of the following properties: strength of fungicidal action, by observing the behavior of treated specimens of wood inoculated with dry rot; diffusion or depth of penetration in wood, observed by color reactions in cross sections; durability of the preservative, fixing on the wood fibers, leaching out or evapn., detd. by accelerated tests of behavior under various conditions by spraying with water, exposure to temp. variations and currents of air. The use and cost of Wolman salts for preservative treatment of wood are also considered. G. G.

Increasing the durability of wood. F. Moll. Russo-German Soc. for Culture and Technology. *Trans. Gen. Conf. 'Standardisation and Manuf. New Bldg. Materials, Moscow 1932, Feb. 8-15, 13-16; Bldg. Sci. Abstracts* 6, 128; cf. C. A. 27, 2553.—A review. G. G.

The protection of wood from fire by impregnation and painting. S. G. Vedenkin. Russo-German Soc. for

Culture and Technology. *Trans. Gen. Conf. Standardisation and Manuf. New Bldg. Materials, Moscow 1932, Feb. 8-15, 17-19; Bldg. Sci. Abstracts* 6, 129.—A brief description is given of fire-resistance tests of specimens of wood impregnated with various salts. Chlorides and sulfates of Na, Ca and Mg do not produce satisfactory resistance to fire. Borax and alum give better results but, because of their low soly., cannot be introduced into the wood in sufficient quantity. Ammonium salts give the best results. Theoretically, the best fireproofing agents are those which are easily decompd. at high temps. liberating noninflammable gases which drive atm. Q out of the wood, or those which fuse at high temps., coating the wood with a protective skin which prevents the penetration of O. The antiseptic properties of a no. of fireproofing salts were also studied. Phosphates,  $MgCl_2$  and, to a smaller degree,  $(NH_4)_2SO_4$  favor the development of fungi.  $NH_4Cl$  and borax gave satisfactorily toxic results, but require to be used with phosphates to prevent corrosion.  $ZnCl_2$  gives very good results, but renders wood hygroscopic and causes corrosion of metal. NaF (1%) protects wood from fungoid growths. As regards the effect of fireproofing on mech. strength, tests of impregnated specimens showed an av. loss of strength from 5 to 10%. G. G.

Utilization of waste materials obtained in the manuf. of  $Al_2O_3$  from kaolin [in manuf. of cement] (Budnikov) 18. Ca aluminate hydrates and their double salts [relation to setting of cement] (Mylius) 6.

British Standard Specifications No. 510: Single-Coat Asphalt (Cold Process). No. 511: Two-Coat Asphalt (Cold Process). London: Brit. Standards Inst.

Cement. Jenny Pohl geb. Hahn. Ger. 590,566, Jan. 5, 1934 (Cl. 80b. 3.12). Cement and like materials are heated to sintering temp. in a furnace and the hot product crushed; e. g., by rolling.

Cement. Metallgesellschaft A.-G., Fr. 758,528, Jan. 18, 1934. Portland and aluminous cement are made on a fixed or moving grating by the combustion of fuel mixed with the charge and air blown through the grating, the charge being composed of fresh fine material (1 part) and material returned from a previous firing (0.8-2.5 parts). The mixt. is preferably so chosen that the moisture content is 10-15%.

Cement. Soc. des ciments du Congo. Fr. 758,787, Jan. 23, 1934.  $CaCl_2$  in amt. of the order of 1% or less is added to the raw materials for making cement. The firing and clinkering may be carried out at a lower temp. HCl is formed during the heating and is recovered.

Cement. Cement Process Corp. Fr. 759,219, Jan. 31, 1934. CaO is mixed with a finely divided material from the group comprising  $SiO_2$ , sands, siliceous earths, clays and clayey materials, the mixt. being carried out in the presence of an amt. of water sufficient to hydrate all the CaO, the materials being subjected to a complementary malaxing in the presence of free moisture at a temp. sufficient to give rise to reaction between the CaO and the siliceous material.

Cement, etc. Soc. pour l'ind. chim. à Bâle. Fr. 758,641, Jan. 20, 1934. Cement, mortar, etc., are made waterproof by mixing with these substances an aq. emulsion of paraffin free from acid or substances capable of yielding acids, soaps, fixed alkalies or sol. salts.

Cement. Mikael Vogel-Jørgensen. Fr. 758,910, Jan. 26, 1934.

**Rotary calcining furnace.** Mikael Vogel-Jørgensen. Fr. 758,911, Jan. 26, 1934. App. for drying and heating the raw materials for cement manuf. Cf. preceding abstr.

**Rotary drum kiln for burning cement.** Fried. Krupp Grusonwerk A.-G. (Arno Andreas, inventor). Ger. 590,925, Jan. 13, 1934 (Cl. 80c. 14.01).

**Concrete.** Philipp Holzmann A.-G. Zweigniederlassung Berlin. Brit. 402,187, Nov. 30, 1933. Addn. to 393,429 (C. A. 27, 5928). The aggregate for concrete described in 393,429 is made by mixing clay with pore-forming material in a mill, cutting and disintegrating in 2 machines, delivering to a shaking screen which converts the pieces into balls, burning in a kiln, passing to a 2nd screen where the balls are coated with clay and again burning in a kiln.

**Waterproofing and bonding composition for use with concrete.** Raymond W. Bowman. U. S. 1,950,444, March 13. A compn. suitable for filling cracks or forming joints comprises  $\text{NH}_4\text{Cl}$  2, hydrated lime 1, and substantially oil-free comminuted grey iron 32 parts.

**Bituminous dispersions.** Deutsche Vialit-G. m. b. H. Ger. 590,723, Jan. 11, 1934 (Cl. 80b. 25.06). Coarse dispersions of bituminous material, especially for road surfacing, are obtained by using the pitchy product from the evapn. of sulfite liquor as dispersion agent, and stirring with water at about 90°.

**Bituminous emulsions.** Wilhelm R. Roederer. Brit. 402,891, Dec. 14, 1933. Addn. to 395,344 (C. A. 28, 6051). Producing bituminous emulsions by using brown coal, rich in bitumen, or oil shale as the dispersing agent, the latter is enriched with regard to its bitumen content before use, e. g., by treatment with acids or alk. lyes or other solvents. Examples are given.

**Applying bituminous emulsions to road surfaces.** Hermann Plauson (to Frederick W. Atack). U. S. 1,949,876, March 6. Water is mixed with a liquid bituminous material such as melted asphalt or tar, and the mixt. is conveyed under pressure and subjected to baffling to form an unstable emulsion which is then sprayed on the road surface (all in a continuous sequential operation).

**Tar emulsions for making roads.** Ges. für Teerstrassenbau m. b. H. Ger. 593,184, Feb. 22, 1934 (Cl. 80b. 25.06). Tar is mixed with about 5-20% of a resin, e. g., colophony or cumaron resin, and the mixt. is emulsified in hot water contg. a very small proportion of a soap inert to the resin. Emulsions stable to heat or frost are obtained.

**Tar, asphalt, etc.** Charles G. J. Lefebvre. Fr. 758,470, Jan. 18, 1934. Crusts of bituminous tar or asphalt from roads are renovated by blowing live steam into the mass in movement and adding an emulsion of tar and bitumen, and preferably a solvent such as oils from the distn. of coal or schists.

**Cement-rubber compositions.** Norman Swindin. Brit. 402,811, Dec. 7, 1933. A quick-setting compn. for the construction of roads, floors, etc., comprises a cement, e. g., portland, an aq. emulsion of rubber, e. g., latex, in amt. such that the dry rubber does not exceed 10% of the whole mix, and a gelling agent for the rubber for accelerating the setting. The gelling agent may comprise "waste pickle," or a soln. of  $\text{FeCl}_3$  and  $\text{HCl}$ , and powd.  $\text{Fe}$  may be added.

**Artificial stone.** Eduard J. Wilhelm. Ger. 563,359, Feb. 17, 1934 (Cl. 80b. 4.07). Bleaching earth, which has been used in refining saponifiable oils and fats, is freed as far as possible from oil or fat and then mixed with Sorel cement and the usual fillers. Specific compns. are described.

**Compositions for lining pipes.** Gutehoffnungshütte Oberhausen A.-G. Ger. 593,284, Feb. 23, 1934 (Cl. 80b. 845). Pipes for conveying hot waste gases are lined with a compn. comprising powd. chamotte 20, clay 30, comminuted cast iron 32, asbestos wool 1 and  $\text{NaOH}$  or  $\text{KOH}$  1 part. The compn. is made into a paste with water,

applied to the pipe and dried at a gradually rising temp., preferably until the free surface of the lining sinters.

**Building materials.** Leo C. Schilling. Ger. 593,121, Feb. 23, 1934 (Cl. 80b. 4.07). Sorel cement is mixed with the usual fillers and an aq. bituminous dispersion which does not flocculate on addn. of an electrolyte. A suitable dispersion may be prepd. with the aid of colloidal clay or humic acid, or by pptg.  $\text{Al}(\text{OH})_3$  in a feebly acid dispersion of asphalt.

**Building materials.** Hans P. Amundsen. Ger. 593,285, Feb. 23, 1934 (Cl. 80b. 21.04). The known compns. prepd. from a Sorel cement and wood meal, with or without other fillers, are improved by replacing the wood meal wholly or in part by a previously hardened and powd. compn. prepd. from Sorel cement and wood meal.

**Porous building materials.** Bruno Neuhof. Brit. 403,094, Dec. 13, 1933. See Ger. 586,795 (C. A. 28, 1500\*).

**Building bricks, etc.** Wm. Adams and Eric M. Adams. Brit. 402,845, Dec. 14, 1933. Building materials, e. g., bricks, tiles, concrete or cement blocks, wood and compressed fibrous materials, are impregnated with a protective compd., e. g., asphalt of low m. p., e. g., 100-110°F., and then (partly) covered with a protective coating of normally solid hydrocarbonaceous material, e. g., asphalt of relatively high m. p., e. g., 220-500°F., with or without fillers, e. g., fibrous material, which may be applied to the brick, etc., or incorporated in the asphalt.

**Protective coverings for buildings.** John F. Burr and Dirk de Lange. Brit. 402,993, Dec. 14, 1933. A covering for buildings, etc., consists of sand or other siliceous material, finely ground or laminated metal, e. g., steel, Cu, Zn, Al or scaly material, e. g., graphite, and a binder consisting of 1 or more synthetic resins dissolved in solvents of low b. p. The compn. is applied as a thick paste or as pre-formed blocks, sheets, etc.

**Plasters.** The Gypsum Mines Ltd. and Reginald Collins. Brit. 402,810, Dec. 7, 1933. A dry pulverulent compn., to be mixed with  $\text{H}_2\text{O}$  to form a plaster, comprises a mixt. of gypsum plaster or cement, portland cement or the like, and vulcanized rubber in shredded, powd. or granular form.

**Roofing material.** Lester Kirschbraun (to Patent and Licensing Corp.). U. S. 1,950,032, March 6. The butt end of composition shingles or the like is face-coated with blown asphalt and edge-coated with dried aq. emulsion of low-melting asphalt with a dispersing agent such as clay or bentonite.

**Plywood.** Jacob R. Brossmann (to The British Thomson-Houston Co. Ltd.). Brit. 402,677, Dec. 7, 1933. Laminated wood product is made by coating or sprinkling sheets or veneers of Yucca wood with powd. resin, e. g., a synthetic resin of the phenolic type, superposing several sheets and molding under pressure.

**Kiln for drying lumber and other material.** Wm. G. Crossle and Geo. C. M. Grant. Brit. 403,169, Dec. 21, 1933.

**Waterproofing compositions for wood, etc.** Albert G. Rodwell. Brit. 402,422, Nov. 20, 1933. See Fr. 754,666 (C. A. 28, 1502\*).

**Impregnating or coloring wood.** Carl Schmittutz. Fr. 758,728, Jan. 22, 1934. Impregnating or coloring agents are applied to the living tree near the ground, after removal of the bark.

**Preserving wood.** British Industrial Solvents Ltd., Henry B. Hutchinson, Herbert Langwell and Charles B. Maddocks. Fr. 758,957, Jan. 26, 1934. Wood and other cellulosic materials are preserved by derivs. of aliphatic alcs. and aldehydes which boil above 200° and are nontoxic, noninflammable and insol. in water. Examples are acetals such as dibutylbutylal, polymerized aldehydes or aldols and alkyl esters such as dibutylphthalate or hexyl butyrate.

Development of the combustion in technical firing [of furnaces]. Kurt Rummel and Hellmuth Schwiedessen. *Arch. Eisenhüttenw.* 6, 513-9 (1933). -- Measurements of the temp. and velocity of the gases and detns. of their compns. at various points in the furnace do not provide sufficient data for evaluating the combustion process, since no deductions can be drawn from these data as to the state of combustion at any point or in any plane of the furnace. The process of combustion is considered mathematically, and the deductions made have been confirmed experimentally.

B. C. A.

The relation between the "volatile matter" and elementary composition of coal. Preliminary notice. Clarence A. Seyler. *J. Soc. Chem. Ind.* 52, 304-6T (1933). -- Reference is made to previous work on the classification of coals under the subhydrous, orthohydrous and perhydrous genera. From a study of the graph lines of isovols, isocals, and percentages of H, O and C of coals several equations are developed. Some of these equations are: (a) If Dulong's formula is applied to calcul. of the calorific value of volatile matter in coal,  $Q_v = 388.12 \text{ IP} + 124.52 \text{ C} - 4269$ ; (b) if it is assumed that the N in coal is approx. 1% then in "pure coal"  $\text{C} = 90 - \text{H} - \text{O}$  and  $\text{V} = 11.82 \text{ H} + 1.227 \text{ O} - 37.93$ , which shows the predominant effect of the H and secondary effect of the O; (c) the "hydrogen index,"  $i(\text{H}) = 0.01 Q_v + \text{V}$  and (d) the "carbon index,"  $i(\text{C}) = 0.01 Q_v - 1.1 \text{ V}/3$ . In these equations V, Q, H and C stand, resp., for volatile matter, gross calorific value in cal./g., and percentage of H, and percentage of C, all calcd. to the "pure coal" basis by Parr's formula, multiplying by the factor  $100/(100 - 1.08 \text{ A} - (22\text{S}/40) - \text{H})$ , when A = percentage of ash, S = combustible S, and H = moisture. This solves the difficulty hitherto found in comparing classifications based on elementary compn. (Seyler's) with those based on calorific value and volatile matter (Parr's). A chart gives Seyler's classification of coal by the indexes;  $i(\text{H})$  and  $i(\text{C})$ . This system does not apply to coals with much less than 10% volatile matter (anthracites). For other coals the av. errors are small. A table gives the provisional limits of various coal genera and species from perhydrous coals, H over 6,  $i(\text{H})$  over 128.5, to lignites, C under 75,  $i(\text{C})$  under 53.9. Should further investigations prove that for some coal fields the relation between volatile matter and elementary compn. is not the same, the difference will probably be in the consts. and not in the form of the "index."

W. W. Hodge

Anthracites: peranthracites and true anthracites. II. True anthracites. P. Lebeau. *Ann. combustibles liquides* 19, 77-115 (1934). -- *C. A.* 28, 1501<sup>h</sup>. Exptl. data are given on the compn. and properties of true anthra-

cites and their products of pyrolysis. The following conclusions are presented for the differentiation between peranthracites (I) and true anthracites (II): (1) for the examd. samples the gaseous products of pyrolysis give a yield as high as 160 cu. m. per ton for I but between 280 and 367 cu. m. per ton for II. The max. gas evolution takes place at 800-900° and up for I, but is between 700 and 800° for II. (2) The H<sub>2</sub> content of the gases of pyrolysis is high for both I and II, being between 80 and 90% except for materials which are comparatively high in ash. However, the difference is pronounced for the CH<sub>4</sub> content, I showing up to 2% only, while II shows 5-10%. (3) The solids differ in their H<sub>2</sub> content calcd. on a (C + H) basis. It is mostly less than 1% and reaches a max. of 2.05% for I, but for II it is practically always more than 3% and shows a max. of 4.07%. (4) The igniting point for I is almost always above 600°, but solids high in ash may give variations; for II it is usually between 525° and 545°. (5) I can be considered as a conductor of electricity, while II exhibits a vtry great resistance. (6) All of I decrepitate on rapid heating to about 300°, while none of II showed this property. (7) I do not give colored solns. with org. solvents while II give yellow solns. of varying intensity which can be evaluated colorimetrically. (8) HNO<sub>3</sub> of sp. gr. 1.48 in contact with I and II, when heated, attacks both, but the liquids, transparent in both cases, do not cloud much with addn. of H<sub>2</sub>O in the case of I, but give an abundant ppt. in the case of II. Similar reactions were observed for mixts. of H<sub>2</sub>SO<sub>4</sub> and HNO<sub>3</sub>.

Karl Kammermeyer

The classification of bituminous coals and the degree of coalification of the humin portion. D. J. W. Kieulen. *Brennstoff-Chem.* 15, 11-12 (1934). -- Classification with regard to humic content in work with 60 coals shows the humic acid factor varies from 0 to 360 and can be correlated with cakingability. Combined H<sub>2</sub>O, calorific value, yield of primary tar and elementary analysis also agree well. Low-rank coals contg. free humic acids are classified particularly well. Only the temp. of max. gasification rate and explosibility are dependent upon content of volatile matter.

F. W. Jung

Lopinite, a new type of coal in China. C. Y. Hsieh. *Contrib. Sin Yuan Fuel Lab., Geol. Surv. China* No. 14; *Bull. Geol. Soc. China* No. 12, 463-90 (1933). -- Analyses of 13 samples of coal from Loping show ash 3.72-26.21%, heating value 5886-8130 cal., (on ash-free basis) moisture 0.23-1.26, volatile matter 45.50-65.15, and fixed C 34.36-53.50%. In 11, the volatile matter exceeds fixed C; in 1 it is more than twice. S is high, 2-5.8%, mostly org. Analyses of 9 related coals, intermediate between those of Loping and normal coals, are given. Yields on low-temp. carbonization of Loping coal are semicoke 54.28, oils 33.05, liquor + NH<sub>3</sub> 3.12 and gas 8.11%. The microstructure is described.

Alden H. Emery

The sulfur forms in Chinese coals. C. H. Young. *Contrib. Sin Yuan Fuel Lab., Geol. Surv. China* No. 15; *Bull. Geol. Surv. China* No. 23, 5-12 (1933). -- Proximate analysis, forms of S and Fe in 15 coals are given. Org. S is greater than pyritic S. Dil. HNO<sub>3</sub> will ext. small amts. of org. S from certain coals. Therefore, it is recommended that pyritic S be calcd. from pyritic Fe.

Alden H. Emery

Solvent extraction of Chinese bituminous coals. K. Ping. *Contrib. Sin Yuan Fuel Lab., Geol. Surv. China* No. 16; *Bull. Geol. Surv. China* No. 23, 21-30 (1933). -- Results of pyridine extn. of 16 coals are given. Pyridine ext. and  $\gamma$ -compds. increase to (fixed C)/(volatile matter + moisture) = 1.9, then decrease. Among coals of one age, cokingability is directly proportional to  $\gamma$ ; this does not hold if ages are mixed.

Duration of drying coal particles. A. V. Luikov. *Isvestiya Teploekkh. Inst.* 1933, No. 9, 27-34.—A discussion of the first thermodynamic law applied to drying of coal dealing with the relation between the time of drying and the moisture content at various periods of the drying operation.

A. A. Bochtlingk

The course of carbonization of bituminous coal in the laboratory and upon plant scale. Fr. Sladek. *Brennstoff-Chem.* 15, 1-4 (1934).—Lab. assay tests have failed to consider factors as carbonizing time, rate of gas evolution and length of coal charge (conforming to  $\frac{1}{2}$  oven width). A new assay method and app. with by-product recovery train are described wherein coke-oven conditions and results are duplicated by a lab. test at 900° which can be adapted to various oven dimensions. Coal charges of 50-60 g. are carbonized in a refractory tube of  $\frac{1}{2}$  oven width either for a time calcd. in proportion to size (e. g., 55-70 min. for 2 sizes of Koppers ovens) or to conform to an oven gasification rate. Progressive heating simulating that in an oven is obtained by gradually moving the furnace out over the tube as the test proceeds, the off-take being through the already heated coal. Productions of coke, gas, tar, benzene, and  $\text{NH}_3$  are plotted to show the effect of variations in carbonizing time in the app. with both procedures for comparison with oven data.

F. W. Jung

Testing and blending coals for coking: Thos. Biddulph Smith. *Blast Furnace and Steel Plant* 21, 471-3, 479, 491 (1933).—By applying suction to a pipe placed in the middle of a coke-oven door and extending 4 ft. into the spongy center of the charge, considerable quantities of condensable oils were obtained. Samples collected during the initial stages of coking were of a light straw color, clear and of low viscosity; later samples were darker and more viscous, those from the plastic layer itself being black and semisolid at normal temp. This material was composed of oils and a mass of fine black particles all of about the same form and size and without the sharp faces and edges characteristic of finely ground coal. By extn. with benzene a dark slate-colored powder was obtained of sp. gr. 1.47. Further sepn. by washing the powder in a mixt. of benzene and  $\text{CHCl}_3$  of density 1.40 gave a product that contained matter volatile at 1000° 2.05%, free C 97.49% and mineral matter 0.46%. The particles were pure C and were uniformly interspersed through the coal; they were surrounded by fusible resinous constituents which liquefied and carried the particles in suspension. Apparently the variable amts. of the liquefiable substance admixed with particles of C in a coal det. whether the resultant coke will be "fingery," "spongy" or "good." A method is described for detg. the degree of "satn." [with noncoking material] of a coal. App. and methods are described for cutting sections from the cokes formed and detg. their crushing strengths such that fairly consistent checks were obtained. Tests to det. their degree of satn. were made with Durham, South Yorkshire and Welch coals. A remarkable amt. of inert C particles must be added before these coals become satd. The finer the materials were ground the more inert C particles were required for satn. Durham coals when blended with 83% ground coke breeze gave such improved cokes that a 1000-ton sample contg. 25% coke breeze was prepd. and carbonized in a battery of coke ovens. Other large-scale tests were run with blends contg. 5 and 15% ground coke breeze. Better cokes, especially for blast-furnace use, were obtained from the blended mixts. than from the coal alone. Photographs of the cokes obtained, tables of data on analyses of the cokes and breeze, and results of porosity, Trommel, crushing and shatter tests are given and discussed. The

carbonizing period in the practical-scale expts. was diminished slightly more than proportionate to the percentage of inert material used. The complete neutralization of the excess resinous constituent with noncoking material reduces the dimension of the plastic layer to a const. min. throughout the process so that carbonization can proceed at a const. speed. Apparently by such a method, wider ovens of the same modern height and length could be designed which, while carbonizing at the same speed, would yield greater outputs per unit operation, with consequent lower labor costs.

W. W. Hodge

Hydrogenation of coal and oils under high pressure. József Varga. *Math. naturw. Anz. ungar. Akad. Wiss.* 50, 386-406 (1933).—Comparative expts. on the hydrogenation of various raw products and by-products of the Hungarian coal and mineral oil industry on one hand, and paraffin-rich Grosny mazout, coal-tar oil of the gas factory, generator-tar oil from Diósgyőr and brown-coal generator tar on the other hand revealed that most H is required for the hydrogenation of coals and most easily hydrogenated are unsatd. and S-rich gas benzenes. The hydrogenated benzene fraction boiling up to 180° always contained less than 0.03% S, although the S content of the raw materials often exceeded 1%.

S. S. de Finály

Hydrogenation of coal, pitch and petroleum. C. Berthelot. *La Nature* No. 2920, 218 (1931).—A review.

P. T.

The hydrogenation of coal, pitch, wood and corn. H. Isobe. *J. Fuel Soc. Japan* 13, 165-90 (1931) (in English, 13-16).—Prior to the investigation of hydrogenating various substances, I. made a study to generate H economically as far as possible, employing a retort 11 cm. in diam. and 2 m. in height. The retort was fully charged with charcoal or coke and the temp. of the upper part was kept at 500° (600° while the bottom part was maintained at 700-950° by reasonable adjustment. The steam supplied at a rate of 1 l. per sec. through this heated layer from the bottom is decompd. into  $\text{CO}_2$  and H during its travel. The mixed gas thus produced was passed into an app. to absorb  $\text{CO}_2$  and the final gas contained over 90% of H. Hydrogenation of coal: A shaking autoclave of 500 cc. capacity, made of Ni-chrome steel, was used throughout the expt. Among the important conditions which affect the reaction is the balance between pressure and temp. The leading reaction occurs at a temp. ranging between 420° and 440° and it is important to proceed with the hydrogenation within this range. Better results are obtained by previously adding to coal a heavy fraction of hydrogenated oil or creosote fraction, mixed with a catalyzer. Hydrogenation of pitch: It is necessary to select the condition as well as the catalyzer by preliminary tests. Hydrogenation of wood: Pieces of wood can also be hydrogenated under a high pressure when they are treated in the presence of a catalyzer mixed with 5-30% of tar oil or mineral oil as well as wood tar. Hydrogenation of corn, beans and seeds: Most corn and other allied substances react with H and they are active in a powd. state. I. adds that a greater part of the N in the sample is reduced to  $\text{NH}_3$ , S to  $\text{H}_2\text{S}$  and O is converted into  $\text{CO}$  or  $\text{CO}_2$  and water.

F. I. Nakamura

Oxidation of coal and the relation to its analysis. E. Stansfield, W. A. Lang and K. C. Gilbart. *Am. Inst. Mining Met. Engrs. Contrib. No. 69*, 10 pp. (1934). Four coals exposed 16 hrs. to dry natural gas gained 0.55-1.15, av. 0.79%. The absorbed gas was not removed by evacuation in cold and only  $\frac{3}{4}$  of it by heating 1 hr. in vacuum. B. t. u. are higher on treated coal. After storage for 12-36 days, 19 air-dried coals showed a moisture increase of 0.08-1.3% due to oxidation; it is slight in high-rank and large in low-rank coals. Vacuum drying gives higher moisture (av. 0.25%) than drying in air or natural gas. The av. of B. t. u. detns. of 14 coals after drying in gas was 20 B. t. u. more than after vacuum drying and 70 B. t. u. higher than air drying. Moisture detns. in air are 0.1-0.6, av. 0.3%, less than detns. in natural gas. Eleven coals exposed to dry air at 106° for 6 hrs. were reduced in calorific value (dry basis) 60-520 B. t. u., or 0.4-3.9%. Umins in 1 coal increased from 6.0 to 8.4%

after 6 hrs. oxidation and to 46.6% after 600 hrs.

Alden H. Emery

Oxidation of pyritic sulfur in bituminous coal. H. W. Nelson, R. D. Snow, and D. B. Keyes. *Ind. Eng. Chem.* 25, 1355 8(1933).—A Kincaid, Ill., bituminous coal contg. ash 17.6, sulfate S 0.94, pyritic S 2.58 and org. S 2.51% was used in the expts. The coal was pulverized, 80.9% through a 100- and 42.3% through a 200-mesh screen. In the first series of expts. the coal was suspended in approx. 4.5 l. of water and air passed through 1-7 days at temps. of 22°, 50°, 70° and 90°. The percentage of pyritic S oxidized varied from 6.7 to 79.0%, this latter result in the 7 days at 90° test. An increase in temp. increased the rate of oxidation of pyritic S to sol. sulfate S. Increasing the rate of air flow and using O in place of air did not increase the amt. of oxidation. Samples of 10 g. of the coal screened to the mesh sizes, 20-60, 60-100, 100-140, 140-200 and finer than 200, were subjected to oxidation for 24 hrs. at 50°. Results showed a faster rate of oxidation of pyritic S in the finer particles; also the amt. oxidized was nearly inversely proportional to the av. diam. of the coal particles. Addn. of ferric sulfate equiv. to 0.05 or 0.1% ferric ion to the coal-water mixt. in tests made at 22° and 70° increased somewhat the rate of oxidation; this effect was enhanced by a rise in temp. In expts. lasting 15 min.-2 hrs. with a small amt. of Cl gas added to the air bubbling through the coal-water mixt. at 22° and 70°, large amts. of pyritic S were removed; more was removed in the 22° than the 70° tests. The org. S was not much affected by any of the processes. A drawing and description of the app. used, details of procedures, tables of data and equations for reactions involved are given and the results are discussed. W. W. Hodge

The determination of nitrogen in coal by the Kjeldahl method. J. H. G. Carlike. *J. Soc. Chem. Ind.* 52, 306-8T(1933).—Several modifications of the Kjeldahl method for detg. N in coal are briefly reviewed. Expts. were carried out with samples of 3 coals, Barnsley, Parkgate and Warwick Thick seam. Digestions were made in an atm. of CO<sub>2</sub>. The gases evolved were collected over Hg by means of a Töpler pump and were analyzed for CO<sub>2</sub>, SO<sub>2</sub>, O and combustible gases, the residue being N. A drawing and description of the app., and the methods of operation are given. N collected varied from 0.03 to 0.06%. The use of Se in place of HgO definitely reduced the time of digestion (C. A. 25, 5938). To det. the amt. of N adsorbed by coal, samples at 100° were subjected successively to prolonged evacuation, then to adsorption of pure N for 50 hrs. An approx. uniform value was obtained for the adsorption of N. Per g. dry coal the av. values were 0.66, 0.73 and 0.88 cc. of N<sub>2</sub>, resp., for Barnsley, Parkgate and Warwick Thick seams. These quantities are of the same order as those of the free N liberated in the Kjeldahl digestions. If the N adsorbed on the coal was all given off during the Kjeldahl detn., not more than 0.1% N would be collected and it would not be completely removed by evacuation at room temp. Apparently the present method, Kjeldahl-Gunning-Wilfarth, is satisfactory for detg. the combined N in coal. W. W. Hodge

Temperature limits of the plastic state of coals. L. P. Bazilevich. *Coke and Chem. (U. S. S. R.)* 1933, No. 1, 30-41. An app. recently designed in the Dnepropetrovsk Coal-Chem. Inst. was used to study the process of formation of the plastic layer, its temp. and decompn., evolution and pressures of gases, etc. The steel needle of this app. used for detn. of the height of the plastic layer and the progress of solidification was replaced by a thermocouple constructed in such manner as to serve the purpose of the needle and of a thermocouple at the same time. The more important observations made from a series of tests were: Temp. limits of the plastic zone in the inner layer of coal are considerably wider than in the outer layer (one of the expts. gave for softening 348° and for solidification 437° for inner, and corresponding temps. of 383° and 413° for the outer layer); methods employing small samples with app. permitting free access of air were found unreliable as the oxidized coal softens at a higher temp. and

solidifies at a lower temp. than does unoxidized coal. The rate of coking practically did not affect the temp. limits of the plastic layer. James Serrel

Ash-to-mineral-matter correction in coal analyses. A study based upon coal-ash analyses. Gilbert Thiesen. *Am. Inst. Mining Met. Engrs. Contrib. No. 68*, 12 pp. (1934).—The Parr formula, mineral matter in coal =  $1.08 \times \% \text{ ash} + 0.55\% \text{ S}$ , gives values that agree closely with mineral matter values found by calcul. from ash analyses. Mineral-matter-free value = (detd. value) /  $(100 - \% \text{ ash}) \times 100$ .  $f$  for calorific value of 21 coals averaged 1.1188 with a range of 3.5%,  $f$  for fixed C averaged 1.1368, with a range of 4.35%.  $f$  for volatile matter was 0.2030 0.8314. If calorific values are corrected to a dry, 1.1 ash + 0.1 S-free basis, values approaching the Parr unit coal values are obtained. In unit coal values simplified by combining correction in numerator terms with terms in the denominator, it is erroneous to use the same denominator for calorific, fixed C and volatile matter values. The Parr unit coal formulas appear to be the best proposed. Alden H. Emery

The fusibility of coal ash. I. A method for determining the fusibility of coal ash in an oxidizing atmosphere. Yōsburō Kōsaka and Hachirō Toda. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 98-101(1934).—An app. is described which contains an indicator hand showing the deformation of the ash pellet with increasing temp. As testing rod a Pt wire of 1.5 mm. diam. with a bulb of 3 mm. diam. is used, the bulb resting on top of the pellet. The fusion curves are plotted as temp. vs. reading of drop of the Pt rod. The operation of the app. and the prepn. of sample pellets are described. Karl Kammermeyer

Peaty lignite and anthracite coals. C. Mahadevan. *Indian J. Physics* 8, 259-48(1933).—Specimens of tertiary coal ranging from peaty lignite to anthracite were analyzed for their lignin and cellulose contents. In the early stages of coalification the ratio of cellulose to lignin decreases rapidly, but increases later. The lignin-cellulose ratio is a good index of coalification. F. R. Rushton

Austrian brown coal. F. Neuwirth. *Berg- u. Hüttenm. Jahrb. Leoben* 80, 86-93, 136-57(1932).—The extn. of bitumen, wax, resin and oil, the effect of various solvents on the soly. of humic acids in NH<sub>3</sub>, and the properties of the tar, aq. distillate, etc., are discussed. Analytical data are recorded. B. C. A.

Briquetting experiments with Hungarian brown coals. J. Finkey. *Mitt. berg. hüttenmann., Abt. ungar. Hochschule Berg-Forstw. Sopron* 5, 7-21(1933).—A paste of wheat flour contg. 73% starch as a binding material gave briquets that were not sufficiently resistant to water and that molded on storage. On impregnation of briquets thus made with low-temp. tar of Eocene brown coal a few seconds at 35° about 1.5 4.3% tar was absorbed. This treatment gave water-proof briquets, resistant to mold, that could be fired in ordinary stoves. S. S. de Pinily

Chemical study of the carbonaceous deposits of Banat. I. L. Blum. *Bul. chim. soc. române chim.* 35, 77 81(1932).—Analyses of eleven samples of coal are given. In the crude coal the C content varied from 53.87 to 76%; H from 3.43 to 4.88% and S from 2.86 to 7.75%. Calorific values ranged from 5304.5 Cal./kg. to 7730.8. Ash varied from 4.95 to 29.40%. A table is given showing the reduction of S content obtained by treatment with Cl. D. F. Brown

A study of the natural gas and naphtha products from twenty-four wells in Turner Valley, Alberta. P. V. Rosewarne, W. P. Campbell and R. J. Offord. *Canada Dept. Mines, Mines Branch, Report No. 737-4*, 22 pp. (1933).—The gals. per M cu. ft. of gas obtained by distg. absorbed hydrocarbons from activated charcoal under a pressure of 30 lb. per sq. in. and condensing the vapors at 0° were approx. = to the gals. calcd. from the pentane and higher hydrocarbon fraction + 30% of the total butane fraction (or 45% of the normal butane) obtained by a fractional distn. in a Podbielniak column. The stripped gas from high-pressure wells contains a smaller proportion of condensable hydrocarbons than the stripped gas from low-

pressure wells. As the pressure on the well is reduced the stripped gas tends to carry a larger proportion of the higher hydrocarbons. Lowering the back pressure on the well increases the production of naphtha per day. Calcd. overall efficiency is highest for high-pressure wells. A. H. E.

The German earth gases, their occurrence and their constitution. Adolph Grotensohn. *Petroleum Z.* 30, No. 5, 1-8, No. 9, 1-10 (1934).—A literature survey on the nomenclature and constitution of gases from many German gas wells. I. M. Levine

How gas fuel has been applied at the Töbele smelter. J. B. Nealey. *Mining Met.* 15, 375-6 (1933). Descriptive. Alden H. Emery

The behavior of iron catalysts in the temperature range of 250° to 450°, toward illuminating gas and other similar gases. Alfons Kleinenc and Juhadin Rupp. *Angew. Chem.* 47, 182-4 (1934).—The behavior of com. illuminating gas was investigated in the presence of the following Fe catalysts: (1) Fe pptd. from  $\text{Fe}(\text{CO})_5$ , (2) Fe powder, (3) Fe powder activated by treatment with  $\text{AlCl}_3$  and  $\text{NH}_4\text{OH}$  or  $\text{NaOH}$  solns. and (4) synthetic catalysts, e. g., Fe oxides from various sources. A reduction of the CO content and an increase of the  $\text{C}_2\text{H}_4$  content take place. The most effective temp. range for the exptl. conditions was found at 280-450°. A greater retort length results in greater CO conversion, while increasing gas velocity results in smaller CO conversion. The catalyst surface undergoes a continual change and the progress of the reaction dilutes the catalyst. As side reactions the decompn. of heavier hydrocarbons and reactions with  $\text{H}_2\text{O}$  vapor were encountered, but it was found that temps. can be chosen low enough to avoid the decompn. of the heavier components; however, larger quantities of  $\text{H}_2\text{O}$  vapor act disturbingly upon  $\text{CH}_4$  formation. Attempts to regenerate the catalyst by simple processes failed and it was found that a mixt. of 21.22% C and 32.34% Fe, with a ratio of Fe:O = 3:4.1, becomes already inactive. At a gas velocity of 500 l./hr. (area = 81.6 sq. cm.) a consumption of 10 g. catalyst per cu. m. of converted gas was detd., after a passage of 140 cu. m. of gas, and the catalyst was still in a decidedly active condition. K. K.

Experiments with the treatment of crude ammoniacal gas liquor. F. Oliver. *The Surveyor* 85, 55 6 (1934).—The biochem. O demand of the gas liquor at Buxton was 8000-16,000 p. p. m. Attempts were made to steam out the  $\text{NH}_3$  and  $\text{H}_2\text{S}$ , but they were abandoned after expts. showed that the waste could be handled by sufficient diln. A. L. Elder

Hydrogenation of naphthalene under high pressure. József Varga. *Math. naturw. Anz. ungar. Akad. Wiss.* 50, 408-26 (1933). Iron iodide was used in a series of expts. as a catalyst in an autoclave of 4.5 l., under a H pressure of 120 atm. Only 11% of the applied naphthalene was unhydrogenated after 1 hr. at 475° and only 4% after 1 hr. at 500°. No decrease of the catalytic action could be observed during 12 expts. An autoclave of 22 l. was used for another series of expts. with Mo and W compds. Their oxides proved to give much better results than sulfides, Molybdenic acid transformed at 520° about 3 times as much naphthalene as tungstic sulfide. The liquid products were sol. in concd.  $\text{H}_2\text{SO}_4$  in all expts.; hence they contained very little or no decahydronaphthalene. S. S. de Finály

An Ostwald viscometer for tar. A. R. Lec. *J. Soc. Chem. Ind.* 53, 69-70 (1934).—A modified Ostwald app. is described, with operating directions. Some of the merits claimed are: Applicable to opaque liquids, covers a wide range of viscosity, only about 20 cc. of tar used, readings may be repeated on the same sample over any temp. range without cleaning, no drainage error, timing is definite and reproducible to 1 part in 1000 even with the most viscous tars. J. H. Moore

Anthracenoid hydrocarbons of low-temperature tar. Gilbert T. Morgan and E. A. Coulson. *J. Soc. Chem. Ind.* 53, 71-3T (1934).—Low-temp tar and its cracked distillates contain anthracene, 2-methyl-, 2,6-dimethyl-, 2,3,6-trimethyl- and 2,3,6,7-tetramethylanthracene. A

constituent of the distillates which imparts an intense yellow color to the anthracenoid hydrocarbons has been proved to be mainly 2,6-dimethylnaphthacene. W. J. Peterson

Cold tars. H. Mallison. *Gas J.* 202, 802-4 (1933).—Sec. C. A. 28, 290<sup>3</sup>. G. G.

The estimation of bitumen in tar mixtures. G. P. Stöfer. *Roads* 11, 134 (1933); *Bldg. Sci. Abstracts* 6, 344.—The test in which the distillate between 270° and 350° is agitated with  $\text{Me}_2\text{SO}_4$ , allowed to stand, and the vol. of oil sepd. is read is in effect a test for paraffins, as bitumen gave a neg. result while tars from vertical retorts gave pos. results. Such tars frequently contain paraffins, whereas horizontal-retort tars do not. G. G.

The determination of asphaltic bitumen with tar. H. Mallison. *Roads* 11, 105 (1933); *Bldg. Sci. Abstracts* 6, 344.—A sample consisting of 3-4 g. of the mixt. is boiled under a reflux condenser for 15 min. with 10 times its wt. of  $\text{CHCl}_3$  or  $\text{CS}_2$ , filtered to sep. the "free C," this residue being washed with the solvent until colorless, and the solvent then distd. off. The bituminous residue is then treated with 6-8 ml. concd.  $\text{H}_2\text{SO}_4$  on a boiling water bath, allowed to cool, washed, dild. with 500 ml. water, left to stand for 2 hrs., decanted through a weighed filter paper, washed with hot water, dried and weighed. The wt. of the asphaltic bitumen so found is that present in the tar mixt. G. G.

Recent investigations of the coking of Transvaal coals and blends. P. E. Hall. *J. Chem. Met. Mining Soc. S. Africa* 34, 213 17 (1933); cf. C. A. 27, 4377.—Discussion. Alden H. Emery

The reactivity of nearly ash-free coke. Bernhard Neumann and Alex van Ahlen. *Brennstoff-Chem.* 15, 5-10 (1934); cf. C. A. 27, 5940. Coal, reduced to 0.78% ash by size selection and flotation upon 1.275 sp. gr.  $\text{CCl}_4$ -xylene, has been briquetted wet, packed into an Fe retort and carbonized at temps. of 500-900° for 3-6 hrs. to the end of gasification. Reactivity was detd. in a new app.; air was passed up through the coke at various temps. between 200° and 1000° but below carbonizing temp. of the coke tested. With reactivity =  $100(\% \text{CO})/1\% \text{CO} + 2(\% \text{CO}_2)$ , results are plotted to show decreases in differences in reactivity between carbonizing temps. as temps. increase, i. e., extrapolation to 1000° of >600° cokes shows equal reactivity. Previous work upon reactivity and theories is discussed. F. W. Jung

Fuel. Allgemeine Elektrizitäts-Ges. Ger. 590,680, Jan. 8, 1934 (Cl. 23b. 4.02). A fuel is composed of hydrocarbons and powd. coal, the latter being blown through a nozzle into the oil.

Smokeless fuel. Soc. de recherches et de perfectionnements industriels. Fr. 757,961, Jan. 8, 1934. In the distn. of carbonaceous material to produce a smokeless fuel a detd. amt. of oxygenated fluid is introduced at chosen points of the principal circuit so that the heat necessary for distn. is furnished by internal combustion of a fraction or

even of the whole of the distn. materials from the coal. An app. is described.

**Agglomerating fuel.** Arthur Roberts (also known as Arthur A. Roberts). Brit. 402,107, Nov. 23, 1933. An inorg. binder of the nature of cement is distributed throughout a pulverulent fuel mass, *e. g.*, coke, coal, lignite, peat, sawdust, spent tan bark, by  $H_2O$  or an aq. soln. or suspension about equal in wt. to the binder when the fuel is fine enough to pass a 30-mesh screen and increasing in proportion as the fineness increases. A small amt. of NaCl or KCl,  $H_3BO_3$  or borax, or  $Fe_2O_3$  and flame-coloring salts, *e. g.*, of Sr, may be added. \*The mass is suitably pressed at 2000-10,000 lb. per sq. in. while at about 100-120°F., the preceding mixing being at about 180-250°F. or not exceeding 400°F. if the fuel itself includes org. binding material. Oxidizing agents or ignition accelerators, *e. g.*,  $CuO$ ,  $Fe_2O_3$  or  $H_3BO_3$  may be applied to the briquet surfaces. In an example coke (30-mesh) 87.5, hydraulic cement 25,  $H_3BO_3$  1.2, NaCl 0.5 and  $H_2O$  6 parts are mixed. The briquets may be heated to 1800°F. for 30-90 min. to make them smokeless. In 402,139, Nov. 23, 1933, divided on 402,107, an org. binder, *e. g.*, pitch, and an inorg. binder as above are used, the  $H_2O$  soln. or suspension being 1.25 times the wt. of the binder when the fuel is 30-mesh size and increasing in proportion as the fineness increases. The briquets are baked to make them smokeless.

**Gelatinized fuels.** James S. B. Fleming and Imperial Chemical Industries Ltd. Brit. 403,401, Dec. 19, 1933. Fuels in paste or jelly form are obtained by dissolving nitrocellulose in MeOH or EtOH, adding a Cu, Pb or Sn compd. which is sol. therein at least in traces so as to gel the soln. and then an aliphatic OH-acid as anti-gelating agent, *e. g.*, citric, malic, tartaric. In an example 7 g. nitrocellulose of 350 c. *e. g.* units viscosity is dissolved in 90 g. MeOH; 0.001 g. Pb(OAc)<sub>2</sub> in 0.5 g. MeOH is mixed therewith and then 0.2 g. citric acid in 2.5 g. MeOH.

**Fuel briquets.** Otto Fehér. Hung. 108,573, Feb. 15, 1934. To powd. or waste coal are added 3.4% pitch, 5-6% beet molasses and 2.5-3%  $Ca(OH)_2$ , and the mixt. is pressed into forms.

**Apparatus for production of coal briquets.** Budapesti Kőszénbánya R. T. Hung. 108,212, Feb. 1, 1934. Mech. details.

**Carbonizing coal briquets.** Ellsworth B. A. Zwoyer and Albert B. Stillman (to General Fuel Briquette Corp.). U. S. 1,950,017, March 6. Various details of app. and operation are described suitable for heat treatment of briquets formed of finely ground anthracite and a binder.

**Carbonizing coal.** Alfred J. A. Hereng. Fr. 757,952, Jan. 8, 1934. A part of the moist coal is distd. at a low temp. to form a semi-distd. porous product which is intimately mixed with the rest of the coal and the whole is heated to at least 800° for sufficient time to obtain hard, dense blocks that burn without smoke, and of which the volatile constituents do not exceed 6%.

**Low-temperature carbonization.** British Carbonised Fuels Ltd., and Harold P. Hird. Brit. 402,853, Dec. 14, 1933. Coal is carbonized at a temp. maintained at or about 420°, the temp. in the flues surrounding the retorts being 600° and being maintained by closed circulation of a large vol. of heating gases whose heat is supplied by a burner. App. is described.

**Furnace for low-temperature carbonization.** Soc. d'études et de valorisation industrielle des combustibles (S. à r. l. called S. E. V. I. C.). Fr. 757,945, Jan. 8, 1934.

**Destructive hydrogenation.** I. G. Farbenind. A.-G. Fr. 758,870, Jan. 24, 1934. In hydrogenating coal, oil, etc., a part, preferably the greater part, of the primary material and the hydrogenating gas are heated by heat exchange to the reaction temp. or near it and the rest of the material is introduced into the reaction vessel without preliminary heating or heating from another source. The proportion of material heated by heat exchange is regulated so that the difference in temp. between the current to be heated and the heating current is not above 100°.

**Destructive hydrogenation of bituminous materials such**

**as coal, tar and pitch.** Erich Steffen. U. S. 1,950,460, March 13. In a process employing a temp. of about 460° and a pressure of not less than about 10 atm., the materials are treated in the presence of a hydrogenating gas contg. about 20%  $CO$ , the balance of the gas consisting mainly of free  $H_2$ . The O compds. in the material treated react to form  $CO_2$  so that the formation of water is thus materially reduced. An arrangement of app. is described.

**Destructive hydrogenation products from coal, etc.** Hein I. Waterman (to N.-V. de Bataafsche Petroleum Maatschappij). U. S. 1,949,891, March 6. Materials such as brown coal are treated with gases which are rich in  $CO$  (suitably at a temp. of about 460° and under a pressure of about 100 atm.) to effect an elimination of O present in the initial material by the oxidation of the  $CO$ ; the substantially O-free product is then subjected to a sep. treatment with  $H_2$  substantially free from  $CO$  to obtain liquid products. \*An arrangement of app. is described.

**Destructive hydrogenation of coal and oil.** James M. Jennings (to Standard-I. G. Co.). U. S. 1,950,309, March 6. Coal reduced to a state of substantially colloidal fineness is suspended in a heavy oil and the suspension, together with  $H_2$ , is passed through a reaction zone packed with lumps of a sulfactive catalyst of a size and arrangement adapted to provide voids permitting free flow of the suspended solids, while maintaining a pressure above 20 atm. and a temp. above 370°. App. is described.

**Hydrogenating carbonaceous materials.** International Hydrogenation Patents Co., Ltd. Brit. 463,481, Dec. 28, 1933. Distillable carbonaceous materials are treated with hydrogenating gases in the presence of catalysts comprising a halogen compd. of Mo, W and (or) V. Addnl. catalysts may be added, *e. g.*, oxides, hydroxides or sulfides of Cu, Ag and metals of groups 2-8; *e. g.*, compds. of Zn, Sn, Cd, Mn, U, rhenium, Ni or Co. The nitrides, phosphides, borides, arsenides and selenides of metals of groups 2-8 and Li, Mg and Al and Si in elementary or compd. form may also be present. The treatment may be destructive hydrogenation, removal of S and O impurities, conversion of O- and S-contg. org. compds., *e. g.*, phenols and cresols, and the hydrogenation of unsatd. hydrocarbons to produce aromatic or hydroaromatic hydrocarbons.

**Hydrogenating coal.** The Ultramar Co. Ltd. and Lindell T. Bates. Brit. 402,846, Dec. 14, 1933. Mixts. of coal and oil are destructively hydrogenated at above 300° and about 10 atm. while the coal is subjected to intensive attrition, *e. g.*, as described in Brit. 281,240 (C. A. 22, 3517). Catalysts may be used, *e. g.*, Zn or Fe balls or grinding bodies. The  $H_2$  may be replaced by water gas. App. is described.

**Rotary retorts and process for the destructive distillation of coal, etc.** British Coal Distillation Ltd. (formerly Leicestershire (L. & N.) Coal Distillation Ltd.) and Clifford MacKen. Brit. 401,767, Nov. 23, 1933.

**Air hearth for dry-working coal and other minerals.** Henry M. Sutton, Walter L. Steele and Edwin G. Steele. Ger. 590,851, Jan. 11, 1934 (Cl. 1a. 28.10).

**Apparatus for pneumatically separating dust and small particles from coal, etc.** The General Electric Co. Ltd. and Bernard Vincent-Lambert. Brit. 403,115, Dec. 8, 1933.

**Recuperative superheating of steam, etc.** André Huot (to Superheater Co.). U. S. 1,949,866, March 6. Various details of app. and operation are described.

**Montan wax.** I. G. Farbenind. A.-G. Brit. 402,751, Nov. 28, 1933. Montan wax products free from asphalt are obtained by sapon. the crude or detersified wax with alkalis and (or) earth alkalis, dissolving out the alcs. and soaps of the wax acids by lower alcs. and ketones or by formic or acetic esters of the alcs. and, if required, acidifying the soaps, which may be first sep'd. from the wax alcs. Sapon. and extrn. may be simultaneous. Solvents specified are EtOH, MeOH, PrOH, EtMeCO. Ex-amples are given.

**Production of gas, oil, etc., from coal, etc.** Lewis C. Karrick. U. S. 1,950,558, March 13. Finely divided solid carbonizable material such as coal is introduced into

a stream of steam, the steam is superheated to above  $370^{\circ}$  and the steam and gas produced are carried into heat-exchange relation with a body of water to produce new steam at a lower pressure which is then used for continuing the process; the hot gas produced is passed through a retort to carbonize other solid carbonizable material and the gas is sep'd. from other products formed. App. is described.

**Combustible gas.** Joseph A. Perry and Walter H. Fulweiler (to United Gas Improvement Co.). U. S. 1,949,810, March 6. A gas suitable for domestic and industrial use is prep'd. by treating coal gas for the substantial removal of its CO content (with recovery of the CO removed), producing H with use of the CO from the coal gas (as by reaction of the CO with  $H_2O$  in the presence of a catalyst), uniting the H thus obtained with blue water gas and thereafter removing a portion of the CO from the mixed gas, converting a substantial portion of the CO remaining in the blue water gas, together with all or part of the H, to  $CH_4$ , producing H by use of the CO removed from the blue water gas, and uniting the resulting H with the methanated blue water gas.

**Apparatus for detecting combustible gases in flue gas.** Svenska Aktiebolaget Monp. Fr. 758,395, Jan. 15, 1934.

**Coal gas.** Alfred Pott. Ger. 590,555, Jan. 5, 1934 (Cl. 26c. 12). A method is desc'd. of regulating the d. and calorific value of coal gas by addn. of steam, air or a mixt. of steam and air.

**Mixed oil gas and water gas.** Harutyun G. Terzian (to United Gas Improvement Co.). U. S. 1,949,819, March 6. In the operation of a set comprising 3 vessels, one of which contains a bed of solid fuel while the other 2 contain heat-storing material, 2 of the vessels are preheated by internal combustion of blast gas generated in the third vessel by air-blasting the fuel bed, and a hydrocarbon material such as oil is introduced alternately to one and then the other of the preheated vessels and then passed through the other preheated vessel; at least a substantial portion of the hydrocarbon gas produced is passed through the fuel bed after tar is extracted from this gas. App. is described.

**Water gas.** Carl Still (trading as the Firma Carl Still) and Alfred Gobiet. Brit. 403,595, Dec. 28, 1933, addn. to 389,377 (C. A. 27, 5944). In the process of 389,377, 2 oven chambers are interconnected so that the water gas and unconverted steam from the 1st oven are passed into the charge of the 2nd oven and the finished water gas is led away.

**Water gas.** Humphreys & Glasgow Ltd. Fr. 758,878, Jan. 24, 1934. The fuel is fed in a continuous manner by a conduit, the lower part of which extends downward into the generator. In the annular chamber formed by this extension, the gases resulting from the air blowing are burnt with secondary air, and, if desired, in contact with the surface of the mass of fuel which forms the base of this annular chamber. During the period of production of water gas, when carburization is necessary, oil, oil residues, tar, etc., are vaporized and disocd. in this chamber and fixed by passage through the mass of fuel, or the injected steam is superheated in this chamber.

**Use of heavy oil in the manufacture of carbureted water gas.** Joseph A. Perry (to United Gas Improvement Co.). U. S. 1,949,811, March 6. Blast gases are burned in a vessel of refractory material to establish a path of radiant heat over which blue water gas is then passed and the blue water gas is carbureted with heavy oil and the blue water gas, oil gas and oil vapors resulting are passed over the radiant heating path and carbon from the oil gas and oil vapors is deposited on the fuel bed by a reversal of flow. App. is described.

**Purifying gases.** I. G. Furhenind, A.-G. Fr. 757,745, Dec. 30, 1933.  $H_2S$  and  $NH_3$  are eliminated from gases by washing the gases with an agent capable of absorbing  $H_2S$  but incapable of absorbing  $NH_3$ , expelling the  $H_2S$  from the agent, burning it to form  $SO_2$  and using this to eliminate  $NH_3$  from the gas. Suitable agents include amines or aq. solns. thereof, hydroxyalkylamines salts of amino acids and alk. solns. of phenols.

**Polymerization of hydrocarbon gases.** Frederick W. Sullivan, Jr., and Robert F. Ruthraft (to The Standard Oil Co.). Can. 340,080, Mar. 13, 1934. Liquid products of the gasoline boiling range are obtained from said hydrocarbon gases other than  $CH_4$  by cracking at  $1400-1600^{\circ}F.$  at atm. pressure to 200 lb. per sq. in. The cracked gases under a pressure of 100-1000 lb. per sq. in. above atm. are brought into contact with a hydrocarbon solvent having a relatively low solvent power for  $CH_4$  and nonhydrocarbon gases. The  $CH_4$  and nonhydrocarbon gases are eliminated from the system. The remaining gases are polymerized at  $700-1000^{\circ}F.$  under 500-3000 lb. per sq. in. for a period of time sufficient to effect conversion. The conversion products are cooled and oils boiling higher than gasoline and unconverted gases are separately recovered.

**Gasification of solid fuel.** Edouard L. A. Brodeur. Fr. 759,154, Jan. 30, 1934. Volatile materials and moisture are completely removed from the fuel before it reaches the furnace proper. The volatile materials are burnt and the combustion products are introduced into the furnace in which they are reduced to combustible gases at the same time as the gas is gasified.

**Furnace for gas and coke.** C. Otto & Co. G. m. b. H. Fr. 758,364, Jan. 15, 1934.

**Double-walled gas producer.** Albert L. Galusha. U. S. 1,950,236, March 6.

**Gas producer for motor cars.** S. I. Dekalenkov. Russ. 31,544, Oct. 31, 1933. Construction details.

**Apparatus for removing hydrogen sulfide from gases.** Carl Still G. m. b. H. Ger. 590,556, Jan. 5, 1934 (Cl. 26d. 9 04).

**Removing sulfur dioxide from gas mixtures.** Metallges. A.-G. (Wilhelm Gensecke, Hans Weidmann and Wolfhart Seeke, inventors). Ger. 593,383, Feb. 24, 1934 (Cl. 12e. 3.01). Gases contg.  $SO_2$  are treated in the presence of O, preferably at 50-60°, with an aq. suspension of products obtained by the complete or partial combustion of carbonaceous material, e. g., with a suspension of coal ash or blue ash. A soln. is obtained contg. sulfates of the metals present in the combustion product, e. g., Al, Mn, Mg and Fe.

**Recovering ammonia and carbon dioxide from gas mixtures.** Nikodem Caro and Albert R. Frank (Rudolf Neubner, inventor). Ger. 536,422, Dec. 29, 1933 (Cl. 12k. 7). Gases contg. at least 2 mols. of  $NH_3$  per mol. of  $CO_2$  are washed with water under pressure to remove all the  $CO_2$  and an equivalent amt. of  $NH_3$ . The residual gases are washed again with water to remove excess of  $NH_3$ . The soln. from the first washing is cooled to sep. solid  $NH_4$  salt, which is removed and decompd. by heat. The mixt. of  $NH_3$  and  $CO_2$  so obtained is washed with water *in vacuo*, whereby  $NH_3$  and some  $CO_2$  are absorbed, and  $CO_2$  free from  $NH_3$  remains. The soln. obtained from the washing *in vacuo* is freed from  $NH_3$  and  $CO_2$  in known manner, and the gases are mixed with fresh initial gases. Cf. C. A. 28, 1481<sup>4</sup>.

**Gas mantles.** South Metropolitan Gas Co. and Albert J. Prestage. Brit. 402,748, Nov. 30, 1933. The inner and outer skeletons of a double mantle with its foundation made in the usual manner are sep'd. except at their ends by supplying air to the interior of the mantle during incineration to produce a greater shrinkage of the inner layer.

**Firelighters.** Walter G. Young, Dennis W. Trussell and Gordon J. H. Howard. Brit. 402,838, Dec. 11, 1933. Firelighters are molded into arched or domed form having slots or perforations from a mixt. of dried sawdust, paraffin scale and saltpeter. A pigment, e. g., Venetian red,  $KClO_3$  and  $C_{10}H_8$  may be included. Molding app. is described.

**Coke.** Gesellschaft für Teerverwertung m. b. H. Brit. 403,232, Dec. 21, 1933. See Fr. 749,014 (C. A. 27, 5917).

**Stamping apparatus for the coal charge in coking plants.** Carl Still (trading as Firma Carl Still). Brit. 403,040, Dec. 14, 1933.

**Apparatus for quenching and conveying away coke discharged from vertical retorts.** Wm. R. McLusky. Brit. 403,023, Dec. 18, 1933.

**Coke ovens.** Soc. de construction de fours de matériel à gaz et hydraulique. Fr. 758,499, Jan. 18, 1934. Means for escapement of the distn. gases is described.

**Coke-oven batteries with regenerator tunnels running longitudinally thereof.** Carl Still (tradig as Firma, Carl Still). Brit. 402,549, Dec. 7, 1933.

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

**Experiments on the determination of the heat of cracking.** N. A. Butkov and O. M. Chechikina. *Neftyanoe Khozyaistvo* 25, 92-3 (1933).—Cracking expts. carried out with a Baku kerosene distillate in an app. constructed by the authors disclosed that a kerosene distillate having a temp. of 20° requires the input of 941-944 cal. per kg. when cracked at 625°, 1052-1095 cal. at 675° and 284-1337 cal. at 725°. A. A. Boetlingk

**Method for the separation of aromatic hydrocarbons from straight-run gasoline and kerosenes.** R. A. Virobyantz. *Neftyanoe Khozyaistvo* 25, 160-1 (1933).—The fraction contg. aromatic compds. is treated with 97-99% H<sub>2</sub>SO<sub>4</sub> (so as to give equal amts. by wt. of H<sub>2</sub>SO<sub>4</sub> and hydrocarbons) and is agitated for at least 5 hrs. and settled for 6-8 hrs. About 90% of the aromatic compds. are extd. The acid sep'd. from the gasoline is diluted with H<sub>2</sub>O (1:1) and distd. with superheated steam, the hydrolysis starting at 140°. The temp. is then gradually raised to 200-210°. From 50 to 90% of the aromatic compds. are sep'd., neutralized and dried. Consists of the aromatic compds. are tabulated. A. A. Boetlingk

**The removal of water dissolved in transformer oil.** Artur Ketnath. *Elektrotech. Z.* 54, 1259-61 (1933).—Phys. and chem. methods are discussed. F. W. Jung

**Hydrogenation of petroleum (Berthelot) 21.** Deposits [crude oil] in the southern part of Baichunas, Ural-Emba dist. (Buskin) 7. Destructive hydrogenation of coal and oil (U. S. pat. 1,950,309) 21. Catalysts [for conversion of hydrocarbons into nonknocking motor fuels] (Brit. pat. 402,938) 18. Condensation products of shale tars with aldehydes (Russ. pat. 31,613) 18.

**Aldehydes and ketones from petroleum acids.** A. E. Chichibabin, M. M. Katznelson and G. V. Chelintzev. Russ. 31,440, Oct. 31, 1933. Petroleum acids are converted into  $\alpha$ -bromo acids and these into  $\alpha$ -hydroxy acids, from which aldehydes and ketones are obtained by dry distn.

**Cracking hydrocarbon oils.** Charles W. MacKay (to Texas Co.). U. S. 1,950,058, March 6. Fresh charging stock is subjected to cracking temp. under superatm. pressure to effect cracking and vaporization in an intermediate pressure zone; condensate oil is subjected to cracking temp. under superatm. pressure to effect cracking and vaporization in a high-pressure zone; residue from the higher pressure zone is passed to the intermediate zone for distn. in the latter; residue from the intermediate pressure zone comprising residual constituents from both the cracked fresh charging stock and condensate is passed to a lower pressure zone for vaporization; and the vapors from the several zones are subjected to fractionation in a dephlegmating zone to produce a vapor fraction and a reflux condensate and this condensate is conducted to the higher pressure zone, and the vapors are condensed. App. is described.

**Cracking hydrocarbon oils.** Sigbert Seelig. Ger. 593,075, Feb. 21, 1934 (Cl. 23b. 1.04). Addn. to 439,044. The oil is led under pressure through a metal bath, and the cracking products, without fractionation, are subjected for some time, e. g., 25 min., to a higher temp. than that of the bath at about the same pressure.

**Cracking and distilling hydrocarbons.** Carl Still. Fr. 759,025, Jan. 27, 1934. Construction of expansion valve.

**Cracking and distilling oils, etc.** Carl Still. Fr. 757,810, Jan. 6, 1934. In cracking and distg. hydrocarbon oils under consecutive pressure and expansion, a section of the furnace for heating and another section for com-

plementary heating or cracking are coupled with a distn. column by 2 expansion valves, so that the heating section may be put into action alone by one valve or the 2 together by the other valve. Details are given.

**Distilling and coking hydrocarbon oils.** Wm. F. Moore (to Texas Co.). U. S. reissue 19,104, March 6. A reissue of original pat. No. 1,873,454 (C. A. 26, 6116).

**Apparatus for cracking vaporized or nebulized heavy hydrocarbon oils.** Sigbert Seelig. Ger. 593,421, Feb. 20, 1934 (Cl. 23b. 1.04).

**Tubular furnaces for cracking or distilling oil, etc.** Gasoline Products Co., Inc. Brit. 402,299, Nov. 30, 1933.

**Atomizer for cracked residuum.** D. A. Strom, P. I. Bulaventzev and Z. E. Matveev. Russ. 31,634, Oct. 31, 1933. The atomizer which is attached to the outlet of the pipe leading from the reaction chamber and terminates in the evaporator is constructed of a flange fastened to the pipe and a second flange held by bolts attached to the first flange at a certain distance from the latter. The second flange has the form of a solid disk.

**Destructive hydrogenation; cracking oils.** Akt. Ges. fur Steinkohleverflüssigung und Steinkohleveredelung. Brit. 402,264, Nov. 30, 1933. See Fr. 749,015 (C. A. 27, 5943).

**Oils, etc.** Jean Herzenberg. Fr. 758,507, Jan. 19, 1934. Compds. of S are removed from benzines, gasolines or mineral or tar oils by treatment with compds. which oxidize org. sulfides and disulfides but do not attack hydrocarbons, e. g., H<sub>2</sub>O<sub>2</sub> and org. per acids.

**Oil-filtering and rectifying apparatus.** Frank C. Frolander and Martin Czarny (to Capillare Holding Corp.). U. S. 1,950,487, March 13. Various structural and operative details are described.

**Motor fuels.** I. G. Farbenind. A.-G. Fr. 759,080, Jan. 29, 1934. Resin-forming hydrocarbons in crude gasoline are polymerized by treatment with a double compd. of AlCl<sub>3</sub> and an olefin. The polymerized compds. are removed.

**Diesel fuel.** Donald A. Howes and Imperial Chemical Industries Ltd. Brit. 403,124, Dec. 15, 1933. Fuel oils for compression-ignition engines are primed by addn. of up to 10% of an aliphatic or aromatic diketone, e. g., 1.5% acetylacetone or benzoylacetone or 1% benzil is added to an oil fraction, boiling up to 300°, obtained by the destructive hydrogenation of coal.

**Refining mineral oils.** Aktiebolaget Separator-Nobel. Fr. 757,987, Jan. 8, 1934. The oil is mixed with H<sub>2</sub>SO<sub>4</sub>, by reiterated and preferably continuous operations and after each mixing operation, the mixt. of oil, tar and free H<sub>2</sub>SO<sub>4</sub> is subjected to a centrifugal sepu. which is also preferably continuous.

**Dewaxing hydrocarbon oils.** Alco Products Inc. Fr. 758,853, Jan. 24, 1934. See U. S. 1,940,014 (C. A. 28, 15209).

**Dewaxing mineral oils.** Leo D. Jones (to The Sharples Specialty Co.). Brit. 403,392, Dec. 18, 1933. A treatment, auxiliary to dewaxing mineral oil by chilling a soln. thereof to -70-0°F. and centrifuging, consists in adding finely divided solids to the oil soln. and filtering the mixt. at a temp., e. g., 50-75°F., low enough to form a cloud other than that due to the added solids but high enough to prevent pptn. of amorphous wax. Kieselguhr, sawdust or paper pulp may be used in proportions of 0.25-1 lb. per gal. oil, or, if clay has been used in the previous refining, a solvent for the oil may be added and the clay removed at the specified temp.

**Bituminous compositions.** The Barber Asphalt Co. Fr. 758,243, Jan. 12, 1934. An aggregate such as ground rock is mixed with a dispersion of soft bitumen in water,

and a powd. hard bitumen is added to the mixt. <sup>1</sup> A volatile solvent for the soft bitumen is incorporated in the mixt.

**Destructive hydrogenation of bituminous materials such as oils, tars, etc., containing sulfur.** Lajos von Szeszich. U. S. 1,950,333, March 6. The material is heated to a high temp. in the presence of a catalyst contg. Mo or W compds., such as molybdic acid, under a pressure above 100 atm. and the material is treated with H under pressure; reaction products are passed off and cooled and subjected to a partial reduction in pressure, to adjust the amt. of H<sub>2</sub>S so that when returned to the reaction the activity of the catalyst is maintained at substantially the optimum (the gas being present within the limits of 1-15%); excess gas rich in H is led off and liquid products are subjected to further reduction, in pressure, this giving a gas rich in hydrocarbons and contg. a substantial amt. of H<sub>2</sub>S; H<sub>2</sub>S is withdrawn from this gas and is added to the gas rich in H, and the latter is then returned to the reaction with sufficient added H to compensate for that used in the reaction.

**Stabilizing gasoline.** August P. Bjerregaard (to Gasoline Antioxidant Co.). U. S. 1,949,896, March 6. For preventing pptn. of gummy substances, gasoline is treated with (about 0.5-3.0 lb. per 200 lbs. of gasoline) anthracene or phenanthrene, and the mixt. is contacted with fuller's earth.

**Apparatus (with a horizontal shell and internal baffles) for refining hydrocarbon material such as cracked gasoline by use of adsorptive material.** Alanson McD. Gray (to Gray Processes Corp.). U. S. 1,950,140, March 6. Various structural and operative details are described.

**Antiknock fuel.** Nicolaas Max (to The Shell Development Co.). Can. 339,889, Mar. 6, 1934. Motor fuels of high antiknock value are produced by adding metal compds. of the condensation products of amines with compds. that contain at least one CO group and several other O-contg. radicals, e. g., hydroxy aldehydes, diketones, or triketones. The components of the condensation product may be aliphatic or aromatic. The most suitable metals are those whose salts can form complexes with NH<sub>3</sub>, Cu, Ni, Co, Zn and Cr.

**Lead tetraalkyls.** Gellert Alleman (to Sun Oil Co.). U. S. 1,949,948, March 6. Compds. suitable for preventing compression knock of motor fuels have the general formula R<sub>4</sub>Pb in which one at least of the R's is a diethylmethyl radical, and are produced, e. g., by adding a mixt. of diethylchloromethane and MeI to a mixt. of Mg, Pb chloride and ether and decomp., the resulting intermediate. U. S. 1,949,949 relates to similar compds. such as dimethylbis(dimethylmethyl) lead.

**Lubricating oils.** Reginald G. Sloane (to Standard Oil Development Co.). Brit. 402,253, Nov. 30, 1933. See Fr. 747,558 (C. A. 27, 5182) and Ger. 582,853 (C. A. 28, 891<sup>2</sup>).

**Lubricating oils.** I. G. Farbenind. A.-G. (Hermann Zorn and Walter Rosinski, inventors). Ger. 593,455, Feb. 28, 1934 (Cl. 23c. 1). A small proportion of a higher polymerization product of isobutylene is mixed with mineral or tar oils or their cracking or hydrogenation products, or with conversion products of fatty oils or with oils obtained by the destructive hydrogenation of coal. The mixts. are then treated with a polymerizing or condensing agent. Thus, a mineral lubricating oil may be mixed with 1% of an isobutylene polymer and the mixt. treated with 2% of AlCl<sub>3</sub> at 80°. The oil may also be treated with the polymerizing or condensing agent before the isobutylene polymer is added. Cf. C. A. 28, 1182<sup>2</sup>.

**Lubricating oils.** I. G. Farbenind. A.-G. Fr. 758,269, Jan. 13, 1934. Solid or liquid hydrocarbons, particularly lubricating oils, are improved by adding small amts. of products having a mean mol. wt. above 500 and obtained by destructive hydrogenation of polymerization products of unsatd. hydrocarbons, e. g., rubber, polymerization products of diolefins or natural or synthetic resins.

**Filter for lubricating oils, etc.** Manufacture de machines auxiliaires pour l'électricité et l'industrie. Fr. 759,199, Jan. 30, 1934.

**Continuous apparatus for indicating the viscosity of lubricating oils, etc.** Walter J. Albersheim and Harvey S. Konheim. Ger. 593,024, Feb. 23, 1934 (Cl. 42/ 7.01).

**Lubricants.** Per K. Frolich (to Standard Oil Development Co.). Brit. 402,262, Nov. 30, 1933. A lubricating oil comprises a hydrocarbon contg. between about 0.25 and 5.5% of a synthetically produced ester having a b. p. above 302°F., preferably above 356°F., the oil being substantially free from suspended matter. In examples, the isopropyl ester of the acids produced by the oxidation of paraffin wax, Me caprylate, Am butyrate, glycol stearate, sec-Bu naphtheneate, iso-propyl benzoate, Ph-OAc, glyceryl oleate, isopropyl oleate and Et stearate are used.

**Lubricants by destructive hydrogenation of heavy petroleum oils.** James M. Jennings (to Standard-I. G. Co.). U. S. 1,950,308, March 6. A relatively heavy petroleum oil and a gas rich in free H are passed under a pressure above 50 atm. over a sulfactive catalyst at a temp. of about 370-440° for a time sufficient to effect appreciable destructive hydrogenation but insufficient to allow formation of more than about 20% of light oil boiling below about 205°, the oil and gas being passed through a stationary bed of the sulfactive solid catalyst and liquid and vaporous products being separately withdrawn. Numerous features of app. arrangement are described.

**Regenerating lubricating oils.** John S. Black, Robert S. Black and Wm. Stewart. Brit. 403,139, Dec. 21, 1933. The used oil is heated to remove volatile impurities, treated with a mixt. of NH<sub>4</sub>Cl and Super-Cel and finally filtered. App. is described.

**Apparatus for regenerating used oils by washing with water.** Wm. F. Johnson and Michael A. Klauck. Brit. 403,178, Dec. 21, 1933.

**Apparatus and method for the hot-water purification of used lubricating oil.** John E. F. Burn. Brit. 402,172, Nov. 30, 1933.

**Separating asphalt from oils such as crude lubricating oil stock.** Ulric B. Bray (to Union Oil Co. of Calif.). U. S. 1,949,989, March 6. The oil is extd. with a normally gaseous liquid hydrocarbon solvent (such as liquefied casing-head gas) a major portion of which consists of hydrocarbons of less than 4 C atoms, to cause a sepn. of the asphalt; pptd. asphalt is washed with fresh solvent. An arrangement of app. is described. Cf. C. A. 28, 2177<sup>4</sup>.

**Aqueous dispersions of asphalt.** August E. Schutte (to Lane Construction Corp.). U. S. 1,950,272, March 6. A dispersion is formed in which the continuous phase comprises water together with the mucilaginous material of flaxseed.

**Rosin and rosin soap from stump tar.** S. P. Serebrovskii. Russ. 31,529, Oct. 31, 1933. The process is carried out in the absence of atm. O to avoid darkening of the products. O is avoided by using a vacuum or an atm. of CO<sub>2</sub>.

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

**Amino derivatives of cellulose.** S. Malowan. *Kunststoffe* 24, 53-5 (1934).—A brief discussion. J. W. P.

**The change of cellulose in mercerization and the aging of alkali cellulose.** XLVIII. Communication on viscose by G. Kita and co-workers. Yoshizo Shinoda. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 55 8 (1934); cf.

C. A. 28, 317<sup>6</sup>.—The Cu oxide-ammonia soln. method of varying Cu concn. was used for the characterization of the 10 tested cellulose samples. The exptl. data showed that the mercerized samples became less sol. in the test solns., because of the removal of the more sol.  $\beta$ - and  $\gamma$ -cellulose by the mercerization. Prolonged mercerization, however

resulted in depolymerization and increased soly. in the test soln. Aging results in a more uniform and more sol. product.

Karl Kammermeyer

**Diffuser washing of sulfate pulp.** Th. Overwien and H. Störvik. *Papir-J.* 21, 231-5, 257-60(1933).—An exptl. diffuser is described and data are given showing the effect of several variables on the time required to bring the black liquor to 0°Be. Conclusions: (1) Best results are obtained with many diffusers. (2) The temp. of the wash water should be 40°. (3) The pressure should be as low as time will allow. (4) It is not advisable to tap off the black liquor on a level with the bottom or middle of the diffuser and run it into an intermediate tank as in American practice. The best results are obtained when the black liquor is tapped off at the top of the diffuser, as is customary in Scandinavian practice, and led from one diffuser to the top of another operating in series with the first.

Clinton L. Brooke

**Methods of utilizing sunflower-seed hulls.** V. S. Sadikov, I. D. Abramson, A. D. Ruibak and K. S. Belkova. *Schriften zentr. biochem. Forschungsinst. Nahr.-Genussmittelind.* (U. S. S. R.) 3, 308-36(1933).—Sunflower-seed hulls are potentially valuable because cheap, abundant (oil mill waste about 500,000 tons per year) and rich in useful materials. Potash can be made from the hulls, but it is more profitable to make furfural and cellulose by hydrolysis. The resulting cellulose (about 89%  $\alpha$ -cellulose, Cu no. 0.5-1.6, ash only 0.1%) is excellent for making viscose or for further hydrolysis to fermentable sugars from which alc. can be made.

Julian F. Smith

**Problem of production of halfstuff.** N. N. Nepenin. *Leningrad. Oblastnoi Sovet Nauch. Inzhenerno-Tekh. Obshchestva Tsellyulozno-Bumazhnoi Prom., New Problems of Cellulose-Paper Production 1933*, 8-36.—The theory and practice of the existing methods for production of halfstuff are discussed.

Chas. Blane

**The use of titanium pigments in paper and other cellulose products.** Gistein Ravner. *Papir-J.* 22, 7-8, 15-16(1934).—A review.

Clinton L. Brooke

**Sources of error in measuring opacity of paper by the contrast-ratio method.** Deane B. Judd. *Bur. Standards J. Research* 12, 345-51(1934)(Research Paper No. 660).

E. H.

**Lime is the most economical cooking agent for making the "hard" sheet of straw paper.** Herbert P. Bailey. *Rock Products* 36, No. 11, 28-31(1933).

R. W.

**Some chemical reactions of maple and spruce lignin.** E. E. Harris, E. C. Sheppard and R. L. Mitchell. *J. Am. Chem. Soc.* 56, 889-93(1934).—Lignin, isolated by the cold  $H_2SO_4$  method, is produced quantitatively, is free from carbohydrates and contains all of the MeO not accounted for in the carbohydrates of the wood. HCl lignin contains carbohydrates and has lost MeO groups. Cuprammonium lignin contains carbohydrates and is not obtained quantitatively. A study of the properties of sugar maple and white spruce lignin showed that lignins from hardwoods and softwoods are not the same. The no. of Ac, MeO, Cl and Br groups introduced indicates that the no. of HO and unsatd. groups in the mols. differ. The behavior of the MeO to halogenation and of the HO to methylation in alkali and to halogenation in  $CCl_4$  or  $H_2O$  suggests that the groups to which these radicals are attached represent at least 3 groups. The results obtained from the methylation and chlorination of lignin in wood show that lignin is little changed during isolation by the modified  $H_2SO_4$  method. The HO groups of lignin are not free for methylation until after hydrolysis; the lignin must be attached to some of the carbohydrates, possibly the hemicellulose in the wood cell. The isolated lignin is thought to exist principally in the keto form, while the original lignin in the enolic form is combined with carbohydrates.

C. J. West

**Electrolytic adsorption of Fe on viscose rayon (Tanemura, et al.)** 25. Structure of cellulose gel (Atsuki, Sobue) 25. Reactions relating to carbohydrates and polysaccharides. XLVI. Structure of the cellulose

1 synthesized by the action of *Agelobacter xylinus* on fructose and glycerol (Barsha, Hibbert) 10. Bonding compn. [for fiberboard] (Brit. pat. 403,159) 18. Resin emulsions [for sizing paper] (Brit. pat. 403,095) 26. Resin [for sizing papers] (Fr. pat. 758,801) 26. Adhesives [for cellulose sheets] (Fr. pat. 758,768) 18.

**Mienes, Karl** Celluloseester und Celluloseäther unter besonderen Berücksichtigungen der Benzylcellulose. Berlin: Chem.-techn. Verl. Bodenbender. 124 pp. Cloth, M. 15.

**Cellulose from annual plants.** F. S. Maashak. *Russ* 31,749, Oct. 31, 1933. In the prepn. of cellulose, annual plants are disintegrated, treated with a weak caustic soln. and then with dild. HCl before chlorination, so as to make the pulp susceptible to the treatment to follow.

**Device for separating cellulose and water by drawing off.** Aktiebolaget A. Ekströms. *Ger.* 590,897, Jan. 12, 1934 (Cl. 55d. 33.01).

**Cellulose esters.** Soc. pour l'ind. chim. à Bâle. *Fr* 758,185, Jan. 11, 1934. Cellulose esters invol. in org. solvents are made by treating substances contg. cellulose, or reaction products of cellulose, with acylating agents in the presence of catalysts while preserving the structure of the initial product, the acylating agent still adhering to the ester being removed by washing with liquids which do not react with the agent and which dissolve the catalyst at the same time. The washing liquid is removed by distn.

**Cellulose ester composition.** Hans T. Clarke and Carl J. Mahn (to The Eastman Kodak Co.). *Can.* 339,838, Mar. 6, 1934. A compn. comprises  $Ph_3PO_4$  and at least one mixed ester of cellulose selected from the group cellulose acetate stearate, acetate propionate, acetate butyrate, acetate stearate palmitate, propionate stearate, acetate oleate, acetate laurate, acetate laurate myristate. The product is used in the plastic and analogous arts, for instance the manuf. of wrapping sheets, photographic film, rayon, varnish or lacquer, and molded products.

**Cellulose-ester sponge.** British Celanese Ltd. and Wm. I. Taylor. *Brit.* 402,055, Nov. 9, 1933. Porous masses made of or contg. a cellulose carboxylic ester are subjected to complete or partial sapon. The material may be made by dispersing, in a liquid or plastic mass of the ester, solid, liquid or gaseous particles incompatible with the mass, treating the mass so as to set it, removing the dispersed solid or liquid, if present, and finally sapon. The sapon. material swells on immersion in  $H_2O$  like a sponge, the unsapon. material being more like pumice. In an example graded particles of crushed rock salt are dispersed in cellulose acetate soln., the mass is pressed into the desired shape and dried, the dried mass is extd. repeatedly with  $H_2O$  and then sapon. with NaOH several hrs.

**Coloring cellulose esters.** Société chimique des usines du Rhône. *Ger.* 590,552, Jan. 5, 1934 (Cl. 22h. 4): Plastic masses of cellulose esters are dissolved in org. solvents and colored by pptg. a pigment from a soln. mixed with the soln. of ester. Thus, a soln. of acetyl cellulose in acetone is treated with a soln. of  $FeCl_3$ . A soln. of  $K_4FeC_6N_6$  is added. A pptn. of Prussian blue results. The blue acetyl cellulose is pptd. by addn. of water, washed, dried and the acetone evapd. off. In another example, acetyl cellulose soln. is given an addn. of  $CdSO_4$  and Na<sub>2</sub>S solns. to ppt. CdS which colors the cellulose yellow.

**Films.** C. F. Boehringer & Soehne G. m. b. H. *Fr.* 757,906, Jan. 8, 1934. Films having a high content of plastifiers are made from films of cellulosic derivs. already contg. plastifiers and carefully freed from volatile solvents of low b. p., by causing the films to swell in non-volatile liquid or liquefied gelifying or plastifying agents until the films have absorbed the desired amt. of plastifiers.

**Films, sheets, etc.** Henry Dreyfus. *Fr.* 758,552, Jan. 19, 1934. A soln. of a cellulose ester or ether in a solvent or solvent mixt. is extruded and the extruded products are received into a coagulating bath contg. the same solvent

or solvent mixt. Thus a soln. of cellulose acetate in acetone alc. is extruded into a bath contg. diacetone alc. and EtOH, or a soln. in dioxane is extruded into an aq. soln. of dioxane.

**Embossing celluloid.** Celluloids Ltd. Brit. 403,008, Dec. 14, 1933. See U. S. 1,924,800 (C. A. 27, 5536).

**Apparatus for mixing viscose.** B. O. Evtzikhevich. Russ. 31,504, Oct. 31, 1933. Construction details.

**Rayon, etc.** Henry Dreyfus. Fr. 750,249, Jan. 31, 1934. Threads, ribbons, etc., are made by extruding a soln. of a cellulose ester or ether in a solvent or solvent mixt. and receiving the products in a coagulating bath contg. the same solvent or solvent mixt. The solvent may be dioxane or methylglycol monoacetate, and the coagulating bath an aq. soln. of these.

**Forming rayon filaments, etc., by the evaporative method.** Wm. I. Taylor (to Celanese Corp. of America). U. S. 1,949,983, March 6. A spinning soln. is extruded into an evacuated zone, the extruded product is led from this zone and dry air is supplied adjacent the point of emergence to prevent ingress of moist air. App. is described.

**Artificial threads of regenerated cellulose.** Harold H. Parker (to Du Pont Rayon Co.). U. S. 1,949,919, March 6. A viscose soln. contg. 8% alkali calcd. as NaOH, prep'd. from a cellulose xanthated with 10-25% CS<sub>2</sub> (based on the wt. of the cellulose), is introduced into a bath contg. 40-50% H<sub>2</sub>SO<sub>4</sub> to form threads.

**Producing artificial filaments by the evaporative method.** Henry Dreyfus and Wm. I. Taylor (to Celanese Corp. of America). U. S. 1,950,025, March 6. A soln. of a cellulose deriv. such as cellulose acetate in a volatile solvent is extruded into an evaporative atm. to form a skin-like outer layer on the extruded filaments which are then passed into an atm. contg. solvent vapor to soften the outer layer, and the softened filaments are stretched. U. S. 1,950,026 relates to an app. for carrying out similar processes.

**Centrifugal spinning pots.** Société de constructions mécaniques de Stains. Brit. 402,362, Nov. 30, 1933.

**Spinning jets for the production of artificial filaments, threads, yarns, etc.** British Celanese Ltd. and Wm. I. Taylor. Brit. 402,449, Dec. 4, 1933, and 402,450, Dec. 4, 1933.

**Digester for cellulose manufacture.** Arnold Brobeck. Ger. 593,473, Feb. 27, 1934 (Cl. 55b. 2.40).

**Fibrous materials containing resin.** Soc. pour l'ind. chim. à Bâle. Fr. 758,458, Jan. 18, 1934. Fibrous materials are mixed with condensation products of carbamides and aldehydes in the form of powder, hardened until they are insol. in water and do not glue up but still swell in water. The mixt. is made in known manner into bands, such as paper, card-board or presspan.

**Apparatus for dewatering paper pulp, etc.** Hobert W. French. U. S. 1,949,998, March 6. Structural and mech. features.

**Purifying apparatus for paper pulp, etc., comprising a drum with straining surfaces.** E. & M. Lamort Fils. Brit. 403,103, Dec. 8, 1933.

**Paper.** James d'A. Clark and John E. Graves (to H

Mead Corp.). U. S. 1,950,357, March 6. Water is removed from paper stock on a forming wire to effect an initial definite formation of the web; a suspension of additive material such as a carbonate filler suspension is then brought into absorbing contact with the wire side of the sheet, and the sheet with the additive material is then subjected to a controlled suction. An arrangement of app. is described. Cf. C. A. 28, 1537<sup>2</sup>.

**Paper-making apparatus.** Firma J. M. Voith. Ger. 593,034, Feb. 20, 1934 (Cl. 55d. 8.20). Means for shaking the wire cloth is described.

**Suction cylinder for use in paper-making machines, etc.** Reginald Richardson. Brit. 402,501, Dec. 7, 1933.

**Paper hollander.** P. J. Wolf & Sohne G. m. b. H. and Hermann Mallickh. Ger. 590,888, Jan. 12, 1934 (Cl. 55c. 8.01).

**Preventing the separation of pitch from paper pulp.** V. I. Abramovich. Russ. 31,754, Oct. 31, 1933. The sepn. of pitch from cellulose is prevented by adding kerosene as emulsifying agent without introducing into the pulp a soln. of Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>.

**Emulsion for sizing and impregnating paper, card-board, etc.** Vsesyuznii Nauchno-Issledovatel'skii Institut Bumazhnoi i Tsellyuloznoi Promishlennosti. Russ. 31,751, Oct. 31, 1933. An aq. emulsion of kaolin of the consistency of heavy cream is mixed with a bitumen melted to a low viscosity.

**Water-repellent coating on paper or the like.** Alfred E. Van Wirt (to Imperial Paper and Color Corp.). U. S. 1,950,279, March 6. A solubilized protein material such as a solubilized casein and clay compn. is applied to a web of the material and the treated surface is printed with a pigment material including a solubilized protein material. The surface is then sprayed with a liquid such as formaldehyde soln. to react with the protein material and render it insol. App. is described.

**Apparatus for coating paper with carbon composition.** George A. Rutkoskie. Fr. 758,587, Jan. 19, 1934.

**Carbon papers, etc.** Deutsche Hydrierwerke A.-G. Fr. 757,735, Dec. 30, 1933. Satd. or unsatd. mono- or polyhydric aliphatic aces. of high mol. wt., or naphthene aces. are used as solvents or emulsifiers in making coloring pastes for carbon papers, ribbon, etc.

**Copying papers.** Soc. anon. des anciens établissements Braunstein Freres. Brit. 403,002, Dec. 14, 1933. See Fr. 751,410 (C. A. 28, 1192<sup>5</sup>).

**Waterproof paper, etc.** International Bitumen Foundations Corp. Brit. 403,116, Dec. 8, 1933. H<sub>2</sub>O impermeable papers and pasteboards contg. 50-60% of asphalt distributed in finely divided form are prep'd. by pre-treating the fibrous pulp in the hollander or beating vat with solns. of resin soaps, oleates of alkali metals, alk. gels or alkali salts of Turkey-red oils, thereupon adding the requisite amt. of asphalt as an aq. emulsion and then working up the material on the paper machine. If desired, a precipitant may be added, prior to the working up, to cause the asphalt to be pptd. in finely divided form throughout the mass, NaCl, Na<sub>2</sub>SO<sub>4</sub>, NaHSO<sub>4</sub>, Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> and alum being specified.

**Machine for producing thick pasteboard.** Bruno Müller. Ger. 590,531, Jan. 4, 1934 (Cl. 55d. 2.101).

## 24--EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

**Combustion in vacuo of compressed mercury fulminate.** H. Muraour and W. Schumacher. *Compt. rend.* 198, 1161-2 (1934).—Though combustion is not propagated along a train of fine crystals of Hg fulminate when touched by a red-hot wire *in vacuo*, it is so propagated, but without detonation, if the fulminate is compressed (d. 1.4). The behavior of explosives when thus treated divides them into 3 classes: (1) no propagation of combustion, even with compression, e. g., picric acid, gun cotton; (2) propagation on compression, but no detonation, e. g., Hg fulminate; (3) detonation, e. g., PbN<sub>3</sub>, Ag fulmi-

nate, diazo-*m*-nitroaniline perchlorate (very violent), Pb trinitroresorcinate (feeble).

C. A. Silberrad

**Explosions in New Mexico coal mines, 1895 to 1932.** G. M. Kintz. *Bur. Mines, Information Circ.* 6760, 10 pp. (1934).

Alden H. Emery

General law relating to exothermal processes [explosions] (Semenov) 2. Detonation in gaseous mixts. (Sokolik, Shehelkin) 2. Mechanism of the upper limit of ignition of a mixt. of C<sub>2</sub>H<sub>4</sub> and O (Sadovnikov) 2. Theory of the upper pressure limit of ignition (Semenov) 2.

Mechanism of the upper limit and the kinetics of the ignition of detonating gas (Nalhandyan) 2. Effect of inert admixts. on the lower limit of ignition of gases (Lavrov) 2.

General Orders on Explosives, Effective March 27, 1933. Issued by Industrial Commission of Wisconsin. Madison: Democrat Printing Co. 39 pp.

**Explosive.** Charles P. Spaeth (to The Canadian Industries Ltd.). Can. 339,803, Mar. 6, 1934. An explosive contains nitroglycerin 21.0, trimethylolmethane trinitrate 7.0, nitro cotton 0.6,  $\text{NH}_4\text{NO}_3$  15.0,  $\text{NaNO}_3$  43.0, carbonaceous combustible matter 12.4 and chalk 1.0%.

**Explosive.** Charles P. Spaeth (to The Canadian Industries Ltd.). Can. 339,804, Mar. 6, 1934. An explosive comprises nitroglycerin, nitrocellulose, one or more oxidizing agents, a carbonaceous combustible ingredient and dimethyloldimethylmethane dinitrate.

**Absorbent material for use in explosives.** Charles P. Spaeth (to The Canadian Industries Ltd.). Can. 339,802, Mar. 6, 1934. Urea and  $\text{NH}_4\text{NO}_3$  are fused and further amts. of  $\text{NH}_4\text{NO}_3$  and  $\text{NaNO}_3$  dissolved in the melt. The temp. of the soln. is increased until a substantially clear soln. is obtained. Absorbent material is impregnated with the soln. and the impregnated material is cooled for use in explosive compositions, e. g., nitroglycerin 15.0,  $\text{NH}_4\text{NO}_3$  55.0,  $\text{NaNO}_3$  9, bagasse pith 17.0, urea 4.0%.

**Explosive charge suitable for use in fiery mines.** Alexander C. Scott. U. S. 1,950,038, March 6. A container which may be formed of steel and which is capable of withstanding a high internal pressure and which has an aperture closed by a relatively easily rupturable disk is charged with a salt such as  $\text{NH}_4\text{NO}_3$  decomposable by heat so as to yield non-inflammable gaseous decompn. products, together with a K-Cl compd. such as  $\text{KClO}_4$  and a fuel and is provided with means for ignition. Various examples and modifications are described.

**Detonator for explosive charges.** Mario F. F. Biazzi. U. S. 1,950,019, March 6. A primary explosive material such as Hg fulminate or Pb azide is compressed in a cap and there is then compressed in the cap an explosive material, such as nitropentaerythritol, having high power and a sensibility to impact between the primary explosive material and the secondary explosive material, which is separately loaded in a case into which the cap is forced.

**Fuse for shells.** Henry E. Nash (to Hercules Powder Co.). U. S. 1,949,841, March 6. Various details are described of a fuse having a powder train comprising a

mixt. of an oxidizing agent such as  $\text{BaO}_2$  and an element of group 6 of the periodic system such as Se which when burned together do not evolve any substantial amt. of gas.

**Matches.** Knut E. Olsson. Brit. 401,805, Nov. 23, 1933. Repeatedly ignitable compn. rods comprise a combustible mass of org. substances, which leave no ash, and an igniting mass, segregated therefrom and contg. an O-developing substance with a binder having such low affinity for O and present in such amt. that the igniting mass is not combustible, or at least cannot burn more quickly than the combustible body material. Aldehydes, e. g., metaldehyde, and amines, e. g.,  $(\text{CH}_3)_3\text{N}$ , may be used for the body material with a binder of nitrocellulose dissolved in  $\text{Me}_2\text{CO}$ , and O-developing substances, e. g.,  $\text{NH}_4\text{ClO}_4$ , or volatile substances, e. g.,  $\text{C}_2\text{H}_6$ ,  $\text{EtOH}$ , may be included to hasten combustion. The igniting mass may contain up to 70%  $\text{KClO}_4$  or  $\text{NH}_4\text{ClO}_4$  with a binder of 3 alkali silicate, e. g., water glass, cement, gypsum. Ordinary P-contg. striking surfaces, comprising, e. g., P,  $\text{Sb}_2\text{S}_3$ , ground glass and gum arabic, may be used for ignition of the rods.

**Igniting mass for matches.** A. V. Penkin. Russ. 31,805, Oct. 31, 1933. In addn. to the usual ingredients the mass contains oil shale.

**Match that can be used repeatedly.** Rezső König and Zoltán Földi. Hung. 108,056, Jan. 15, 1934. A core of active matter is covered by a filling material satd. with a substance of low burning velocity and gasifying under  $260^\circ$ . An outer coating consists of a substance that melts much higher. As examples: (1) 20 g. red P, 10 g. black  $\text{Sb}_2\text{S}_3$ , 10 g. glass powder, 3 g. powd. gum arabic, 0.5 g.  $\text{NaHCO}_3$  and 2 g. potato starch form an active mixt. that can be ignited on a surface covered by a mixt. of 20 g.  $\text{NaClO}_4$ , 3 g.  $\text{PbO}_2$  and 1 g. acetylcellulose; (2) a rod made of a mixt. of 6 g.  $\text{NaClO}_4$ , 0.4 g. hexachloroethane, 2 g. glass powder, 1.2 g. formaldehyde, 0.8 g. metaldehyde, 0.15 g. S flower and 1.7 g. acetylcellulose dissolved in acetone, is covered by a mass of 13% celluloid and 87% metaldehyde. The prepn. can be ignited on a surface covered by a mixt. of 8 g. amorphous P, 2 g.  $\text{Sb}_2\text{S}_3$ , 1 g.  $\text{MnO}_2$ , 1 g. cement and 1 g. tragacanth.

**Match that can be used repeatedly.** Zoltán Földi and Rezső König. Hung. 108,188, Feb. 1, 1934; cf. preceding abstr. A ground substance, of low tension and low decompn. temp. is mixed with an O-forming substance in the least amt. that is ignitable on a P-contg. surface.

**Miner's safety vapor lamp.** Flame Lamp Research Association Ltd. and Richard L. Woosnam. Brit. 402,862, Dec. 14, 1933.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**The present state of knowledge of dyes of the indanthrene type.** Max A. Kunz. *Bull. soc. ind. Mulhouse* 100, 3-50 (1933).—An address. The subject is thoroughly discussed, and mention is made of some expts. of K. on dianthrone derivs. I. H. Odell

**Color and constitution from viewpoint of recent electronic theory.** VI. H. H. Hodgson. *J. Soc. Dyers Colourists* 49, 213-16 (1933); cf. C. A. 25, 5843.—Electronic explanations are offered of the substantivity of benzidine derivs., the possibility of successive coupling with the 2 diazonium groups in  $(\text{C}_6\text{H}_4\text{N}_2\text{X})_2$ , etc., the coupling of diazonium salts with  $\text{NHPh}_2$ , but not with  $\alpha\text{-C}_6\text{H}_4\text{NH}_2$ , in suspension in mineral acid, the replacement of Br by H in 4-bromo-3,5-dinitrobenzaldehyde, the ease of dinitration of the *p*- $\text{MeC}_6\text{H}_4\text{SO}_3$  derivs. of  $\alpha\text{-C}_6\text{H}_4\text{NH}_2$  and 3,5,4-( $\text{NO}_2$ ) $\text{NH}_2\text{C}_6\text{H}_3\text{Me}$ , the sepn. of *m*- and *p*-xylydines by W. R. Hodgkinson and L. Limpach's method (cf. *J. Chem. Soc.*, 77, 65 (1900)), and bromination of phenols in aq. as contrasted with inert solvents. It is suggested that benzidine dyes are substantive to cotton only when the 2 C<sub>6</sub> nuclei are co-planar. B. C. A.

**Action of light upon dyes.** Hanns Rein. *Angew. Chem.* 47, 157-61 (1934).—Exptl. data are given on the

action of light of different wave lengths upon various dyes. With equal conditions of exposure, the max. action of light occurs when the absorption of the dye and the light source coincide most closely in their wave lengths. The destructive action of daylight is due mainly to the abundant visible portion of the sun's spectrum. The ultra-violet absorbing, white and yellow substances form an exception, as their absorption lies almost exclusively in the ultra-violet range. The action of several addns. to increase light fastness is discussed. Most artificial light sources are entirely unsuited for comparative purposes. A series of 8 specially selected wool dyes of decreasing fastness was established for finding the amt. of reacting light. These were tested by sunlight exposures at stations all over the earth, together with dyes of a cotton scale, and exhibited considerable superiority as a standard for comparing climatic influences upon dyes. Karl Kammermayer

**Application of indigosol dyes.** K. Stierwaldt. *Melliand Textilber.* 14, 411-12 (1933).—Soly. data for, and methods of dyeing even shades with, certain indigosol dyes are indicated. In applying mixts. of substantive and non-substantive indigosol dyes even results are promoted by raising the temp. of the dye liquor, since this reduces the

affinity of both types of dyes; an addn. of 0.028–0.1% of Rongalite C to such hot liquors prevents premature oxidation (development) of the dye. With certain dyes which require development in a bath contg. more than the usual amt. of  $H_2SO_4$ , the process is complete within 30 sec. and, if prolonged the  $NO_2$  present decomposes the developed portion of the dye. B. C. A.

Cold dyeing of cellulose acetate with reserve printings. P. Barsy. *Russa* 9, 105, 107 (1934).—Practical operating directions. A. Papineau-Couture

Sorption on cotton fibers of dyes with varying molecular association in solution. Geo. L. Clark and Julia Southard. *Physica* 5, 95–100 (1934).—As a concd. soln. of oxazine dye (Nile Blue sulfate) or of methylene blue is dild., the predominant mol. species alters by steps in complexity (cf. *C. A.* 25, 3223). This property permits a study of cotton fiber pore structure and size by measuring sorption as function of concn. The amt. of sorption was detd. by spectrophotometric measurements on the solns. before and after sorption of the dye to equil. on known wts. of cotton. X-ray diffraction studies of cotton with sorbed dye showed no alteration of cellulose pattern. A large increase in dye sorption naturally accompanies change from micellar to mol. dimensions, compatible with predominating cotton pore sizes. B. R. Anderson

High-pressure steam boilers in the aniline dye industry. B. P. Fintiktkov. *Anilnokraskovnaya Prom.* 3, 106–7 (1933).—The advantages of various types of boilers are discussed. B. C. A.

The structure of cellulose gel. IV. Cellulose structure and direct dyeing. Katsumoto Atsuki and Hiroshi Sobue. *Cellulose Ind.* (Tokyo) 10, 31–7 (1934). *Abstracts* (in English) 7–12; cf. *C. A.* 28, 395. Dyeing with Congo red which has a high colloidal property gives in general very good results. Acetate rayon is dyed proportionally to the dyestuff mol.; good dyeing is obtained with Bismark brown which has an amino group at one end; with orange and fast red having a OH group, dyeing by a chem. combination occurs, because these dyes are more bathochromic. Cotton dyeing occurs as a phys. adsorption; the color on the cotton fiber is hypochromic, and the amt. of dyes on the fiber increases in the following order: orange > Congo red > Bismark brown > fast red > toluylene red. Calico cloth is dyed similarly. Mercerized calico cloth has a stronger affinity for dyestuff than unmercerized cloth. Lilienfeld silk, which has a regular arrangement of micelles, retains the bathochromic effects. All artificial silks have stronger bathochromic effects than cotton, which indicates that viscose and cupro-ammonia rayons have more free OH group than cotton. From these facts, the same combination as in the coordination compd.,  $\lambda$  e.,  $C:O:H$ , is considered between the OH groups of  $H:O:H$ .

cellulose and water, and in the dyeing process the dyestuff is absorbed at first; it is then combined with a cellulose coordination compd. as a substitution or additive compd. as follows:  $[ROH + (H_2O)](D) + (H_2O) = [ROH \cdot (H_2O) \cdot D](H_2O)$ , where R and D are radicals of cellulose and dyestuff. K. Konda

New artificial fibers. M. Jeanny. *Russa* 9, 90, 101, 175–9 (1934).—A description of Soc. Nobel Française's Fr. pat. 751,824, Sept. 11, 1933, for the manuf. of artificial fiber from polyvinyl compds. A. P.-C.

The leading of wool. L. Armand. *Tiba* 12, 83–9 (1934).—A brief review. A. Papineau-Couture

Empire fibers for marine cordage. Anon. *Bull. Imp. Inst.* 31, 500–7 (1933); cf. *C. A.* 27, 3338. Comparative service tests carried out on New Zealand hemp and Manila hemp in the British navy gave very satisfactory results. If the 2 materials were on an equal footing as regards origin, the results of the tests would not warrant any change in present practice; but in view of the Admiralty's policy to give the preference to British Empire products, the results warranted partial adoption of the New Zealand hemp in conjunction with sisal, provided the price was satisfactory and the fiber was sufficiently strong to give

yarn and cordage breaking strains in accordance with specifications. A. Papineau-Couture

X-ray studies of the structure of hair, wool and related fibers. II. The molecular structure and elastic properties of hair keratin. W. T. Astbury and H. J. Woods. *Trans. Roy. Soc. (London)* A232, 333–94 (1933); cf. *C. A.* 25, 4460; 27, 2168. About 200 x-ray photographs of mammalian hairs, spines, etc., were taken under a great variety of conditions. The x-ray fiber photograph of stretched hair ( $\beta$ -keratin) is analogous to that of natural silk (fibroin), whether stretched or unstretched. Stretched hair is therefore built of extended polypeptide chains, while unstretched hair ( $\alpha$ -keratin) must consist of the same chains in a folded state, so that the elastic mechanism is that of a reversible intramol. transformation. By means of "quadrant photographs" it is shown that the mol. complex of  $\alpha$ -keratin stretches reversibly by about 2% before the onset of the main transformation. The limiting elastic extensibility of all mammalian hairs is about 100% of their initial unstretched length. Intramol. folds (transverse to the general direction of the side chains) of the nature of linked pseudo-diketopiperazine rings which open up on extension to produce the normal zigzag protein chain are assigned to  $\alpha$ -keratin. The side chains of  $\beta$ -keratin are roughly coplanar and serve to unite neighboring main chains by a variety of cross linkages, including both covalent and electrovalent bonds. In the extended configuration, the existence of the "primary fold" in the main chains reduces the av. length of an amino acid residue to less than is found in fibroin. The structure of  $\beta$ -keratin is one of flat polypeptide "grids" adhering by virtue of attractions between  $-CO$  and  $=NH$  groups. The normal equil. form of these grids involves the transverse "secondary folds." The general intramolecular elastic mechanism of keratin thus falls into line with that of simpler mols., though the usual possibilities are greatly enhanced by the mobility of both main chains and side chains and by the longitudinal attractions between electropos. and electroneg. centers in the latter. The available chem. analyses of keratin are in close agreement with the concept of an av. vol. per amino acid residue of  $3.38 \times 4.65 \times 9.8$  A., as deduced from the photographs, the dimensions being, resp., the av. length of the residue, the thickness transverse to the side chains and the av. width in the plane of the side chains. These quantities may be used to calc. the av. d. of all proteins and the av. thickness of monomol. protein films. An approx. tentative scheme for the distribution of the keratin side chains is proposed. The elastic properties of hair are referred to 3 "phases," intercellular, cell-wall and intracellular keratin, which, resp., show increasing powers of resistance to extension and the action of reagents, and function elastically both in series and in parallel. The phenomena exhibited under the following conditions are studied and explained: stress of water at increasing temps., action of dil. NaOH at ordinary temps., adsorption of water, hydrolysis with steam or dil. alkali, irradiation with ultra-violet light or x-rays, and action of  $K_2Cr_2O_7$  and of eosin. F. D. Rossini

Delustering of rayon. J. C. Meiss. *Chem. Weekblad* 31, 214–22 (1934). E. Schotte

Military khaki. J. B. Prince. *Tiba* 12, 181–9 (1934). The process of making military khaki is described. The factors affecting the fastness of the shade were investigated. Conclusions: (1) With Cr sulfate and Fe acetate, excellent fastness to washing, Cl and sweat is obtained by using  $Na_2CO_3$  at the boil as fixing agent and passing through the Mather-Platt after the hot flue. (2) Similar results are obtained with Cr formate; Cr acetate gives approx. the same fixation of Cr and Fe, but less satisfactory fastness. A. Papineau-Couture

The effects of laundering processes on fabrics. R. E. V. Hampson. *J. Textile Inst.* 25, 23–32P (1934).—The various stages in the present-day washing process are described and their effects on fabrics are discussed. The relation of the construction and chem. finishing treatments to the behavior of fabrics in laundering is also considered.

Ruby K. Warner

**Strength measurements on rayon crepe yarns before and after boiling.** A new method of testing crepe yarns. W. Weltzien and W. Königs. *Mitt. Textilforschungsanst. Krefeld* 8, 67-9 (1932).—It is recommended to det. the breaking load of rayon crepe yarns both before and after soaking overnight in 1% soap and then heating at 80-90° for 1 hr., washing and drying. This treatment often causes a marked fall in strength, but is less severe than most dyeing processes. The strength of the soaped yarn should be not less than 1.1 g. per denier, and if it is < 1 g. per denier faults are likely. B. C. A.

**Stabilization of hydrogen peroxide in the bleaching of wool.** II. Effect of phosphate, ketone and alcohol sulfonate. R. Folner and G. Schneider. *Melliand Textilber.* 15, 24-7 (1934).—The catalytic effect of  $\text{NH}_3$  on the decompn. of  $\text{H}_2\text{O}_2$  was greatly decreased by adding lauryl alc. sulfonate and acetone. The strength and elasticity of wool yarn bleached in these baths were generally increased. The best results were obtained with lauryl alc. sulfonate and acetone in alk. solns. also contg.  $\text{Na}_2\text{P}_2\text{O}_7$ . Igepon T also gave good results. E. R. Rushton

**Electrolytic adsorption of iron on viscose rayon and other fibers.** Kotaro Tanemura, Hidco Kohno and Kotarō Nishimura. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 89-90 (1934).—The electrolytic adsorption of Fe on viscose rayon, silk, cotton and wool in solns. of  $\text{FeCl}_3$ ,  $\text{FeSO}_4$  and  $\text{FeSO}_4(\text{NH}_4)_2\text{SO}_4$  (concn. of Fe = 0.01 g./l. as  $\text{Fe}_2\text{O}_3$ ) was investigated by varying the  $\text{pH}$  of the solns. The optimum  $\text{pH}$  for the adsorption was 2.5-3.0 for  $\text{FeCl}_3$  soln. and 4.0-5.5 for  $\text{FeSO}_4$  soln. All the tested fibers showed the same tendency, although the degree of adsorption was different, showing that the change of the colloidal state of Fe hydroxide sol greatly affected the adsorption process. With  $\text{FeCl}_3$ , negatively charged  $\text{Fe}(\text{OH})_3$  sol and  $\text{Fe}^{++}$  had no affinity for the fiber, but the

positively charged micelle expressed as  $\left[ \frac{m\text{FeCl}_3}{n\text{Cl}} \cdot \frac{x\text{H}_2\text{O}}{x\text{H}_2\text{O}} \right] \text{FeCl}_3^+$  possessed affinity. With  $\text{FeSO}_4$ , the negatively charged micelle expressed as  $\left[ \frac{H\text{FeO}_2}{\text{Cl}, \text{H}_2\text{O}} \right] \text{FeO}_2^-$  had no affinity,

while the positively charged micelle  $\left[ \frac{H\text{FeO}_2}{\text{Cl}, \text{H}_2\text{O}} \right] \text{FeO}^+$  had affinity for the fiber. The greatest amt. of Fe on the fiber which could not be detected with the tannic acid test was about 0.01% of the fiber as  $\text{Fe}_2\text{O}_3$ ; this concn. was called the "allowable Fe concn.," it increased with the concn. of the acid, being 0.01 and 0.005 g.  $\text{Fe}_2\text{O}_3$ /l. for N and 0.1 N  $\text{H}_2\text{SO}_4$ , resp. Karl Kammermeyer

**Absorption of chromium salts by natural silk.** L. P. Michel. *Tiba* 12, 89-93 (1934); *Russa* 9, 185-9 (1934).—Tests carried out under quite different conditions on the whole bore out the findings of Hishiyama and Sekiguchi (C. A. 26, 3380, 5761). The amt. of  $\text{CrO}_3$  fixed by silk increases with the concn. of the bath (up to about 1%), the temp. (up to boiling), the time (up to 30 min.) and the alk. of the bath. Addn. of neutral salts had but little effect on the fixation of  $\text{CrO}_3$ , while addn. of mineral acids decreased it. A. Papineau-Couture

**Fixation of metal ions by animal hair.** I. Joseph Caspe and Wm. E. Austin. *J. Tech. Assoc. Fur Ind.* 4, 12-18 (1933).—Results indicate that the absorption of Fe as  $\text{FeSO}_4$  by Australian rabbit hair increases with the concn. of  $\text{FeSO}_4$  up to a concn. of 7% (where the absorption was 5.15%) and then decreases. At the higher concns. evidence of the formation of a sol. Fe proteinate was obtained. Preliminary treatment of the hair with  $\text{NH}_4\text{OH}$  or the addn. of  $\text{NaCl}$  to the  $\text{FeSO}_4$  soln. increases the absorptive capacity for Fe. Lowering the  $\text{pH}$  decreases the amt. of Fe fixed by the hair. W. A. Moore

**Action of alkaline copper solution on silk fibroin.** VII-VIII. Solution phenomena in the system fibroin-copper-amine alkali. Yūgiro Takamatsu. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 107-10 (1934); cf. C. A. 28, 1539.—Exptl. results are reported which led to the conclusion that, when fibroin is placed in an alk. Cu-

amine soln. where fibroin : Cu : K (as KOH) is 10 : 4 :  $\geq 10$ , and where amine is present in excess, the fibroin reacts first with a Cu-amine base, forming a fibroin-Cu-amine compd., and then reacts further with alkali, forming a fibroin-Cu-alkali compd. The amine therefore takes part in the formation of an intermediate product and thus accelerates the rate of soln. of fibroin. K. K.

**The properties of Sirrix O.** G. Tagliani. *Dyer* 71, 294-5 (1934).—Analyses of fabrics kier-boiled with and without Sirrix O Patented show that, calcd. on the weight of the goods, an addn. of 1/2% of this new kier-boiling assistant effects a more complete removal of the nitrogenous and mineral materials, increases the whiteness and absorbency of the textile and produces a stronger fiber. The compn. of Sirrix O Patented is not indicated. Ruby K. Worner

**Methods for determining the value of different tannins (catechu type) for tanning fish nets.** J. Olie and G. Brouwer. *Collegium* 1933, 541 7.—To det. total and permanent absorption (on cotton yarn with 2% tannin soln., centrifuge, weigh, dry, reweigh (loss of  $\text{H}_2\text{O}$  is used to calc. and correct for capillary absorption), then wash at 15.5° for 15 hrs. with 120 cc.  $\text{H}_2\text{O}$  per lb. to det. fixed or permanent absorption. This method has not been compared with exposure tests. South African wattle ext. is cheaper and is absorbed to a greater extent, and more firmly than catechu which is now used for tanning fish nets. I. D. Clarke

**Determining the wetting properties of liquids.** M. D. Rozenbrock. *Melliand Textilber.* 14, 306-7 (1933).—Constructional details are given of an app. which comprises a long and narrow liquor trough (A) and an arrangement whereby 2 standard lengths of right- and left-hand, hard-twisted cotton yarns are extended horizontally (similar to 2 consecutive links in a chain) between a fixed stop and the lower end of a pivoted needle, the upper end of which moves over a graduated dial. The wetting power of a liquid is detd. by raising A until the yarn is submerged and noting the rate of contraction of the yarn. B. C. A.

**Absorption of dyestuffs by cellulose** (Neale, Stringfellow) 2. Retene field. III. Nitroretenols, nitrofluorenes and related compds. [used in dyeing] (Bogert, Hasselstrom) 10. Effecting chem. reactions [optg. dyes] (Brit. pat. 402,410) 4. Aromatic amines [products used as dye intermediates] (U. S. pat. 1,950,079) 10.

**Gerin, J.:** Traité théorique et pratique de tissage du ruban (Tissus unis) Paris: Librairie polytechnique Ch. Béranger. 273 pp. Bound, F. 75. Reviewed in *Chimie & Industrie* 31, 665 (1934).

**Johannsen, Otto:** Handbuch der Baumwollspinnerei Rohwollerei und Fabrikanlagen. Lfg. 1. 4th ed., revised. Leipzig: B. F. Voigt. 40 pp. M. 2.50.

**Dyes.** I. G. Farbenind. A.-G. (Fritz Baumann, inventor). Ger. 590,746, Jan. 9, 1934 (Cl. 22a. 3.08). Acidones of the anthraquinone series are prepd. by treating 1,4-diaroylamino-5-aminoanthraquinone with *o*-halo carboxylic acids, or by treating 1,4-diaroylamino-5-chloroanthraquinone with *o*-amino carboxylic acids, and converting the products into acidones with optional acylation. In an example, 1,4-dibenzoylamino-5-aminoanthraquinone, Me *o*-bromobenzoate, anhyd. AcOK and Cu powder are heated in  $\text{PhNO}_2$  to give 1,4-dibenzoylaminoanthraquinone-6,5(N)-1',2'(N)-benzeneacidone. Another example describes the prepn. of 1,4-dibenzoylaminoanthraquinone-6,5(N)-2',3'(N)-naphthaleneacidone.

**Dyes.** I. G. Farbenind. A.-G. (Richard Stusser, inventor). Ger. 590,872, Jan. 15, 1934 (Cl. 22a. 2). Dyes contg. Cr or Cu, obtained by chroming or coppering *o*-alkoxy azo dyes, are treated with salts or acids which split off the metal to form Cu or Cr salts. Thus, the complex Cu compd. obtained by coppering the dye from 1 mol. of tetrazotized 3,3'-dimethoxy-4,4'-diaminobiphenyl and 2 mols. of 1-( $\beta$ -naphthyl)-3-methyl-5-pyrazolone-8'.

sulfonic acid is treated with  $\text{Na}_2\text{S}$  and  $\text{NaOH}$ .  $\text{CuS}$  is pptd. and is filtered off to leave a metal-free  $\alpha$ -hydroxy-diazo dye. Other examples are given.

**Dyes.** I. G. Farbenind. A.-G. Fr. 758,289, Jan. 13, 1934. Powd. vat dyes, particularly for printing textiles, are prepd. by intimately mixing fine pastes of the dyes or their leuco compds. with solns. of wetting or dispersing agents besides solns. of fixation accelerators and then drying the mixt. rapidly by pulverization in a current of heated air or other gas.

**Dyes.** I. G. Farbenind. A.-G. Fr. 758,961, Jan. 26, 1934. Derivings of improved fastness are obtained with mixts. on the one hand of vat dyes of the di- and isodibenzanthrone series and on the other those obtained by the process of Ger. 202,788, or their derivs. or substitution products.

**Dyes.** Compagnie nationale de matières colorantes et manufactures de produits chimiques du Nord Réunis, établissements Kuhlmann. Fr. 750,178, Jan. 30, 1934. A violet-blue dye suitable for acetate silk is made by nitrating 1,8-diamino-2,7-dimethylanthraquinone and reducing to the 1,4,5,8-tetraamino compd.

**Dyes.** E. I. du Pont de Nemours & Co. Fr. 758,880, Jan. 24, 1934. New diazo-imino compds. sol. in water and alkalies are prepd. by coupling a diazotized aromatic amine contg. no solubilizing group, such as  $\text{SO}_3\text{H}$  or  $\text{COOH}$ , with a compd. of piperidine or pyrrolidine contg. at least one solubilizing group. Dyes are prepd. by mixing these compds. with a coupling component and treating the mixt. with an acid at a high temp. Examples are given.

**Dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 758,081, Jan. 10, 1934. Arylides of carboxylic acids capable of coupling are united with diazotized or polyazotized bases of the formula  $\text{R}^1-\text{N}=\text{N}-\text{R}^2$  ( $\text{R}^1, \text{R}^2$  and  $\text{R}^3$  are any aryl groups, one at least of which has a diazotizable  $\text{NH}$  group and which may contain various substituents). Thus 4-aminotriphenylamine  $\rightarrow$  anilide of 2,3-hydroxynaphthoic acid gives a reddish blue shade. Several examples are given.

**Synthetic dye.** Standard Oil Development Co. Fr. 758,155, Jan. 11, 1934. A dye suitable for coloring lubricating oils is made by causing anhyd.  $\text{AlCl}_3$  to act on a mixt. of a polycyclic aromatic hydrocarbon and another hydrocarbon chosen from the class of aromatic and aromatic polycyclic hydrocarbons, eliminating the  $\text{AlCl}_3$  and sepg. the dye. Examples are given of dyes prepd. from a mixt. of  $\text{C}_{10}\text{H}_{10}$  and  $\text{C}_{10}\text{H}_8$ , xylene and  $\text{C}_{10}\text{H}_8$ .

**Mixed dyes.** Deutsche Hydrierwerke A.-G. Fr. 758,140, Jan. 11, 1934. Mixed quinone dyes are prepd. by condensing di- $\beta$  contg. free, monoalkylated or mono-aralkylated amino groups with quinones, by the usual methods, or dye intermediates are condensed with quinones and the dyes are then formed. The basic character of the amino group becomes sufficiently compensated by the electroneg. properties of the quinone to prevent formation of salts with acid. Several examples are given.

**Dye dispersions.** British Celanese Ltd., Tobias Orkman, George Reeves, Edmund Stanley, Henry C. Olpin and George H. Ellis. Brit. 402,054, Nov. 21, 1933. Dyes which exist in stable and unstable phys. forms and which normally yield dispersions unstable to hot soap soln. are converted into their stable forms by heat and then dispersed in an aq. medium by milling or grinding, whereby dispersions stable to hot soap soln. and suitable for dyeing org. derivs. of cellulose are obtained. Steam, hot air or hot  $\text{H}_2\text{O}$  may be used for the conversion. Among examples (1) diazotized 5-nitro-2-aminonaphthol is added to a soln. of dimethylaniline in aq.  $\text{HCl}$  in the presence of concd. sulfite cellulose waste liquor; the mixt. is made alk. with soda ash and heated to  $80^\circ$  and the dye is then filtered, washed and milled in  $\text{H}_2\text{O}$  and (2) the azo dye  $p$ -nitroaniline  $\rightarrow p$ -xylylene is prepd. and treated as in example 1.

**Metallized dyes.** I. G. Farbenind. A.-G. Fr. 758,069, Jan. 10, 1934. Azo dyes contg. at least 1 acid group and as coupling constituent, an 8-hydroxyquinoline are treated

with agents furnishing a heavy metal. Thus the dye obtained from sulfanilic acid and 5-methyl-8-hydroxyquinoline is heated with a soln. of  $\text{Cr}$  formate. Other examples are given. Fr. 758,070. Azo dyes prepd. by coupling a halogenated, nitrated or sulfonated diazotized  $\alpha$ -aminophenol with a tetrahydro- $\beta$ -naphthol, *e. g.*, 2-hydroxytetrahydronaphthalene-3-sulfonic acid, are treated with an agent furnishing a metal.

**Chromed dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 758,262, Jan. 13, 1934. Dyes obtained by coupling diazotized  $\alpha$ -hydroxyaminonaphthalene-sulfonic acids with naphthols are chromed so as to contain less than 1 atom of  $\text{Cr}$  for each group capable of being chromed and treating the resulting products with alk. agents which may be capable of yielding  $\text{Cr}$ . Several examples are given. Fr. 758,263. Azo dyes of the formula

$\text{R}^1\text{N}=\text{N}:\text{C}(\text{M})\text{C}(\text{N}:\text{NR}^2):\text{COOH}$ , where  $\text{R}^1$  is aryl contg.  $\text{COOH}$  in one of the  $\alpha$ -positions with respect to the azo chromophore and not contg.  $\text{OH}$  in the other  $\alpha$ -position,  $\text{R}^2$  is  $\text{H}$ , alkyl or aryl and one of the aryls contains at least one  $\text{SO}_3\text{H}$  group, are treated with chroming agents. Several examples are given. Fr. 758,264. Unsulfonated dyes which contain groups forming complexes with metals are caused to react with metallizing agents in the presence of aliphatic hydroxycarboxylic acids, *e. g.*, tartaric, lactic, citric or succinic acid.

**Chromed dyes.** I. G. Farbenind. A.-G. Fr. 758,268, Jan. 13, 1934. The tinctorial properties of chromed dyes are often favorably modified by treatment with org. compds. which are capable of being transformed into complex  $\text{Cr}$  compds., but which are not themselves dyes. Such compds. include oxalic, salicylic, tartaric, picramic, sulfo-salicylic and 2,3-hydroxynaphthoic acid and pyrocatechol.

**Dyes derived from cyanoacetic acid.** Ottmar Walil (to General Aniline Works). U. S. 1,950,421, March 13. Dyes which are suitable for dyeing "acetate silk" yellow to orange shades of good fastness are produced by causing about mol. quantities of a cyanoacetic acid ester or of a cyanoacetic acid arylamide, and of an aromatic  $p$ -amino-aldehyde of the benzene series (or a corresponding benzylidene compd.) which may be substituted in the amino group by alkyl, aralkyl or aryl to react together (suitably in the presence of a solvent such as alc. and pyridine and with the addn. of a sol. alk. reacting substance such as piperidine, ethylenediamine,  $\text{NaOEt}$  or  $\text{KOEt}$ ). Several examples with details of procedure are given.

**Indigoid dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 758,261, Jan. 13, 1934. Asym. indigoid dyes are prepd. by condensing 4,7-dialkyl-3-thionaphthenones of the formula (I) with 3-thionaphthenones of the formula (II) in which  $\text{X}$  is  $\text{H}$  or halogen,  $\text{R}$  is aryl and one of the groups  $-\text{C}-\text{Y}$  or  $-\text{C}-\text{Z}$  is  $-\text{C}-\text{H}_2$  or its equivs. where one  $\text{H}$  is replaced by  $\text{COOH}$  and the other of the groups is  $-\text{C}-\text{O}$  or its equivs. in which the  $\text{O}$  is replaced by  $N$ -aryl, or by  $\text{H}$  and halogen or 2 halogens. The dyes may be halogenated if necessary. Examples are given. Cf. C. A. 28, 2545<sup>1</sup>.

**Indigoid dyes; intermediates.** I. G. Farbenind. A.-G. Brit. 402,265, Nov. 30, 1933. Dimethylalkoxybenzenethioglycolic acids, having either a free  $\alpha$ -position or an  $\text{NH}_2$ ,  $\text{CN}$ ,  $\text{CONH}_2$ , or  $\text{COOH}$  group therein, are obtained by customary methods from dimethylalkoxybenzenes which contain an amino or a  $\text{HSO}_3$  group and a free  $\alpha$ -position thereto or both groups in  $\alpha$ -position to each other and are then converted into the corresponding hydroxythionaphthenes in the usual manner. Dyes are obtained by oxidizing the latter or by condensing them or their 2-anils with indigoid components. Dyes contg. halogen are

obtained by starting with the halogenated dimethylalkoxybenzenes or by halogenating the intermediates, *e. g.*, the hydroxythionaphthenes, or the final products. Among examples (1) 2,3-dimethyl-4-hydroxybenzenesulfonic acid, prep'd. by decomp'g. the diazo comp'd. of 2,3-dimethyl-4-aminobenzenesulfonic acid, is treated with  $\text{Me}_2\text{SO}_4$  and alkali and the resulting Na salt of 2,3-dimethyl-4-methoxybenzenesulfonic acid is melted with  $\text{PCl}_5$ ; the 2,3-dimethyl-4-methoxyphenylthioglycolic acid, obtained by reducing the resulting sulfonyl chloride and condensing with chloroacetic acid, is converted into the thioglycolic sulfonyl chloride and then into the hydroxythionaphthene; by oxidizing the 6,7-dimethyl-5-methoxyhydroxythionaphthene or by condensing with 2,1-naphthoxythiophene anil, dyes are obtained and (2) 1,4-dimethyl-2-methoxybenzene is acetylated, treated with Br and sapon'd. and the resulting base is converted into the corresponding thioglycolic acid and hydroxythionaphthene by the customary methods; the 4,7-dimethyl-5-methoxy-6-bromo-3-hydroxythionaphthene is condensed with 4-methyl-6-chloro-2,3-diketodihydrothionaphthene 2-*p*-dimethylaminoanil or with 4,6-dimethyl-5,7-dichloroisatin  $\alpha$ -chloride.

**Oxazine dyes.** I. G. Farbenind. A.-G. Fr. 758,247, Jan. 12, 1934. Condensation products of the oxazine series are prep'd. by condensing *o*-aminophenols contg. a  $\text{NO}_2$  group with quinones or haloquinones. Examples are given of the prep'n. of 3-bromo-7-nitro-, 4-chloro-7-nitro-, 1,3,4-trichloro- and tribromo-7-nitro-, 1,3,4-trichloro-6-nitro-, 1,3,4-trichloro-6-methyl-7-nitro-, 1,3,4,6-tetrachloro-7-nitro- and 1-chloro-3,4-benzo-7-nitro-2-phenoxazine, triphenyldioxazine dyes and a 6,13-dichloro-3,10-dinitrotriphenyldioxazine.

**Sulfur dyes.** I. G. Farbenind. A.-G. Fr. 758,589, Jan. 19, 1934. S dyes are obtained by treating with sulfurizing agents 2-phenoxazines, which may be substituted in the benzene ring by any substituents and in the quinone ring by atoms of halogen. Thus, dyes may be obtained from 1,3,4-trichloro-, 1,3,4-trichloro-6-methyl-, 1,3,4-trichloro-7-amino-, 1,3,4,6-tetrachloro-7-amino-, 1,3,4-trichloro-6-methyl-7-amino-, 1,3,4-trichloro-7-benzylamino- and 1,3,4-trichloro-7-nitro-2-phenoxazine.

**Sulfur dyes.** I. G. Farbenind. A.-G. (Otto Bayer, Wilhelm Hohenemser and Karl Larbig, inventors). Ger. 580,873, Jan. 12, 1934 (Cl. 22a: 1). Org. compds. are fused with polysulfides and Mo and Cu or compds. of these added. Thus,  $\text{Na}_2\text{S}$ , S,  $\text{H}_2\text{MoO}_4$  and  $\text{CuSO}_4$  are fused with 3-amino-6-hydroxyphenazine to give a dye coloring cotton red. Other examples are given.

**Sulfur dyes.** I. L. Khmel'nitskaya, G. E. Bonvech and V. A. Verkhovskaya. Russ. 31,525, Oct. 31, 1933. Nitro compounds, indophenols, etc., are fused with polysulfides of alkali metals in 2 stages. In the first stage the fusion is carried out under ordinary conditions and the process is discontinued upon a complete reduction of the original material; in the second stage the fusion is continued and is accompanied by the introduction into the melt, without any diln. with oxidizing substances, of such compds. as nitrites which do not contain hydroxyl groups of nitro compounds of K persulfate, air which is blown through the melt, etc. The melt is then treated in the usual manner.

**Acid dyes of the triphenylmethane series.** N. G. Laptev. Russ. 31,523, Oct. 31, 1933. In the oxidizing condensation of dialkyldisulfoaralkylaminodiphenylmethane with dialkylaniline by means of chromic acid mixt. salting out of the dye obtained is effected without preliminary filtration of the ppt. of the Cr compds. The entire ppt. obtained is filtered off and dried in the usual manner.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Brit. 403,222, Dec. 21, 1933. See Fr. 747,641 (C. A. 27, 5193-4).

**Azo dyes.** I. G. Farbenind. A.-G. Brit. 403,106, Dec. 11, 1933. Direct cotton dyeing dyes are made by (1) linking 2 moles of the azo dyes derived from diazotized 4,4'-nitroaminostilbene-2,2'-disulfonic acid (I), or the corresponding dibenzyl compds., by a suitable conversion of their  $\text{NO}_2$  groups, *e. g.*, by reduction to azo or

azoxy groups or conversion into the group  $\text{NHNH}$ , where X is a bivalent radical, *e. g.*, CO or cyanuryl, or (2) linking 2 moles of 4,4'-nitroaminostilbene- or -dibenzyl-2,2'-disulfonic acid itself, tetrazotizing the product thus obtained, *e. g.*, the dinitrodistilbeneureatetrasulfonic acid or the diaminoazoxydistilbenetetrasulfonic acid (if necessary after reduction) and coupling with suitable components. The dyes may be after-treated, *e. g.*, by oxidation, reduction, alkylation or formation of metal complexes. Among examples (1) the dye I  $\rightarrow$  salicylic acid (II) is reduced with NaOH and dextrose to the azoxy comp'd.; the same product is obtained by reducing I to the azoxy stage, tetrazotizing and coupling with II, (2) the monoazo dye of (1) is reduced with  $\text{Na}_2\text{S}$  and phosgenated, and (3)  $(\text{CN})_2\text{Cl}_2$  is condensed with I and the product is reduced, tetrazotized, coupled with PhOH and finally methylated.

**Azo dyes.** I. G. Farbenind. A.-G. (Arthur Zkscher, inventor). Ger. 590,956, Jan. 13, 1934 (Cl. 22a: 1). Dyes, insol. in water, are prep'd. by coupling diazo compds. with 4,8-dihydroxy-1,2,5,8-dibenzophenazine. Examples and a table of components and colors produced are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Georg Niemann, inventor). Ger. 590,957, Jan. 13, 1934 (Cl. 22a: 6). Diazo dyes insol. in water are prep'd. by coupling tetrazotized aromatic diamines with components including 3-alkyl-5-pyrazolone. Thus, 1-amino-4-nitrobenzene is diazotized and coupled with 3-methyl-5-pyrazolone. The product is reduced, further diazotized and again coupled with 3-methyl-5-pyrazolone to give a red dye. Another example is given.

**Azo dyes.** I. G. Farbenind. A.-G. (Hans Schindhelm, Richard Gast, and Richard Fleischhauer, inventors). Ger. 593,144, Feb. 22, 1934 (Cl. 22a: 13). Addn. to 591,495 (C. A. 28, 2543). 1 Mol. of an azo dye from diazotized 4-nitro-4'-aminostilbene-2,2'-disulfonic acid is condensed in the presence of alkali with 1 mol. of an amine or aminoazo dye not identical with the component used in making the stilbene dye. Substantive dyes of various colors are obtained, and may be subjected to any of the after-treatments ordinarily applied to stilbene or azo dyes. Examples are given.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 758,265, Jan. 13, 1934. Azo dyes are prep'd. by coupling arylides of 2,3-hydroxynaphthoic acids with diazotized bases of the

formula  $\text{acylNHC:CH.CR':C(NH}_2\text{):CH:COR}$ , where R is aryl or aralkyl and R' is halogen, alkyl, aralkoxy or alkoxy. A large no. of examples is given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 758,526, Jan. 18, 1934. Dyes which are stable to vulcanization and may be used for coloring plastic substances, such as rubber and synthetic resins, are made by combining 1 g. mol. of a tetrazotized diamine, such as benzidine, *o*-toluidine, dianisidine, with 2 g. mols. of a 3-alkyl-5-pyrazolone not substituted in the 1-position, the constituents not contg. free COOH or  $\text{SO}_2\text{H}$  groups.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 759,019, Jan. 27, 1934. Azo dyes insol. in water are prep'd. by coupling diazotized 1-amino-2- $\beta$ -alkoxycethoxy-4-nitrobenzenes with 2'-hydroxynaphthalene-3'-carbonyl-1-amino-4-methoxy-3-methylbenzene.

**Azo dyes.** Imperial Chemical Industries Ltd. Fr. 758,112, Jan. 11, 1934. Azo, diazo and polyazo dyes are prep'd. by combining compds. contg. diazo or tetrazo groups with the condensation products of alkylene chlorohydrin and aminonaphtholsulfonic acids. The products may be treated with compds. of Cu or Cr. Thus, diazotized picramic acid is coupled with the product obtained by condensing 2-amino-8-naphthol-6-sulfonic acid with ethylene chlorohydrin. Several examples are given.

**Disazo dyes.** I. G. Farbenind. A.-G. (Adolf Seglitz and Konrad Stenger, inventors). Ger. 590,879, Jan. 8, 1934 (Cl. 22a: 8). Diaminodiphenyl sulfones or their substitution products are tetrazotized and the products coupled with 1 mol. of a *o*-hydroxy carboxylic acid of the benzene series and 1 mol. of a 2-arylamino-8-hydroxy-

naphthalene-6-sulfonic acid. Thus, 3,3'-diaminodiphenyl sulfone is tetrazotized and coupled with 2-phenylamino-8-hydroxynaphthalene-6-sulfonic acid and salicylic acid, to give a dyescoloring wool in fast brown shades. Other examples are given.

**Disazo dyes.** I. G. Farbenind. A.-G. Fr. 757,817, Jan. 5, 1934. Disazo dyes capable of being chromed are prep'd. by coupling 1 mol. of 2,2'-dihydroxy-1,1'-binaphthyl-*ar*-octahydroide (m. 139-40°, by treating 2,2'-dihydroxy-1,1'-binaphthyl by H in the presence of a catalyst and under pressure in a solvent or diluent) with a sulfo-*o*-hydroxydiazotized component. The diacetyl comp'd. of the above, m. 112-3°, is prep'd. by hydrogenating the corresponding binaphthyl deriv.

**Vat dyes.** I. G. Farbenind. A.-G. Fr. 757,882, Jan. 5, 1934. Leuco acid esters of H<sub>2</sub>SO<sub>4</sub> are prep'd. by transforming phthaloylfluoranthenes, or their substitution products, by reduction and esterification with SO<sub>2</sub> in the presence of tertiary bases, into leuco acid esters of H<sub>2</sub>SO<sub>4</sub> sol. in water, or into const. salts of these. Phthaloylfluoranthene (m. 333°) and its substitution products are prep'd. by condensing fluoranthene and its substitution products with aromatic *o*-dicarboxylic anhydrides, and treating the ketonic acids by agents closing the chain.

**Vat dyes of the etherified hydroxydibenzanthrone series.** Otto Stallmann (to E. I. du Pont de Nemours & Co.). U. S. 1,950,366, March 6. In forming vat dyes of this "jade-green series," if the dihydroxydibenzanthrone is first converted into an alkali metal salt, such as the di-Na salt, and isolated dry in this form, and then submitted to alkylation, the latter reaction proceeds smoothly and regularly even with the heavier and less reactive alkylating agents, and, when using reagents such as Me<sub>2</sub>SO, less of the latter is required. Various examples and details of procedure are given.

**Derivatives of 4-aminodiphenylamine.** I. G. Farbenind. A.-G. (Arthur Zitscher and Wilhelm Seidenfaden, inventors). Ger. 590,581, Jan. 6, 1934 (Cl. 12q. 1.02). Diphenylaminoderivs. contg. an alkoxy or alkyl group in the 3-position and unsubstituted in the 4-position are coupled with diazonium comp'ds. and the azo dye split off. Thus, sulfanilic acid is diazotized and coupled with 3-methoxydiphenylamine. The product is treated with NaOH and Zn dust to give 4-amino-3-methoxydiphenylamine. Other examples describe the prep'n. of 4-amino-3-methoxy-3'-chlorodiphenylamine, m. 79-80°, 4-amino-3-ethoxydiphenylamine, m. 77-8°, 4-amino-3-propoxydiphenylamine, m. 52-3°, 4-amino-3-butoxydiphenylamine, m. 87-8°, 4-amino-3,6-dimethoxydiphenylamine, m. 117-18°, 4-amino-3-methoxy-5-methyldiphenylamine, m. 64-5°, 4-amino-3-methoxy-6-methyldiphenylamine, m. 80-1°, 4-amino-3-methoxy-3'-methyldiphenylamine, m. 52-3°, 4-amino-3-methoxy-2'-methyldiphenylamine, m. 60-1°, 4-amino-3-methoxy-2'-chlorodiphenylamine, m. 84-5°, 4-amino-3-methoxy-2',5'-dimethyldiphenylamine, m. 89-90°, 4-amino-3-methoxy-2'-methyl-5'-chlorodiphenylamine, m. 102-3°, 4-amino-3-methoxy-2',5'-dichlorodiphenylamine, m. 116-17°, 4-amino-3,6-dimethyldiphenylamine, m. 86-7°, and 4-amino-3-methyl-3'-chlorodiphenylamine, b<sub>p</sub> 188°.

**Naphthalene derivatives.** I. G. Farbenind. A.-G. Brit. 402,309, Nov. 30, 1933. 4-Aminonaphthalimide and derivs. thereof are prep'd. by treating 4-sulfonaphthalene-1,8-dicarboxylic acid (I), or the anhydride or a salt thereof, at 150° or above with NH<sub>3</sub> or with a simple or substituted alkylamine or with N<sub>2</sub>H<sub>4</sub> or cyclohexylamine. The products are useful as dye intermediates or dyes. Among examples I is treated (1) with aq. NH<sub>3</sub> at 170-80°, (2) as in example 1 but with (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> instead of NH<sub>3</sub>, (3) with aq. MeNH<sub>2</sub> at 150-100° to yield 4-methylaminonaphthalimide, and (4) taurine soln. at 170° in presence of Na<sub>2</sub>SO<sub>4</sub> to produce 4-sulfoethylaminonaphthalimide, which dyes animal fibers greenish yellow tints.

**Anthraquinone derivatives (dye intermediates).** Alexander J. Wiertz (to E. I. du Pont de Nemours & Co.). U. S. 1,950,348, March 6. A 1-haloanthraquinone-2-carboxylic acid is condensed with an aromatic primary

aminocarboxylic acid such as anthranilic, *m*- or *p*-amino-benzoic acid or a naphthylaminocarboxylic acid in an alk. medium in the presence of a catalyst such as CuCl<sub>2</sub> or CuSO<sub>4</sub>, forming dicarboxylic acid derivs. which when treated with condensing agents such as an excess of thionyl chloride or a slight excess of PCl<sub>5</sub> in an inert medium such as PhNO<sub>2</sub>, solvent naphtha, dichlorobenzene or toluene form anthraquinone acridones, the carboxylic acid being simultaneously converted into a carbonyl chloride group so that the final product has a COCl group in the phenyl nucleus. The resulting products readily condense with aromatic primary amines to form pink and violet dyes, and also readily condense with amino derivs. of anthraquinone to form fast orange dyes. Examples with details of procedure are given.

**Intermediates and dyes.** Kodak-Pathé. Fr. 757,707, Jan. 4, 1934. Selenazoles contg. an alkyl group in the 2-position and II or univalent radicals in the 4- and 5-positions are prep'd. by the reaction of selenoumidates of the aliphatic series with halo aldehydes or ketones of the type X.CHA.COBr (A and B are H, alkyl or aryl and X is Cl or Br), e. g., ClCH<sub>2</sub>CHO, ClCH<sub>2</sub>COCH<sub>3</sub>, BrCH<sub>2</sub>COC<sub>2</sub>H<sub>5</sub>,  $\alpha$ -bromopropiophenone and  $\alpha$ -bromodisubstituted benzoin. Examples are given of the prep'n. of 2-methyl- (b<sub>p</sub> 32-4°), 2,4-dimethyl- (b<sub>p</sub> 56-8°), 4-phenyl-2-methyl- (m. 63-4°), and 4-methyl-2-ethyl-selenazole (b<sub>p</sub> 74-8°). Fr. 757,708. New dyes which are particularly useful as photographic sensitizers are prep'd. by uniting a comp'd. contg. the ring

with a comp'd. contg. a quinoline group. The dyes may be prep'd. by treating an alkylated quaternary salt of the heterocyclic base, contg. a Me group capable of reacting, by an alkyl halide of a 2-haloquinoline, particularly 2-iodoquinoline. Examples are given of the prep'n. of the iodides of 3,4-dimethyl-1'-ethyl-, 4-phenyl-3-methyl-1'-ethyl- and 4-phenyl-1',3-diethyl-oxazolopseudo-cyanine, 3-methyl-1'-ethyl-, 3,4-dimethyl-1'-ethyl-, 4-phenyl-1',3-dimethyl-, 4-phenyl-1',3-diethyl- and 4-phenyl-3,5-dimethyl-1'-ethyl-thiazolopseudo-cyanine, 1',3,4-trimethyl-, 4-methyl-1',3-diethyl- and 4-phenyl-3-methyl-1'-ethyl-selenazolopseudo-cyanine.

**Intermediates and dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 758,079, Jan. 10, 1934. New intermediates for dyes are prep'd. by introducing alc., aryl alc. or alkylenic ether or ester groups into imogen groups of aromatic comp'ds., or new dyes are prep'd. by introducing *N*-hydroxyalkyl groups of which the OH is esterified or etherified into azo dyes. Examples are given of the prep'n. of  $\beta$ -(ethylphenylamino)ethyl methyl ether, b<sub>p</sub> 93°, ( $\omega$ -acetoxyethyl)- $\beta$ -thylaniline, b<sub>p</sub> 128°,  $\beta$ -(2-methoxy-5-methylanilino)-ethyl methyl ether, b<sub>p</sub> 108-10°, and of several dyes.

**Intermediates and dyes.** I. G. Farbenind. A.-G. Fr. 759,210, Jan. 31, 1934. 4,8-Dihydroxy-1,2,5,6-dibenzophenazine (6,13-dihydroxy- $\alpha\gamma'$ -dibenzophenazine), m. 375-80° (with decompn.), and its derivs. are prep'd. by transforming 2-amino-3-hydroxynaphthalene, the II atom of the OH being replaced by an appropriate radical, into the phenazine and splitting off the radicals joined to the OH groups. Dyes are prep'd. by coupling the above with diazo comp'ds. Examples are given of the prep'n. 6,13-dihydroxy-2,9-dimethoxy- (m. above 380°), 6,13-dimethoxy-2,9-dibromo- (m. 382-5°) and 6,13-dihydroxy-2,9-dibromo- $\alpha\gamma'$ -dibenzophenazine (m. above 385°) and of dyes prep'd. from these. The m. p.'s given are uncorrected.

**Intermediates for dyes.** I. G. Farbenind. A.-G. Fr. 757,958, Jan. 8, 1934. Arylamides of 2-hydroxycarbazole-3-carboxylic acid substituted in the imino group are prep'd. by eliminating the alkoxy or alkoxycarbonyl group from 2-alkoxycarbazoles contg. a substituent in the imino group, treating the resulting products in the form of alkali metal salts by CO<sub>2</sub> under pressure and heating the resulting carboxylic acids with aromatic or heterocyclic amines in a solvent and with the addn. of PCl<sub>5</sub>. The prep'n. of *N*-ethyl-2-ethoxy- (m. 85°), *N*-ethyl-2-hydroxy- (m. 109-10°), *N*-methyl-2-ethoxy- (m. 85°), *N*-phenyl-2-

hydroxy-, and *N*-methyl-2-methoxy-carbazole (m. 235°), *N*-phenyl-, *N*-ethyl-, and *N*-methyl-2-hydroxy-carbazole-3-carboxylic acid (m. 239°) and the *p*-chloroanilide of the last compd. (m. 277-8°) is described.

**Dyeing.** I. G. Farbenind. A.-G. Brit. 403,248, Dec. 21, 1933. H<sub>2</sub>O-insol. monoazo dyes are made on the fiber by coupling diazotized 4-amino-3-methoxydiphenylamine with the *m*-nitroanilide of 2,3-hydroxynaphthoic acid. A fast, clear, greenish blue shade is obtained on cotton or regenerated cellulose. An example is given. The *N*-nitrosodiazo compd. of the base may be used in yarn dyeing and the NO group split off.

**Dyeing.** Karl Thies. Ger. 590,902, Jan. 12, 1934 (Cl. 8m. 1.01). Textiles are wetted in a bath at 15-25° before immersion in the hot dye bath.

**Dyeing textiles.** Deutsche Hydrierwerke A.-G. Fr. 758,190, Jan. 11, 1934. Direct dyeings on natural or regenerated cellulose fibers are made fast to washing by treating the fibers in a 2nd bath contg. a soln. of a salt of a quaternary NH<sub>4</sub> base which gives rise to an insol. salt. The fibers may also be treated with the salt before dyeing. Several examples are given.

**Dyeing cellulose esters and ethers.** British Celanese Ltd., George H. Ellis and Frank Brown. Brit. 402,391, Nov. 17, 1933. The cellulose derivs. are colored with an anthraquinone compd. having a *m*-alkylphenylamino or *m*-alkoxyphenylamino group as a substituent in the nucleus, sulfo groups being preferably absent, e. g., 1-hydroxy-4-*m*-tolylaminoanthraquinone, 1-amino-4-*m*-tolylaminoanthraquinone (I), 1,5-diamino-4,8-di-*m*-tolylaminoanthraquinone, 1-amino-4-(5'-methyl-2'-methoxyphenylamino)anthraquinone, 1-amino-4-(2',5'-dimethylphenylamino)anthraquinone. In an example I (from 1-amino-4-methoxyanthraquinone and *m*-toluidine) is dispersed in soap soln. and cellulose acetate dyed a bright blue shade from such soln. In 402,392, Nov. 17, 1933, the materials are colored with an anthraquinone compd. contg. as sole substituents an  $\alpha$ -hydroxy group, a free NH<sub>2</sub> or non-aromatically substituted amino group and an  $\alpha$ -arylamino group of the C<sub>6</sub>H<sub>5</sub> series. Among examples (1) 4-nitrochrysazin is reduced in soda and glucose and condensed with PhNH<sub>2</sub> in H<sub>2</sub>BO<sub>3</sub>; when dispersed by Turkey-red oil it yields blue shades on cellulose acetate, and (2) 4-aminochrysazin is condensed with *o*-toluidine. In 402,393, Nov. 30, 1933, the cellulose derivs. are colored by applying aq. suspensions of unsulfonated arylaminoanthraquinone compds. having an ether group as a substituent in *o*-position in the arylamino residue. In an example, cellulose acetate is dyed blue shades from a soap soln. contg. 1-amino-4-(2'-methoxyphenylamino)anthraquinone and Turkey-red oil; for printing purposes the dye paste is dild. and thickened with a gum thickening paste which may also contain a swelling agent (methylated spirits).

**Dyeing cellulose ester and ether materials.** British Celanese Ltd., Henry C. Olpin and George H. Ellis. Brit. 403,118, Dec. 11, 1933. Colorations are produced on materials made of or contg. cellulose esters or ethers by applying thereto, e. g., by immersion, mech. impregnation, printing or stenciling, an aromatic compd. (other than an azo compd.) contg. a nuclear NO<sub>2</sub> group and a OII-substituted wholly aliphatic group linked to an aryl nucleus through N, O or S, such compd. contg. at least 1 auxochrome. Specified compds. are nitroethanolamino-benzenes, -toluenes or -naphthalenes, e. g., 4-chloro-2-nitro- or 2,4-dinitro-1-ethanolaminobenzene; compds. contg. 2 or more aryl nuclei linked directly or through O, S, NH, CH<sub>2</sub>, CO, CONH or other atom or group, e. g., 2,4-dinitro-4'-ethanolaminodiphenylamine, 3-nitro-4'-ethanolaminobiphenyl, 1-benzoylamino-3-ethanolamino-4-nitrobenzene; nitroanthraquinone derivs., e. g., 1,4-, 1,5- or 1,8-nitro(hydroxyalkylamino)anthraquinones; and di(hydroxyalkyl)aminoaryl compds. They are obtained by the action of chlorohydrins, e. g., ethylene or glycerol chlorohydrins, or ether hydroxyalkylating agents, e. g., ethylene oxide, epichlorohydrin, upon amino, OH or SH compds. of appropriate configuration. Among examples, cellulose acetate in hank form is immersed in an aq. solu. at

80° contg. 4-chloro-2-nitro-1-ethanolaminobenzene (obtainable by reaction of 2,6-dichloronitrobenzene with monoethanolamine) with turning until the requisite golden yellow shade is obtained whereupon the hanks are lifted, rinsed and dried.

**Dyeing regenerated cellulose.** Soc. pour l'ind. chim. à Bâle. Brit. 402,284, Nov. 30, 1933. See Ger. 584,403 (C. A. 28, 340°).

**Dyeing animal fibers.** I. G. Farbenind. A.-G. (Heinrich Wagner, Hans Krzikalla and Alfred Hirsch, inventors). Fr. 758,085, Jan. 22, 1934; Ger. 590,934, Jan. 13, 1934 (Cl. 8m. 10.02). Animal fibers are dyed by treating them with a monoalkyl ether of a 1,4-naphtho-hydroquinone or of a 1,4-dihydroxyanthracene in the presence of an oxidizing agent. Probably 2 mols. combine in the 2-position with elimination of 4 atoms of H to form a new compd. Mordants such as compds. of Fe, Cu and Cr may be added to the fibrous materials.

**Dyeing wool.** Albert Landolt (to Soc. pour l'ind. chim. à Bâle). U. S. 1,949,801, March 6. See Brit. 399,226 (C. A. 28, 1874°).

**Dyeing furs, etc.** I. G. Farbenind. A.-G. (Erich Lehmann and Hans Wassenecker, inventors). Ger. 593,061, Feb. 21, 1934 (Cl. 8m. 10.02). Mordanted or unmordanted furs, hair and feathers are dyed with oxidation products of aromatic diamines contg. a group SR, where R is H or an alkyl or aryl residue. Oxidation products of aromatic *p*-diamines contg. a group SR may be used alone, but oxidation products of other aromatic diamines contg. a group SR are used in assocn. with known oxidation dyes. Thus, an aq. soln. contg. *p*-phenylenediamine and 1-ethylmercapto-2,4-diaminobenzene may be treated with H<sub>2</sub>O<sub>2</sub> soln. and then applied to white rabbit skin mordanted with a Cr, Cu, or Fe salt, whereby the skin is dyed black. Other examples are given.

**Photographically printing designs on textile piece goods with light-sensitive, e. g., diazo-type, materials.** N. V. Philips' Gloeilampenfabrieken. Brit. 403,001, Dec. 14, 1933. A discharge tube is used which has an incandescent cathode, the energy distribution being such that the energy of wave lengths shorter than 2700 Å. is less than 10% of that of wave lengths between 2700 and 5000 Å. The filling may be a gas, e. g., CN, He, or a metal vapor, e. g., Zn, Ti, Hg, Mg, Cd, Bi, Sb.

**Machine for defleshing sisal leaves and like fibrous material.** Geo. F. T. Holloway and Ralph Carter. Brit. 402,202, Nov. 30, 1933.

**Retting.** "Les Fibres Textiles," Soc. anon. Brit. 403,544, Dec. 7, 1933. Plants are retted by immersion in H<sub>2</sub>O, the temp. of which never exceeds 35° and to which is added a sol. agent comprising sapo., oils or fatty acids, sol. carbonates or chlorides, and hyposulfites or hypochlorites or oxides of the Na<sub>2</sub>O type. Cf. C. A. 27, 2826.

**Textile threads.** Marcel Ginet. Fr. 758,330, Jan. 15, 1934. A colloidal soln. of material of animal origin, e. g., pickled skin, is mixed with a soln. of cellulose, e. g., viscose, and the mixt. is used for making threads. The pickled skin is submitted to the action of a boiling concd. soln. of slaked lime to dissolve the skin and the Ca salts are afterwards sepd.

**Treating textiles.** Moritz Freiburger. Fr. 759,182, Jan. 30, 1934. In treatments of textiles involving the use of caustic alk. solns., proteins, e. g., albumin, casein or glue, or products derived therefrom, are added to the treating baths.

**Treating textiles with rubber and dye.** Merwyn C. Teague and Nehemiah H. Brewster (to Naugatuck Chemical Co.). Brit. 403,121, Dec. 11, 1933. Cf. U. S. 1,845,569 (C. A. 26, 2329 30). The dil. rubber dispersion contains a relatively high proportion of casein or other protein.

**Treating textiles.** Merwyn Clarence Teague and Nehemiah Hans Brewster (to Naugatuck Chemical Co.). Brit. 403,394, Dec. 11, 1933. Divided on 403,121 (preceding abstr.). In treating silk or rayon fabrics, e. g., stockings, with an aq. dispersion of rubber, e. g., latex, to produce a deposit of rubber imperceptible to the touch and sight and prevent laddering, etc., the stockings are first

scoured in a soap soln. heated to boiling. After scouring, the liquid may be removed and replaced by a dil. soap soln. together with an aq. dispersion of rubber and a dye preferably composed of 75% acid dye and 25% direct dye. Heating at 110°F. is continued till the dye is set, the latex being thereafter coagulated by adding at intervals a 5% soln. of K or NH<sub>4</sub> alum. Small amts. of glycerol and pine oil may be added prior to the addn. of the dye. Other coagulants may be used.

**Rubber and cloth sheets.** The International Latex Processes Ltd. Fr. 759,270, Jan. 31, 1934. The surface of cloth covered with rubber is hardened and made smooth by treatment with a heavy metal salt of a fatty acid, e. g., Zn stearate, and then halogenating, at least superficially.

**App. for drying webs of fabric.** Ernst Gessner A.-G. Brit. 402,676, Dec. 7, 1933.

**Crape fabrics.** British Celanese Ltd. Brit. 403,251, Dec. 21, 1933. In producing crepe fabrics, mixed fabrics whose warp and (or) wft contain(s) both yarns of org. cellulose derivs. and stretched yarns of regenerated cellulose are treated with a reagent, e. g., H<sub>2</sub>O or aq. solns., that causes the regenerated cellulose to shrink but does not affect the org. deriv. yarn.

**Crepe effect fabrics.** Inward Hoos (to American Glanzstoff Corp.). U. S. 1,950,474, March 13, 1934. After producing viscose filaments, they are wound while untwisted upon spools, the untwisted filaments are washed without desulfurizing, high left- and right-hand twists are applied to the filaments thus produced, a fabric is formed from the filaments, and the fabric is then desulfurized.

**Saponifying and drying rayon.** Henry Dreyfus. Brit. 402,104, Nov. 20, 1933. Filaments, threads, yarns, etc., of org. esters of cellulose, which at some stage of their manuf. have been stretched, or fabrics contg. the same, are saponif. by applying the saponif. agent to the materials while they are traveling and immediately drying under the influence of heat to effect rapid sapon. The products have a high tenacity and an affinity for cotton colors. Brit. 402,105, Nov. 20, 1933. See Fr. 750,550 (C. A. 28, 806<sup>o</sup>). Brit. 402,106, Nov. 20, 1933. Filaments, yarns, fabrics, etc., of org. esters of cellulose are subjected to sapon. by a medium comprising NaOH, KOH or other alk. compd. of an alkali metal, e. g., Na silicate, Na<sub>2</sub>PO<sub>4</sub>, in quantity less than that necessary to effect the desired degree of sapon., and in presence of an auxiliary agent which is not a compd. of an alkali metal and is alk. in character though less alk. than the saponif. agent proper or reacts with NaOAc or KOAc or other salt formed by the sapon. of the cellulose ester to re-form the saponif. agent, e. g., CaO, BaO, SrO, Ca(OH)<sub>2</sub>. Such reagent is present as a satd. soln. or a fine suspension. In 402,141, Nov. 20, 1933, divided on 402,104, the filaments, etc., which have undergone a stretching operation, or fabrics therefrom, are saponif. by an alc. saponif. agent contg. not more than 2% NaOH or the equiv. of another base. App. is described. In 402,143, Nov. 20, 1933, divided on 402,104 and 402,105, filaments, etc., of org. esters of cellulose are saponif. while being drawn in the form of a warp, web or sheet of yarns through a bath contg. the saponif. agent by rollers or the like extending over the whole warp, web or sheet. In 402,144, Nov. 20, 1933, divided on 402,105, the process of 402,104 is applied to the high viscosity products of 402,105. The saponif. agent comprises NaOH, KOH, Na silicate, Na<sub>2</sub>PO<sub>4</sub>, NaOAc or NaCl, in a medium which may contain a mono-, di- or poly-hydric alc., e. g., MeOH, EtOH, glycols, glycerol.

**Washing viscose rayon on bobbins.** T. D. Kornblit. Russ. 31,505, Oct. 31, 1933. The washing operation is discontinued before complete removal of the acid and the drying is carried out only to certain moisture content which should not permit the formation of hydrocellulose, thus eliminating the necessity of moistening the silk again for the spinning operation as well as its fixation by steam treatment.

**Dressing rayon yarn.** Algemeen Kunstzijde Unie N. V. Ger. 500,658, Jan. 8, 1934 (Cl. 8k. 1). Rayon yarn is dressed with solns. of oil and polymerized oil in a volatile solvent.

**Device for detecting defects in a running yarn or the like.** Charles D. Reynolds and George W. Scott (to Universal Winding Co.). U. S. 1,949,943, March 6, 1933. Mech. features.

**Apparatus for centrifuging thread or yarn windings.** Glanzstoff-Courtaulds G. m. b. H. Brit. 403,205, Dec. 21, 1933.

**Deformable bobbins for the liquid treatment of yarn.** Aldo Bazzocchi. Brit. 402,268, Nov. 30, 1933.

**Weighting textiles.** Maywood Chemical Works. Brit. 403,239, Dec. 21, 1933. Silk or fibers of rayon are weighted by treatment with colloidal solns. of mixed basic chlorides of weighting metals, prep'd. by adding to aq. solns. of the chlorides of said metals 1 or more carbonates or hydroxides of weighting metals whose chlorides are sol. and phosphates are insol., followed by the usual treatment with phosphate or other solns. to ppt. the weighting metals. In a modification, solns. of compds. in which the weighting metal is present in the acid radical, e. g., Na zincate, aluminate, plumbate or stannate, are used instead of carbonates or hydroxides. In an example ZnCO<sub>3</sub> is added to a soln. of Sn chloride, degummed silk or viscose is treated with the resulting colloidal soln. of basic Zn-Sn chloride, and the weighting finally effected by treatment with an alkali metal phosphate, e. g., Na<sub>2</sub>HPO<sub>4</sub>. Na silicate, tungstate or molybdate may be used instead of Na<sub>2</sub>HPO<sub>4</sub>, etc., and the chlorides of Fe, Cr, Mn, Zr and Ti are suitable in place of Sn chloride.

**Weighting animal fibers.** I. G. Farbenind. A.-G. Brit. 402,094, Nov. 21, 1933. Animal fibers, e. g., wool, silk, hairs of rabbits, dogs, camels, etc., are weighted by treatment with an aq. acid soln. contg. at least 10% (calcd. on the wt. of the fiber) of sulfonated aliphatic amides having the formula HCONR'R''SO<sub>3</sub>H, in which R and R' are aliphatic radicals and R'' is H or an aliphatic radical. The salts of the sulfonated amides may be used. The weighting may be effected together with other textile processes, e. g., dyeing. Among examples wool yarn is treated at elevated temp. with aq. baths contg. *N*-methylaminoethanesulfonic acid, trichlorostearyl-*N*-methylaminoethanesulfonic acid, etc., and mackintosh gabardine is dyed and weighted in a bath contg. hexachloropalmityl-*N*-methylaminoethanesulfonic acid, Cy-anchrol BGA, Amido yellow R, Amidonaphthol red 6B and H<sub>2</sub>SO<sub>4</sub>.

**Bleaching textiles.** Thomas Wm. Holt and Archibald S. Kilpatrick. Fr. 758,301, Jan. 15, 1934. Textile materials are passed through a bleaching liquid in a longitudinally plaited state. Ozonized air is injected into the liquor. An app. is described.

**Mercerizing.** Chemische Fab. vorin. Sandaz. Ger. 593,048, Feb. 20, 1934 (Cl. 8k. 2). The wetting and penetrating capacity of mercerizing lyes is improved by addn. of a phenol and an org. base. Thus, a mixt. contg. tar cresols 90 and aniline 10% may be added to a lye of 32° Bé. in the proportion of 1.17% by wt. Other examples are given.

**Marking textiles.** Imperial Chemical Industries Ltd. Fr. 759,114, Jan. 29, 1934. A marking compn. fast to boiling, bleaching, etc., contains stabilized rubber latex a pigment (monolite G yellow, Fast Monolite RN scarlet, lampblack, Caledon RC blue or indigo) and a filler (kaolin) and preferably a small amt. of a hydrocarbon such as C<sub>6</sub>H<sub>6</sub>.

**Upholstery material.** Magyar Ruggyantaárnyar R. T. (to The Anode Rubber Co. Ltd.). Brit. 403,375, Dec. 18, 1933. In making shaped upholstery material by coating animal, vegetable or mineral fibers with rubber dispersions, e. g., latex, the fibers are preliminarily treated with liquids which wet them and effect coagulation of the latex, preferably before the fibers are placed in the mold. A single liquid, e. g., CaCl<sub>2</sub> dissolved in a C<sub>6</sub>H<sub>5</sub>-MeOH mixt., or 2 liquids, e. g., C<sub>6</sub>H<sub>5</sub> or an org. sulfonic acid followed by a soln. of a coagulant, may be used. After treatment with the coagulant and drying, the fibers may be loosened by carding. A suitable dispersion comprises rubber latex, S. transformer oil, paraffin wax, a vulcanization accelerator and an antioxidant.

**Mothproofing.** I. G. Farbenind. A.-G. Fr. 758,192, Jan. 11, 1934. Products of the formula  $R-CHX-R$  ( $R$  is an aromatic ring, preferably a  $C_6H_5$  ring, contg. one or more atoms of halogen and an alkoxy or aralkoxy group,  $X$  is H or an aromatic ring, preferably a  $C_6H_5$  ring, which may contain one or more halogen atoms,  $SO_2H$  or both) are used to protect wool, furs, etc., from moths, etc. Examples include 2,2'-dimethoxy(or ethoxy)-3,5,3',5'-tetrachloro-2''- (or 4'')-sulfo-, dicyclohexyloxy (or benzyl-

oxy)-3,5,3',5',4'-pentachloro-6'-sulfo- and 2,2'-dimethoxy-3,5,3',5'-tetrachloro-4'-bromo-6'-sulfo-triphenylmethane. The compds. may be made by condensing 1 mol. proportion of an aldehyde with 2 mol. proportions of an alkyl, cycloalkyl or aralkyl ether of a phenol or naphthol. Several examples are given.

**Cleaning preparation for fabrics.** Arthur Eichengrün. Ger. 590,551, Jan. 5, 1934 (Cl. 8i. 5). The prepn. consists of  $CH_2Cl_2$  alone or mixed with other solvents.

## 26—PAINTS, VARNISHES AND RESINS

### A. H. SABIN

**A discussion on cooperative research.** J. A. Frome Wilkinson. *J. Oil & Colour Chem. Assoc.* 17, 80-8 (1934).—Cooperative research with special reference to paint and varnish problems is discussed. G. G. Sward

**Synthetic resin era in paint, varnish and lacquer technology.** A. O. Plambeck. *Can. Chem. Met.* 18, 50-1 (1934).—Many synthetic resins used in the varnish, lacquer and enamel mfg. industries are grouped in a table.

W. H. Boynton

**Photogenic spots on paint tests.** Henry A. Gardner. Nat'l. Paint, Varnish & Lacquer Mfrs.' Assoc. *Circ.* No. 455, 66-8 (1934).—Paint films prepd. indoors and stored in confined spaces often develop a mottled appearance when later exposed out of doors. Thus paints shipped for exposure at distant places may exhibit this characteristic. The phenomenon is ascribed to the photogenic action of the sun.

G. G. Sward

**Comparison of wet- and dry-film hiding-power tests.** Roscoe H. Sawyer. *Ind. Eng. Chem., Anal. Ed.* 6, 113 16 (1934).—Wet- and dry-film hiding-power detns. were made on paints contg. (1) basic carbonate white lead, (2) lithopone and (3)  $TiO_2$ . Hiding power of paint or pigment increased with increasing pigment concn. Wet- and dry-film tests yield significantly different relations between hiding power and pigment concn. A new dry-film test is described.

H. M. Stark

**The violet pigments.** W. Ludwig. *Farbe u. Lack* 1934, 110, 122, 135, 149-50.—The inorg. violet pigments are more permanent but also more expensive than the org. type. Individual members of each type are briefly discussed.

G. G. Sward

**Manufacture of Mars yellow.** Kaller. *Farben-Ztg.* 39, 301-2 (1934).—Precautions to be observed in the manuf. of Mars yellow are accurate ratio of  $FeCl_3$  to  $CaCO_3$  and oxidation at a low temp. (not over  $10^\circ$ ).

G. G. S.

**Titanium pigments for gloss finishes.** D. W. Robertson. *Official Digest Federation Paint Varnish Production Clubs* No. 134, 67-73 (1934).—The gloss of paints is influenced by the degree of dispersion of the pigments. Different vehicles are needed for active pigments, as  $ZnO$ , and inert pigments, as the  $Ti$  pigments. For the latter, a substantial proportion of highly polar compds. in the vehicle is required. Examples are given of successful formulation with  $Ti$  pigments.

G. G. Sward

**Some fundamental pigment vehicle relations and their effects in paints.** L. W. Ryan. *Paint, Oil & Chem. Rev.* 96, No. 7, 8 et seq. (1934); *Official Digest Federation Paint Varnish Production Clubs* No. 134, 73-83 (April, 1934).—A review of surface and interfacial tension theories and studies of Harkins, Langmuir, Bartell and others.

G. G. Sward

**Physical evaluation of finishes.** A. E. Schuh and H. C. Theuerer. *Ind. Eng. Chem., Anal. Ed.* 6, 91-7 (1934).—Tests measuring abrasion and impact resistance and distensibility were performed periodically on finish panels. The results were correlated with those from the usual exposure tests of the same panels. The phys. tests were shown to offer a means of predicting the probable endurance characteristics of a finish long before any visible failure sets in.

H. M. Stark

**Action of antioxidants on linseed oil for varnishes.** Franco Baldracco. *Boll. ufficiale staz. sper. ind. pell. mat. concianti* 11, 569-73 (1933).—Different series of linseed

films contg. various amts. of stearic acid or 1 or 2 rubber antioxidants were exposed to ozonized air or to ordinary air in the dark or in combination with either sunlight or Hg-vapor arc light. Tabulated data of film wt. variations are given. Further work is promised.

J. W. P.

**Synthetic varnish resins of today.** Ewald Fomrobert. *Farben-Ztg.* 39, 247-9, 273-4 (1934).—The resinous state of matter is characterized by a mixt. of similar high mol. wt. compds. rather than by single compds. contg. so-called resinophoric groups. Stability in resins is easier to control with condensation than with polymerization processes. The properties of some synthetic resins are briefly described.

G. G. Sward

**Evaluating aluminum bronze powder.** W. B. Roberts and Junius D. Edwards. *Official Digest Federation Paint Varnish Production Clubs* No. 134, 61-7 (1934).—The following tests are among those applied to Al bronze powder: coarse-particle by dry screening in a "Rotap" machine, leafing properties in a Cumar mineral spirits soln. (30 g. to 100 cc.), color of flowed films, apparent density by settling in  $CCl_4$  or alc., chem. analysis for impurities, flake thickness by floating on  $H_2O$ .

G. G. Sward

**Reliable protective coatings for underground iron pipe lines.** Stüner. *Bauenschutz* 4, 38 (1933); *Bldg. Sci. Abstracts* 6, 165 G.—The most suitable type of coating for protection during transport and storage consists of 10%  $ZnCrO_4$  and 90% of a vehicle obtained by boiling 75% wood oil and 25% other vegetable or animal oil with 1% metal oxide drier. The oil should be free of resins and of the required viscosity when the pigment and 2 parts by vol. of benzine have been added. The pipes should also subsequently be given a priming coat of rust-preventive paint before the protective bituminous coating and impregnated wrapping are applied. As vehicle for the priming coat, varnish contg. wood oil is preferable to raw linseed oil.

G. G.

**Frederick Walton. Centenary of the birth of the inventor of kerosene.** Wm. B. Coleman. *Ind. Eng. Chem., News Ed.* 12, 119, 128 (1934).

R. J. C.

**Studies of resins. XII. Copal esters and fused copals.** Erich Stock. *Farben-Ztg.* 39, 141 (1934); cf. *C. A.* 26, 1458.—Certain constns. of a no. of com. copal esters and fused copals are given. The Storch-Morawski test may be either pos. or neg. for genuine copals.

**XIII. Larch turpentine.** *Ibid.*—Normal values for acid no. and sapon. no. were obtained, viz., 70.08 and 99.50, resp.

**XIV. Run amber.** *Ibid.* 141-2.—Certain constns. of a no. of samples are given. Contrary to usual experience, some samples were only partially sol. in a mixt. of alc.- $C_6H_6$ .

**XV. Brazilian copal.** *Ibid.* 142.—The authenticity of a so-called Brazilian copal is questioned.

**XVI. Purified kauri copals.** *Ibid.*—The constns. of kauri copals purified by (1) soln. methods and (2) fusion methods are given. In appearance they are similar but vary considerably in their constns. Both types are suitable for varnishes.

G. G. Sward

**The electrical, chemical and physical properties of alkyl resins.** R. H. Kienle and H. H. Race. *Trans. Electrochem. Soc.* 65, 20 pp. (preprint) (1934).—Alkyl resins may be hard, rigid, soft, balsam-like, flexible and rubbery. Such alkyl resins as are typical of the more common states were prepd. and investigated. During the

formation of unmodified alkyd resins, there occurs a progressive increase in elec. resistance with time, temp. of prepn. being const. No abrupt change in resistance was obtained with the heat-convertible resins as they jelled. Mobility is an important factor in influencing the resistance of a resin during formation, since the heat-convertible resin shows a much higher resistance for a given percentage esterification than does the heat-nonconvertible resin. Elec. resistance may be conveniently used to study and follow resin formation. High dielec. losses and, to some extent, high effective dielec. const. of synthetic resins result from some form of conduction in the resin. Curing the resins improves the elec. properties. At high temps. the thermoplastic resins, because of their tendency to liquefy, are poorer electrically than heat-convertible resins. In general, dielec. losses are greater at high temps. than at low temps. Differences in elec. properties of heat-convertible and heat-nonconvertible resins are in agreement with differences in their phys. structure. Of the 3 mechanisms postulated as explanations of observed elec. characteristics having a critical frequency polar orientation in a viscous medium seems least probable, while conduction in the solvating component of a gel structure seems most probable.

**Oil-soluble phenolic resins.** E. Leighton Holmes. *J. Soc. Chem. Ind.* 53, 74-77 (1934).—Fractions of low-temp. tar boiling above 230° are condensable with (CH<sub>3</sub>O)<sub>2</sub> to form resins which can be incorporated in lung oil. This is also the case with phenols boiling above 230° when derived from vertical-retort tars (carbonization temp. 1000-2000°). Unattacked phenols are removed by distn. with superheated steam at 200° and above; *p*-EtPhOH reacts with HCHO in the presence of (COOH)<sub>2</sub> to yield an oil-sol. resin, m. 120-35°.

W. J. Peterson

**Glycerol [use in the production of synthetic resins] (Höover) 27.** Viscosity curves of lyophilic colloids [linseed-oil emulsions] (Shemyakin) 2. [Resin-like] rubber products (Ger. pat. 590,605) 30. Azo dyes [for coloring synthetic resins] (Fr. pat. 758,526) 25.

**Paint.** N. F. Rabotnov. *Russ.* 31,526, Oct. 31, 1933. In mixing an aq. lithopone paste with drying oil, linseed oil and gasoline rapid sep. of the water is effected by the introduction of about 0.2% of Na<sub>2</sub>CO<sub>3</sub> to the paste accompanied by agitation.

**Phosphorescent compositions.** Frederic Wm. V. Fitzgerald. *Brit.* 402,777, Nov. 27, 1933. Dehydrated quinine sulfate (I), which may be replaced by a quinine compd. formed by adding an alc. soln. of I to a soln. of I in AcOH and dehydrating the crystals formed, is added to the compns. to prevent decompn. of the phosphorescent ingredients. A luminous paint is prepd. from a powder or paste, made by mixing dry ZnS or CdS with I (heated to remove H<sub>2</sub>O of crystn.), with or without glycerol and liquid paraffin, by the addn. of a lacquer-such as collodion or a mixt. of French turpentine, copal or dammar, and boiled linseed oil. Small amts. of radioactive substances may be added and powd. glass or pigments. A mixt. of powd. Zn and Si may be incorporated to render the coating electrically conducting.

**Pigments.** Mario Michels. *Fr.* 758,012, Jan. 8, 1934. Pigments fast to light are prepd. by pptg. basic dyes with solns. of prussians and Cu salts, reducing the ppts. obtained and subjecting the pigments which result to a certain ripening by simple storage in the form of a paste or by prolonged heating in acid, neutral or alk. medium and with or without accelerators, such as Na citrate.

**Iron oxide pigments; sodium sulfate.** Verein für chem. und metallurgische Produktion. *Ger.* 593,269, Feb. 23, 1934 (Cl. 22f. 7). FeSO<sub>4</sub> is treated with NaCl in known manner to yield FeSO<sub>4</sub>·Na<sub>2</sub>SO<sub>4</sub>·4H<sub>2</sub>O, and the latter is mixed with soda, in an amt. equivalent to the Fe content, and heated to about 700° with access of air. A mixt. of Fe<sub>2</sub>O<sub>3</sub> and Na<sub>2</sub>SO<sub>4</sub> is obtained, and is sepd. by extn. with water. The double salt may be dehydrated before the soda is added.

**Dispersing pigments.** Brevolite Lacquer Co. *Fr.* 758,068, Jan. 10, 1934. Pigments are dispersed in solns. of cellulose esters by slowly grinding a mixt. of pigment and cellulose ester (e. g., nitrocellulose) with an agent capable of swelling the ester and with an oxidized vegetable oil (e. g., oxidized castor oil) in a hydrocarbon of low b. p. (e. g., petroleum naphtha of low b. p.) until a homogeneous mixt. is obtained, and sepg. the hydrocarbon from the reaction product.

**Lithopone.** Frank G. Breyer and Joseph P. Koller (to Krebs Pigment & Color Corp.). *U. S.* 1,949,925, March 6. An aq. slurry of the previously pptd., muffled and quenched product is passed through a colloid mill to refine the grain size to that of a good French-process ZnO, about 0.3-0.5% of Na silicate is added (based on the lithopone), the slurry is agitated to permit adsorption of the silicate, and the product is filtered out and dried. It has improved flowing properties for producing smooth coatings.

**Cadmium yellow.** Silesia, Verein Chemischer Fabriken. *Brit.* 402,358, Nov. 30, 1933. See *Fr.* 757,225 (C. A. 28, 2553).

**Oxidized fatty oils; paints.** Mitchell G. Thomson, Arthur C. Hetherington, Stuart A. Sinn and Imperial Chemical Industries Ltd. *Brit.* 403,648, Dec. 18, 1933. Solid gelled oils are prepd. by heating nondrying vegetable oils with an O-contg. gas at 140-200° and subsequently working the product, with or without solvents. Thus a stream of air is passed through castor, blown cottonseed or olive oil, heated at 155°, and the stiff jelly thus produced passed through a mill together with PhMe, C<sub>11</sub>H<sub>7</sub>, Me<sub>2</sub>CO, EtOAc or turpentine to form a homogeneous dispersion or soln. A paint is formed by mixing such soln. with a cellulose deriv., e. g., nitrocellulose, together with camphor, ester gum or other resins, pigments, e. g., C black, drying oils and solvents, e. g., methylated spirits, ethyleneglycol, Et<sub>2</sub>O, cyclohexanol, mineral oils. The paint may be applied to fabric to form leather cloth.

**Drying-oil products.** I. C. Farbenind. A.-G. *Brit.* 402,759, Dec. 6, 1933. Sulfite compds. of oxidized drying oils are made by treating blown oils or oxygens with H<sub>2</sub>SO<sub>3</sub> or its salts. The oxygens prepd. from linseed, perilla, soy-bean or tung oil by the process of *Brit.* 238,200 (C. A. 20, 1913), are suspended in H<sub>2</sub>O and agitated with SO<sub>2</sub>. The resulting foaming mass is heated to remove excess SO<sub>2</sub>, whereupon the sulfite compd. is pptd. and rendered H<sub>2</sub>O-sol. by treating with an alkali base or NH<sub>3</sub>. H<sub>2</sub>O-sol. compds. may be made directly by replacing H<sub>2</sub>SO<sub>3</sub> with an aq. soln. of NaHSO<sub>3</sub>. Aq. solns. of such compds. may be used in the manuf. of adhesives or paints and, on evapn., yield films which may be hardened and rendered insol. by heating to 100° or by treating with O or H<sub>2</sub>O<sub>2</sub>. The H<sub>2</sub>O-sol. compds. may be treated with alk. earth or heavy-metal salts, e. g., BaCl<sub>2</sub>, FeCl<sub>3</sub>, Pb(OAc)<sub>2</sub>, to form resinous substances which may be used as varnish ingredients.

**Varnishes and pressed goods.** G. S. Petrov. *Russ.* 31,612, Oct. 31, 1933. Artificial phenol resins or resols are subjected to a preliminary purification by extn. with ethers, gasoline, C<sub>6</sub>H<sub>6</sub>, C<sub>6</sub>H<sub>5</sub>CH<sub>3</sub> or chlorine-substituted hydrocarbons or mixts. of these.

**Novo-varnishes.** G. S. Petrov and A. A. Pichugina. *Russ.* 31,615, Oct. 31, 1933. The initial phase of the condensation of phenols with aldehydes is carried out in the presence of two catalysts, mineral and fatty acids, while the second phase is characterized by the use of only the second catalyst after the removal of mineral acid by washing the semifinished product with H<sub>2</sub>O.

**Lacquers and varnishes.** Jean M. Martinon-Bourget. *Fr.* 758,328, Jan. 15, 1934. A soln. of beeswax in gasoline and a soln. of paraffin and Bourgogne pitch in benzene are mixed and used as a support for lacquers and varnishes.

**Lacquer.** Thomas F. Murray, Jr. (to The Eastman Kodak Co.). *Can.* 339,837, Mar. 26, 1934. An outer coating of cellulose acetate lacquer contg. diphenylguanidine or a diphenylbenzene or their derivs. or equivalents is applied to an undercoating of cellulose nitrate, which deteriorates rapidly in the presence of ultra-violet light.

**Cellulose ester lacquers.** Carbide and Carbon Chemicals Corp. Ger. 590,858, Jan. 11, 1934 (Cl. 22h. 4). The lacquers contain a synthetic resin obtained by the incomplete polymerization of a mixt. of vinyl chloride and vinyl acetate. Examples are given.

**Coating surfaces.** Eberhard Wurbs. Fr. 757,884, Jan. 5, 1934. Coating compns. having a basis of mineral oils, heavy oils, asphalt or varnish have incorporated in them substances which liberate gases more or less continuously. The osmotic pressure of the gases prevents the attacking agents reaching the surface. Carbonates, nitrites, etc., may be used. Metals which are far from one another in the potential series of Arrhenius and which act as a galvanic element may also be incorporated in powder form.

**Apparatus for coating surfaces by spraying.** George A. Stevenson. Brit. 403,207, Dec. 21, 1933.

**Ornamenting.** N. V. Veruis-, Ver- en Japanlaka-fabrieken Hermann A. Schreuder & Co. Brit. 402,710, Dec. 7, 1933. A thick white or colored paint, which comprises a pigment and a binding agent, preferably consisting of a mixt. of wood oil, linseed oil (artificial) resin and driers, and dries to form a mat surface; is applied to the surface to be ornamented, a light relief is formed by means of a roller, etc., and the protruding parts of the pattern are polished to produce a lustrous surface forming a contrast with the low parts.

**Wrinkle finish for flexible materials such as cloth, paper, leather, rubber, etc.** Frank B. Root (to Chadeloid Chemical Co.). U. S. 1,950,417, March 13. A flexibilized wrinkle-finish coating is produced on materials such as paper, cloth, etc., by use of various described compns. which may include wrinkling and non-wrinkling oils, dibutyl phthalate, fillers, etc.

**Condensation products.** I. G. Farbenind. A.-G. Fr. 758,042, Jan. 9, 1934. Products resembling resins are made by causing  $C_2H_2$  to act at a temp. of 100–300° on a hydroxy cyclic compd., e. g.,  $PhOH$ , cresol, *o*-chlorophenol, hydroxybiphenyl, resorcinol,  $\alpha$ -naphthol, tetrahydro- $\beta$ -naphthol and dihydroxydiphenyldimethylmethane, in the presence of an org. salt of Zn or Cd, e. g.,  $(AcO)_2Zn$ .

**Complex polymerization products.** I. G. Farbenind. A.-G. (Walter Reppe, Werner Starck and Arthur Voss, inventors). Ger. 593,399, Feb. 26, 1934 (Cl. 39h. 4.02). Vinyl esters of fatty acids contg. more than 4 C atoms are mixed with other polymerizable substances, e. g., with vinyl esters of lower fatty acids or with acrylic esters or diolefins. The mixts. are then polymerized by standard methods. Products useful for making lacquers and plastic masses are obtained. Examples are given. Cf. C. A. 28, 1484<sup>7</sup>.

**Resinous plastic composition suitable for molding under pressure.** Arthur S. Ford (to Industrial Sugar Products Corp.). U. S. 1,949,831, March 6. A plastic material is obtained by reacting together urea and the reaction product of a mono- or di-saccharide such as sucrose with an aldehyde such as formaldehyde. U. S. 1,949,832 relates to a generally similar process in which, however, phthalic anhydride is used instead of urea.  $(CH_2)_6N_4$  may be added for hardening.

**Alkyd resinous composition.** Frithjof Zwilmeyer (to National Aniline and Chemical Co.). U. S. 1,950,468, March 13. A resinous condensation product which is suitable for plastics, coatings, insulation, etc., is derived from a polyhydric alc. such as glycerol or a polyglycerol or glycol, an org. polycarboxylic acid such as monobromo-

maleic anhydride and a partially esterified org. polycarboxylic acid such as mono-isopropyl ester of monochlorosuccinic acid. Numerous examples are given.

**Resin emulsions.** Kurt Bruckmann and The Arber Size and Chemical Co. Ltd. Brit. 403,095, Dec. 11, 1933. Emulsions, suitable for sizing paper, are prepd. by introducing, simultaneously and as sep. streams, molten resin and an aq. soln. of a protective colloid; e. g., casein or  $CH_3O$ -casein, dispersed in an aq. alk. medium, or glue, gum arabic, agar-agar or Irish moss, into a high-speed rotary pump or a colloid mill. Colloidal or peptized clays may also be incorporated.

**Urea-aldehyde resins.** A. L. Eidlin. Russ. 31,616, Oct. 31, 1933. The reacting mixt. is condensed on a fabric.

**Resin.** Antoine C. Gillet. Fr. 758,891, Jan. 24, 1934. Opaque solns. of resin for sizing papers, etc., are made by subjecting resin to agitation in the acid in the presence of an aq. soln. of a sol. base, e. g.,  $NaOH$ ,  $KOH$  or  $NH_3$ , or of a salt of these. A rotary cylinder contg. balls may be used. Cf. C. A. 28, 1191<sup>4</sup>.

**Resins from cellulose.** Uchtbno-Oputnuil Zavod Moskovskogo Tekhnikuma Zhirovol Promuisl'mosti "Tekhzirzavod", G. S. Petrov and S. I. Dimakov. Russ. 20,747, May 31, 1931. In the prepn. of resins from cellulose materials, reacting with  $H_2O$  or aq. alkali under pressure sun-flower husks either natural or after hydrolysis with mineral acids are used as cellulose-contg. material. The resins are extd. in the usual manner.

**Varnishes.** G. S. Petrov and S. I. Dimakov. Russ. 31,530, Oct. 31, 1933; addn. to Russ. 20,717 (preceding abstr.). In the prepn. of varnishes with the application of resins obtained according to Russ. 20,747, phenol resins or oxidized gasoline-insol. high-mol. acids obtained in the oxidation of hydrocarbons and of drying or semidrying fatty oils or their acids are added.

**Synthetic resins.** Glasurit-Werke M. Winkelmann A.-G. (Richard Weithöner, inventor). Ger. 590,636, Jan. 6, 1934 (Cl. 12o. 26.02). See Brit. 395,894 (C. A. 28, 664<sup>9</sup>).

**Synthetic resins.** Herbert Hönel and Soc. Beck, Koller & Co. Fr. 758,168, Jan. 11, 1931. Resins are prepd. by condensing  $CH_3O$  in considerable excess with phenols or mixts. of phenols in which only 2 positions entering easily into reaction are not substituted and which contain at least one stable hydrocarbon radical of a relatively high order. The reaction takes place in contact with an energetic base which is neutralized after the reaction has terminated, and the whole is heated, before or after neutralization, to form a resinous product, solid at ordinary temp. Suitable phenols include thymol, *p*-tertiarybutylphenol, *p*-tertiaryamylphenol, *o*- and *p*-cyclohexylphenol, *o*-phenylphenol and  $\beta,\beta$ -bis-(4-hydroxy-3-methylphenyl)-propane.

**Synthetic resins.** Imperial Chemical Industries Ltd. Fr. 758,655, Jan. 22, 1934. Resins which are sol. in varnish oils and miscible or otherwise compatible with nitrocellulose are made by treating the Me or Et ether of 1,3,5-xenol with  $CH_3O$  or like reactive compd. of  $CH_2$  in an acid medium, e. g., aq.  $HCl$ .

**Synthetic resins.** Hans Th. Bucherer. Fr. 758,680, Jan. 22, 1934. Resins made from phenols and aldehydes are heated in dil. alk. soln. on a water bath or under reflux until a sample taken, after pptn. and washing with water, does not become turbid by diln. of its alc. soln. with any amt. of water.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

**Unsaponifiable fraction of spinach fat.** A glucoside of  $\gamma$ -spinasterol. Frederick W. Heyl and Donald Larsen. J. Am. Chem. Soc. 56, 942–3 (1934); cf. C. A. 27, 5996. Extn. of dry spinach with 95% EtOH and extn. of the EtOH residue with petr. ether to remove the lipides and then with 95% EtOH gives *phylosteroles*, m. 275–80°,

$[\alpha]_{D}^{25}$ , –33.0° ( $C_2H_5N$ ); *tetra-Ac deriv.*, m. 178.5–9°;  $[\alpha]_{D}^{25}$ , –13.4° ( $CHCl_3$ ); *tetra-Bz deriv.*, m. 178–8.5°;  $[\alpha]_{D}^{25}$ , 21.6°. Hydrolysis of the glucoside gives  $\gamma$ -*spinasterol*, m. 159.5–60°, optically inactive; *acetate*, m. 139.5–40°;  $[\alpha]_{D}^{25}$ , –14.1°; *benzoate*, m. 118.5–9.5°;  $[\alpha]_{D}^{25}$ , –10.3°; *p*-nitrobenzoate, m. 200°,  $[\alpha]_{D}^{25}$ , –8.0°;

*phenylurethan*, m. 144-5°,  $[\alpha]_{D}^{25}$  -15.9°; *dihydro- $\gamma$ -spinasterol*, m. 105.5-6°,  $[\alpha]_{D}^{25}$  24°; *acetate*, m. 115.5-6°,  $[\alpha]_{D}^{25}$  12.4°. This sterol is probably an isomer of  $\alpha$ -spinasterol. C. J. West

**Fat, lecithin and protein of the soy bean.** Hugo Kuhl. *Mühlenlab.* 4, 7-14 (1934).—A review. C. L. B.

**Direct determination of calcium soaps in fats.** Bergell. *Allgem. Oel- u. Fett-Ztg.* 30, 301-2 (1933).—After refluxing 10 g. of fat for a few min. with 200 cc. of  $Me_2CO$ , the soln. is cooled and decanted through a filter; the residue is again extd. with 100 cc. of  $Me_2CO$ , collected, washed with  $Me_2CO$ , and treated with acid to liberate the fatty acids, which are exhd. with ether and weighed as usual. Loss by solg. of Ca soap is not more than 6 mg. B. C. A.

**The fatty substances of shell fish. I. The fatty substances of asari, shijimi, karasugai, and hamaguri.** Mitsuharu Tsurumoto and Hanji Koyanagi. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 81-5 (1934).—The fatty substances of the 4 shell fish belonging to the class of Pelecypoda amount to only about 0.7% of the hard shell fish ("mukimi"). However, the dried "mukimi" of hamaguri gave 4.5% of substance. The fatty substances usually contained more than 50% by wt. of phosphatides, which gave fatty acids of high I nos. The phosphatide-free fatty substances formed a viscous mass and contained appreciable amts. of unsaponifiable matter, in the case of asari up to 45%. The fatty acids from these substances also had high I nos., e.g. large proportions of highly unsatd. acids. The unsaponifiable matter contained a sterol which is an isomer of cholesterol and forms an acetate of high m. p. It shows a characteristic red color reaction when a drop of  $H_2SO_4$  is added to its  $Ac_2O$  soln. It is probably a new compd. and differs from other zoosterols such as bombicsterol. II. The fatty substances of ear-shell (I) and top-shell (II) belonging to the class of Gastropoda amounted to about 1%. The phosphatide contents were about 40 and 61% for I and II, resp. The unsaponifiable matter of the phosphatide-free substances was about 20 and 38% for I and II, resp., and gave fatty acids with high I nos. The solid parts of the unsaponifiable matter consisted mostly of cholesterol with small amts. of the sterol found in the fatty substances of Pelecypoda. The liquid parts had fairly high I nos. Karl Kummermeyer

**Oleic-elaidic acid transformation as an aid in the analysis of mixtures of oleic, linoleic and linolenic acids.** H. N. Griffiths and T. P. Hilditch. *J. Soc. Chem. Ind.* 53, 75-81T (1934).—A method has been developed whereby oleic acid in admixture with linoleic and linolenic acids, can be detd. by analysis of the mixed fatty acids after treatment with the oxides of  $N_2$  until the oleic-elaidic acid equil. has been reached. The elaidization method is useful as an independent procedure whereby the results by thiocyanogen value may be checked, but its execution is more intricate and tedious than the latter. Its use has served strongly to support the validity of the Kaufmann process in the instances studied. W. J. Peterson

**New determining influences in oil- and fat-spoilage.** Th. Ruemele. *Seifensieder-Ztg.* 61, 125 (1934).—The action of light and the compn. of the fatty acid mixt. det. the speed in fat spoilage. Methyl oleate turns rancid more quickly than the mixed Me esters of oleic plus linoleic acid. The smaller the amt. of linoleic and linolenic acids in a fat, the easier does it turn rancid. P. Escher

**Antioxygens of fatty oils. XIII. Inversion of oxidative catalysts due to the species of fatty oils: 4. Action of *p*-nitroaniline on the oxidation of fatty oils.** Mitsuo Nakamura. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 80-9 (1934); cf. C. A. 27, 4703.—The action of *p*-nitroaniline (I) upon the oxidation of 2 groups of fatty oils was examd. under special conditions. It was found that I accelerates the oxidation of any fatty oil, natural or blended, in the earlier stage of oxidation, and that the prooxygenic activity increases nearly directly proportional to the I no. of the fatty oils. In oils, which have I

nos. less than 120, I gradually begins to become an anti-oxygen in the course of oxidation and this phenomenon of inversion takes place more quickly as the I nos. become lower. This inversion was not observed for oils of higher I nos. The expl. conditions have no effect on this inversion. From the fact that the relation between the catalytic action of I and the I nos. of fatty oils is analogous in both natural and blended oils, N. concluded that the inversion of catalysis in the case of I can entirely be attributed to the I nos. and not to the minor ingredients of the fatty oils. Karl Kummermeyer

**Palm-oil bleaching.** O. Eckert. *Seifensieder-Ztg.* 61, 140-51 (1934).—Crude as well as refined palm oil is readily bleached with 4% bleaching earth type Tonvil A. C. Addn. of 0.15-0.30%  $H_2SO_4$  to the earth does not improve bleaching but causes darkening during storage. P. Escher

**Processing of cottonseed meats.** W. R. Woolrich and E. L. Carpenter. *Chem. Met. Eng.* 40, 291-2 (1933). The functions and efficiency of the rolling and cooking operations prior to the hydraulic pressing of cottonseed oil are discussed. Expts. indicate that the cooking period can be considerably reduced by (a) good stirring of the meats, which are bad conductors of heat, and (b) adding the moisture immediately before the cooking and then heating to 90° with dry steam. With rapid heating to 110° the cell walls are ruptured by the steam enclosed. The pressure expelling process also is described. B. C. A.

**Chemical composition of the fruits of Aleurites produced in China. I. Aleurites fordii.** Ryu Hakubun. *J. Agr. Chem. Soc. Japan* 10, 25-30 (1934).—Tung oil is prepd. from the fruits of *Aleurites* in China. Analysis of the fruits of *Aleurites fordii* gave:  $H_2O$  3.742, ash 2.606, crude fat 61.500, crude protein 16.500, crude fiber 4.350 and sol. non-nitrogenous compds. 11.233% in air-dry matter. Most of the sugar consisted of nonreducing sugars; 6.68% of pentosans as present. Y. K.

**Extracting oils from comminuted animal wastes with dichloroethane and trichloroethylene.** T. A. Podosevna. *Schriften zentral. Forschungsinst. Lebensmittelchem.* (U. S. S. R.) 4, 20-32 (1933).—As solvents for extg. fats from bone meal, fish meal and the like,  $C_2H_5Cl_2$  and  $C_2HCl_3$  are very effective and almost as rapid as petr. ether. They are easily removed from the residue, which has high N content and little of the original odor. The solvent cannot be readily removed from the ext. without the aid of vacuum or aeration, and the fat undergoes a chem. change (decreased I no.). Julian F. Smith

**The grouping of halibut-liver oils.** R. T. M. Haines and J. C. Drummond. *J. Soc. Chem. Ind.* 53, 81-2T (1934); cf. C. A. 27, 3099.—Halibut-liver oils show a relationship between their I values and blue values, and can be grouped on the basis of ratios thus obtained. It is suggested that pure halibut-liver oil can be distinguished from any oils blended with cod-liver or similar oils by a consideration of the I value/blue value ratio, particularly if the origin of the halibut-liver oil is known. W. J. P.

**Effect of salt upon oil spoilage in emulsions.** Lowell B. Kilgore. *Oil and Soap* 11, 72-3 (1934).—A 50% cottonseed oil and water emulsion with pectin as the emulsifying agent and a conventional mayonnaise made with cottonseed oil were used in the tests. It was shown that the presence of above 3% of NaCl in the emulsions has a tendency to inhibit the spoilage of cottonseed oil. Emulsions having little or no NaCl darkened much more than those having a high NaCl content. Those oils which had been removed from the emulsions having a low salt content differed in taste from the oils from salty emulsions, the latter giving sweet oils and the others giving rancid flavors. B. Scherubel

**Making lecithin from soy beans.** A. N. Lebedev and V. S. Gryuner. *Schriften zentral. Forschungsinst. Lebensmittelchem.* (U. S. S. R.) 4, 118-35 (1933).—Crushed soy beans, after  $Et_2O$  extn., gave 1.84% phosphatides by extn. with abs. alc. at 60-65°, and 2.06% phosphatides with 96% alc. at 60-65°. Whole beans contained 1.25% org. P, soy-bean grits 0.77%, and hulls only 0.24%. The

ext. obtained with 96% alc. contained 16.07% lecithin. Extn. with gasoline gave only 0.51% yield of phosphatides; but gasoline contg. 15% alc. gave about the same yield as did 96% alc.; and the phosphatides thus obtained were much richer in lecithin (84.17%) than the phosphatides extd. with alc. A new method of lecithin production, based on this observation, is to ext. oil from the beans with gasoline, ext. again with gasoline and alc. mixt. (85:15), distill off the solvent, purify the ext. with alc. and blend with 20-40% of a solid fat, e. g., cacao butter, to make the finished lecithin product. This prepn. compares favorably with imported (American) lecithin preps. in its effect on the viscosity of chocolate. J. F. S.

**Some newer aspects of glycerol.** Kenneth Hoover. *Oil and Soap* 11, 69-71 (1934).—One of the new applications of glycerol is its use in the production of synthetic resins, especially the "alkyd or Glyptal" resins which are made by esterifying polyhydric alcs. with polybasic acids. These resins have found practical application as constituents of nitrocellulose lacquers where they are used to replace natural resins. They offer a substitute for celluloid and can be handled like rubber and are inflammable. Of the newer outlets for glycerol the most important in size is the anti-freeze field. The application of glycerol to food uses is likely to become of increasing importance. Studies by Carlson, Johnson and Johnson (C. A. 27, 2716) proved glycerol acceptable as food in the animal organism and without adverse subjective effects in human beings even upon the addn. of 110 g. glycerol per day to the diet. A newer field is that of glycerol derivs. of which the esters have received the most attention. Important among other derivs. are the ethers, amino derivs. and the oxidation products of glycerol. The ethers are colorless stable compds. of mild odor and vary from mobile liquids to cryst. solids and have excellent solvent powers. The amines are hygroscopic, viscous liquids or solids. They are strong bases with an ammoniacal odor and combine readily with fatty acids to produce soaps which are sol. in org. liquids and are excellent emulsifying agents. Of the numerous oxidation products of glycerol only a few have had much study such as glyceric acid, tartronic acid, mesoxalic acid and dihydroxyacetone. Biochem. syntheses have produced numerous products from glycerol including EtOH, acrolein, hydroacrylic aldehyde, PrOH, BuOH, butyric, lactic and citric acids, phorone and trimethylene glycol. E. Scherufel

**Liquid soaps and their preparation.** A. Thieme. *Seifensieder Ztg.* 61, 179-80, 199-200 (1934).—T. produces liquid K soaps contg. 4-30% fatty acids by running the oils at 70-90° into 50% KOH diluted with 60% H<sub>2</sub>O and stirring until thick. After standing 12 hrs. it is neutralized with olein or sulfonated oils, stretched with sugar soln. or KCl, etc., and filtered at 8° through asbestos pulp. P. Escher

**Properties of soap solutions.** V. Power of soap solutions to remove oily dirt. B. Tyutyunnikov, S. Pleshkova and A. Chernichkina. *Allgem. Oel- u. Fett-Ztg.* 30, 294-6 (1933); cf. C. A. 27, 4433.—The detergent (oil-removing) power of soap solns. of 0.25-1% concn. was measured; within this range: (1) Soaps of rosin and naphthenic acids have no detergent power (although the solns. can suspend powders in the McBain C test) and reduce the washing action if added to solns. of ordinary (fatty) soaps; (2) the detergent action of soaps increases with the concn. of the soln.; raised temp. improves the detergency of Na palmitate and stearate, but reduces that of soaps of rosin and the higher liquid fatty acids; (3) addn. of Na<sub>2</sub>CO<sub>3</sub> improves the washing power of solns. of soaps of rosin and naphthenic acids and mixts. contg. them, but reduces that of ordinary soap solns. (addn. of Na<sub>2</sub>CO<sub>3</sub> has a similar qual. effect on interfacial tension in all cases). Expts. indicate that the peptizing action of oleic soap is an important, although not the only, factor in detg. detergent power. B. C. A.

**Action of carbon dioxide upon soap base.** L. Lascaray. *Seifensieder-Ztg.* 61, 156 (1934).—Bergell's observation (cf. C. A. 28, 2205<sup>a</sup>, 2209<sup>a</sup>) that atm. CO<sub>2</sub> decomposes

<sup>1</sup> soaps during the drying process is correct. Soap is both a mol. and colloidal soln. and during drying the molecularly dissolved portion becomes colloidal. The decomposition of solid soaps by CO<sub>2</sub> can be explained by the steady spl. of fatty acids in concd. soap soln., because the small amt. of fatty acid which is liberated on the soap surface is strongly absorbed and held by the colloidal body of the soap, thus permitting a further decompn. of the soap. P. Escher

**Shaving-soap manufacture.** G. Knigge. *Allgem. Oel- u. Fett-Ztg.* 30, 299-301 (1933).—Practical notes on com. methods. B. C. A.

**Birch sap and its uses.** C. Voss. *Seifensieder-Ztg.* 61, 163-4 (1934).—Collection of birch sap occurs in March; trees of 12-14" diam. yield 2 l.; alc. is added as a preservative and the product used for cosmetics and soaps. P. Escher

<sup>3</sup> **The "fitting" of soaps and its influence upon stability during storage.** C. Bergell. *Seifensieder-Ztg.* 61, 143-5 (1934).—A cold-made neutral coconut-oil soap with 5% neutral fat may, after a few weeks, how 1-2% free fatty acids which would seriously interfere with its perfume. Cold-made soaps contg. tallow or tallow-like fats do not keep well; it can be analytically proved that the unstable tallow acids are displaced by the stronger free coconut-oil acids. If any stronger rosin soap is present, the rosin acids are liberated in place of the tallow acids, and they, being stable, will prevent rancidity. Stability in soaps is best secured by a gentle alk. reaction in the finished product. P. Escher

<sup>4</sup> **Spontaneous heating of soap.** W. H. Simmons. *Perfumery Essent. Oil Record* 24, 219 20 (1933).—A sample of powd. olive oil soap (0.0025% Fe), packed in paper bags, after one month's storage had a temp. of > 100° in the middle of the package; analysis showed: free fatty acids (as oleic) 13.7%, normal fatty acids 69.1%, oxidized fatty acids 16.0%, and I value of total fatty acids 61.6. B. C. A.

Utilizing sunflower-seed hulls (Sadikov, et al.) 23.

**Cignoli, Francisco:** Antioxigenos. Aceites endurecidos y liporolados. Rosario, Argentina: Ruiz. 40 pp.

<sup>6</sup> **Leent, F. H. van:** Analyse en Warekenis der voornameste vette Lichamen. Amsterdam: D. B. Centen's Uitgevers-Maatschappij. 384 pp. Fl. 9.

**Catalyst for hydrogenating fats and oils.** V. S. Sadikov. Russ. 21,535, Oct. 31, 1933. Glass wool, pearls or glass chips are covered with a metal compd. which is then reduced to metal.

**Apparatus for hydrogenating fats.** S. G. Mamotin. Russ. 31,536, Oct. 31, 1933. A hydrogenation app. constructed of clusters of vertical tubes, each being equipped with valves, which can be disconnected individually without discontinuing the process, is charged with a catalyst. The hydrogen is passed upward and the tubes can be preheated by flushing with superheated water or mineral oil.

<sup>8</sup> **Sulfo derivatives of higher fatty acids.** Georg Kalischer and Karl Keller (to General Aniline Works). U. S. 1,949,837, March 6. By methods similar to those used in accord with U. S. 1,851,102 (C. A. 26, 2989), sulfo derivs. are obtained by using as starting materials a water-sol. sulfite and a water-sol. salt of a halogen-contg. conversion product having an unsatd. character formed by heating a halogenated fatty acid of the general formula C<sub>n</sub>H<sub>m</sub>-RHal, COOH where R means hydroxyl or H and  $\alpha$  the number 4 or more with an alk.-acting agent, selected from the group consisting of hydroxides and carbonates of alkali and alk. earth metals with the addn. of a diluent. The products may be used as protective colloids.

<sup>9</sup> **Oxidation products of sulfur-containing derivatives of high fatty acids.** Karl Keller (to General Aniline Works). U. S. 1,949,838, March 6. See Ger. 553,854 (C. A. 28, 776<sup>a</sup>).

**Fatty glycerides.** The Procter & Gamble Co. Fr. 757,763, Jan. 4, 1934. Glycerides contg. more combined glycerol than necessary for the formation of triglyceride, are prepd. by chemically combining a polyhydric alc. with a fatty ester of the type of those found in fats, fatty oils and waxes, agitating them together in the presence of an active catalytic compd. chosen from the group of alcoholates and soaps, and concurrently removing steam from the reaction mixt.

**Purifying fatty oils.** Standard Oil Co. Brit. 402,651, Dec. 7, 1933. Fatty oils, *e. g.*, lard, sperin, cottonseed, soy or corn oil, are freed from high-melting constituents, *e. g.*, stearin, palmitin, free fatty acids, by dissolving in a liquefied, normally gaseous, org. solvent, *e. g.*, (iso-)butane, (iso-)butylene,  $C_3H_8$ , ethylene, propylene,  $Me_2O$ ,  $MeOEt$ , ethylene oxide, chilling the soln. and sepg. the pptd. substances. App. is described.

**Emulsions of fish-liver oils.** Deutsch Pentosin-Werke G. m. b. H. Ger. 593,395, Feb. 26, 1934 (Cl. 30h. 2). Aq. emulsions of fish-liver oils are stabilized by adding a small proportion of a soln. of Ca saccharate.

**Catalyst suitable for hardening oils.** Robinson Hindley Processes Ltd. Fr. 758,751, Jan. 23, 1934. Ni oxide is treated by another compd. of Si (*e. g.*, ethyl orthosilicate), coagulated by the action of  $NH_3$ , and the mass divided into granules, which are dried and submitted to the action of heat in a reducing atm.

**Waxy substances.** J. G. Farbermand. A.-G. Fr. 759,201, Jan. 31, 1934. A mixt. of aliphatic acyl compds. (acids, anhydrides and esters) is submitted to a "condensation-splitting" treatment in the presence of catalysts capable of removing  $CO_2$  from org. O compds., thus forming direct C chains contg. more C atoms than the primary substances. Several examples are given.

**Soap.** John Wearham. Brit. 403,650, Dec. 20, 1933. In the manuf. of irradiated soaps, ergosterol not previously irradiated is added to the soap or the fats to be saponify, and the mixt. irradiated artificially, *e. g.*, by means of a quartz Hg-vapor lamp or an elec. arc light.

**Irradiated soap.** Anthony Joseph Lorenz and Mark H. Wodlinger. Brit. 403,083, Dec. 11, 1933; cf. Fr. 742,181 (C. A. 27, 3632). Irradiated cholesterol, phytosterol, zymosterol, etc., may be used and irradiation may be with x-rays, infra-red rays or cathode rays.

**Purifying liquid toilet soaps and perfumed liquids.** K. A. Lukin and S. G. Vainshtein. Russ. 31,537, Oct. 31, 1933. The liquid to be purified is treated with freshly pptd.  $Al(OH)_3$  and left to settle for 2-3 days.

**Soap substitutes.** Adolf Welter. Fr. 758,733, Jan. 22, 1934. Sulfonates of hydrocarbon compds. are made into filaments, either alone or in the presence of other electrolytes or small amts. of soap, for rapid soln.

**Emulsifying, cleansing and wetting agents.** H. Th. Böhme A.-G. Ger. 593,422, Feb. 26, 1934 (Cl. 23c. 2).

Use is made of synthetic glucosides of high mol. wt. Suitable glucosides are obtainable by condensing glucose, maltose or lactose with aliphatic alcs. contg. more than 8 C atoms or with alkylphenols or hydrogenated phenols. Examples of the use of the glucosides are given.

**Capillary-active water-soluble substances suitable for wetting, emulsifying, etc.** Ludwig Becker and Robert Müller (to Chemische Fabrik Pott & Co.). U. S. 1,950,287, March 6. Polymerized unsatd. aliphatic hydrocarbons (such as may be produced from oil-cracking gases or from tertiary  $abu$  alc.) contg. non-aromatic polymers are treated with a sulfonating agent such as concd.  $H_2SO_4$ .

**Wetting agents, etc.** H. Th. Böhme A.-G. Brit. 402,295, Nov. 30, 1933, divided on 393,904 (C. A. 27, 4001). To improve their wetting, dispersing and penetrating properties and to improve the conveyance of the effective substances present, esters of tetrahydrofurfural alcohol (I) with aliphatic carboxylic acids contg. not more than 5 C atoms are added to dispersions of liquids insol. in  $H_2O$  and to solns., plastic preps., and dispersions of fats, waxes, highly polymeric hydrocarbons or carbohydrate, *e. g.*, rubber, gutta-percha, cellulose, polysaccharides and cellulose esters, camphor and esters serving as plasticizing agents for lacquers, *e. g.*, triphenyl phosphate, tritolyl phosphate, dibutyl tartrate, glycerol triacetate, and adipic and methyladipic alkyl esters. The insol. liquids specified are (halogenated) hydrocarbons, hydrogenated phenols, higher alcs. and ketones. The said esters of I may be used with soaps, sulfonated oils or higher alcs. and aromatic sulfonic acids, *e. g.*, in the prepn. of solvent soaps. In 402,290, Nov. 30, 1933, said esters are added to dispersions or pastes of dye powders.

**Wetting agents, etc.** Soc. pour l'ind. chim. à Bâle. Fr. 758,078, Jan. 10, 1934. Sulfones of the formula  $R^1SO_2R^2$  ( $R^1$  is an aromatic, aliphatic, aliphatic-aromatic or cycloaliphatic group and  $R^2$  is an aliphatic or cycloaliphatic group, at least one of the 2 being of high mol. wt.) are transformed into sulfuric derivs. sol. in water by the introduction of true sulfonic acid or ester groups. The products are auxiliary products in the textile industry. The sulfones are prepd. by causing  $\alpha$ -halogen acids of high mol. wt. or their derivs. to act on aromatic sulfonic acids. Thus, the Et ester of  $\alpha$ -bromostearic acid is heated under pressure with Na toluenesulfinate in  $EtOH$ , and the product is sulfonated.

**Wetting agents, etc.** Henkel & Cie G. m. b. H. Fr. 759,750, Jan. 23, 1934. Org. compds. which contain at least one lipophilic radical and at least one group of esters of thiosulfuric acid in the mol., are used as agents having capillary activity, particularly wetting, washing, purifying, cleansing, emulsifying and dispersing agents. Compds. include fatty esters of high mol. wt. of the hydroxyethyl ester of thiosulfuric acid ( $RCOOCH_2CH_2SSO_3Na$ ) and alkyl esters of high mol. wt. of the (carboxymethyl) ester of thiosulfuric acid ( $ROCOCH_2SSO_3Na$ ).

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

**Some colloid-chemical processes in the sugar factory.** Erich Gundermann. *Centr. Zuckerind.* 42, 51-2, 71-3 (1934).—A review of the types of colloids present in raw beet juice and of their behavior during defecation with lime and satn. with  $CO_2$ . C. B. Purves

**The relationship among the viscosity, temperature and density of pure sugar solutions.** Kurt Heinrich. *Centr. Zuckerind.* 42, 29-31 (1934).—A graphical method of interpreting data ranging from 20° to 100° and from 0° to 76° Brix. C. B. Purves

**Investigations on the ripening of POJ 2878. VI. Estimation of the number of stalks to be sampled, and practical application of the refractometric method to determine the state of maturity.** L. Levert, C. A. A. van der Woude and C. van Dillewijn. *Arch. Suikerind.* 42, 83-115 (1934); cf. C. A. 27, 4116.—Further expts. have shown that the correlation between Brix of field samples and the

rendement obtained is 0.94 to 0.97; the correlation between Brix by hand refractometer and that of expressed juice is 0.88 to 0.96. This is sufficient for practical purposes. The method for finding the true av. Brix for a field plot is described, and a table is presented, showing the no. of stalks that must be sampled to obtain the Brix within a given limit of error. In practice it is not necessary to det. the Brix for each stalk separately, but a sampling knife with a juice reservoir may be used. Directions are given for the practical use of the new method, which is more reliable and cheaper than the old method. F. W. Z.

**Filterability tests on cane sugars.** F. W. Zerban. *Facts About Sugar* 29, 7-12 (1934).—In filtration tests on 65 raw sugars, with the Elliott filter (C. A. 20, 1000), with a pressure filter which is described and illustrated, and by actual factory runs, it was found that the first 2 methods show fairly high correlation with each other, but that the

filtration rate in the factory cannot be reliably predicted from either. The discrepancies need not be due to errors in the lab. tests, but may be caused by difficulties involved in factory runs. It is recommended that the Elliott test be used for routine tests to improve the quality of raw sugars; definite specifications are proposed to make the results mutually comparable. The pressure method is recommended for research work.

**Processing of sugar beet by the Komers and Cuker method.** K. Smolenski. *Prace Centr. Lab. Cukrownicz., Latach.* 1928-31, 23 5.- The process is criticized.

**Density [of beet juice] and maturity.** F. Guilbert. *Bull. assoc. chim. suc. dist.* 50, 81 5(1933).—High purity of juice depends mainly on ripeness of the roots. Relations between ripening, rainfall, soil texture, and soil temp. at the surface and 30 cm. below are discussed, with reference to tabulated data for 1931 and 1932.

**New results with the magnesia installation at Wismar.** E. v. Huyden. *Deut. Zuckerind.* 59, 17 18(1934).—Thin beet-sugar juice from the third satn. was filtered on the factory scale through mixts. of MgO and charcoal.

**Clarification of sugar solutions according to Horne.** II. P. Honig and K. Douwes Dekker. *Arch. Suikerind.* 42, 116-19(1934); cf. C. A. 27, 4918.—For 35 molasses sugars the polarization after clarification by Horne's method was 0.1 0.35, av. 0.194 lower than with the use of subacetate soln. It is recommended that Horne's method be used in the future because it gives results closer to the truth.

**The control of crystallization on the basis of Claassen's doctrine of saturation and supersaturation.** Brunolf Brukner. *Deut. Zuckerind.* 59, 35 9(1934).—Graphical methods in conjunction with routine analyses facilitate the calcn. of the correct vol. of water to add to the massecuite in the mash and of the yield of beet-sugar crystals.

**Peculiar precipitate in a turbocompressor for saturation gas.** K. Smoleński and W. Reicher. *Prace Centr. Lab. Cukrownicz., Latach.* 1928 31, 160-75.—The compn. of the ppt., which arose from the presence of insufficient air and excess of coke in the lime kiln, is recorded.

**Raffinose. Preparation and properties.** F. H. Hungerford and A. R. Nees. *Ind. Eng. Chem.* 26, 462-4 (1934). Raffinose has been prepd. on a small com. scale from the molasses obtained in the barium desugarizing process, by seeding it heavily with raffinose and allowing it to crystallize at 15° to 18° during 20 days under slow agitation. The crystals are filtered off after dilg. the magma to 65% solids with cold water, and are recrystd. several times from H<sub>2</sub>O. The effect of raffinose on the crystal form of sucrose is described. The soly. of raffinose hydrate has been detd. between 0° and 78°; above this temp. the hydrate is not stable. The anhydride is much more sol. than the hydrate.

**Saccharifying lignin with dilute solutions of sulfuric acid.** L. V. Kotovskii. *J. Applied Chem.* (U. S. S. R.) 6, 519-27 (in German 527-8) (1933).—The use of a large amt. of acid leads as a rule to higher yields of sugar. The concn. of the sugar in hydrolyzed solns. varies usually within 1.8-2%. The yield of sugar does not increase as

rapidly as the increase in the concn. of acid or its amt. The use of a 2 2 1/2% acid in the presence of small amts. of H<sub>2</sub>O is the most economical procedure while the yield of sugar does not exceed 18%. For acid concns. of 3-4% the yield of sugar increases with lower temp. and higher concn. The hydrolysis of the lignin is influenced by the temp. and pressure. Addnl. pressure exercised by an oil press or a gas cylinder raises the yield another 5%. The hydrolysis of the lignin takes place in 2 stages. In the 1st stage are hydrolyzed the less stable polyvinyl compds. which yield products which are also unstable, while in the 2nd stage the more stable carbohydrates are hydrolyzed (probably the cellulose), which require more severe conditions for their decompn. and yield accordingly products of a higher crit. temp. Neutralization with excessive caustic or carbonates leads to an increase in the sugar content and it may reach 5% with chalk. The lignin residues may absorb sugar from the soln. to the extent of 10% of the sugar in the soln.

**Hoppler viscometer (Knop) 1. Relationship of sprouting in sugar beet to the nutrient content of the soil (Claus) 15. Results of the plot tests on various [sugar-cane] problems (Demandt) 15. Results of the fertilizer tests [on sugar-cane] (Demandt) 15. Sugar-cane cultivation and manuf. of white sugar at Palur Agr. Research Station (Krishnaswami) 15. Phys. consts. for Hawaiian sugar-cane soils (Wadsworth) 15.**

**Preservation of beet slices at sugar factories.** Mezögaz-dasági Ipar R. T.° Hung. 108,505, Feb. 15, 1934. A layer of 100 kg. of beet slices is moistened with a soln. of 0.1 8 kg. HCl, 0.1-1.6 kg. molasses and 0.01° 0.1 kg. Ca, Na or K phosphate; successive layers are added and similarly treated, and finally the whole is covered with straw.

**Apparatus for saturating sugar juices.** Oskar Spengler, Georg Bartsch and Jochen Wigand. *Ger.* 590,850, Jan. 11, 1934 (Cl. 89c. 16).

**Centrifugal apparatus for filtering sugar slurry.** Raffinerie Irlenmontoise, Soc. anon. *Ger.* 590,802, Jan. 11, 1934 (Cl. 89c. 16).

**Utilizing sugar diffusion waters.** G. N. Shevchenko and A. S. Fedchenko. *Russ.* 31,835, Oct. 31, 1933. To avoid infection with microorganisms by contact with air diffuser waters are pumped by the diffuser pump directly into the proper diffuser with shavings without any purification of the waters from the pulp, whereby simultaneously with the transfer of the diffuser water the diffuser to be discharged is filled with fresh water and the pressings are mechanically removed in the usual manner.

**Purifying the diffuser water with mud from filter presses.** V. A. Krasilshchukov. *Russ.* 31,836, Oct. 31, 1933. For the purpose of combining in one process the purification of recycled diffuser waters and utilization of the sugar contained in the filter-press mud, the two are mixed after the diln. of the mud and after the addn. of lime to an alk. of 0.01 0.015 and after a proper agitation the mixt. is allowed to stand for clarification.

**Artificial honey.** M. T. Kokonov. *Russ.* 31,838, Oct. 31, 1933. In the prepn. of artificial honey by hydrolyzing starch, rhubarb stalks are used as hydrolyzing medium.

## 29—LEATHER AND GLUE

ALLEN ROGERS

**The leather chemist.** Vittorio Casaburi. *Boll. ufficiale stat. sper. ind. pell. mat. concianti, suppl. tec.* 8, 34-54(1933).—A discussion of the Italian leather industry.

**Dry tanning.** G. Fabzin. *Koshevenno-Obuvnaya Prom. S. S. S. R.* 12, 357-60(1933); *Chimie & industrie* 31, 417.—A study of the accelerated tanning of hides by means of highly concd. vegetable exts. The following procedure may be followed: treat the raw washed hides in a

drum, for 1-3 days, with a buffer soln. consisting of 200% of spent liquor to which are added 1-1.5% H<sub>2</sub>SO<sub>4</sub> and 8% NaCl, remove excess liquid in a hydraulic press, place in a dry drum and rotate for 30 min., add the vegetable ext. at as high a d. as possible (optimum 30-31° Bé., but tanning still takes place at 22-24° Bé.). The temp. at the start is 18-20° and should not exceed 36° at the end. The other operations are as usual.

**Iron tanning.** I. Veisberg and I. Bunimovich. *Koshe-*

*venno-Obuvnaya Prom. S. S. S. R. 12, 383-4(1933); Chimie & industrie 31, 418.*—Tanning can be effected with neutral  $\text{Fe}_2(\text{SO}_4)_3$ , very slightly alkalized by addn. of 0.2-0.3%  $\text{Na}_2\text{CO}_3$  (on the wt. of raw hides). The Fe soln. is prepd. by heating powd. com. salt (contg. 10-15%  $\text{H}_2\text{O}$ , 45-55%  $\text{Fe}_2(\text{SO}_4)_3$ , 4-5%  $\text{FeSO}_4$  and 15-25% insol.) with  $\text{H}_2\text{O}$  under pressure for 2-4 hrs., letting stand overnight, decanting (the soln. has a d. of 45° BÉ., contains about 200 g. Fe oxide per l. and has an acidity equiv. to 200 g.  $\text{H}_2\text{SO}_4$  per l.), dilg. to 25-27° BÉ. (80-90 g. Fe oxide per l.) and neutralizing with  $\text{Na}_2\text{CO}_3$  to an acidity of 55-55 g. per l. Hcps. of the hides is the same as for Chrome tanning. They are then introduced into a drum contg. 100%  $\text{H}_2\text{O}$  at 50° and 2%  $\text{NaCl}$  (on the wt. of hides); during rotation a soln. contg. 185 g.  $\text{CrO}_3$  per l. (0.4-0.5%  $\text{CrO}_3$  on the wt. of hides) and having an alk. of 38-40% is added; at the end of 2 hrs. impregnation of the hides is complete, and they can stand a temp. of 55-60°. The Fe soln. is then added in 3 portions over a period of 1 hr.; at the end of 3 hrs. the hides acquire a light yellow color and can stand a temp. of 80-5°; add 0.4%  $\text{Na}_2\text{CO}_3$  and rotate for another 3 hrs. During the whole operation the temp. should not exceed 30-2°. The tanned hides can stand a temp. of 94-6°.

**Chrome tanning.** XVIII. Further experiments on two-bath tanning processes. B. Masny and A. Papayannis. *Collegium 1934, 89-87*; cf. *C. A. 27, 5573*.—Vertical distribution of Cr and acid in the hide after the first bath was studied. In the second bath, if the acid is added slowly, a more basic Cr salt is formed than if the addn. is rapid; in the latter case the  $\text{Na}_2\text{S}_2\text{O}_8$  is oxidized to  $\text{Na}_2\text{SO}_4$  and  $\text{H}_2\text{SO}_4$ , in the former to  $\text{Na}_2\text{S}_2\text{O}_5$  and  $\text{Na}_2\text{SO}_4$ .  $\text{HCl}$  in the second bath can be replaced by formic but not by lactic acid. With formic acid a soft plump leather is obtained; it is resistant to boiling  $\text{H}_2\text{O}$  and contains 2.2-2.6% Cr in a 30-50% basic salt. I. D. Clarke

**Two-bath (chrome) tanning.** I. B. Bělavský and J. Makarius. *Collegium 1934, 87-92*.—Practical observations on the two-bath chrome-tanning process.

**Determination of sodium chloride in sulfite waste liquor tanning extracts.** P. Kharlamov. *Koshevno-Obuvnaya Prom. S. S. S. R. 12, 284(1933); Chimie & industrie 31, 416*.—The solns. cannot be titrated directly on account of their deep color. Dil. the sample to a d. of 5° BÉ., evap. 10 cc. on water bath, char, take up in water acidified with  $\text{HNO}_3$ , boil off  $\text{H}_2\text{S}$  completely, make to 250 cc., and titrate an aliquot by the Volhard method.

**Further investigations on the effect of pickling process upon imported dried skins infected with anthrax.** G. Pohl. *Z. Infektionskrankh. parasit. Krankh. Hyg. Haustiere 45, 260-4(1934)*.—Imported cattle skins, infected with anthrax, were rendered sterile after pickling in a fluid contg. 3%  $\text{HCl}$  and 10.22%  $\text{NaCl}$ . The process appeared to be more or less harmful to the leather.

**Lizards, serpents, crocodiles.** Vittorio Casaburi. *Boll. ufficiale staz. sper. ind. pell. mat. concianti, Suppl. sec. 8, 73-81, 100, 130-2(1933)*.—Tables are given listing the various reptiles capable of furnishing leather which are found in the Brit. Empire or the East Indies. J. W. P.

**Behavior of sole leather toward water.** M. Bergmann and A. Miekeley. *Collegium 1934, 117-36*.—Review of previous articles by Bergmann and coworkers. Unrolled leather absorbs more  $\text{H}_2\text{O}$  if tanned with sulfited ext. than if with unsulfited ext.; after rolling absorption is about the same. Al soaps are much more effective in decreasing  $\text{H}_2\text{O}$  absorption if they are added in an org. solvent than if produced on the leather fibers from aq. solns.

**Use of fleshings from pig skins for the manufacture of glue.** B. Nisnevich and F. Azarkh. *Koshevno-Obuvnaya Prom. S. S. S. R. 12, 372-3(1933); Chimie & industrie 31, 418*.—First fleshings.—As pig-skin fleshings differ from others, particularly by their high fat content (up to 35%) and smaller size, they are cooked directly without preliminary treatment, and are washed directly in the

cooking tanks. The glue is not transparent and has a high ash content; it has a satisfactory viscosity, but it dries more slowly than ordinary glue, even when the viscosity of the latter is lower. Cooking should be carried out at as low a temp. as possible (70-80°) to avoid formation of emulsions. Second fleshings.—They differ in compn. from the 1st fleshings, and moreover have been subjected to a 4-8 days' liming. They must be first completely neutralized and then washed 2 or 3 times. Other operations are the same as for ordinary fleshings.

A. Papineau-Couture

**Detg. jelly strength (Gradstein, Mendel) 2. Chemistry of quebracho tannin (Freudenberg, Maillard) 10. 2-Rutaldehyde [from tanbark] (Russ. pat. 31,433) 10.**

**Impregnating hides.** V. A. Babun. *Russ. 31,558, Oct. 31, 1933*. The hides are treated with a soln. of a product obtained by treating anthracene and heavy coal-tar oil with small amounts (10 to 20% by wt.) of  $\text{H}_2\text{SO}_4$ . The treatment is carried out in a soln. of light hydrocarbons.

**Treating hides, skins, furs, leather, etc., in order to soften them.** Karl Brodersen and Heinrich Wagner (to I. G. Farbenind. A.-G.). U. S. 1,949,990, March 6. A treating agent is used comprising an org. acid ester of a polyhydric aliphatic alc., such as a glycerol mono-ester of the acids of coconut oil.

**Tanning.** Charles Kannel. *Brit. 402,521, Dec. 7, 1933*. In a process for the quick tanning of leather in rotary drums, the hides, after usual liming and washing processes, are treated with an aq. bath (preferably acid) contg. sulfites, e. g., alkali bisulfites,  $\text{H}_2\text{BO}_3$ , or its salts, and sol. carbohydrates, preferably glucose. They are then treated in a tanning bath contg. sulfonic acids, quinones or hydroquinones and, preferably, aldehydes and then subjected to accelerated rotation in a drum contg. a tannic liquor. App. is described.

**Tanning agents.** I. G. Farbenind. A.-G. (Johann Hunsmann and Gustave Mauthe, inventors). *Ger. 593,053, Feb. 21, 1934 (Cl. 28a. 6)*. See *Brit. 353,046 (C. A. 26, 5150)*.

**Preparing chrome extract and chrome alum.** V. P. Kizhaev and N. A. Andrianov. *Russ. 31,559, Oct. 31, 1933*. The products are prepd. by treating the chrome and mixt. with org. reducing agents and particularly with the sludge obtained as a waste product in tanning.

**Leather.** Manó Frankl. *Hung. 108,534, Feb. 15, 1934*. Pretanned leather is stretched and softened for 45 min. in a 10% salt soln. at 22°, 2% glycerol is added and after 30 min. the usual tanning with Cr salts applied.

**Treatment of coated leather.** J. H. Epstein A.-G. (Frank English, inventor). *Ger. 593,270, Feb. 23, 1934 (Cl. 22g. 13)*. Nitrocellulose coatings are removed from leather with the aid of known lacquer-removing compns. comprising water, an org. solvent, e. g., methylcyclohexanone, and a finely divided solid, e. g., sawdust, asbestos or talc, with or without an emulsifying agent, e. g., Turkey-red oil.

**Dyeing leather, etc.** I. G. Farbenind. A.-G. *Brit. 402,327, Nov. 30, 1933*. See *Rev. 754,388 (C. A. 28, 15484)*.

**Leather substitute.** Harold Jackson. *Brit. 402,982, Dec. 14, 1933*. A latex-vulcanizing agent without a coagulant is added to vegetable fiber having no tendency to coagulate rubber latex, e. g., manila hemp, cotton, flax, jute or wood being pulped in a heating engine, and non-coagulated rubber latex is subsequently added, partly or wholly during or at the end of the beater stage or in the paper-making machine. Known accelerators may be added with the vulcanizer or to the pulp, and dyes, etc., may be added to the pulp or latex.

**Boot and shoe heels.** The British United Shoe Machinery Co., Ltd., and Wm. R. Barclay. *Brit. 402,448, Dec. 4, 1933*. A board of leather board, pulp board or like fibrous leather substitute, before or after cutting into heel lifts, is coated on 1 or both sides with a lubricant

dressing of paraffin wax, applied molten or as an emulsion in H<sub>2</sub>O prep'd. with the aid of Castile soap, an ethanoline soap or similar agent, to facilitate subsequent trimming.

Animal glue composition. Edward F. Christopher and

Frank L. DeBeukelaer (to Swift & Co.). U. S. 1,950,483, March 13. Animal glue is mixed with about 20-50% of urea or biuret to form a product which is liquid at ordinary temps. and which is hygroscopic when dried and suitable for use on articles which are to be exposed to low temps.

### 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

The preparation of chlorinated rubber from latex. Hypochlorination and chlorination processes. G. F. Bloomfield and E. H. Farmer. *J. Soc. Chem. Ind.* 53, 43-7T (1934).—A mixt. of dild. latex (contg. NH<sub>3</sub>) and HClO (I) (1 mol. per C<sub>2</sub>H<sub>4</sub> unit) let stand pptd. a pale yellow substance (II) of the approx. compn. C<sub>2</sub>H<sub>3</sub>OCl. The yield was 95%, based on a simple addn. reaction. It was insol. in org. solvents, but swelled in certain ones. It decompd. at 130°, and by acidic K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, Ac<sub>2</sub>O, H<sub>2</sub>SO<sub>4</sub> and HNO<sub>3</sub>. Dild. of the HNO<sub>3</sub> decompn. liquor pptd. an unidentified nitrogenous acid. Heated with water or aq. alkalis, II lost Cl and darkened. In C<sub>2</sub>H<sub>5</sub>N or 1% NH<sub>3</sub> at 120-50°, it formed a brown substance contg. Cl. With varying proportions (in all cases a deficiency) of I, chlorinated substances were obtained, the Cl contents of which corresponded almost exactly to the quantities of HClO used. With very low proportions of I, they were tacky and dissolved in org. solvents, but as the Cl content increased they became nontacky and insol. (at 0.3 mol. of I added), and finally crumbly (at 0.85-0.90 mol. of I added). With excess I (4 mols.), and treatment with NH<sub>3</sub>, there was formed a pale yellow substance (III) (14 g. from 20 cc. of 34% latex) contg. 41.5% Cl, and with the same properties as II. An ice-cold mixt. of latex and aq. NaHCO<sub>3</sub> yielded on chlorination and treatment with NH<sub>3</sub> an insol. cream-colored substance (IV) contg. 45.8% Cl. By incomplete chlorination intermediate substances were obtained with properties like those above from a deficiency of I. Concd. (centrifuged) latex gave cleaner products than did dild. latex, free from serum impurities. II chlorinated in boiling CCl<sub>4</sub> until HCl was no longer evolved yielded an insol. white substance (V) contg. 56.3% Cl, which corresponds to C<sub>2</sub>H<sub>3</sub>OCl<sub>2</sub>. A similar substance contg. 59.1% Cl was obtained under like conditions from III. Chlorination of acid latex stabilized with casein or of latex contg. Na<sub>2</sub>CO<sub>3</sub> or NaOH instead of NaHCO<sub>3</sub> yielded insol. substances similar to IV, but which were probably mixts. of varying degrees of chlorination. Dild. latex contg. NaHCO<sub>3</sub> chlorinated at 0-10° until acidic, and further chlorinated at 80-100° yielded a white substance (VI) contg. 51.1% Cl, sol. in various org. solvents. *In vacuo* at room temp. it lost HCl, and at 110° decompd. rapidly. Heated in water at 100° it lost HCl, and formed an insol. more stable (decompd. 170°) substance, evolved Cl in hot concd. HCl and did not react with PCl<sub>5</sub> or POCl<sub>3</sub>. No other sample of latex gave a sol. chlorinated product, *e. g.*, various samples of Malay, Java and 80% latexes gave white or yellow insol. substances of lower Cl contents than those above. After 2 months the Malay latex from which II and VI were prep'd. no longer gave sol. products, so the effects on the soly. of II of various natural and artificial components of the latex were studied. The catalyst necessary for the formation of sol. chlorinated substances was a serum substance, probably a protein. However, chlorination with a relatively small quantity of NaHCO<sub>3</sub> or in acid medium yielded only insol. substances, even with added serum. Oxidation of latex with H<sub>2</sub>O<sub>2</sub>, addn. of NaHCO<sub>3</sub> and chlorination gave insol. substances, and with addnl. serum, sol. substances. Chlorination of vulcanized latex by the method used in prep'g. V without addnl. serum yielded partly sol. white substances contg. S. Though *q. q.* free of Cl and HCl can be prep'd. by the method of Taylor, MacMullin and Gammal (*C. A.* 19, 968; B. and F., *C. A.* 26, 5065), the method had to be changed in the present work to avoid CaCl<sub>2</sub>. This was achieved by passing Cl into aq. NaHCO<sub>3</sub> in place of a

suspension of CaCO<sub>3</sub>. Though the various products were difficult to analyze, the expts. leave little doubt as to the initial reaction of the rubber and I was a predominantly additive. The differences in soly. and stability between chlorinated rubbers prep'd. from latex and those from rubber solns. are wide, and indicate a great difference in the mechanism of the reaction in water and in an org. solvent. These differences do not depend upon relatively extensive hydroxylation in water because chlorinated derivs. are formed by the action of I on rubber solns., which though extensively hydroxylated are sol. (unpublished work). The work also shows the notable fact that rubber is capable of easy chlorination beyond the point corresponding to additive satn.

C. C. Davis

The action of hypochlorous acid on rubber. G. F. Bloomfield and E. H. Farmer. *J. Soc. Chem. Ind.* 53, 47-8T; *India Rubber J.* 87, 301-2 (1934).—Treatment of CHCl<sub>3</sub> solns. of purified rubber (I) with aq. HClO (II) gave substances with properties different from those obtained from latex (*cf.* preceding abstr.). With less than 1 mol. of II per C<sub>2</sub>H<sub>4</sub> unit, there was evidence of substitutional chlorination, and with more II a considerable replacement of H by Cl, so that with sufficient II, substances contg. Cl up to 66% were obtained. Though chlorinated products from latex are insol., those from I solns. are less so, and the highly chlorinated substances were sol. in org. solvents of I. At 0-5°, and with 1 mol. of aq. II, a small quantity of a gelatinous product sep'd., which dried to an insol. substance (III) contg. more Cl than that corresponding to (C<sub>2</sub>H<sub>3</sub>OCl)<sub>2</sub>, while the product pptd. from the CHCl<sub>3</sub> by EtOH dried to a pale brown horny insol. substance (IV) contg. 27.1% Cl, 57.4% C and 6.83% H, *i. e.*, correspondingly deficient in Cl. The Cl in III and IV corresponded to all of that in the II. Substitutional chlorination of IV occurred, judged by the Cl/O ratio. The tendency of IV to become insol. was inhibited by a trace of quinol, so it was probably a mol. aggregation or polymerization. Under the same conditions with 0.5 mol. of aq. II and I in CCl<sub>4</sub>, the gelatinous ppt. yielded a white insol. substance (V) contg. 55.1% Cl (4.3 g. from 10 g. of rubber), corresponding to C<sub>2</sub>H<sub>3</sub>OCl<sub>2</sub>, while EtOH pptd. from the CCl<sub>4</sub> a horny insol. substance (VI), contg. 25.1% Cl with properties like those of IV. All Cl in the I was accounted for by the yields and compns. of V and VI. With 5 mols. of II and I in CHCl<sub>3</sub> at 0°; the CHCl<sub>3</sub> layer yielded on ppt'g. a white substance (VII) contg. 66.0% Cl and 8.5% OH, sol. in some org. solvents. Its analysis corresponded in an approx. way to C<sub>2</sub>H<sub>3</sub>OCl<sub>2</sub>. With solvents other than CHCl<sub>3</sub>, the products were also highly chlorinated substances, but unlike VII were insol. and variable in compn. With unpurified rubbers in place of I, the results were similar, except that with the lower proportions of II, the products were darker. Treatment of Et<sub>2</sub>O-sol. rubber (VIII) (prep'd. by the method of Pummerer, Andriessen and Gündel, *C. A.* 22, 4973) in Et<sub>2</sub>O with different proportions of aq. II pptd. gelatinous products which yielded with 1, 2, 6 and 10 mols., *resp.*, of II, a hard white substance contg. 29.0% Cl, a hard white substance contg. 39.5% Cl, a white spongy substance (IX) contg. 48.7% Cl and a white spongy substance (X) contg. 49% Cl. With increase in II, the Et<sub>2</sub>O was attacked considerably, and in the formation of IX and X most of the II reacted with the Et<sub>2</sub>O. On the other hand, dried VIII in CHCl<sub>3</sub> and aq. II (10 mols.) at 0° yielded a white substance contg. 53.5% Cl, sol. in org. solvents (including Me<sub>2</sub>CO), while under the same conditions dried Et<sub>2</sub>O-insol. (gel) rubber yielded a white

substance contg. 65.8% Cl, and also sol. in org. solvents.  
C. C. Davis

**Kinetics of polymerization of butadiene in a glow discharge (Rubanovskii) 2.** Azo dyes [for coloring rubber] (Fr. pat. 759,529) 25. Closures [of rubber-like material] for bottles (Brit. pat. 402,623) 18. Rubber and cloth sheets (Fr. pat. 759,270) 25. Aromatic amines [products used as antioxidants] (U. S. pat. 1,950,079) 10.

**Heintz, Arvid:** Hundert Jahre russische respektive osteuropäische Gummi-Industrie. Riga: N. Kymmels Buchhandlung, 44, pp. Reviewed in *Rubber Age* (London) 14, 299 (1934).

**Rubber.** Firms E. Merck (Erich Wurm, inventor). Ger. 590,685, Jan. 8, 1934 (Cl. 39b, 7)<sup>2</sup>. A rubber soln. which will not vulcanize at ordinary temps. contains Zn stearate as activator, instead of ZnO or ZnO and stearic acid.

**Rubber, etc., compositions.** Dunlop Rubber Co., Ltd., Douglas F. Twiss and John A. Wilson. Brit. 403,341, Dec. 21, 1933. A 3-phase plastic compn. is made by dispersing (synthetic) rubber, gutta-percha, balata, waste or reclaim in a plastic (mixt.) as the continuous medium and then dispersing this modified plastic into rubber as the continuous medium. Rubber-insol. plastics thus used are ca. in, albumin, cellulose deriva. and synthetic resins. Details of the formation of the dispersions are given.

**Latex conversion.** The Naugatuck Chemical Co. Fr. 759,275, Jan. 31, 1934. The rapidity of conversion of latex to cream is increased by adding known conversion agents and afterwards allowing the latex to sep. under the action of gravity into 2 portions, one rich in rubber, the other composed of serum.

**Rubber compositions.** Siemens & Halske A.-G. Brit. 403,503, Dec. 28, 1933. An elec. conductor, e. g., marine cable, is insulated by a mixt. of solid raw rubber, which may be deproteinized, and polyvinyl compds., e. g., polystyrene, polyvinyl acetate. Vulcanization or further polymerization, either during mixing or subsequently, is avoided. Volatile or high-boiling solvents and, if desired, further softeners, e. g., mineral waxes, may be present.

**Rubber compositions.** The International Latex Processes, Ltd. Fr. 758,511, Jan. 18, 1934. Granular, fibrous or divided materials such as leather fiber, sawdust, cork dust, jute fiber or paper pulp are mixed with floccular or granular ppts. of rubber obtained from aq. dispersions, and the mixt. is converted into grains or crumbs, preferably dry. Cf. C. A. 28, 1571<sup>1</sup>.

**Hydrogenation of rubber, etc.** I. G. Farbenind. A.-G. Brit. 402,925, Dec. 14, 1933; Fr. 758,043, Jan. 9, 1934. The hydrogenation of rubber and like highly polymerized unsatd. hydrocarbons is effected, e. g., at 200–320°, under pressure, e. g., 10–180 atm., in presence of solvents and of catalysts contg. heavy metals of the 6th group, or oxides or sulfides thereof, with or without the addn. of oxides or sulfides of other metals, particularly 8th group metals, or of the metals themselves.

**Chlorinated rubber.** Wilfrid D. Spencer and Imperial Chemical Industries, Ltd. Brit. 402,454, Dec. 4, 1933. Chlorinated rubber is removed from solns. by introducing the soln. beneath the surface of an agitated liquid which is immiscible with the solvent and the rubber and which is maintained at above the b. p. of the solvent. In an example a soln. of chlorinated rubber in CCl<sub>4</sub> is fed into boiling H<sub>2</sub>O, the rubber rising to the surface in a porous, spongy or fibrous condition and all the solvent being evapd. before the surface is reached.

**Chlorinated rubber.** Chemische Fabrik Buckau. Fr. 758,290, Jan. 13, 1934. See Brit. 400,898 (C. A. 28, 2219<sup>1</sup>).

**Retarding deterioration of rubber.** Wm. S. Calcott and Wm. A. Douglass (to E. I. du Pont de Nemours & Co.). U. S. 1,950,478, March 13. To retard deterioration, there is incorporated in vulcanized rubber a compd.

1 such as *p*-aminodiphenylamine, *p*-amino-*p*'-hydroxydiphenylamine or *p*-phenylamino-8-aminonaphthalene.

**Aqueous rubber dispersion.** Harold L. Levin (to Patent and Licensing Corp.). U. S. 1,950,451, March 13. Rubber is plasticized in the presence of a softening agent such as cumar, "mineral rubber" or gum rosin and the plasticized rubber is added to a relatively stiff paste of a water-sol. org. colloid such as rosin soap and a non-colloidal "attriting agent" such as whitening and the rubber and paste are masticated together so that the rubber is dispersed in the paste, and a product is obtained which may be used as a latex substitute. U. S. 1,950,452 relates to manuf. of artificial dispersions of rubber by effecting dispersion of the rubber in the presence of a relatively stiff aq. paste of non-colloidal mineral powder such as whitening colloidized with a gum such as locust-bean gum while the paste is maintained as the continuous phase. U. S. 1,950,453 relates to a generally similar process in which, however, starch or dextrin is used instead of a gum as a colloidizing agent for the non-colloidal mineral powder.

**Porous rubber from aqueous rubber dispersions.** Dunlop Rubber Co., Ltd., and The Anode Rubber Co., Ltd. Ger. 591,905, Jan. 29, 1934 (Cl. 39b, 9). Addn. to 551,407 (C. A. 26, 4505). See Brit. 359,584 (C. A. 27, 445).

**Porous rubber articles.** The International Latex Processes, Ltd. Fr. 759,109, Jan. 20, 1934. Reinforced and practically untearable articles which are porous or microporous are made by treating fibers, after teasing them, with aq. dispersions of rubber which have been made capable of setting to a gel under the action of heat, and vulcanizing under such conditions that evapn. of liquid is avoided.

**Rubber articles.** The International Latex Processes, Ltd. Fr. 758,547, Jan. 18, 1934. See Brit. 400,874 (C. A. 28, 2220<sup>1</sup>).

**Rubber products.** Artifex chemische Fabrik G. m. b. H. Ger. 500,605, Jan. 6, 1934 (Cl. 39b, 6). Resin-like products obtained by treating a soln. of rubber, etc., with SCl<sub>2</sub>, S<sub>2</sub>Cl<sub>2</sub> or SO<sub>2</sub>Cl<sub>2</sub> are worked up by application of heat and pressure, after removal of the solvent.

**Rubber thread.** The International Latex Processes, Ltd. Brit. 402,364, Nov. 30, 1933. A coagulant, e. g., AcOH, HCOOH, alc., which may be thickened by the addn. of cellulose acetate, gums, resins, etc., is streamed into a body of latex and the filamentary coagulum formed is continuously withdrawn. Heat-sensitive latex may be used and a hot coagulant streamed into it. Cf. C. A. 27, 5579.

**Rubber threads.** Willis A. Gibbons (to The International Latex Processes, Ltd.). Brit. 402,140, Nov. 27, 1933. Fr. 758,912, Jan. 26, 1934. See U. S. 1,924,924 (C. A. 27, 5579).

**Coating tools with rubber.** I. G. Farbenind. A.-G. Ger. 590,647, Jan. 8, 1934 (Cl. 39b, 5). Tools are given a protective coating by covering them with molten unvulcanized rubber and then vulcanizing the rubber.

**Halo-butadienes.** Wallace H. Carothers and Donald D. Coffman (to E. I. du Pont de Nemours & Co.). U. S. 1,950,441, March 13. See Ger. 588,708 (C. A. 28, 2015<sup>1</sup>).

**Substituted chlorobutadienes.** Ralph A. Jacobson (to E. I. du Pont de Nemours & Co.). U. S. 1,950,440, March 13. Hydrogen halides add to substituted monovinylacetylenes of the general formula CH<sub>2</sub>=CH—C≡C—R to form substituted butadienes of the general formula CH<sub>2</sub>=CH—CX:CHR in which X is a halogen atom and in which R is a C-contg. radical such as alkyl, aryl and heterocyclic residues, new products thus formed having properties generally similar to those of 2-chloro-1,3-butadiene and being suitable for producing rubber-like polymerization products, etc. Details are given of the production of 1-methyl-2-chloro-1,3-butadiene, b<sub>m</sub> 99.5–101.5°; 1-ethyl-2-chloro-1,3-butadiene, b<sub>m</sub> 68.2–69°; 1-butyl-2-chloro-1,3-butadiene b<sub>m</sub> 64–5°; 1-heptyl-2-chloro-1,3-butadiene, b<sub>m</sub> 74–6°; and prepn. of polymerization products from these compds. is also described, many details and modifications of procedure being given.

2-Halo-1,3-butadiene. Arnold M. Collins (to E. I.

du Pont de Nemours & Co.). U. S. 1,950,435, March 13.  $C_2H_2$  is passed in contact with an aq. soln. of a cuprous halide such as  $Cu_2Cl_2$  or  $Cu_2Br_2$ , a halide such as  $NH_4Cl$  or  $C_2H_5Br$  which increases the soly. of the cuprous halide, and a H halide such as  $HCl$  or  $HBr$  (the latter being in a concn. of 6-15% to favor the desired reaction).

**Polymerizing 2-halo-1,3-butadiene.** Wallace, H. Carothers, Arnold M. Collins and James E. Kirby (to E. I. du Pont de Nemours & Co.). U. S. 1,950,438, March 13. The polymerization of compds. such as 2-chloro-1,3-butadiene is controlled by adding an inhibitor of polymerization such as a phenol, quinone, amine, nitro aryl compd., Et selenide, I or Br. U. S. 1,950,439 (Wallace H. Carothers and James E. Kirby (to E. I. du Pont de Nemours & Co.)) relates to effecting similar polymerization in the presence of S or a thiuram disulfide, which serves to control polymerization. Numerous examples are given in both patents.

**Polymerizing 2-chloro-1,3-butadiene.** Howard W. Starkweather, (to E. I. du Pont de Nemours & Co.). U. S. 1,950,437, March 13. Polymerization of 2-chloro-1,3-butadiene is effected (suitably by heating to  $35^\circ$  in the dark) in the presence of a catalyst comprising water, ethylene oxide or dioxane.

**Polymerizing 2-chloro-1,3-butadiene.** Ira Williams and Herbert W. Walker (to E. I. du Pont de Nemours & Co.). U. S. 1,950,442, March 13. Polymerization is effected to a stage short of gelation at a temp. below substantially  $45^\circ$  (suitably at about  $35-40^\circ$ ) and the material is further polymerized at a higher temp. (suitably about  $60^\circ$ ). This method serves to effect satisfactory control of the polymerization.

**Polymers such as those of 2-chloro-1,3-butadiene.** Wallace H. Carothers and Arnold M. Collins (to E. I. du Pont de Nemours & Co.). U. S. 1,950,432, March 13. A polymer which is of the character of a synthetic rubber is obtained by polymerization of 2-chloro-1,3-butadiene (numerous details of procedure being described). U. S. 1,950,433 relates to polymerizing 2-bromo-1,3-butadiene and interrupting the polymerization before the product has reached the insol., elastic stage, so that a product is obtained which is similar to rubber.

**Plastic polymer from 2-chloro-1,3-butadiene.** Ira Williams (to E. I. du Pont de Nemours & Co.). U. S. 1,950,436, March 13. For obtaining a plastic polymer, the material is partially polymerized, and the unpolymerized material is sepd. from the partially polymerized product (suitably by distn. under sub-atm. pressure). A benzene-sol. further polymerizable product is thus obtained. Numerous details, examples and modifications are described.

**Polymerizing monovinyl- and divinyl-acetylene.** Wm. S. Calcott and Frederick B. Downing (to E. I. du Pont de Nemours & Co.). U. S. 1,950,429, March 13. Various details of app. and operation are described for effecting polymerization of the material while in the form of a flowing stream, as while passing through a pipe or coil.

**Addition product from monovinylacetylene and hydrogen halide.** Wallace H. Carothers and Arnold M. Collins (to E. I. du Pont de Nemours & Co.). U. S. 1,950,431, March 13. A product of the formula  $ClCH_2-CH_2C \equiv CH_2$  is obtained by the reaction of monovinylacetylene with  $HCl$  (suitably in the presence of a metal halide)  $HBr$  yields a similar Br deriv. Dihalogen derivs. may also be formed.

**Hydrohalide addition products of acetylene hydrocarbons.** Frederick B. Downing, Albert S. Carter and Donald Hutton (to E. I. du Pont de Nemours & Co.). U. S. 1,950,434, March 13. Reaction of  $HCl$  or  $HBr$  on monovinylacetylene is effected by passing a stream of gaseous monovinylacetylene into contact with a soln. of the halide (suitably in the presence of a catalyst such as  $Cu_2Cl_2$ ).

**Diphenylguanidine salts.** Robert L. Sibley (to Rubber Service Laboratories Co.). U. S. 1,950,067, March 6. Salts are prepd. by reaction between a diphenylguanidine salt of an inorg. acid such as dihydroxyguanidine hydro-

chloride with an alkali metal salt of an org. carboxylic acid, contg. less than 14 C atoms and having a viscos. const. in water less than  $1.0 \times 10^{-2}$ . Diphenylguanidine acetate, phthalate, butyrate, tartrate, citrate and salicylate may be used in regulating rubber vulcanization.

**Plastic compositions.** Jean Baer. Ger. 593,017, Feb. 20, 1934 (Cl. 39b, 4.02). Latex is mixed with a CS<sub>2</sub> soln. of a condensation product prepd. in known manner from an alkali or a k. earth polysulfide and  $C_2H_5Cl_2$  or other sand. halo hydrocarbon. Plastic products which can be vulcanized in the cold are obtained.

**Device for making rubber tubes.** The Anode Rubber Co., Ltd. Ger. 590,910, Jan. 18, 1934 (Cl. 39c, 10.04).

**Machine and method for extruding simultaneously two halves of an inner tube or tread member for a pneumatic tire.** The Goodyear Tire & Rubber Co. Brit. 402,195, Nov. 30, 1933.

**Fibrous tubes.** The B. F. Goodrich Co. Brit. 403,175, Dec. 21, 1933. Resilient material is made of flexible fiber, e. g., hair, maintained in thin open mesh sheet form by an agglutinant, e. g., a flexible glue or nitrocellulose compd. or a rubber compn. deposited on the fibers from a rubber cement or an aq. dispersion such as latex, which unites the fibers at their crossing portions. App. for making tubes of the material is described.

**Removing scale from the surface of molds such as steel molds for rubber tires.** John F. Anderson, Walter J. Strong and Maynard F. Torrence (to B. F. Goodrich Co.). U. S. 1,950,208, March 6. The mold carrying scale is heated in contact with a liquid (such as an alkali soln. contg. a small proportion of soap) adapted to soften the scale, the scale is chilled without substantially cooling the mold and without drying the scale, the mold is cooled to prevent drying of the scale, and the scale is washed from the mold. App. is described.

**Cement receptive backing for rubber soles or the like.** Albert L. Murray. U. S. 1,950,258, March 6. An unvulcanized, but vulcanizable, rubber body is subjected to vulcanization heat, and a cement of raw rubber and solvent is applied to the body prior to its cooling to leave a deposited and unvulcanized film.

**Impregnating porous materials such as cloth, paper, wood or concrete with polymerization products such as those of vinyl acetylenes.** Wm. S. Calcott, Albert S. Carter and Frederick B. Downing (to E. I. du Pont de Nemours & Co.). U. S. 1,950,430, March 13. Polymerization is effected under superatm. pressure after the polymerizable material has been introduced into the pores of the material to be impregnated.

**Impregnating belting.** Alfred Abrahamson and Johannes E. Hansen. Brit. 403,015, Dec. 14, 1933. Conveyor belting consisting of several superposed layers of fabric is coated with an aq. dispersion of rubber, balata or gutta-percha, and stretched and calendered while in a moist condition. App. is described.

**Vulcanizing molds for rubber bar type spring units, more particularly for buffing and draft gear.** George Spencer Moulton & Co., Ltd., and Alexander Spencer. Brit. 402,155, Nov. 30, 1933.

**Vulcanization.** Allon Skipsey. Brit. 404,480, Dec. 28, 1933. Vulcanization of rubber by use of sulfides of P as described in Brit. 230,037 is accelerated by adding an inorg. base and S, with or without oil, to the sulfide and retarded by adding polyhydroxy compds., e. g., glycerol, starch, ester gum, or org. bases, aldehyde-amine condensation products, pine tar, creosote or lycopodium. Several examples are given.

**Vulcanizing rubber.** The Goodyear Tire & Rubber Co. Fr. 758,000, Jan. 10, 1934. Alkylene diamines prepd. by hydrogenating mono- or di-substituted amino-acetonitriles are used in the vulcanization of rubber. The nitriles are prepd. by causing an aldehyde or a ketone to react with a metal cyanide in the presence of a mineral acid and causing the product obtained to react with an amine. Suitable amines include phenyl-(b<sub>1</sub> 112-5°), dibenzoyl deriv., m. 124-7°, o-tolyl-(b<sub>1</sub> 121-2°, dibenzoyl deriv., m. 128-8°) and p-tolylethylenediamine (b<sub>1</sub> 110-15°).
